bad success at first, being defeated with great slaughter in three pitched battles. With great difficulty Belesis prevailed upon his men to keep the field only five days longer; when they were joined by the Bactrians, who had come to the assistance of Sardanapalus, but had been prevailed upon to renounce their allegiance to him. With this reinforcement they twice defeated the troops of Sardanapalus, who shut himself up in Nineveh, the capital of his empire. He was here closely besieged, while the conspirators received large accessions of strength from the revolt of the different provinces; but Sardanapalus confided in the prediction that 'Nineveh could never be taken, unless the river became her enemy.' The city being well supplied with provisions, the confederate forces remained two whole years before it without producing any impression, till at length the Tigris, having been swollen by unusual quantities of rain, overflowed twenty stadia (two miles and a half) of the wall, and thus made a practicable breach. Sardanapalus now, dreading to fall into the hands of an enraged enemy, retired into his palace, in a court of which he caused a vast pile of wood to be raised; and heaping upon it all his gold and silver, and royal apparel, and at the same time enclosing his eunuchs and concubines in an apartment within the pile, he set fire to it, and thus destroyed himself. Athenæus represents the treasures thus destroyed as worth a thousand myriads of talents of gold, and ten times as many

talents of silver, i. e. about £1400,000,000 sterling.

SARDANAPALUS, another monarch of Assyria, mentioned by Clectarchus, who died of old age. Sir Isaac Newton supposes him to be the same with Esarhaddon.

SARDEL, *n. s.* } A sort of precious stone:
SARDINE STONE, } sardonix; found in Sar-
SARDIUS. } dinia.

Thou shalt set in it four rows of stones; the first row shall be a sardius. *Exod. xxviii. 7.*

He that sat was to look upon, like a jasper and a sardine stone. *Rev. iv. 3.*

SARDINIA, an insular and continental kingdom of Southern Europe. The continental part occupies the north-west portion of Italy, and is bounded by Switzerland on the north, the duchies of Milan and Parma on the east, the Mediterranean on the south, and France on the west. It stretches about 200 miles from north to south, and 130 from east to west. With the island, it comprises a surface of 27,400 English square miles, and a population of 3,994,000.

All the continental dominions of the king of Sardinia had, without ceremony, been seized by the French, and were united to their empire, till the congress of Vienna, which restored it to the condition of 1792, adding the states of Genoa, and making other slight changes on the frontiers of Switzerland and France. It contains at present the following countries:—

Countries.	Square miles.	Population.	Chief Towns.	Inhabitants.
Piedmont, with the county of Nice	7900	1,750,000	Turin	85,000
Duchy of Montferrat	900	186,000	Casale	15,000
Part of the duchy of Milan	3300	556,000	Alessandria	35,000
Territory of the late Republic of Genoa	2300	532,000	Genoa	80,000
Savoy (not properly included in Italy)	3800	450,000	Chamberri	12,000
Island of Sardinia, with the adjacent Isles	9200	520,000	Cagliari	30,000

Piedmont thus appears one of the best peopled districts in Europe, while the mountainous duchy of Savoy is the most thinly peopled of the continental states. Intersected from north to south by the Maritime Alps, Continental Sardinia can scarcely be excelled in sublime mountain scenery. The ridge that, sweeping round the gulf of Genoa, joins the Appennines, gives a fine character to the southern regions, while all the centre and eastern districts form part of the grand basin of the Po, the greatest river of this kingdom. The summit of Mont Blanc, rising 15,660 feet above the level of the sea, with Mont Cenis, Mont Viso, and several other lofty peaks, serate the western chain; and the noble St. Bernard, Mont Rosa, and others of the great Alps, rise majestically on its northern frontier. The Tanaro, the Siara, and other rivers, fall into the Po, from the south and south-east; while the Doira, Baltea, the Sesia, and the Tesino, enter it from the north. The last separates the Austrian from the Sardinian dominions. Most of the lakes in northern Italy are situated between the eastern confines of Sardinia and the top of the Adriatic. Lago Maggiore forms a part of the north-west boundary, while that of Geneva stretches along the borders of Switzerland.

The soil in the lower parts of these territories is a rich sandy loam, intermixed with gravel; but the more elevated parts are chiefly composed of rock. The climate is hot in the valleys; on the hills mild; and on the mountains severe: but in most places, except the marshy plains, it is salubrious. The annual temperature of Genoa, in the immediate vicinity of the sea and the mountains, is about 61° of Fahrenheit's thermometer. In the lower parts all kinds of European grain, with Indian corn, rice, and hemp, are produced. Oranges, lemons, olives, vines, mulberries, figs, and other fruits, are of the finest flavor; and rich pastures feed, in several places, large herds of cattle. Irrigation is practised to a great extent. Silk is a valuable product, and of good quality here. The Alps of Piedmont contain gold, silver, and copper; the last, in the duchy of Aosta, is often mixed with antimony, zinc, and arsenic. A vein of cobalt has been discovered not long since, a little east of Mont Blanc, and plumbago near Binay. Green porphyry is found on Mont Viso, and various inferior precious stones in other places. Valuable marbles are also found in many parts; and some of the mineral waters are in good repute; particularly the baths of Binay.

SARDINIA, THE ISLAND OF, is fifty-five leagues long, north and south, and twenty-five broad, having upwards of 200 leagues of coast. On the north it is mountainous, but has extensive plains, marshes, and lakes, towards the south. It has productive iron and lead mines, some poor silver ones, copper, pyrites, precious stones, porphyry, marbles, alabaster, and some thermal springs. The two principal rivers are the Oristano and Fumendosa. The former, also called the Tirsi, empties itself into the gulf of Oristano on the west coast, and the latter on the south-east coast. There is said to be an inland navigable communication between Cagliari and Oristano, principally by the river Mariel, which empties itself into the gulf of Cagliari. The soil in the valleys is fertile, producing wheat and barley, and all the fruit trees of Europe, besides oranges, lemons, jujubes, grapes, palms, caroubs, lentisk (*cistus ladanum*), tobacco, &c. The horse is here met with in a wild state: it is small, well made, and very active. The asses are strong; the mules few; the hogs excellent, being fed on chestnuts. The wild quadrupeds are small deer, abundance of wild hogs: the muffoli, or wild sheep, inhabits the most solitary parts of the mountains. The island of Assinara has numbers of land turtle, and sea turtle are taken on the coasts as well as tunny fish, but both anchovies and sardines are scarce. The small bustard and wild-ducks abound. The climate is in general healthy, except in the vicinity of the morasses, which cause putrid fevers. The population is about 50,000, and the revenues do not exceed £80,000. Surrounded by people highly civilised, the Sardes are still in a state of surprising barbarity. In the country the men are clothed in goat-skins, one before and another behind, without breeches, shoes, or stockings, and a woollen or skin cap on the head. The women have no other habili-ment than a long woollen gown and a woollen cap. The peasants always go armed to defend themselves from one another; for they are all robbers and assassins, so that travelling in the interior is extremely unsafe without an escort; and it is even dangerous for ships to send their people on shore for water unless they are well armed. In short, the Sardes are the Malays of the Mediterranean. They are, however, strongly attached to their king and country. The barbarism of the peasantry is strongly contrasted by the pomp and outward show of the citizens of the capital, all of whom, mechanics not excepted, strut about with bag-wig, sword, and chapeau bras; and even in this costume it is common to be solicited for charity.

The coasts are indented by numerous gulfs and lined with islets and rocks. The principal headlands are, cape Comino, the east point and north limit of the gulf of Orosei. Cape Carbonera, the south-east point and east limit of the gulf of Cagliari: off it is the rocky island Cortellazzo (Ficaria), the west point of which is foul, but there is a good road on its north-west: on it is a castle, and north-east of it are two small islands, with a watch-tower on each; the outermost is named Serpentaria. Cape Pola, the west point of the gulf of Cagliari, is a low

rocky point with a watch-tower, and off it two rocky islets. Cape Tavolara, or Teulada, is the south-west point of the island, and east point of the gulf of Palma. Cape de Napoli, or la Fresca, the south point of the gulf of Oristano, on the middle of the west coast. Cape della Caccia (Nympheus) on the north-west. Cape Falcon (Gorditatum) is the north-west point of the island.

The chief gulfs are Terra-Nova on the north-east, the north point of which is cape Figueri; Porto Cavallo within the islands Tavolara, and others. The gulf of Orosei, between cape Comino and Monte Santo; the bay of Oliastro, south of cape Monte Santo, and of which cape Bellevue is the south point. The gulf of Cagliari on the south-east, at the head of which is Cagliari (Calaris), the capital of the island, containing 25,000 inhabitants. Its port is formed by two moles, and receives vessels of twelve feet. The gulf of Rosso has cape Tavolara for its west point: near its head is the isle Rossa, tolerably large, flat, and very rocky, within which is good anchorage before a river. The gulf of Palma, at the south-west extremity of the island, is formed by the main land on the east, and by the island Antiocha, also called St. Jago and Palma de Sal (Plumbaria), on the west, which is three leagues long and one broad. In the entrance of the gulf are two great rocks, named the Bull and Cow. A league north-west of Antiocha, and three leagues from the main, is the island San Pietro (Accepitum), rocky, barren, and surrounded by islets, with fort St. Carlos on its east side. The gulf of Oristano on the middle of the west coast. Porto Conta on the north-west is a good harbour whose entrance is protected by two towers; that on the right on an elevation seventy feet high, and so perpendicular that the ascent is by a rope ladder. There is good anchorage throughout the port, except near the town, where are some rocks level with the sea. At the head of the port is a spring of brackish water.

The north coast of the island curves greatly inward, forming a large gulf between the island Asinara on the north-west and Cape Scardo, the north point of Sardinia. The island Asinara (Herculis) is separated from cape Falcon by a channel with but two fathoms, and in it is the little island Piana. Asinara is very irregular, but three leagues in its greatest length. On its east side is Porto Trabuco, well sheltered, and with good anchorage in six and eight fathoms. Sassari, the second town of the island, is on the river Fiuminaria, four leagues from the sea. Its port, named Torres, is at the mouth of the river, secured by two moles. Off the north-east end of Sardinia are the isles Madelaine (Hermæa), between which and the main is an excellent road for the largest ships. On the largest island is a village and several forts, and here beef, wine, and vegetables may be procured for a fleet, and water from a considerable river on the main.

Sardinia, as well as Corsica, passed under the dominion of successive masters, until it came in the seventh century under that of the Saracens, who were driven from it by the Pisans and

Genoese, and the Genoese were dispossessed of it by the king of Arragon in 1330. It remained with Spain until 1708, when it was taken by the English for the emperor of Germany, who in 1720 ceded it with the title of kingdom to the house of Savoy.

'The inhabitants of Sardinia,' says Mr. Salt, '(I speak of the common people,) are yet scarcely above the negative point of civilisation; perhaps it would be more correct to say that they appear to have sunk a certain way back into barbarism. They wear, indeed, linen shirts, fastened at the collar by a pair of silver buttons, like hawks' bills; but their upper dress of shaggy goat skins is in the pure savage style. A few have gone one step nearer to perfectibility, and actually do wear tanned leather coats, made somewhat in the fashion of the armor worn in Europe in the fifteenth century. With such durable habiliments, it is easy to conceive that they do not require much assistance from the manufactures of foreign countries.'

SARDIS, or **SARDES**, now called **SARDO** or **SART**, an ancient town of Asia, in Natolia, about forty miles east of Smyrna. It was much celebrated in early antiquity, was enriched by the fertility of the soil, and had been the capital of the Lydian kings. It was seated on the side of mount Tmolus; and the citadel, placed on a lofty hill, was remarkable for its great strength. It was the seat of king Cræsus, and was in his time taken by Cyrus; after which the Persian satrap or commandant resided at Sardis, as the emperor did at Susa. The city was also taken, burnt, and evacuated by the Milesians in the time of Darius, and the city and fortress surrendered on the approach of Alexander after the battle of the Granicus. Under the Romans, Sardis was a very considerable place till the time of Tiberius Cæsar, when it suffered prodigiously by an earthquake. The munificence of the emperor, however, was nobly exerted to repair the damages. Julian attempted to restore the heathen worship in the place. He erected temporary altars where none had been left, and repaired the temples where any vestiges remained. In the year 400 it was plundered by the Goths, and it suffered considerably in the subsequent troubles of Asia. On the incursions of the Tartars, in 1304, the Turks were permitted to occupy a portion of the citadel, separated by a strong wall with a gate, and were afterwards murdered in their sleep. The site of this once noble city is now green and flowery, the whole being reduced to a poor village. There are, however, some curious remains of antiquity about it, and some ruins which display its ancient grandeur.

The SARDIUS, SARDEL, or SARDINE STONE, was a precious stone of a blood red colour. The best came from Babylon.

SARDONYX, *n. s.* A precious stone. See below.

The onyx is an accidental variety of the agate kind; 'tis of a dark horny colour, in which is a plate of bluish white, and sometimes of red; when on one or both sides the white there happens to lie also a plate of a reddish colour, the jewellers call the stone a *sardonyx*.

Woodward.

The SARDONYX is a precious stone consisting of a mixture of white and red cornelian, sometimes in strata, but at other times blended together. It is found 1. Striped with white and red strata, which may be cut in cameo as well as the onyx. 2. White with red dendritical figures, greatly resembling the mocha stone; but with this difference, that the figures in the sardonyx are of a red color, in the other black. The sardonyx was highly esteemed among the ancients; the Romans used it in rings and other articles of jewellery. According to Pliny, the rings of knights and senators were frequently adorned with the sardonyx. Martial uses the expression *sardonychiata manus* to indicate a hand embellished with rings of sardonyx.

SARI, a commercial town of Mazanderan, Persia, on the coast of the Caspian. It is an ancient city, alluded to by the poet Ferdusi; and, when visited by Hanway, contained four or five temples, built of the most solid materials, with rotundas, thirty feet in diameter, and nearly 120 feet high. Sari is well fortified, having a good wall and deep ditch, and a palace the residence of one of the Persian princes. It is crowded with inhabitants, we are told, and a society of Armenians is established in its vicinity. It has a brisk trade with Astracan and the interior. Long. 52° 58' E., lat. 35° 35' N.

SARISBURIENSIS (Joannes), or John of Sarisbury, an English writer, born at Rochester about 1110, and who went to France in 1126. He was sent by Henry II. to pope Eugenius, and was much patronised by him and his successor, and by Thomas à Becket, the chancellor, whom he accompanied in his travels to France. When Becket was murdered, Sarisbury was severely wounded in the arm, defending him. He afterwards went to France, where he was made bishop of Chartres in 1179. He died about 1181. He wrote, 1. *Policraticon*, sive de Nugis Curialium, et Vestigiis Philosophorum; 2. *Letters*; 3. *The Life of Thomas à Becket*; and, 4. *A Treatise upon Logic and Philosophy*.

SARK, *n. s.* Sax. *reýnk*. A shark or shirk; in Scotland, a shirt.

Flaunting beaux gang with their breast open, and their *sarks* over their waistcoats. *Arbutnot.*

SARK, in geography, a British island in the English Channel, near the coast of France; about six miles east of Guernsey, on which it is dependent, and west of Jersey. The climate is healthy, and the land, though sandy, sufficiently fertile to produce provisions for its inhabitants. It is about two miles square, and contains about 450 inhabitants. The island is surrounded with steep rocks, and the air is in general serene, free from fogs and damps, and remarkably healthy.

SARLAT, a town, the capital of an arrondissement in the department of the Dordogne, in the south-west of France, situated on the Sarlat. It has nothing interesting except a few Roman remains, the houses being ill built, and the streets narrow. Before the revolution it was the seat of a bishop. Population 6000. Thirty miles south-east of Périgueux, and ninety-eight east by north of Bordeaux.

SARMATIA, in ancient geography, an exten-

sive country at the north of Europe and Asia, lying partly in the former and partly in the latter; comprehending all Poland, Russia, and great part of Tartary. Littleton. It was divided into European and Asiatic.

ASIATIC SARMATIA was bounded by Hyrcania, the Tanais, and the Euxine Sea. It contained Great Tartary, Circassia, and the neighbouring country.

EUROPEAN SARMATIA was bounded by the ocean on the north, Tanais on the east, the Jazzygæ on the south, and the Vistula on the west. It contained the modern countries of Russia, Poland, Lithuania, and Little Tartary. Lempriere.

SARMATIANS, Sarmatii, the ancient inhabitants of Sarmatia. They were a savage uncivilised nation, often confounded with the Scythians, naturally warlike, and they painted their bodies to appear more terrible in battle. They were infamous for their lewdness, and in the time of the emperors they became very powerful, and disturbed the empire by their frequent incursions; till at last, increased by the savage hordes of Scythia, they successfully invaded, and finally ruined the empire in the third and fourth centuries. They generally lived on the mountains, without houses, residing in their chariots, whence they were called Ilamaxobii. They lived upon plunder, and fed upon milk mixed with the blood of horses.

SARMATIAN SEA, or SARMATICUM MARE, a name given to the Euxine Sea, because on the coast of Sarmatia. Ovid.

SARNO, an inland town of Naples, in the Principato Citra, near the base of Mount Vesuvius, remarkable for the superior quality of the silk raised in its environs. It has an old castle belonging to the Barberini family, who are dukes of Sarno. It is the see of a bishop. Inhabitants 12,000. Twenty miles east of Naples, and twelve north by west of Salerno.

SARONICUS SINUS, the Saronic Bay, in ancient geography, a bay of the Ægean Sea, on the south of Attica, and north of Peloponnesus: so named from Saron king of Trozene, who was drowned in it, swimming after a stag. The entry to it was between the promontories of Sunium and Scylla.

SAROS, or SCHAROS, a county of Hungary, separated from Austrian Galicia by the Carpathians. Its area is about 1400 square miles, containing several lofty mountains, the chief of which are called Simonka and Oblik. The mineral springs are numerous; but there are few mines, except of salt: there is also a mine of opals at Czervenitz. The cold is rather intense, on account of the vicinity of the mountains; but corn succeeds, and vines in particular spots. Population 142,000. The chief town is Eperies.

SAROS-PATAK, a well built town of the north-east of Hungary, on the Bodrog. It has a Catholic, Calvinist, and Greek church. Here is also a Calvinist college, on a large scale. Inhabitants 8000. Fourteen miles north by east of Tokay, and 125 E. N. E. of Pest.

SAROTHTA, in botany, bastard gentian, a genus of the trigynia ord., and pentandria class of plants; natural order twentieth, rotacææ:

VOL. XIX.

cor. pentapetalous: caps. unilocular, trivalved, and colored.

SARPEDON, in fabulous history, the son of Jupiter by Europa, and younger brother of Minos, with whom he stood competitor for the kingdom of Crete. Failing in that attempt, he went to Caria, and built Miletus.

SARPEDON, another son of Jupiter by Laodamia, daughter of Bellerophon, flourished about a century later than the brother of Minos. He went to the Trojan war to assist king Priam against the Greeks, where he was attended by his faithful friend Glaucus. He made a great slaughter of the Greeks; but was at last killed by Patroclus.

SARRACENA, or SARRACONIA, in botany, side-saddle flower, a genus of the monogynia order, and polyandria class of plants; natural order fifty-fourth, miscellanææ: cor. pentapetalous: cal. double, triphyllous below, pentaphyllous above: caps. quinquelocular; the style has a stigma of the form of a shield. Species four, all natives of America.

SARRASIN, or SARRAZIN, in fortification, a kind of portcullis, otherwise called a herse, which is hung with ropes over the gate of a town or fortress, to be let fall in case of a surprise.

SARSAPARILLA, in botany. See SMILAX.

SART, an insignificant village of Asia Minor, distinguished by containing on its site the ruins of Sardis. These are confusedly scattered over a large verdant plain, and consist largely of bricks, so strongly cemented as to make it scarcely possible to detach them. They seem to have no tendency to crumble to pieces by mere time.

SARTHE, or SARTE, a department of the north-west of France, comprising the greater part of the former province of Maine, and bounded by the departments of the Orne, the Loir and Cher, and the Mayenne. It is nearly of a circular form, and has a superficial and level extent of 2430 square miles, except in the north-west part, where there are small hills. Lime and sand predominate in the soil, which yields luxuriant fields of corn. The principal rivers are the Sarthe, the Loir, the Huine. The climate is mild, and the air healthy. The productions, beside corn, are flax, hemp, vines, and fruits. Here are also some iron mines and marble quarries. Grazing is followed to a considerable extent: the principal manufactures are of hardware, leather, paper, and woollens. The department is in the diocese of Le Mans, and jurisdiction of the cour royale of Angers, and is divided into four arrondissements, Le Mans (the capital), La Fleche, Mamers, and St. Calais. Population 410,000.

SARTORIUS (from sartor, a tailor; because tailors cross their legs with it), a flat slender muscle which is the longest of the human body, and from an inch and a half to two inches in breadth, situated immediately under the integuments, and extending obliquely from the upper and anterior part of the thigh, to the upper anterior part of the tibia; being enclosed by a thin membranous sheath, which is derived from the adjacent fascia lata. It serves to bend the leg obliquely inwards, or to roll the thigh outwards,

Y

and at the same time to cross one leg over another. See ANATOMY.

SARUM, *OLD*, an ancient borough of Wiltshire, about one mile north of New Sarum or Salisbury. It has the ruins of a fort which belonged to the ancient Britons; and is said also to have been a Roman station. In the north-west angle stood the palace of the bishop, whose see was removed hither from Wilton and Sherborn; but, the bishop quarreling with king Stephen, he seized the castle and put a garrison into it, which was the principal cause of its destruction, as the see was soon after removed hence to Salisbury in 1219. Here synods and parliaments have formerly been held, and hither were the states of the kingdom summoned to swear fidelity to William the Conqueror. Here also was a palace of the British and Saxon kings, and of the Roman emperors; which was deserted in the reign of Henry III., for want of water, so that one farm-house is all that is left of this ancient city; yet it is called the Borough of Old Sarum, and sends two members to parliament, who are chosen by the proprietors of certain adjacent lands.

SARUN, an extensive district of Hindostan, in the province of Bahar, on the north-east side of the Ganges; one of the most prosperous for its size in the British territories. The Ganges, Gunduck, and several other streams, render it rich in pasture, and it produces excellent cattle and horses. A great quantity of the saltpetre exported from Calcutta is manufactured here; the inhabitants are about one-fourth Mahometans. The chief town is Chuprach.

SARZEDAS, an inland town of the north of Portugal, supposed to be the Oppidum Sarsidense of the Romans; eight miles west of Castel Branco, and 117 E. N. E. of Lisbon. It contains 3000 inhabitants, and various antiquities. Particles of gold are found in the Lica at a little distance.

SASCACIHWAN, or **SASKATCHIWINE**, a considerable river of North America, rising in the Rocky Mountains. Its two principal branches are the north and south, which, pursuing very winding courses to the east, for about 440 miles, in a direct line, join about sixty miles east of Hudson's House, and then run north-east through Pine Island Lake, and Cedar Lake, into Lake Winnipic, in lat. 51° 45' north. As far as Cedar Lake, the navigation is interrupted by falls and rapids; but above this lake it may be considered navigable for canoes to its sources. On the banks are five principal factories of the North-west company.

SASH, *n. s.* *Fr. chassis.* Of this word, says Johnson, the etymologists give no account: I suppose it comes from *scache*, of scavoire, to know, a sash worn being a mark of distinction; and a sash window being made particularly for the sake of seeing and being seen. A belt worn by way of distinction; a silken band worn by officers in the army. A window so formed as to be let up and down by pulleys.

She ventures now to lift the sash;
The window is her proper sphere. *Swift.*
She broke a pane in the sash window that looked
into the yard. *Id.*

SASHES, in military dress, are worn by the officers of most nations, either round their waist or over their shoulders. Those for the British army are made of crimson silk.

SASNEE, a town and fortress of Hindostan, province of Agra, once the residence of a zemindar, who, having proved refractory, was expelled by the British after a desperate resistance in 1803. Long. 78° 4' E., lat. 27° 45' N.

SASSAFRAS, in botany. See *LYCUES*.

SASSARI, a considerable town and province of the island of Sardinia, standing in a luxuriant neighbourhood, and abounding with some rivers. It is the seat of the courts of justice, as well as of a university, and several lesser seminaries. It is likewise the see of an archbishop, and contains an unusual number of churches. The harbour, called Porto Torre, is situated on the gulf of this name, about ten miles from the town, and communicates with it by means of a river. Sixty-four miles north of Oristano.

SATALIA, **ANTALIA**, or **ADALIA**, a city of Caramania, on the site of the ancient Olbia, and beautifully situated round a small harbour: on the level summit of the hill the city is enclosed by a ditch, a double wall, and a series of square towers, about fifty yards asunder. Between two of the towers appear the remains of a splendid gateway, exhibiting fourteen columns, the upper parts of which are of the Corinthian order. The inside walls and towers appear to have been well built. The port is enclosed by two stone piers, which once had towers on the extremities; but they are now in a ruinous state. The gardens round the town are beautiful. Population 8000.

SATARAIL, a celebrated town and fortress of Bejapoor, Hindostan, occupying the point of a rock at the west of a range of hills, and having only a very narrow passage up to it, admitting but a single person. After it had capitulated to the British, in February 1818, the officers declared that 200 men might defend it against any force. Taken originally from the king of Bejapoor, by the Mahratta chief Sevajee, in 1673, this fortress was captured by Aurungzebe in 1690, but was retaken soon after the death of that monarch in 1707, and is now the capital of a Mahratta state. It owes its celebrity principally to its having been for a long period the residence or state prison of the Maha rajah. Here he was confined about the middle of the last century by the peishwa, who usurped the government, still inserting the name of the rajah in all public records and forms. It stands in long. 74° 3' E., lat. 17° 30' N., a short distance north of the Kistnah.

SATCHEL, *n. s.* *Teut. seckel*; *Lat. sacculus.* A little bag; commonly a bag used by schoolboys to carry books.

The whining schoolboy with his satchel,
And shining morning face, creeping like snail
Unwillingly to school. *Shakspeare. As You Like It.*

Schoolboys lag with satchels in their hands.

Swift.

SATE, *v. a.*
SATIATE, *v. a. & n. s.* } Both verbs, from
SATIETY, *n. s.* } *Latin satio*, signify
fill; satisfy: and the first is commonly confined

to the idea of filling to repletion, or over fulness, or beyond natural desire: satiety is fulness beyond desire or pleasure; hence wearisomeness of abundance.

He leaves a shallow plash to plunge him in the deep,
And with *satiety* seeks to quench his thirst.

Shakspeare.

Those smells are the most grateful where the degree of heat is small, or the strength of the smell allayed; for these rather woo the sense than *satiate* it.

Bacon.

Nothing more jealous than a favourite, especially towards the waining time and suspect of *satiety*.

Wotton.

I may yet survive the malice of my enemies, although they should be *satiated* with my blood.

King Charles.

In all pleasures there is *satiety*; and after they be used, their verdure departeth.

Hakevill.

Sated at length, ere long I might perceive
Strange alteration in me. *Milton's Paradise Lost.*

They *satiate* and soon fill,
Though pleasant; but thy words, with grace divine
Imbued, bring to thy sweetness no *satiety*. *Milton.*

Whatever novelty presents, children are presently eager to have a taste, and are as soon *satiated* with it.

Locke.

How will their bodies stript
Enrich the victors, while the vultures *sate*
Their maws with full repast. *Philips.*

The loosened winds
Hurled high above the clouds; till all their force
Consumed, her ravenous jaws, the earth *satiated* closed.

Id.

He may be *satiated*, but not satisfied. *Norris.*
No action, the usefulness of which has made it
the matter of duty, but a man may bear the continual
pursuit of, without loathing or *satiety*. *South.*

Thy useless strength, mistaken king, employ,
Sated with rage, and ignorant of joy. *Prior.*

Why does not salt of tartar draw more water out
of the air than in a certain proportion to its quantity,
but for want of an attractive force after it is *satiated*
with water? *Newton.*

Our generals retired to their estates,
In life's cool evening, *satiate* of applause,
Nor think of bleeding even in Brunswick's cause.

Pope.

The joy unequalled, if its end it gain,
Without *satiety*, though e'er so blest,
And but more relished as the more distressed. *Id.*

SATELLITE, *n. s.* } Fr. *satellite*; Lat.
SAT'ELLOUS, *adj.* } *satelles*. Pope has in
the plural continued the Latin form, and assigned
it four syllables. I think, says Johnson, improperly.
A small planet revolving round a larger: consisting of satellites.

Four moons move about Jupiter, and five about
Saturn, called their *satellites*. *Locke.*

The smallest planets are situated nearest the sun
and each other; whereas Jupiter and Saturn that
are vastly greater, and have many *satellites* about
them, are wisely removed to the extreme regions of
the system. *Bentley.*

Ask of yon argent fields above,
Why Jove's *satellites* are less than Jove? *Pope.*

SATELLITES, in astronomy. See ASTRONOMY.

SATGONG, an ancient royal port of Bengal,
known to the Romans by the title of Ganges
Reggia, and formerly the residence of the kings
of that country. The district belonging to it
contained 700 square miles. It is mentioned in

De Barro's Portuguese History, supposed to
have been written about the year 1530, as being
as great and noble as Chatigong, but less frequented,
because its port is not so convenient for the entry
and departure of shipping. It is first spoken of by
the Mahometan historians in 1592, when it was
plundered by the Afghauns. The Dummooda is
supposed formerly to have fallen into the Bhagurutty
above Satgong. The town stands two or three miles
from the river side, and four from Hoogly. Long. 88° 30' E.,
lat. 22° 57' N.

SATHMAH, a county of Hungary, adjacent
to Transylvania, on both sides of the river
Szamos. Its territorial extent is 2250 square
miles. Many tracts are sandy, others strewed
with soda, or covered with marshes; the marsh
of Etseid is twenty-eight miles in length; yet
this country produces on the whole a considerable
quantity of wheat, maize, and wine. Particular
districts contain mines of salt and metals. The
chief town is Nagy-Caroly. Population 187,000.

SATHMAR, or SATHMAR NEMETHI, a town of
Hungary, in the palatinate of the same name,
situated on the Szamos, 255 miles south of
Presburg. It consists of two parts, Sathmar
and Nemethi, standing on the two sides of the
river, and previous to 1715 forming two distinct
towns. The inhabitants carry on an active
trade, and produce a large quantity of wine. In
the neighbourhood are salt-mines. Sathmar is a
bishop's see, erected in 1806, and has a Catholic
seminary, one Greek and two Calvinist churches.

SATMANGALUM, a town and strong fortress
of the province of Coimbatore, South of India.
The fort was built in the seventeenth century,
by Trimula Naick, governor on the part of the
rajah of Madura. It was taken about fifty years
afterwards by the rajah of Mysore, and by the
British in the year 1792. It contains a temple,
dedicated to Vishnu, and is inhabited by weavers
of coarse cotton cloth. A severe battle was fought
in the vicinity of this place between the British
and the troops of Tippe. Long. 77° 20' E., lat. 10° 28' N.

SATIN, *n. s.* Fr. *satén*; Ital. *setan*; Belg. *sattin*. A soft close, shining silk.

Upon her body she wore a doublet of sky-colour
satin, covered with plates of gold, and as it were
nailed with precious stones, that in it she might seem
armed. *Sidney.*

The ladies dressed in rich symars were seen,
Of Florence *satin*, flowered with white and green,
And for a shade betwixt the bloomy girdlin.

Dryden.

Lay the child carefully in a case, covered with a
mantle of blue *satin*. *Arbuthnot and Pope.*

Her petticoat, transformed apace,
Became black *satin* flounced with lace. *Swift.*

SATIN, in the arts, has become of late an article
of considerable use for hats. See SILK MANUFACTURE.

SATIRE, *n. s.* } Fr. *satire*; Lat. *satira*,
SATIR'IC, *adj.* } anciently *satura*. A
SATIR'ICAL, } poem in which wicked-
SATIR'ICALLY, *adv.* } ness or folly is censured.
SATIRIST, *n. s.* } Proper satire, says John-
SATIRIZE, *v. a.* } son, is distinguished by
the generality of the reflection from a lampoon

which is aimed against a particular person: the adjective and adverb strictly agree with the noun substantive: a satirist is a writer or utterer of satires: to satirize, to censure as in a satire.

Slanders, sir; for the *satirical* slave says here, that old men have grey beards; that their faces are wrinkled. *Shakspeare.*

He that hath a *satirical* vein, as he maketh others afraid of his wit, so he had need be afraid of others memory. *Bacon.*

I first adventure, follow me who list,
And be the second English *satirist*. *Hall.*

All vain pretenders have been constantly the topicks of the most candid *satirists*, from the *Codr*us of Juvenal to the Damon of Boileau. *Cleveland.*

You must not think that a *satyriack* style
Allows of scandalous and brutish words. *Roscommon.*

He dares to sing thy praises in a cline,
Where vice triumphs, and virtue is a crime;
Where even to draw the picture of thy mind,
Is *satyr* on the most of human kind. *Dryden.*

What human kind desires, and what they shun,
Rage, passions, pleasures, impotence of will,
Shall this *satirical* collection fill. *Id. Juvenal.*

Covetousness is described as a veil cast over the true meaning of the poet, which was to *satirize* his prodigality and voluptuousness. *Dryden.*

Should a writer single out and point his railery at particular persons, or *satirize* the miserable, he might be sure of pleasing a great part of his readers; but must be a very ill man if he could please himself. *Addison.*

Wycherly, in his writings, is the sharpest *satyr*ist of his time; but, in his nature, he has all the softness of the tenderest dispositions: in his writings he is severe, bold, undertaking; in his nature gentle, modest, inoffensive. *Granville.*

Yet soft his nature, though severe his lay;
His anger moral, and his wisdom gay:
Blest *satyr*ist! who touched the mean so true,
As showed vice had his hate and pity too. *Pope.*

On me when dances are *satirick*,
I take it for a *panegyrick*. *Swift.*

It is as hard to *satirize* well a man of distinguished virtues, as to praise well a man of distinguished virtues. *Id.*

My verse is *satire*, Dorset lend your ear,
And patronise a muse you cannot fear. *Young.*

SATISFY, <i>v. a. & v. n.</i>	} Fr. <i>satisfaire</i> ; Lat. <i>satisfacio</i> . To content; please to contentment; re- compense; con- vince; appease; free from doubt or perplexity; make payment; give content: the noun substantive corresponds: satisfactive and satisfactory mean giving content or gratification; atoning: the adverb and noun substantive following correspond.
SATISFACTION, <i>n. s.</i>	
SATISFACTIVE, <i>adj.</i>	
SATISFACTORY,	
SATISFACTORILY, <i>adv.</i>	
SATISFACTORINESS, <i>n. s.</i>	

I will pursue and divide the spoil; my lust shall be *satisfied* upon them. *Exodus.*

Who hath caused it to rain on the earth, to *satisfy* the desolate and waste ground, and to cause the bud of the tender tree to spring forth? *Job.*

A good man shall be *satisfied* from himself. *Proverbs.*

Wilt thou leave me so unsatisfied?
—What *satisfaction* can you have? *Shakspeare.*

He is well paid that is well *satisfied*;
And I, delivering you, am *satisfied*.
And therein do account myself well paid. *Id.*

A most wise and sufficient means of redemption and salvation, by the *satisfactory* and meritorious death and obedience of the incarnate son of God, Jesus Christ. *Sanderson.*

They strain their memory to answer him *satisfactorily* unto all his demands. *Digby.*

Die he, or justice must; unless for him
Some other able, and as willing, pay
The rigid *satisfaction*, death for death. *Milton.*

Will he draw out,
For anger's sake, finite to infinite
In punished man, to *satisfy* his rigour,
Satisfied never? That were to extend
His sentence beyond dust and Nature's law. *Id.*

By a final and *satisfactive* discernment of faith, we lay the last effects upon the first cause of all things. *Browne.*

Bellonius hath been more *satisfactorily* experimental, not only affirming that chameleons feed on flies, but upon exenteration he found these animals in their bellies. *Id.*

The incompleatness of the seraphick lover's happiness in his fruitious proceeds not from their want of *satisfactoriness*, but his want of an entire possession of them. *Boyle.*

Of ev'ry nation each illustrious name,
Such toys as these have cheated into fame;
Exchanging solid quiet to obtain
The windy *satisfaction* of the brain. *Dryden's Juvenal.*

Of many things useful and curious you may *satisfy* yourselves in Leonardo de Vinci. *Dryden.*

'Tis a wretched *satisfaction* a revengeful man takes, even in losing his life, provided his enemy go for company. *L'Estrange.*

The mind, having a power to suspend the execution and *satisfaction* of any of its desires, as at liberty to consider the objects of them. *Lorke.*

An intelligent American would scarce take it for a *satisfactory* account, if, desiring to learn our architecture, he should be told that a pillar was a thing supported by a basis. *Id.*

This I would willingly be *satisfied* in, whether the soul, when it thinks thus, separate from the body, acts less rationally than when conjointly with it? *Id.*

Run over the circle of earthly pleasures, and, had not God secured a man a solid pleasure from his own actions, he would be forced to complain that pleasure was not *satisfaction*. *South.*

I'm *satisfied*. My boy has done his duty. *Addison.*

The standing evidences of the truth of the Gospel are in themselves most firm, solid, and *satisfying*. *Atterbury.*

SATURATE, <i>v. a.</i>	} Lat. <i>satura</i> . Fully to SATURABLE, <i>adj.</i> } impregnate: impregnable with any thing till it will receive no more.

Be the figures of the salts never so various, yet, if the atoms of water were fluid, they would always so conform to those figures as to fill up all vacuities; and consequently the water would be *saturable* with the same quantity of any salt, which it is not. *Grew's Cosmol. Sacra.*

Rain-water is plentifully *saturated* with terrestrial matter, and more or less stored with it. *Woodward.*

His body has been fully *saturated* with the fluid of light, to be able to last so many years without any sensible diminution, though there are constant emanations thereof. *Cheyne.*

Still night succeeds
A softened shade, and *saturated* earth
Awaits the morning beam. *Thomson.*

SATURATION, in chemistry, is the impregnating an acid with an alkali, or vice versa, till either will receive no more, and the mixture will then become neutral. Some substances unite in all proportions. Such, for example, are acids in general, with water, and many of the metals with each other. But there are likewise many substances which cannot be dissolved in a fluid, at a settled temperature, in any quantity beyond a certain proportion. Thus water will dissolve only about one-third of its weight of common salt, and if more be added it will remain solid. A fluid, which holds in solution as much of any substance as it can dissolve, is said to be saturated with it. But saturation with one substance does not deprive the fluid of its power of acting on and dissolving some other bodies, and in many cases it increases this power. For example, water saturated with salt will dissolve sugar.

SATURDAY, *n. s.* Sax. *ƿæternƿæg*, or *ƿæternƿæg*, according to Verstegan, from *ƿætern* a Saxon idol; more probably from Saturn, dies Saturni. The last day of the week.

This matter I handled fully in last *Saturday's* Spectator. Addison.

SATURDAY, the seventh day of the week, is so called from the idol Seater, worshipped on this day by the ancient Saxons, and thought to be the Saturn of the Latins.

SATUREIA, savory, in botany, a genus of the gymnospermia order, and didynamia class of plants; natural order forty-second, verticillatæ: segments of the corolla nearly equal; the stamina standing asunder.

1. *S. hortensis*, or summer savory, is an annual plant, which grows naturally in the south of France and Italy, but is cultivated in this country both for the kitchen and medicinal use. Summer savory is a very warm pungent aromatic; and affords in distillation with water a subtle essential oil, of a penetrating smell, and very hot acrid taste. It yields little of its virtues by infusion to aqueous liquors; rectified spirit extracts the whole of its taste and smell, and elevates nothing in distillation.

2. *S. montana*, or winter savory, is a perennial plant growing naturally in the south of France and Italy, but is cultivated in gardens both for culinary and medicinal purposes. Both kinds are propagated by seeds. Those of the first kind should be sown in the beginning of April upon a bed of light earth, either where they are to remain, or for transplanting. If the plants are to stand unremoved, they should be sown thinly; but if they are to be transplanted, they may be sown closer. The second species may be sown upon a poor dry soil, where the plants will endure the severest winters, though they are often killed by the frost when planted in good ground.

SATURN, *n. s.* } Fr. *saturne*; Lat. *saturnus*.
SATURNINE, *adj.* } *nus*. A planet long thought
SATURNIAN. } the remotest of the solar
system: supposed by astrologers to impress dulness, or severity of temper: hence the adjective, which signifies gloomy; grave; severe: and hence the opposing adjective saturnian, which signifies golden; happy; like the fabled days of the reign of Saturn.

I may cast my readers under two divisions, the

mercurial, and *saturnine*: the first are the gay part, the others are of a more sober and solemn turn.

Addison.

The smallest planets are placed nearest the sun and each other; whereas Jupiter and Saturn, that are vastly greater, are wisely removed to the extreme regions.

Bentley.

Th' Augustus, born to bring *Saturnian* times.

Pope.

From the far bounds
Of utmost *Saturn*, wheeling wide his round.

Thomson.

SATURN, in astronomy, one of the planets of our solar system. See **ASTRONOMY**, Index.

SATURN, in chemistry, an appellation anciently given to lead.

SATURN, in heraldry, denotes the black color in blazoning the arms of sovereign princes.

SATURN, in the ancient mythology, one of the principal of the Pagan deities, was the son of Cælus and Terra, and the father of Jupiter, Neptune, and Pluto. He deposed and mutilated his father, and obliged his brother Titan to resign his crown to him, on condition of his bringing up none of his male issue, that the succession might at length devolve on him. For this purpose he devoured all the sons he had by his wife Rhea or Cybele: but, bringing forth at one time Jupiter and Juno, she presented the latter to her husband, and sent the boy to be nursed on Mount Ida; when Saturn, being informed of her having a son, demanded the child; but in his stead his wife gave him a stone swaddled up like an infant, which he instantly swallowed. Titan, finding that Saturn had violated the contract he had made with him, put himself at the head of his children, and made war on his brother; and, having made him and Cybele prisoners, confined them in Tartarus; but Jupiter raised an army in Crete, went to his father's assistance, defeated Titan, and restored Saturn to the throne. Some time after, Saturn being told that Jupiter intended to dethrone him, endeavoured to prevent it; but the latter, being informed of his intention, deposed his father, and threw him into Tartarus. But Saturn, escaping thence, fled into Italy, where he was kindly received by Janus, king of the country, who associated him in the government: whence Italy obtained the name of Saturnia Tellus; as also that of Latium, from lateo, 'to lie hid.' There Saturn, by the wisdom and mildness of his government, is said to have produced the golden age. Saturn is represented as an old man with four wings, armed with a scythe. Sometimes he is delineated under the figure of a serpent with its tail in its mouth: this is emblematic of the seasons, which roll perpetually in the same circle. Sometimes, also, Saturn is painted with a sand-glass in his hand. The Greeks say that the story of his mutilating his father and destroying his children is an allegory, which signifies, that Time devours the past and present, and will also devour the future. Tatius, king of the Sabines, first built a temple to Saturn on the Capitoline hill: a second was afterwards added by Tullus Hostilius, and a third by the first consuls. On his statues were generally hung fetters, in commemoration of the chains he had worn when imprisoned by Jupiter. From this circumstance, all slaves that obtained

their liberty generally dedicated their fetters to him.

SATURNALIA, in Roman antiquity, a festival observed about the middle of December, in honor of the god Saturn, whom Lucian introduces giving an account of the ceremonies observed on this occasion, thus:—'During my whole reign, which lasts but for one week, no public business is done: there is nothing but drinking, singing, playing, creating imaginary kings, placing servants with their masters at table, &c. There shall be no disputes, reproaches, &c., but the rich and poor, masters and slaves, shall be equal,' &c. On this festival the Romans sacrificed bare-headed, contrary to their custom at other sacrifices. During its continuance no business or profession was allowed to be carried on except cookery; all distinctions of rank ceased; and slaves could say what they pleased to their masters with impunity.

SATURNIA, a name of Juno as the daughter of Saturn.

SATURNINUS (P. Sempronius), a Roman general under Valerian, who was proclaimed emperor by the troops against his inclination. He was afterwards murdered by them, for attempting to restore the ancient discipline, in his forty-third year, A. D. 262. See **ROME**.

SATRINIXUS (Sextus Julius, or Junius), another Roman general, a native of Gaul, who was compelled by the soldiers to assume the title of emperor. See **ROME**. He was in favor with Aurelian.

SATYAVRATA, or **MENV**, in Indian mythology, is believed by the Hindoos to have reigned over the whole world in the earliest age of their chronology, and to have resided in the country of Dravira on the coast of the eastern Indian peninsula. His patronymic name was Vaivaswata, or child of the sun. In the Bhagavat we are informed that the Lord of the universe, intending to preserve him from the sea of destruction caused by the depravity of the age, thus told him how he was to act:—'In seven days from the present time, O thou tamer of enemies, the three worlds will be plunged in an ocean of death; but, in the midst of the destroying waves, a large vessel, sent by me for thy use, shall stand before thee. Then shalt thou take all medicinal herbs, all the variety of seeds; and, accompanied by seven saints, encircled by pairs of all brute animals, thou shalt enter the spacious ark and continue in it, secure from the flood, on one immense ocean without light, except the radiance of thy holy companions. When the ship shall be agitated by an impetuous wind, thou shalt fasten it with a large sea serpent on my horn; for I will be near thee: drawing the vessel, with thee and thy attendants, I will remain on the ocean, O chief of men, until a night of Brahma shall be completely ended. Thou shalt then know my true greatness, rightly named the supreme God-head; by my favor all thy questions shall be answered, and thy mind abundantly instructed.' This story is evidently that of Noah disguised by Asiatic fiction and allegory.

SATYR, *n. s.* } Lat. *satirus*. A sylvan
SATYRIASIS. } god; supposed among the
 ancients to be rude and lecherous: a disease defined below.

Satyr, as Pliny testifies, were found in time past in the eastern mountains of India. *Peacum.*

If the chyle be very plentiful, it breeds a *satyriasis*, or an abundance of seminal lymph.

Floyer on the Humours.

The heathen lawgivers of ancient days,
 Names almost worthy of a Christian's praise,
 Would drive them forth from the resort of men,
 And shut up every *satyr* in his den. *Cowper.*

SATYRS, in ancient mythology, a species of demi-gods who dwelt in the woods. They are represented as monsters, half men and half goats; having horns on their heads, a hairy body, with the feet and tail of a goat. They are generally in the train that follows Bacchus. As the poets supposed that they were remarkable for piercing eyes and keen raillery, they have placed them in the same pictures with the Graces, Muses, and even with Venus herself. It seems probable that some large species of monkey or baboon seen in the woods gave the first occasion to feign these demi-gods. Pliny evidently points out some sort of ape under the name of *Satyr*. He says satyrs are found in some mountains of India; they are nimble, running sometimes upon all four, sometimes erect like men, and they are so swift that it is difficult to overtake them except they are old or sick. To this we may add, that shepherds covered with goat skins, and still more often priests of Bacchus, counterfeited satyrs, to seduce the innocent shepherdesses; and thus we have the true explication of the fable. Hence the opinion spread that the woods were full of these mischievous divinities. The shepherdesses trembled for their honor, and the shepherds for their flocks; for which reason they sought to appease them by sacrifices, and by the offerings of the firstlings of their flocks.

SATYRIASIS. See **MEDICINE**.

SATYRIUM, in botany, a genus of the dianthia order, and gynandria class of plants; natural order forty-second, verticillatæ: nectarium scrotiform, or inflated double behind the flower. Species twenty-one, natives of warm climates.

SAV'AGE, *adj.*, *n. s.* & *v. a.* } Fr. *sauvage*;
SAV'AGELY, *adv.* } Ital. *selvaggio*.
SAV'AGENESS, *n. s.* } Wild; uncultivated;
SAV'AGERY. } taught: a man untaught or uncivilised: to make barbarous (a barbarism of Thomson's): the adverb corresponding; and the noun substantives see below.

Chain me to some steepy mountain's top,
 Where roaring bears and *savage* lions roam.

Shakspeare.

Your castle is surprised, your wife and babes
Savagely slaughtered. *Id. Macbeth.*

A *savageness* in unreclaimed blood
 Of general assault. *Id. Hamlet.*

This is the bloodiest shame,
 The wildest *savag'ry*, the vilest stroke,
 That ever wall-eyed wrath, or staring rage,
 Presented to the tears of soft remorse. *Shakspeare.*

Thus people lived altogether a *savage* life, 'till Saturn, arriving on those coasts, devised laws to govern them by. *Raleigh.*

Long after these times were they but *savages*. *Id.*
 The seditious lived by rapine and ruin of all the country, omitting nothing of that which *savages*, enraged in the height of their unruly behaviour, do commit. *Hayward.*

I see the *savagest* of all creatures, lions, tigers, bears, by an instinct from God, come to seek the ark (as we see swine foreseeing a storm run home crying for shelter), men I see not; reason once debauched is worse than brutishness. *Bp. Hall.*

The *savage* clamour drowned,
Both harp and voice. *Milton.*

Cornels, and *savage* berries of the wood,
And roots and herbs, have been my meagre food. *Dryden.*

A herd of wild beasts on the mountains, or a *savage* drove of men in caves, might be so disordered; but never a peculiar people. *Sprat's Sermons.*

To deprive us of metals is to make us mere *savages*; to change our corn for the old Arcadian diet, our houses and cities for dens and caves, and our cloathing for skins of beasts: 'tis to bereave us of all arts and sciences, nay, of revealed religion. *Bentley.*

Tyrants no more their *savage* nature kept,
And foes to virtue wondered how they wept. *Pope.*

The Cyclops were a people of Sicily, remarkable for *savageness* and cruelty. *Broome.*

Friends, relations, love himself,
Savaged by woe, forget the tender tie. *Thomson.*

SAVAGE (Richard), the poet, was the son of Anne countess of Macclesfield by the earl of Rivers, according to her own confession; and was born in 1698. This confession of adultery was made to procure a separation from her husband, the earl of Macclesfield: yet, having obtained this end, no sooner was her spurious offspring brought into the world, than she resolved to disown him; and, as long as he lived, treated him with the most unnatural cruelty. She endeavoured to send him secretly to the plantations; but, this plan being frustrated, she placed him apprentice with a shoemaker. In this situation, however, he did not long continue; for his nurse dying he discovered his real mother, and therefore applied to her, and tried every art to attract her regard. But in vain did he solicit this unnatural parent; she avoided him with the utmost precaution, and took measures to prevent his ever entering her house. Mean time, having a strong taste for poetry, he wrote two plays, *Woman's a Riddle* and *Love in a Veil*: by the second of which he acquired the acquaintance of Sir Richard Steele and Mr. Wilks, by whom he was pitied, caressed, and relieved. But the kindness of his friends not affording him a constant supply, he wrote the tragedy of Sir Thomas Overbury, which brought him in £200. He soon after published a volume of *Miscellanies*, to which he wrote a preface, in which he gives an account of his mother's cruelty. The profits of his tragedy and his *Miscellanies* somewhat raised him both in circumstances and credit; so that the world began to behold him with a more favorable eye, when both his fame and life were endangered by a most unhappy event. A drunken frolic in which he one night engaged ended in a fray, and, swords having been drawn on both sides, *Savage* unfortunately killed a man, for which he was condemned to be hanged. But the countess of Hertford at length laid his whole case before queen Caroline, and *Savage* obtained a pardon. *Savage* now lost that affection for his mother which the whole series of her cruelty had not before been able wholly to repress; and considering her as an

implacable enemy, whom nothing but his blood could satisfy, threatened to harass her with lampoons, and to publish a copious narrative of her conduct, unless she consented to allow him a pension. This expedient proved successful; and lord Tyrconnel, upon his promise of laying aside his design of exposing his mother's cruelty, took him into his family, treated him as an equal, and engaged to allow him a pension of £200 a-year. This was the happy period of *Savage's* life. He was courted by all who wished to be thought men of genius and taste. At this time he published the *Temple of Health and Mirth*, on the recovery of lady Tyrconnel from a long illness; and the *Wanderer*, a moral poem, which he dedicated to lord Tyrconnel, in strains of the highest panegyric: but these praises he soon was inclined to retract, being discarded by the man on whom they were bestowed. Of this quarrel lord Tyrconnel and Mr. *Savage* gave very different accounts. But our author's conduct was ever such as made all his friends, sooner or later, grow weary of him, and even forced most of them to become his enemies. Being thus once more turned adrift upon the world, *Savage*, whose passions were very strong and whose gratitude was very small, exposed the faults of lord Tyrconnel. He also took revenge upon his mother, by publishing *The Bastard*. Some time after this, *Savage* formed the resolution of applying to the queen; who having once given him life, he hoped she might extend her goodness to him, by enabling him to support it.—With this view, he published a poem on her birth-day, which he entitled *The Volunteer Laureat*; for which she was pleased to send him £50 with an intimation that he might annually expect the same bounty. But this annual allowance was nothing to a man of his strange and singular extravagance. His usual custom was, as soon as he had received his pension, to disappear with it, and secrete himself from his most intimate friends, till every shilling of it was spent; which done he again appeared, penniless as before; but he would never inform any person where he had been, nor in what manner his money had been dissipated.—From the reports, however, of some who penetrated his haunts, he expended both his time and his cash in the most sordid and despicable sensuality; particularly in eating and drinking, in which he would indulge in the most unsocial manner, sitting whole days and nights by himself, in obscure houses of entertainment, over his bottle and trencher, immersed in filth and sloth, with scarcely decent apparel; generally wrapped up in a horseman's great coat. His wit and talents, however, still raised him new friends as fast as his misbehaviour lost him his old ones. Yet such was his conduct, that occasional relief only furnished the means of occasional excess; and he defeated all the attempts made by his friends to fix him in a decent way. Yet, amidst all his penury and wretchedness, this man had so much pride, and so high an opinion of his own merit, that he was always ready to repress, with scorn and contempt, the least appearance of any slight towards himself, in the behaviour of his acquaintance; among whom he looked upon none as his superior. He would be treated as an equal.

even by persons of the highest rank. He once refused to wait upon a gentleman who was desirous of relieving him when in the lowest distress, only because the message signified the gentleman's desire to see him at nine in the morning. His life was rendered still more unhappy by the death of the queen, in 1738, when his pension was discontinued. His distress now became so notorious that a scheme was at length concerted for procuring him a permanent relief. It was proposed that he should retire into Wales, with an allowance of £50 a year, on which he was to live privately, in a cheap place, for ever quitting his town haunts, and resigning all farther pretensions to fame. This offer he seemed gladly to accept. In 1739 he set out for Swansea, in the Bristol stage-coach, and was furnished with fifteen guineas to bear the expense of his journey. But, on the fourteenth day after his departure, his friends and benefactors, the principal of whom was Mr. Pope, who expected to hear of his arrival in Wales, were surprised with a letter from Savage, informing them that he was yet upon the road, and could not proceed for want of money. There was no other remedy than a remittance; which was sent him, and by the help of which he was enabled to reach Bristol, whence he was to proceed to Swansea by water. At Bristol, however, he found an embargo laid upon the shipping; so that he could not immediately obtain a passage. Here, therefore, being obliged to stay for some time, he so ingratiated himself with the principal inhabitants, that he was often invited to their houses, distinguished at their public entertainments, and treated with a regard that highly gratified his vanity. At length, with great reluctance, he proceeded to Swansea; where he lived about a year, very much dissatisfied with the diminution of his salary; for he had, in his letters, treated his contributors so insolently that most of them withdrew their subscriptions. Here he finished a tragedy, and resolved to return with it to London; which was strenuously opposed by his constant friend Mr. Pope; who proposed that Savage should put this play into the hands of Mr. Thomson and Mr. Mallet, that they might fit it for the stage, that his friends should receive the profits it might bring in, and that the author should receive the produce by way of annuity. This kind and prudent scheme was rejected by Savage with contempt.—He declared he would not submit his works to any one's correction; and that he would no longer be kept in leading-strings. Accordingly he soon returned to Bristol, in his way to London; but at Bristol, meeting with a repetition of the same kind treatment he had before found there, he was tempted to make a second stay in that opulent city for some time. Here he was again not only caressed and treated, but the sum of £30 was raised for him, with which it had been happy if he had immediately departed for London. But he never considered that a frequent repetition of such kindness was not to be expected. In short, he remained here till his company was no longer welcome. Necessity came upon him before he was aware; his money was spent, his clothes were worn out, his appearance was shabby; he

now began to find every man from home at whose house he called; and he found it difficult to obtain a dinner. Thus reduced, it would have been prudent in him to have withdrawn from the place; but the mistress of a coffee house, to whom he owed about £8, arrested him for the debt. He remained for some time at a great expense, in the house of the sheriff's officer, in hope of procuring bail; which expense he was enabled to defray by a present from Mr. Nash at Bath. No bail, however, was to be found; so that poor Savage was at last lodged in Newgate, a prison in Bristol. But it was the fortune of this extraordinary mortal always to find more friends than he deserved. The keeper of the prison took compassion on him, and greatly softened the rigors of his confinement by every kind of indulgence. While he remained here his ingratitude again broke out, in a bitter satire on the city of Bristol; to which he certainly owed great obligations, notwithstanding his arrest. This satire is entitled *London and Bristol delineated*; and in it he abused the inhabitants of the latter, with such a spirit of resentment, that the reader would imagine he had never received any other than the worst of treatment in that city. In about six months after his arrest he was seized with a disorder, which at first was not suspected to be dangerous; but, growing daily more languid and dejected, at last a fever seized him; and he died on the 1st of August 1743, in the forty-sixth year of his age. The works of this original writer, after having long lain dispersed in magazines and fugitive publications, were collected and published in an elegant edition, in 2 vols. 8vo.; to which are prefixed, the admirable *Memoirs of Savage*, by Dr. Samuel Johnson.

SAVAGE ISLAND, an island in the south Pacific Ocean, about thirty-three miles in circumference, discovered by captain Cook, in the year 1774. The name was given on account of the rude behaviour of the inhabitants. Captain Cook says the island is of a round form, and good height; and has deep waters close to its shores. All the sea coast, and as far inland as he could see, was covered with trees, shrubs, &c., among which were some cocoa-nut trees. The inhabitants seemed to be stout and well made. They fish with lights by night, called *tomais*, made from the bark of the cocoa-nut tree. They form a decoy for fish. The island is in long. 139° 37' W., and lat. 19° 1' S.

SAVAGISM, a word of modern adoption, designed to express that ignorant and barbarous state of mankind, which most ancient philosophers, and some modern authors of eminence, suppose to have been the original state of all mankind. A numerous sect of ancient philosophers maintained that man literally sprung at first from the earth; that he was without ideas and without speech; and that many ages elapsed before the race acquired the use of language, or attained to greater knowledge than the beasts. Other sects again, with the vulgar, and almost all the poets, maintained that the first mortals were wiser and happier, and more powerful, than any of their offspring; that mankind, instead of being originally savages, and rising to

the state of civilisation by their own gradual and progressive exertions, were created in a high degree of perfection; that, however, they degenerated from that state, and that all nature degenerated with them. Hence the various ages of the world have almost every where been compared to gold, silver, brass, and iron, the golden having always been supposed to be the first age. See AGE.

Since the revival of letters in Europe, and especially during the last century, the same question has been agitated both in France and the England. Such of the ancients as held that man was originally a savage were countenanced by the atheistic cosmogony of the Phœnicians, and by the early history of their own nations; the moderns build their system upon what they suppose to be the constitution of the human mind, and upon the late improvements in arts and sciences. As the question must finally be decided by historical evidence, before we make our appeal to facts, we may remark, upon the supposition that all mankind were originally savages, destitute of the use of speech, and, in the strictest sense of the words, mutum et turpe pecus, the great difficulty is to conceive how they could emerge from that state, and become at last enlightened and civilised: but the modern advocates for the universality of the savage state remove this difficulty by a number of instincts or internal senses, with which they suppose the human mind endowed, and by which the savage is, without reflection, not only enabled to distinguish between right and wrong, and prompted to do every thing necessary to the preservation of his existence and the continuance of the species, but also led to the discovery of what will contribute, in the first instance, to the ease and accommodations of life. These instincts, they think, brought mankind together when the reasoning faculty, which had hitherto been dormant, being now roused by the collisions of society, made its observations upon the consequences of their different actions, taught them to avoid such as experience showed to be pernicious, and to improve upon those which they found beneficial; and thus was the progress of civilisation begun. But this theory seems opposed by unanswerable objections.

In the preliminary discourse to *Sketches of the History of Man*, lord Kames would infer, from some facts which he states, that many pairs of the human race were at first created, of very different forms and natures, but all depending entirely on their own natural talents. But to this statement he rightly observes that the Mosaic account of the creation opposes objections. 'Whence then,' says his lordship, 'the degeneracy of all men into the savage state? To account for that dismal catastrophe, mankind must have suffered some dreadful convulsion.' Now this is taking for granted the very thing to be proved. We deny that at any period since the creation, all men were sunk into the state of savages; and, that they were, no proof has yet been brought, nor do we know of any that can be brought, unless our fashionable philosophers choose to prop their theories by the buttress of Sanchoniatho's Phœnician cosmogony. His

lordship, however, says, or rather supposes, that the confusion at Babel, &c., was this dreadful convulsion: For, says he, by confounding the language of men, and scattering them abroad upon the face of all the earth, they were rendered savages. Here again we have a positive assertion without the least shadow of proof; for it does not at all appear that the confusion of languages, and the scattering abroad of the people, was a circumstance such as could induce universal savagism. There is no reason to think that all the men then alive were engaged in building the tower of Babel; nor does it appear from the Hebrew original that the language of those who were engaged in it was so much changed as the reader is apt to infer from our English version. That the builders were scattered is indeed certain; and if any of them were driven, in very small tribes, to a great distance from their brethren, they would in process of time inevitably become savages. But it is evident, from the Scripture account of the peopling of the earth, that the descendants of Shem and Japheth were not scattered over the face of all the earth, and that therefore they could not be rendered savage by the catastrophe at Babel. In the chapter which relates that wonderful event the generations of Shem are given in orders down to Abraham; but there is no indication that they had suffered with the builders of the tower, or that any of them had degenerated into the state of savages. On the contrary, they appear to have possessed a considerable degree of knowledge; and if any credit be due to the tradition which represents the father of Abraham as a statuary, and himself as skilled in the science of astronomy, they must have been far advanced in the arts of refinement. Even such of the posterity of Ham as either emigrated or were driven from the plain of Shinar in large bodies, so far from sinking into savagism, retained all the acquirements of their antediluvian ancestors, and became afterwards the instructors of the Greeks and Romans. This is evident from the history of the Egyptians and other eastern nations, who in the days of Abraham were powerful and highly civilised. And that for many ages they did not degenerate into barbarism is apparent from its having been thought to exalt the character of Moses, that he was learned in all the wisdom of the Egyptians, and from the wisdom of Solomon having been said to excel all the wisdom of the east country and of Egypt. Thus decided are the Scriptures of the Old Testament against the universal prevalence of savagism in that period of the world; nor are the most authentic Pagan writers of antiquity of a different opinion. Mochus the Phœnician (Strabo, lib. 17), Democritus, and Epicurus, appear to be the first champions of the savage state, and they are followed by a numerous body of poets and rhapsodists, among the Greeks and Romans, who were unquestionably devoted to fable and fiction. The account which they have given of the origin of man, the reader will find in other parts of this work. But we hardly think that he will employ it in support of the fashionable doctrine of original savagism. Against the wild reveries of this school might be quoted all the leaders of the other sects,

Greeks and barbarians; the philosophers of both academies, the sages of the Italian and Alexandrian schools; the magi of Persia; the brahmins of India, and the druids of Gaul, &c. The testimonies of the early historians among all the ancient nations, indeed, who are avowedly fabulists, is very little to be depended on, and has been called in question by the most judicious writers of Pagan antiquity. (See Plutarch *Vita Thes.* sub. init.; Thucyd. l. i. cap. 1; Strabo, l. xi. p. 507; Livy Pref.; and Varro ap. August. de Civ. Dei.) The more populous and extensive kingdoms and societies were civilised at a period prior to the records of profane history; the presumption, therefore, without taking revelation into the account, certainly is, that they were civilised from the beginning. This is rendered further probable from other circumstances. To account for their system, the advocates of savagism are obliged to have recourse to numerous suppositions. They imagine that since the creation dreadful convulsions have happened, which have spread ruin and devastation over the earth, which have destroyed learning and the arts, and brought on savagism by one sudden blow. But this is reasoning at random, and without a vestige of probability; for the only convulsion that can be mentioned is that of Babel, which we have already shown to be inadequate.

It may be farther argued, that it does not appear that any people that were once civilised, and in process of time had degenerated into the savage or barbarous state, have ever recovered their pristine condition with foreign aid. Whence we conclude that man, once a savage, would never have raised himself from that hopeless state. This appears evident from the history of the world; for that it requires strong incitements to keep man in a high state of knowledge and civilisation is evident from what we know of the numerous nations which were famed in antiquity, but which are now degenerated in an astonishing degree. That man cannot, or, which is the same thing, has not risen from barbarism to civilisation and science by his own efforts and natural talents, appears further from the following facts:—The rudiments of all the learning, religion, laws, arts, and sciences, and other improvements that have enlightened Europe, a great part of Asia, and the northern coast of Africa, were so many rays diverging from two points, on the banks of the Euphrates and the Nile. In proportion as nations receded from these two sources of humanity and civilisation, in the same proportion were they more and more immersed in ignorance and barbarism. The Greeks had made no progress towards civilisation, when the Titans first, and afterwards colonies from Egypt and Phœnicia, taught them the very elements of science and urbanity. The aborigines of Italy were in the same state prior to the arrival of the Pelasgi, and the colonies from Arcadia and other parts of Greece. Spain was indebted for the first seeds of improvement to the commercial spirit of the Phœnicians. The Gauls, the Britons, and the Germans, derived from the Romans all that in the early periods of their history they knew of science, or the arts of civil life, and so on of other nations in antiquity. The same

appears to be the case in modern times. The countries which have been discovered by the restless and inquisitive spirit of Europeans have been generally found in the lowest stage of savagism: from which, if they have emerged at all, it has been exactly in proportion to their connexion with the inhabitants of Europe. Even Western Europe itself, when sunk in ignorance, during the reign of monkery, did not recover by the efforts of its own inhabitants. Had not the Greeks, who in the fifteenth century took refuge in Italy from the cruelty of the Turks, brought with them their ancient books, and taught the Italians to read them, we, who are disputing about the origin of the savage state, and the innate powers of the human mind, had at this day been gross and ignorant savages ourselves, incapable of reasoning with accuracy upon any subject. That we have now advanced far before our masters is readily admitted; for the human mind, when put on the right track, and spurred on by emulation and other incitements, is capable of making great improvements; but between improving science, and emerging from savagism, every one perceives there is an immense difference. Lork Kames observes that the people who inhabit a grateful soil, where the necessities of life are easily procured, are the first who invent useful and ingenious arts, and the first who figure in the exercises of the mind. But the Egyptians and Chaldeans, who are thought to support this remark, appear from what we have seen to have derived their knowledge from their antediluvian progenitors, and not from any advantages of situation or strength of genius. Besides, the inhabitants of a great part of Africa, of North and South America, and of many of the islands lately discovered, live in regions equally fertile, and equally productive of the necessities of life, with the regions of Chaldea and Egypt; yet these people have been savages from time immemorial, and continue still in the same state. The Athenians, on the other hand, inhabited the most barren and ungrateful region of Greece, while their acquirements in the arts and sciences have rarely been excelled. The Norwegian colony which settled in Iceland about the beginning of the eighth century inhabited a most bleak and barren soil, and yet the fine arts were eagerly cultivated in that dreary region, when the rest of Europe was sunk in ignorance and barbarism. Again, there are many parts of Africa, and of North and South America, where the soil is neither so luxuriant as to beget indolence, nor so barren and ungrateful as to depress the spirits by labor and poverty; where, notwithstanding, the inhabitants still continue in an uncultured state. From all which, and from numerous other instances which our limits permit us not to bring forward, we infer that some external influence is necessary to impel savages towards civilisation; and that in the history of the world, or the nature of the thing, we find no instance of any people emerging from barbarism by the progressive efforts of their own genius. On the contrary, as we find in societies highly cultivated and luxurious a strong tendency to degenerate, so in savages we not only find no mark of tendency to improvement, but rather a

rooted aversion to it. Among them, indeed, the social appetite never reaches beyond their own horde. It is, therefore, too weak and too confined to dispose them to unite in large communities; and of course, had all mankind been once in the savage state, they never could have arrived at any considerable degree of civilisation. Instead of trusting to any such natural progress as is contended for, the providence of Heaven, in pity to the human race, appears, at different times, and in different countries, to have raised up some persons endowed with superior talents, who, having themselves acquired some knowledge in nations already civilised by useful inventions, legislation, religious institutions, and moral arrangements, sowed the first seeds of civilisation among the hordes of wandering disunited barbarians. Thus we find the Chinese look up to their Fohee, the Indians to the Brahma, the Persians to Zoroaster, the Chaldeans to Oannes, the Egyptians to Thoth, the Phœnicians to Melicerta, the Scandinavians to Odin, the Italians to Janus, Saturn, and Picus, and the Peruvians to Manco. In later times, and almost within our own view, we find the barbarous nations of Russia reduced to the same order and civilisation by the genius and exertions of Peter the Great. The endeavours of succeeding monarchs have powerfully contributed to the improvement of this mighty empire. In many parts of it, however, we still find the inhabitants in a state very little superior to savagism; and, through the most of it, the lower, and perhaps the middling orders, appear to retain an almost invincible aversion to further improvements. A fact which, when added to numerous others of a similar nature which occur in the history of the world, seems to prove indisputably that there is no such natural propensity to improvement in the human mind as we are taught by some authors to believe. The origin of savagism, if we allow mankind to have been at first civilised, is easily accounted for by natural means: the origin of civilisation, if at any period the whole race were savages, cannot, we think, be accounted for otherwise than by a miracle, or a series of miracles. To many persons in the present day the doctrines we have now attempted to establish will appear very humiliating: it is a popular kind of philosophy to attribute to the human mind very pre-eminent powers; which so flatter our pride as in a great measure to pervert our reason, and blind our judgment. The history of the world, and of the dispensations of God to man, are certainly at variance with this doctrine respecting the origin of civilisation: for, if the human mind be possessed of that innate vigor which that doctrine attributes to it, it will be extremely difficult to account for those numerous facts which seem with irresistible evidence to proclaim the contrary; for that unceasing care with which the deity appears to have watched over us; and for those various and important revelations He has vouchsafed to us. Let us rejoice and be thankful that we are men and Christians; but let not a vain philosophy tempt us to imagine that we are angels or gods.

SAVAN'NA, *n. s.* Span. *sabanna*. An open meadow; pasture ground.

He that rides post through a country may tell how, in general, the parts lie; here a morass, and there a river; woodland in one part, and *savannas* in another.

Locke.

Plains immens',
And vast *savannas*, where the wandering eye,
Unfixed, is in a verdant ocean lost.

Thomson.

SAVANNAH, a city and port of entry of the United States, in Chatham county, Georgia, on the south-west bank of the Savannah, seventeen miles from its mouth. It is situated on a sandy plain, about forty feet above low tide, and contains a court-house, jail, alms-house, hospital, theatre, public library, academy, exchange, three banks, including a branch of the United States bank, and seven houses of public worship, one for Presbyterians, one for Episcopalians, one for Lutherans, one for Methodists, one for Baptists, one for Roman Catholics, and a Jewish synagogue.

The academy is built of brick and stone, 180 feet by sixty, of three stories. The exchange is a brick edifice of five stories. The new Presbyterian church is a very spacious and elegant edifice of stone. The city, a few years since, was almost wholly built of wood, with very few elegant houses; but a large proportion of the houses recently erected are handsomely built of brick. Savannah has heretofore been accounted very unhealthy during the summer and autumn, but the salubrity of the place is now much improved, by appropriating to a dry culture those lands in its immediate vicinity which were formerly appropriated to rice.

The city is regularly laid out, and contains ten public squares, each consisting of two acres, with a pump in the centre. The squares and public walks are planted with china trees, which contribute much to the ornament, comfort, and salubrity of the place. Savannah is the great emporium of the state, and is a place of much trade. In six months, ending the 31st of March 1818, there were exported from it 61,797 bales of cotton, 13,680 tierces of rice, and 1500 hogsheads of tobacco. The shipping owned here, in 1816, amounted to 12,766 tons. Vessels drawing fourteen feet of water come up to the wharfs; larger vessels take in their cargoes at Five Fathom Hole, three miles below the town. On the east side of the city is Fort Wayne; at Five Fathom Hole is Fort Jackson; and on Tybee Island, near the mouth of the river, there is a light-house. 118 miles south-west of Charlestown, and 123 south-east of Augusta.

SAVANNAH, a river of the United States, which is formed by the union of the Tugeloo and Keowee. It separates South Carolina from Georgia, and runs south-east into the Atlantic. It is navigable for large vessels to the town of Savannah, seventeen miles, and for boats of 100 feet keel to Augusta, which, by the course of the river, is 340 miles above Savannah. Just above Augusta there are falls; beyond these the river is navigable for boats to the junction of the Tugeloo and Keowee.

SAVARY (James), an eminent French writer on trade, was born at Done, in Anjou, in 1622. He continued in trade until 1658, and was afterwards admitted of the council for the reforma-

tion of commerce; and the orders which passed in 1670 were drawn up by his instructions and advice. He wrote *Le Parfait Negociant*, 4to.; and *Avis et Conseils sur les plus Importantes Matieres du Commerce*, 4to. He died in 1690; and out of seventeen children, whom he had by one wife, left eleven.

SAVARY (James and Philemon Lewis), two of the sons of the preceding, labored jointly on a *Dictionnaire Universelle du Commerce*, 2 vols. folio. This work was begun by James, who was inspector-general of the manufactures at the custom-house, Paris; who called in the assistance of his brother Philemon-Lewis, a canon of the royal church of St. Maur, and at his death left him to finish it. This work appeared in 1723, and Philemon afterwards added a third supplemental volume to the former.

SAVARY, an eminent French traveller and writer, born at Vitry, in Brittany, about 1748. He studied with applause at Rennes, and, in 1776, travelled into Egypt, where he remained about three years. During this period he was engaged in the study of the Arabian languages, in searching out ancient monuments, and in examining the national manners. He next visited the islands in the Archipelago, where he spent eighteen months. On his return to France, in 1780, he published, 1. A Translation of the Koran with a short Life of Mahomet, 2 vols. 8vo.; 2. The Morality of the Koran, or a collection of the most excellent maxims in the Koran; a work extracted from his translation, which is esteemed both elegant and faithful; 3. Letters on Egypt, in 3 vols. 8vo., in 1785. In these the author makes his observations with accuracy, and renders interesting every thing he relates; but he is censured for painting modern Egypt and its inhabitants in too high colors. These letters, however, were rapidly sold; and, encouraged by this flattering reception, he prepared his Letters upon Greece. But about this time he contracted a malady from too intense application. His digestion became languid; sleep forsook him; a dry and troublesome cough came on; his face appeared bloated, and his legs inflamed. In this situation he returned to Paris, in the beginning of 1788, to attend to the publication of his new work. He had then all the symptoms of a dangerous dropsy. His strength was exhausted, and he died on the 4th of February 1788.

SAUCE, *n. s.* & *v. a.* } Fr. *sauce*, *saulse*;
SAUCE'PAN. } Ital. *salsa*; Lat. *salsus*.
Something eaten with food to improve it or give a relish: to treat with sauce; hence to intermix: a sauce-pan is properly a pan for cooking sauce.

The bitter *sauce* of the sport was that we had our honours for ever lost, partly by our own faults, but principally by his faulty using of our faults.

Sidney.

Then fell she to *sauce* her desires with threatenings.

Id.

All the delights of love, wherein wanton youth walloweth, be but folly mixed with bitterness, and sorrow *sauced* with repentance.

Spenser.

Epicurean cooks

Sharpen with cloyless *sauce* his appetite.

Shakspeare.

Such was the *sauce* of Moab's noble feast,
Till night far spent invites them to their rest.

Cowley.

He that spends his time in sports is like him whose meat is nothing but *sauces*; they are healthless, chargeable, and useless.

Taylor.

Your master will not allow you a silver *saucepan*.

Swaift.

High *sauces* and rich spices are fetched from the Indies.

Baker.

SAUCER, *n. s.* Fr. *sauciere*, or from *sauce*. A small pan or platter in which *sauce* is set on the table.

Infuse a pugil of new violets seven times, and it shall make the vinegar so fresh of the flower, as, if brought in a *sauceer*, you shall smell it before it come at you.

Bacon.

Some have mistaken blocks and posts

For spectres, apparitions, ghosts,

With *sauceer* eyes and horns.

Hudibras.

The SAUCISSE, or SAUCISSON, in mining, is a long pipe, sometimes made of leather, of about an inch and a half diameter, filled with powder, going from the chamber of the mine to the entrance of the gallery. It is generally placed in a wooden pipe called an *auget*, to prevent its growing damp. It serves to give fire to mines, bomb-chests, &c.

SAUCY, *adj.*

SAUCE'BOX, *n. s.*

SAUC'ILY, *adv.*

SAUCINESS, *n. s.*

Fr. *saluce*; Lat. *salar*.
Pert; petulant; rude;
impertinent: the adverb
and noun-substantive corresponding: *saucebox* is an impertinent busy fellow.

With how sweet saws she blamed their *saucesness*,
To feel the panting heart, which through her side
Did beat their hands.

Sidney.

You are more *saucey* with lords than the heraldry of your birth and virtue gives you commission.

Shakspeare.

And if thou hast the mettle of a king,
Being wronged as we are by this peevish town,
Turn thou the mouth of thy artillery,
As we will our's against these *saucey* walls.

Id.

Though this knave came somewhat *sauceily* into the world before he was sent for, yet was his mother fair.

Id.

By his authority he remains here, which he thinks is a patent for his *saucesness*.

Id.

A freed servant, who had much power with Claudius, very *sauceily* had almost all the words; and, amongst other things, he asked in scorn one of the exannates, who was likewise a freed servant of Scribonianus, I pray, sir, if Scribonianus had been emperor, what would you have done? He answered, I would have stood behind his chair, and held my peace.

Bacon.

It is *saucesness* in a creature, in this case, to reply.

Bramhall.

I lose my patience, when with *saucey* pride
By untuned ears I hear his numbers tried.

Roscommon.

Power's first pedigree from force derives,

And calls to mind the old prerogatives

Of free-born man; and with a *saucey* eye

Searches the heart and soul of majesty.

Denham.

You *saucesness*, mind your pruning knife, or I may use it for you.

Dryden's Don Sebastian.

Imputing it to the natural *saucesness* of a pedant,

they made him eat his words.

L'Estrange.

Homero, to express a man both timorous and *saucey*,

makes use of a kind of point, namely, that he had the eyes of a dog, but the heart of a deer.

Addison's Spectator.

The foolish old poet says that the souls of some women are made of sea water: this has encouraged my *saucebox* to be witty upon me.

Id.

A trumpet behaved himself very *saucily*. *Addison*.
This might make all other servants challenge the
samelibility, and grow pert upon their masters; and,
when this *sauciness* became universal, what less mis-
chief could be expected than an old Scythian re-
bellion? *Collier on Pride*.

SAVE, *v. a., v. n., & adv.* } French *sauver*;
SA'VER, *n. s.* } Lat. *salvo*. To
SA'VING, *adj., adv., & n. s.* } make or keep
SA'VINGLY, *adv.* } safe; reserve;
SA'VIOUR, *n. s.* } spare; save;
embrace opportunely; preserve from eternal
death; to be chief: a saver or saviour is one
who preserves; rescues; keeps; the Redeemer
of mankind: saving, frugal; parsimonious; and
as an adverb with exception in favor of: as a
noun-substantive an escape of expense; excep-
tion: savingly agrees with saving as an adjective.

He shall not feel quietness, he shall not *save* of
that which he desired. *Job xx. 20.*

One shall cry unto him, yet cannot he answer, nor
save him out of his troubles. *Isa. xlv. 7.*

We are not of them who draw back unto perdition;
but of them that believe to the *saving* of the soul.

They were manifoldly acknowledged the *savers* of
that country. *Sidney.*

But being all defeated, *save* a few,
Rather than fly, or be captived herself she slew.
Spenser.

All this world's glory seemeth vain.
And all their shows but shadows, *saving* me. *Id.*

Whatsoever we read in Scripture concerning the
endless love and *saving* mercy which God sheweth
towards his church, the only proper subject thereof
is this church. *Hooker.*

There are some that will be *saved*, and some that
will be damned. *Shakspeare.*

All the conspirators, *save* only he,
Did that they did in envy of great Cæsar. *Id.*

Brass ordinance *saveth* in the quantity of the material,
and in the charge of mounting and carriage.
Bacon.

He never put down a near servant, *save* only
Stanley, the lord chamberlain. *Id. Henry VII.*

It is a great *saving* in all such lights, if they can
be made as fair and light as others, and yet last
longer. *Bacon.*

By nature far from profusion, and yet a greater
sparer than a *saver*; for though he had such means
to accumulate, yet his garrisons and his feasting
soaked his exchequer. *Wotton.*

His merits *save* them.
How build, unbuild, contrive
To *save* appearances: how gird the sphere
With centrick and eccentric. *Id.*

How have I then with whom to hold converse,
Save with the creatures which I made? *Id.*
So judge he man, both judge and Saviour sent. *Id.*

We may be confident whatever God does is in-
tended for our good, and whatever we interpret other-
wise we can get nothing by repining, nor *save* any
thing by resisting. *Temple.*

The circling streams, once thought but pools of
blood,
From dark oblivion Harvey's name shall *save*.
Dryden.

Will you not speak to *save* a lady's blush? *Id.*

Laws of arms permit each injured man
To make himself a *saver* where he can. *Id.*

Contend not with those that are too strong for us,
but still with a *saving* to honesty; for integrity must
be supported against all violence. *L'Estrange.*

Saving the reverence due to so great a man, I
doubt not but they did all creep out of their holes.

Ray on the Creation.
Silvio, finding his application unsuccessful, was
resolved to make a *saving* bargain; and, since he
could not get the widow's estate, to recover what he
had laid out of his own. *Addison.*

By reducing interest to four per cent. there was a
considerable *saving* to the nation. *Id.*

However consonant to reason his precepts ap-
peared, nothing could have tempted men to acknow-
ledge him as their God and Saviour, but their being
firmly persuaded of the miracles he wrought. *Id.*

He who feareth God, and worketh righteousness,
and perseveres in the faith and duties of our religion,
shall certainly be *saved*. *Rogers.*

She loved money; for she was *saving*, and applied
her fortune to pay John's clamorous debts.

Arbuthnot's History of John Bull.

They meanly pilfer, as they bravely fought,
Now *save* a nation, and now *save* a groat. *Pope.*

The same persons, who were chief confidants to
Cromwell, foreseeing a restoration, seized the castles
in Ireland, just *saving* the tide, and putting in a stock
of merit sufficient. *Swift.*

Who dares affirm this is no pious age,
When charity begins to tread the stage?
When actors, who at best are hardly *savers*,
Will give a night of benefit to weavers? *Id.*
Be *saving* of your candle. *Id.*

Will no superior genius snatch the quill,
And *save* me on the brink from writing ill? *Young.*

SAVE, a large river of Austrian Illyria, rising
about six miles to the south of Villach, and flow-
ing through a part of Styria and Croatia. After
leaving the latter, it separates Slavonia from
Turkey, till it joins the Danube, between Semlin
and Belgrade. Its course is at first winding; and
it frequently overflows its banks. It is, however,
of great importance to the trade of all the coun-
tries through which it passes, and is the medium
by which the corn and tobacco of the Bannat
and neighbouring provinces are interchanged.

SAVENDROOG, a celebrated but unhealthy
fortress of the Mysore, Hindostan. It is situated
on the summit of an immense rock, half a mile
in perpendicular height, and surrounded by a
thick wood. It was considered by the natives
impregnable; but was taken by storm, without
the loss of a man, by the British, in 1791. It
was used by Hyder Aly and Tippoo Sultan as a
state prison. Long. 77° 29' E., lat. 12° 56' N.

SAVERNE, a well built town in Alsace, de-
partment of the Lower Rhine. It is situated on
the Sarre, and has a castle, formerly the residence
of the bishops of Strasburg. Saverne has a great
trade in woollens, leather, hardware, pottery, and
tobacco, almost all manufactured in the town;
and the surrounding country is productive in
wine. The town contains a college, an hospital,
and 6000 inhabitants. Twenty-two miles W.N.W.
of Strasburgh.

SAVILLE (Sir George), afterwards marquis of
Halifax, was born about 1630; and, some time
after his return from his travels, was created a
peer, in consideration of his own and his father's
merits. He was a strenuous opposer of the bill
of exclusion; but proposed such limitations of
the duke of York's authority as should disable
him from doing any harm either in church or
state, as the taking out of his hands all power in

ecclesiastical matters, the disposal of the public money, and the power of making peace and war; and lodging these in the two houses of parliament. After that bill was rejected in the house of lords, he pressed them, though without success, to proceed to the limitation of the duke's power; and began by moving that, during the king's life, he might be obliged to live 500 miles out of England. In August 1682 he was created a marquis, and soon after made lord privy-seal. Upon king James's accession he was made president of the council; but, on his refusal to consent to the repeal of the test, he was dismissed from all public employments. In that assembly of the lords which met after king James's withdrawing himself the first time from Whitehall, he was chosen president; and upon the king's return from Feversham he was sent, with the earl of Shrewsbury and lord Delamere, from the prince of Orange, to order his majesty to quit the palace at Whitehall. In the convention-parliament he was chosen speaker of the house of lords, and strenuously supported the motion for the vacancy of the throne, and the conjunctive sovereignty of the prince and princess; upon whose accession he was again made privy-seal. Yet, in 1689, he quitted the court, and became a zealous opposer of the measures of government till his death, in April 1695. He wrote, *The Anatomy of an Equivalent*; a *Letter to a Dissenter*; a *Rough Draught of a new Model at Sea*; and *Maxims of State*; all in one volume 8vo. He also published the character of king Charles II., 8vo.; the Character of Bishop Burnet, and Historical Observations upon the Reigns of Edward I., II., III., and Richard II., with Remarks upon their faithful Counsellors and false Favorites.

SAVILLE, or SAVILLE (Sir Henry), was born at Bradley, near Halifax, in Yorkshire, in 1549. He was entered of Merton College, Oxford in 1561, where he took the degrees in arts, and was chosen fellow. When he proceeded M.A., in 1570, he read for that degree on the *Almagest* of Ptolemy. In 1578 he travelled into France and other countries; and at his return was made tutor in the Greek to queen Elizabeth, who had a great esteem for him. In 1585 he was made warden of Merton College, which he governed thirty-six years with great honor, and improved it by all the means in his power. In 1596 he was chosen provost of Eton College. In 1619 he founded in the university of Oxford two professorships in geometry and in astronomy; which he endowed with a salary of £160 a-year besides a legacy of £600 to purchase more lands for the same use. He also furnished a library with mathematical books, near the mathematical school, for the use of his professors; and gave £100 to the mathematical chest of his own appointing; adding afterwards a legacy of £40 a-year to the same chest, to the university, and to his professors jointly. He likewise gave £120 towards the new building of the schools, besides several rare MSS. and printed books to the Bodleian library; and a quantity of Greek types to the printing-press at Oxford. After a life spent in the encouragement of science and literature in general, he died at Eton College the 19th of

February, 1622, in the seventy-third year of his age, and was buried in the chapel. The highest encomiums are bestowed on him by all the learned of his time: by Casaubon, Mercerus, Meibomius, Joseph Scaliger, and bishop Montague; who in his *Diatribe* upon Selden's History of Tythes, styles him, 'that magazine of learning, whose memory shall be honorable amongst not only the learned, but the righteous for ever.' His publications are, 1. *Four Books of the Histories of Cornelius Tacitus*, and the *Life of Agricola*; with Notes upon them, in folio, dedicated to queen Elizabeth in 1581. 2. *A View of certain Military Matters, or Commentaries concerning Roman Warfare*, 1598. 3. *Rerum Anglicarum Scriptores Post Bedam, &c.* 1596. 4. *The Works of St. Chrysostom*, in Greek, in 8 vols. folio, 1613. Several editions of this work were afterwards published in Paris. 5. In 1618 he published a Latin Work, written by Thomas Bradwardin, archbishop of Canterbury, against Pelagius, entitled *De Causâ Dei contra Pelagium, et de Virtute Causarum*; to which he prefixed the life of Bradwardin. 6. In 1621 he published a collection of his own *Mathematical Lectures on Euclid's Elements*, in 4to.—7. *Oratio Coram Elizabetha Regina, Oxoniæ Habita*, anno 1592. Oxford 1658, 4to. 8. He translated into Latin King James's Apology for the Oath of Allegiance. He also left several MSS behind him, written by order of king James; all which are in the Bodleian library. Four of his letters to Camden are published by Smith, among Camden's Letters, 1691, 4to.

SAVIN, in botany. See JUNIPERUS.

SAVIOUR, ORDER OF ST., a religious order of the Romish church, founded by St. Bridget, about the year 1445, and so called from its being pretended that our Saviour himself declared its constitution and rules to the foundress. It is principally founded for religious women, who pay a particular honor to the holy virgin; but there are some monks of the order, to administer the sacrament and spiritual assistance to the nuns.

SAUL, Heb. שָׂאֻל, i.e. asked, the son of Kish, a rich man of Gibeah, of the tribe of Benjamin, the first king of Israel. Saul's fruitless journey seeking his father's asses; his meeting with the prophet Samuel; the interesting particulars foretold to him, with his anointing as king, about A.A.C. 1095, or A.M. 2909; his prophesying with the young prophets; his appointment by the lot; his modesty in hiding himself; his first victory over the Amorites; his rash sacrifice in the absence of Samuel; his equally rash curse; his victories over the Philistines and Amalekites; his sparing of king Agag, with the judgment pronounced against him for it; his jealousy and persecution of David; his barbarous massacre of the priests and people of Nob; his repeated confessions of his injustice to David; his consultation of the witch of En-dor; with his defeat and suicide, are recorded in 1 Sam. ix.—xxxi. He reigned forty years, and died A.M. 2949.

SAUMUR, a central town of France, in Anjou, situated on the southern bank of the Loire, over which it has two bridges, the one

from the northern bank to an island in the middle, and the other from the island to the southern bank. The former was much injured in the revolutionary war; but the latter, consisting of twelve elliptical arches, each of sixty feet span, is still one of the finest structures of the kind in France. The principal street, built on a line with this bridge, contains the theatre, and various other elegant buildings. The castle, situated on an eminence which commands the town, is a very ancient building, and is used as a depot for military stores. The cavalry barracks are spacious and handsome, and the town contains several squares and Roman and Celtic antiquities. Its chief attraction, however, is the beauty of the surrounding scenery. Saumur was formerly fortified, and has long been noted for Protestantism. In the time of Henry IV. the governor of this part of France, Duplessis Mornay, founded here a Protestant academy, much resorted to during the seventeenth century. It has manufactures of linen, woollens, leather, and some trade in wine and brandy. Saumur was the birthplace of madame Dacier. The road to Tours is along the banks of the Loire, on the great mound called the Leve. Twenty-seven miles south-east of Angers, and thirty-eight W. S. W. of Tours.

SAUNDERS, in botany and dyeing. See *PTEROCARPUS SANTALUM*.

SAUNDERSON (Dr. Robert), an eminent preacher, born at Rotherham in Yorkshire, in 1587. He attended the grammar-school at Rotherham, where he made such rapid proficiency that at thirteen he was sent to Lincoln College, Oxford. In 1608 he was appointed logic reader. He took orders in 1611, and was promoted successively to several benefices. Archbishop Laud recommended him to king Charles I. as a profound casuist, who appointed him one of his chaplains in 1631. The king regularly attended his sermons, and said that 'he carried his ears to hear others, but his conscience to hear Saunderson.' In 1642 Charles created him regius professor of divinity at Oxford and canon of Christ Church; but in 1648 he was ejected by the visitors from the parliament. When the parliament proposed the abolition of the episcopal form of church-government, Charles desired him to take the subject under his consideration. He accordingly wrote a treatise entitled *Episcopacy as Established by law in England not Prejudicial to Regal Power*. At the request of the celebrated Boyle, who sent him a present of £50, Saunderson published his book *De Conscientia*. On the restoration of Charles II. he recovered his professorship and canonry, and soon after was made bishop of Lincoln. During the two years and a half in which he possessed this new office, he spent a considerable sum in augmenting poor vicarages, in repairing the palace at Bugden, &c. He died January 29th, 1663, in his seventy-sixth year. 1. In 1615 he published *Logicæ Artis Compendium*, which was the system of lectures he had read in the University. 2. Sermons, amounting to thirty-six, printed in 1681, folio, with the author's life by Walton. 3. *Nine Cases of Conscience Resolved*; 1678, 8vo. 4. *De Juramenti Obligatione*. This book was translated into English by Charles I. while a

prisoner in the Isle of Wight, and printed in London in 1665, 8vo. 5. *De Obligatione Conscientiæ*. 6. Censure of Mr. Antony Ascham, and of his book of the Confusions and Revolutions of Government. 7. *Pax Ecclesiæ*, concerning Predestination, or the Five Points. 8. *Two Discourses in Defence of Archbishop Usher's Writings*.

SAUNDERSON (Dr. Nicolas), born at Thurlstone in Yorkshire in 1682, lost his sight by the small-pox before he was a year old. But nevertheless he was initiated into the Greek and Roman authors at a free school at Pennistoun. After spending some years studying the languages, his father, who was in the excise, began to teach him arithmetic. He soon surpassed his father; and made long and difficult calculations without any sensible marks to assist his memory. At eighteen he was taught the principles of Algebra and geometry by Richard West, esq., of Undoorbank, who, though a gentleman of fortune, yet, being strongly attached to mathematical learning, undertook his education. Saunderson was also assisted in his mathematical studies by Dr. Nettleton. These two gentlemen read books to him and explained them. Some of his friends, who had remarked his perspicuous manner of communicating his ideas, proposed that he should attend the university of Cambridge as a teacher of mathematics. This proposal was immediately put in execution; and he was conducted to Cambridge, in his twenty-fifth year, by Mr. Joshua Dunn, a fellow-commoner of Christ's College. The subject of his lectures was the *Principia Mathematica*, the Optics, and *Arithmetica Universalis* of Sir Isaac Newton, and he was attended by a very numerous audience. When Whiston was removed from his professorship, Saunderson was universally allowed to be the man best qualified for the succession. The heads of the university applied to their chancellor, the duke of Somerset, who procured the royal mandate to confer upon him the degree of A.M. He was then elected Lucasian professor of mathematics in November 1711. He now devoted his whole time to his lectures. When George II., in 1728, visited the university of Cambridge, he expressed a desire to see professor Saunderson. He waited upon his majesty in the senate house, and was there, by the king's command, created LL.D. He was admitted F.R.S. in 1736. He was naturally of a vigorous constitution; but his sedentary life at length rendered him scorbutic. He died on the 19th of April, 1739, aged fifty-seven. He wrote a system of algebra, which was published in 2 vols. 4to. at London, after his death in 1740, at the expense of the University. Dr. Saunderson invented for his own use a Palpable Arithmetic; that is, a method of performing operations in arithmetic solely by the sense of touch. In the cabinet of medals, at Cambridge, he could single out the Roman medals with the utmost correctness; he could also perceive the slightest variation in the atmosphere. When he walked, he knew when he passed by a tree, a wall, or a house. He made these distinctions from the different way his face was affected by the motion of the air. In his youth he had been a performer on the flute; and

made such proficiency, that, if he had cultivated his talents in this way, he would probably have been as eminent in music as he was in mathematics. He recognised not only his friends, but even those with whom he was slightly acquainted, by the tone of their voice.

SAUNTER, *v. n.* Fr. *aller à la sainte terre*. from idle people who roved about the country, and asked charity under pretence of going to the holy land; or sans terre, having no settled home. To wander about idly; loiter; longer.

Tell me, why *sauntering* thus from place to place I meet thee, Navolus, with clouded face! *Dryden*.

The cormorant is still *sauntering* by the sea-side, to see if he can find any of his brass cast up. *L'Estrange*.

Though putting the mind upon an unusual stress that may discourage, ought to be avoided; yet this must not run it into a lazy *sauntering* about ordinary things. *Locke*.

So the young squire, when first he comes
From country school to Will's or Tom's,
Without one notion of his own,
He *saunters* wildly up and down. *Prior*.
Here *sauntering* apprentices o'er Otway weep. *Guy*.

The brainless stripling
Spells uncouth Latin, and pretends to Greek;
A *sauntering* tribe! such born to wide estates,
With yea and no in senates hold debates. *Tickel*.
Led by my hand, he *sauntered* Europe round,
And gathered every vice in every ground. *Dunciad*.

SAVONA, at one time a place of great trade in the north-west of Italy, was, in 1648, half destroyed by an explosion of 1000 barrels of gunpowder, which had been deposited in the citadel. Since then it has suffered both from pestilence and war. The principal articles of trade are silk, wool, and fruit; and heavy iron ware, such as ships' anchors. Savona was the birth-place of popes Sixtus IV. and Julius II. Columbus was for some time a resident here. In 1745 sixteen French and Spanish vessels, laden with military stores, and lying in the harbour, were sunk by the bombs of a British squadron. In 1746 the king of Sardinia took the town; and in 1810 and 1811 pope Pius VII. resided here some time during his dispute with Buonaparte. Inhabitants 10,000. Twenty miles W.S.W. of Genoa, and sixty north-east of Nice.

SAVONAROLA (Jerome), a celebrated Italian monk, born at Ferrara in 1452, and descended from a noble family. At the age of twenty-two he assumed the habit of a Dominican friar, without the knowledge of his parents, and distinguished himself in that order by his piety and ability as a preacher at Florence. He placed himself at the head of the faction which opposed the family of the Medici. He explained the Apocalypse, and pointed out a prophesy which foretold the destruction of his opponents. He predicted a renovation of the church, and declaimed with much severity against the clergy and the court of Rome. Alexander VI. excommunicated him, and prohibited him from preaching. He derided the anathemas of the pope; yet he forbore preaching for some time, and then resumed his employment with more applause than ever. The pope and the Medici family then thought of attacking him with his own weapons. Savonarola having posted up a thesis as a subject of disputation, a Franciscan, by their

instigation, offered to prove it heretical. The Franciscan was seconded by his brother friars, and Savonarola by his brethren. To convince their antagonists of the superior sanctity of Savonarola, one of the Dominicans offered to walk through a fire: and, to prove his wickedness, a Franciscan agreed to the same experiment. The multitude, eager to witness so extraordinary a spectacle, urged both parties to come to a decision; and the magistrates were constrained to give their consent. Accordingly, Saturday the 7th of April, 1498, was fixed for the trial. On that day the champions appeared; but when they saw one another in cold blood, and beheld the wood in flames, they were anxious to escape the imminent danger into which they had rashly thrown themselves. The Dominican pretended he could not enter the flames without the host in his hand. This the magistrates refused to allow; and the Dominican's fortitude was not put to the test. The Franciscans incited the multitude against their opponents, who accordingly assaulted their monastery, broke open the gates, and entered by force. Upon this, the magistrates brought Savonarola to trial as an impostor. He was put to the torture, and examined; and in the answers which he gave fully evinced that he was a fanatic. He boasted of having frequent conversations with God; and his brother friars were credulous enough to believe him. John Francis Picus, earl of Mirandula, who wrote his life, assures us that the devils which infested the convent of the Dominicans trembled at the sight of friar Jerome. At length pope Alexander VI. sent the chief of the Dominicans, with bishop Romolino, to degrade him from holy orders, and to deliver him up to the secular judges with his two fanatical associates. They were condemned to be hanged and burned on the 23d of May, 1498. Savonarola submitted to the execution of the sentence with great firmness and devotion, and without uttering a word respecting his innocence or his guilt. He was forty-six years of age. Immediately after his death, his Confession was published in his name. It contained many extravagancies, but nothing to deserve so horrid a punishment. His adherents did not fail to attribute to him the power of working miracles; and so strong a veneration had they for their chief that they preserved with pious care any parts of his body which they could snatch from the flames. The earl of Mirandula, the author of his life, has described him as an eminent saint. He gravely informs us that his heart was found in a river; and that he had a piece of it in his possession, which had been very useful in curing diseases, and ejecting demons. Savonarola has also been defended by F. Quetif, Bzovius, Baron, and other religious Dominicans. He wrote a prodigious number of books. He has left, 1. Sermons in Italian: 2. A treatise entitled Triumphus Crucis; 3. Eruditorum Confessorum; and several others. His works have been published at Leyden in 6 vols. 12mo.

SA'VOR, *n. s., v. n. & v. a.* } Fr. *savcur*.
SA'VORILY, *adv.* } A scent; odor;
SA'VORINESS, *n. s.* } taste: to have
SA'VORY, *adj.* } a particular
taste; betoken: to like; relish: the adverb,

noun-substantive, and adjective corresponding.

Savoury meat, such as my father loveth. *Genesis*.
Thou *savourest* not the things that be of God.

Matthew.

What *savour* is better, if physick be true,
For places infected, than wormwood and rue?

Tusser.

This ripping of ancestors is very pleasing, and *savour*eth of good conceit and some reading.

Spenser on Ireland.

Wisdom and goodness to the vile seem vile;

Filths *savour* but themselves. *Shakspeare*.

The duke's answers to his appeachments are very diligently and civilly couched; and, though his heart was big, yet they all *savour* of an humble spirit.

Wotton.

Benzo calls its smell a tartareous and hellish *savour*.

Abbot.

If 'twere a secret that concerned my life,

This boldness might become thee;

But such unnecessary rudeness *savours*

Of some design. *Denham's Sophy*.

That *savours* only of rancour and pride. *Milton*.

The pleasant *savoury* smell

So quickened appetite, that I

Could not but taste! *Milton's Paradise Lost*.

That Jews stink naturally, that is, that there is in their race an evil *savour*, is a received opinion we know not how to admit. *Brown's Vulgar Errors*.

This mufti is some English renegade, he talks so *savourily* of toaping. *Dryden's Don Sebastian*.

The collation he fell to very *savourily*. *L'Estrange*.

A directer influence from the sun gives fruit a better *savour* and a greater worth. *South*.

I have rejected every thing that *savours* of party.

Addison.

Truffles, which have an excellent oil, and a volatile salt of a grateful *savour*, are heating.

Arbutnot on Diet.

SAVOY, a duchy of the north-west part of the continental states of Sardinia, extending from lat. 45° 8' to 46° 28' N. It is bounded on the west by France, on the east by Piedmont. Its form is oblong, its length from north to south being ninety-four miles, its general breadth between sixty and seventy. Its superficial extent is about 3800 square miles; its population about 450,000.

The scenery of Savoy, less remarkable for beauty than for grandeur, produces in the mind of the spectator feelings of awe, and even terror. From the bleak tops of the mountains the view is infinitely diversified: the bottom of the valley is strewed with cottages, fields, and vineyards; verdant pastures extend along the base, and through a considerable part of the ascent: here succeed forests, often of great length; while the summit is crowned with snow and ice. Savoy is the region of Mount Blanc, Mount St. Bernard, Mount Cenis, Mount Iseran, Mount Valaisan, and Mount Toumet, all connected, forming the stupendous barrier between Savoy and Piedmont. The roads are often impassable for carriages, and burdens are generally carried on the backs of horses or mules. Wheat, barley, oats, rye, and hemp, are produced in the valleys: and the pasturage enables the agriculturists to send numbers of fine cattle into Piedmont and the Milanese. The exports are chiefly raw produce, such as cheese, butter, hemp, tanned skins, and wool. The transit trade between France and Italy is carried on chiefly by the new road across Mount

VOL. XIX.

Cenis: the manufactures are confined to a few coarse linens, tanning, hardware, pottery, and a little paper.

The Savoyards have a brown complexion, from their frequent exposure to the air, and live chiefly in the country; for except Chambery, their capital, there is no town of 5000 inhabitants. From the simplicity of their manners, and their frugality and sobriety, they have, by some writers, been compared to the Germans, as described by Tacitus. An uninstructed, they are at the same time an uncorrupted people. The language in common use is a mixture of French and Italian. The Savoyards quit their native mountains, in the same way as the Welsh or the Scottish Highlanders, and are remarked for pursuing a variety of petty callings. 'The Savoyards,' says Mr. Galette, a late observer, 'are good-natured, gentle, plain in their manners, simple in their affection, faithful, and honest. Improvidence is a striking feature in their national character, and is as strong in the nobleman as the peasant. They are always in debt; and I really should not think it possible to name three persons among a hundred, taken at random, whose property would be free from incumbrance. They are unthinkingly liberal and generous; yet they cannot bring themselves to pay what they owe! If you happen to have a claim for £5 on a Savoyard, he will, very probably, spend £100 in giving you and your whole family a hearty hospitable reception, for months, but the poor £5 will not be forthcoming after all. The laws, with respect to debtors, are the worst in Europe; they are framed in such a manner as effectually to prevent strangers from lending pecuniary assistance to the natives, even on the best landed security.' On the whole, this country is very far behind the rest of Europe, and seems to belong to another century, or to another quarter of the globe.

Savoy (derived from the Latin Sabaudia) was the country of a well known tribe of Celtic origin, the Allobroges, who were subjugated in the reign of Augustus. Their country formed a part of the great province of Gallia Narbonensis, and remained in possession of the Romans during several centuries; a length of possession which accounts for the numerous remains of Roman antiquities found in different parts. After various changes, it was erected, in the beginning of the eleventh century, into a county. In the fifteenth century it became a dukedom, and had a large accession of power in the acquisition of Piedmont. The ducal family, as we have seen in the article SARDINIA, acquired the royal title in 1719, and with it nearly its present dominions.

SAVOY, in botany. See BRASSICA.

SAURIN (James), a celebrated preacher, born at Nismes in 1677, and the son of a Protestant lawyer of eminence. He applied to his studies with great success; but at length he relinquished them for the profession of arms. In 1694 he made a campaign as a cadet in lord Galloway's company, and soon afterwards obtained a pair of colors in the regiment of colonel Renault, which served in Piedmont. But, the duke of Savoy having made peace with France, he returned to Geneva, and resumed the study of philosophy

Z

and theology, under Turretin and other professors. In 1700 he visited Holland, then came to England, where he remained for several years, and married. In 1705 he returned to the Hague, where he fixed his residence, and preached with the most unbounded applause. His sermons, especially those published during his life, are distinguished for justness of thought, and an elegant unaffected style. Saurin died on the 30th of December, 1730, aged fifty-three. He wrote 1. Sermons, in 12 vols. 8vo. and 12mo. 2. Discourses Historical, Critical, and Moral, on the most memorable Events of the Old and New Testament. This is his greatest and most valuable work. It was printed first in 2 vols. folio. Beausobre and Roques undertook a continuation of it, and increased it to 4 vols. 3. The State of Christianity in France, 1725, 8vo. 4. An Abridgment of Christian Theology and Morality, in the form of a Catechism, 1722, 8vo. He afterwards published an abridgment of this work. 5. His Dissertation on the Expediency of sometimes disguising the Truth raised a multitude of enemies against him. In this discourse his plan was to state the arguments of those who affirm that, in certain cases, it is lawful to disguise truth, and the answers of those who maintained the contrary. He does not determine the question, but seems, however, to incline to the first opinion. He was immediately attacked by several adversaries, and a long controversy ensued; but his doctrines and opinions were at length publicly approved of by the synods of Cambray and of the Hague.

SAURIN (Joseph), a geometrician of the Academy of Sciences at Paris, born at Courtoison, in the principality of Orange, in 1659. His father, who was a minister at Grenoble, was his first preceptor. He made rapid progress in his studies, and was admitted minister of Eure, in Dauphiny, when very young; but, having made use of some violent expressions in one of his sermons, he was obliged to quit France in 1683. He retired to Geneva, and thence to Berne, where he obtained a considerable living; but soon after repaired to Holland. He returned afterwards to France, and surrendered himself to Bossuet bishop of Meaux, who obliged him to make a recantation of his errors. He was favorably received by Louis XIV., obtained a pension from him, and was treated by the Academy of Sciences with the most flattering respect. At that time (1717) geometry formed his principal occupation. He adorned the *Journal des Sçavans* with many excellent treatises; and he added to the *Memoirs of the Academy* many interesting papers. These are the only works which he has left. He died in Paris December 29th, 1737, in his seventy-eighth year, of a fever.

SAURIMATE. See SARIMATE.

SAURURUS, in botany, lizard's tail, a genus of the tetragynia order and heptandria class of plants; natural order second, piperite: CAL. a catkin, with uniflorous scales: COR. none; germina four and four monospermous berries.

SAUSSURE (Horace Benedict), de, was born in Geneva in 1740. His earliest passion was botany: his father was a scientific agriculturalist; and a variegated soil, abundant in plants of dif-

ferent kinds, invites the inhabitant of the banks of the Leman to cultivate that agreeable science. This taste produced an intimacy between De Saussure and the great Haller. De Saussure was induced also to study the vegetable kingdom, by his connexion with Ch. Bonnet, who had married his aunt, and who soon set a just value on the rising talents of his nephew. Bonnet was then employed on the leaves of plants. De Saussure studied these organs of vegetables also, and he published the result of his researches, under the title of *Observations on the Bark of Leaves*. This small work, which appeared soon after 1760, contains new observations on the epidermis of leaves, and in particular on the milary glands by which they are covered. About that period, the place of professor of philosophy falling vacant, it was conferred upon De Saussure, who was then only twenty-one years of age. At that time the two professors of philosophy at Geneva taught physics and logic alternately. De Saussure discharged this double task with equal success. For physics, however, he had the greatest taste, and they conducted him to the study of chemistry and mineralogy. He then began his travels through the mountains; not now to examine their vegetable productions, but to study their geological character. During the first fifteen or twenty years of his professorship he employed himself by turns in discharging the duties of his office, and in traversing the different Alpine ranges near Geneva. He even extended his excursions on one side as far as the banks of the Rhine, and on the other to Piedmont. At the same time he undertook a journey to Auvergne, to examine there the extinguished volcanoes, and another to Paris, England, and Holland. After that he visited Italy and Sicily. In 1779 he published the first volume of his *Travels through the Alps*; which contains a minute description of the environs of Geneva, and an excursion as far as Chamouni, a village at the bottom of Mont Blanc. Amidst his numerous excursions through the Alps, and at the time of the political troubles of Geneva in 1782, he made his experiments on hygrometry, which he published in 1783, under the title of *Essays on Hygrometry*. In 1786 De Saussure resigned the professor's chair, which he had filled for about twenty-five years, to his pupil and fellow-laborer Pictet. The second volume of his *Travels* was published in 1786. It contains a description of the Alps around Mont Blanc, and also some interesting experiments on electricity, and a description of his electrometer. Some years after the publication of the second volume of his *Travels*, he was admitted as a foreign associate of the Academy of Sciences of Paris. De Saussure was the founder of the Genevese Society of Arts, over which he presided till the last moment of his life; and one of his fondest wishes was the preservation of this useful establishment. By his fatiguing labors in the council of Five Hundred, of which he was a member, and afterwards in the National assembly, his health, however began to be deranged, and in 1794 he was almost deprived of the use of his limbs by a stroke of the palsy. But his mind still preserved its activity; and after that accident he revised the

two last volumes of his *Travels*, which appeared in 1796. They contain an account of his excursions to the mountains of Piedmont and Switzerland, and in particular of his journey to the summit of Mont Blanc. It was also during his illness that he directed the experiments made on the height of the bed of the Arve, and that he published *Observations on the Fusibility of Stones by the Blow-pipe*, which were inserted in the *Journal de Physique*. Having gone for the sake of his health to the baths of Plombiers, he still observed the mountains at a distance, and caused to be brought to him specimens of the strata which he perceived in the steepest rocks. He had announced that he would conclude his travels with some ideas on the primitive state of the earth; but the more he acquired new facts, and the more he meditated on the subject, the more uncertain did his opinions become in regard to those grand revolutions which preceded the present epoch. Though the state of his health began gradually to become worse, the French government appointed him professor of philosophy at the Special School of Paris; but his strength was exhausted. On the 22d of March, 1799, he terminated his brilliant career at the age of fifty-nine. Saussure was not only the author of many *Essays and Papers*, relating to natural history, but displayed his ingenuity by the construction of a thermometer for measuring the temperature of water at various depths, of a hygrometer, to determine the quantity of aqueous vapor in the air, of a eudiometer to ascertain the purity of the atmosphere, of an electrometer, an anemometer, and other philosophical instruments. He had a most extensive correspondence with men of science.

SAVU, an island in the eastern seas, described by Cook as twenty miles in length; in the middle are hills of a considerable height. It is represented both by captain Cook and by M. Labillardiere as presenting an enchanting prospect from the sea. 'The principal trees of this island,' says our great navigator, 'are the fan-palm, the cocoa-nut, tamarind, limes, oranges, and mangoes; and other vegetable productions are maize, Guinea-corn, rice, millet, calavances, and water-melons. We saw also one sugar-cane, and a few kinds of European garden stuff, particularly celery, marjoram, fennel, and garlic. For the supply of luxury, it has betel, areca, tobacco, cotton, indigo, and a small quantity of cinnamon, which seems to be planted here only for curiosity. There are, however, several kinds of fruit besides those which have been already mentioned. The tame animals are buffaloes, sheep, goats, hogs, fowls, pigeons, horses, asses, dogs, and cats; and of all these there is great plenty. The sheep are of the kind which in England are called Bengal sheep, and differ from ours in many particulars. The fowls are chiefly of the game breed, and large, but the eggs are remarkably small. Of the fish which the sea produces here we know but little: turtles are sometimes found upon the coast, and are by these people, as well as all others, considered as a dainty. The people are rather under than above the middling size; the women especially are remarkably short, and squat built; their complexion is a dark brown,

and their hair universally black and lank. The men are in general well made, vigorous, and active, and have a greater variety in the make and disposition of their features than usual; the countenances of the women are, on the contrary, all alike. The men fasten their hair up to the top of their heads with a comb; the women tie it behind in a club, which is very far from becoming. Both sexes eradicate the hair from under the arm, and the men do the same with their beards, for which purpose the better sort always carry a pair of silver pincers, hanging by a string round their necks; some, however, suffer a very little hair to remain upon their upper lips; but this is always kept short. The dress of both sexes consists of cotton cloth, which being dyed blue in the yarn, and not uniformly of the same shade, is in clouds or waves of that color, and even in our eye had not an inelegant appearance. This cloth they manufacture themselves; and two pieces, each about two yards long and a yard and a half wide, make a dress. Almost all the men had their names traced upon their arms in indelible characters of a black color; and the women had a square ornament of flourished lines impressed in the same manner, just under the bend of the elbow. The houses of Savu are all built upon the same plan, and differ only in size, being large in proportion to the rank and riches of the proprietor. Some are 400 feet long, and some are not more than twenty; they are all raised upon posts or piles about four feet high. When the natives of this island were first formed into a civil society is not certainly known, but at present it is divided into five principalities or nigrees: Laai, Seba, Regecua, Timo, and Massara, each of which is governed by its respective rajah or king. The religion of these people, according to Mr. Lange's information, is an absurd kind of Paganism, every man choosing his own god, and determining for himself how he should be worshipped, so that there are almost as many gods and modes of worship as there are people. In their morals, however, they are said to be irreproachable.' Long. 122° 30' E., lat. 10° 35' S.

SAUVAGES (Francis Boissier), de, an eminent French physician, born in 1706. His abilities procured him the professorships of medicine and botany in the university of Montpellier. His works are very numerous. The principal are, 1. *Theoria Febris*, 1738, 12mo.: 2. *Nosologia Methodica*; 5 vols. 8vo. 1763: 3. *Physiologiae Mechanicae Elementa*; 1755, 12mo.

SAUVAGESIA, in botany, a genus of the monogynia order, and pentandria class of plants: cor. pentapetalous and fringed: cal. pentaphyllous; the nectarium the same, having its leaves placed alternately with the petals: caps. unilocular. Species one; a West Indian plant.

SAW, *n. s.* Sax. *raga*; Belg. *saeghe*; Goth. *saga*. A saying; maxim; proverb.

Good king, that must approve the common saw:
Thou out of Heaven's benediction comest
To the warm sun! *Shakspeare. King Lear.*

His weapons, holy saws of sacret writ *Shakspeare.*

Strict age and sour severity,

With their grave saws in slumber lie. *Milton.*

SAW, *n. s. & v. a.* } Sax. *raga*, or *rige*, of
 SAWDUST, *n. s.* } Goth. *sega*, to cut; Fr. *scie*.
 SAW-PIT, } A dentated instrument
 SAW-WREST, } which cuts by attrition:
 SAWYER. } to use such an instrument:
 saw-dust is the dust it makes: saw-pit, a pit for the sawing of timber: saw-wrest an instrument used in sharpening saws: sawyer, a man whose trade is to saw timber.

They were stoned, they were *sawn* asunder.

Hebrews.

A carpenter after he hath *sawn* down a tree, and wrought it handsomely, sets it in a wall.

Wisd. xiii. 11.

Let them from forth a *sawpit* rush at once
 With some diffused ongez.

Shakspeare.

The roach is a leather mouthed fish, and has *saw*-like teeth in his throat.

Walton's Angler.

It is an incalcegency, from a swift motion, such as that of running, threshing, or *sawing*.

Ray on the Creation.

Then *saws* were toothed, and sounding axes made.

Dryden.

Rotten *sawdust*, mixed with earth, enriches it very much.

Mortimer's Husbandry.

They colour it by laying it in a *sawpit* that hath oak *sawdust* therein.

Id.

With the *saw-wrest* they set the teeth of the *saw*; that is, they put one of the notches of the wrest between the first two teeth on the blade of the *saw*, and then turn the handle horizontally a little about upon the notch towards the end of the *saw*; and that at once turns the first tooth somewhat towards you, and the second tooth from you.

Mozon's Mechanical Exercise.

The pit-saw is used by joiners, when what they have to do may be as soon done at home as send it to the *sawyers*.

Id.

If I cut my finger, I shall as certainly feel pain as if my soul was co-extended with the limb, and had a piece of it *sawn* through.

Collier.

If the membrane be fouled by the *sawdust* of the bone, wipe it off with a sponge.

Wiseman.

If they cannot cut,

His *saws* are toothless, and his hatchets lead.

Pope.

SAWING. This is practically regarded as a distinct business from the trades, in which the saw is not only a very useful, but necessary implement, such as those of the carpenter, cabinet-maker, cooper, &c. The saw is an instrument which serves to cut into pieces several solid matters; as wood, stone, ivory, &c. The best saws are of tempered steel, ground bright and smooth; those of iron are only hammer-hardened; hence the first, besides their being stiffer, are likewise found smoother. They are known to be well hammered by the stiff bending of the blade; and to be well and evenly ground by their bending equally in a bow. The edge in which are the teeth is always thicker than the back, because the back is to follow the edge. The teeth are cut and sharpened with a triangular file, the blade of the saw being first fixed in a whetting-block. After they have been filed, the teeth are set, that is, turned out of the right line, that they may make the kerf or fissure the wider, that the back may follow the better. The teeth are always set ranker for coarse cheap stuff than for hard and fine, because the ranker the teeth are set the more stuff is lost in the kerf. The saws by which marble and other stones are cut have

no teeth: these are generally very large, and are stretched out and held even by a frame. The lapidaries, too, have their saw, as well as the workmen in mosaic; but of all mechanics none have so many saws as the joiners; the chief are, 1. The pit-saw, which is a large two-handed saw, used to saw timber in pits; this is chiefly used by the sawyers. 2. The whip-saw, which is also two-handed, used in sawing such large pieces of stuff as the hand-saw will not easily reach. 3. The hand-saw, which is made for a single man's use, of which there are various kinds; as the bow, or frame saw, which is furnished with cheeks: by the twisted cords which pass from the upper parts of these cheeks, and the tongue in the middle of them, the upper ends are drawn closer together, and the lower set further apart. 4. The tennon saw, which, being very thin, has a back to keep it from bending. 5. The compass saw, which is very small, and its teeth usually not set; its use is to cut a round, or any other compass kerf: hence the edge is made broad, and the back thin, that it may have a compass to turn in.

The surgeons use a saw to cut off bones: this should be very small and light, in order to be managed with the greater ease and freedom, the blade exceedingly fine, and the teeth exquisitely sharpened, to make its way more gently, and yet with great expedition.

Saws are now generally used by butchers in separating the bones of the meat: the divisions by the saw are neater than those by the chopper, and there is a certain saving, as the chopper splinters bones, the parts of which cannot be included in the weight.

The *pit-saw* is that which is chiefly used in the employment properly denominated sawing. The teeth are set rank for coarse work, so as to make a fissure of about a quarter of an inch. To perform the work, the timber is laid on a frame over an oblong pit, called the saw-pit; and it is cut by means of a long saw fastened in a frame, which is worked up and down by two men, the one standing on the wood to be cut, and the other in the pit. As they proceed in their work they drive wedges, at proper distances from the saw, to keep the fissure open, which enables the saw to move with freedom. This, though a profitable, is a very laborious employment, and hence have been introduced saw-mills, which, in different countries, are worked by different means, as by men, by horses, by water, by wind, or by steam.

A *saw-mill*, worked by men, consists of several parallel saws, which are made to rise and fall perpendicularly by means of mechanical motion. In this case a very few hands are necessary to carry on the operation, to push forward the pieces of timber, which are either laid on rollers, or suspended by ropes, in proportion as the sawing advances. We shall, however, give a more detailed account of the saw-mills as used in various parts of the world. The history of the invention of sawing is curious, and may be inserted.

In early periods of society the trunks of trees were split with wedges, into as many, and as thin pieces as possible; and if it was necessary

to have them still thinner they were hewn, by some sharp instrument, on both sides, to the proper size. This simple but wasteful manner of making boards has been still continued in some places, to the present time. Peter the Great, of Russia, endeavoured to put a stop to it, by forbidding hewn deals to be transported on the river Neva. The wood-splitters perform their work more expeditiously than sawyers, and split timber is much stronger than that which has been sawn; for the fissure follows the grain of the wood, and leaves it whole; whereas the saw, which proceeds in the line chalked out for it, divides the fibres, and by these means lessens its cohesion and strength. Split timber, indeed, turns out often crooked and warped; but, in many purposes to which it is applied, this is by no means prejudicial; and the fault may sometimes be amended. As the fibres, however, retain their natural strength and direction, thin boards particularly can be bent much better. This is a great advantage in making pipe-staves, and in forming various implements of the like kind.

Our common saw, which needs only to be guided by the hand of the workman, however simple it may be, was not known to the inhabitants of America when they were subdued by the Europeans. The inventor of this instrument has, by the Greeks, been inserted in their mythology, with a place among those whom they have honored as the greatest benefactors of the earliest ages. By some he is called Talus, and by others Perdix. Pliny ascribes the invention to Dædalus, but Hardouin, in the passage where he does so, reads Talus rather than Dædalus. Diodorus Siculus, Apollodorus, and others, name the inventor Talus. He was the son of Dædalus's sister; and was, by his mother, placed under the tuition of her brother, to be instructed in his art. Having, it is said, once found the jaw-bone of a snake, he employed it to cut through a small piece of wood; and, by these means, was induced to form a like instrument of iron, that is, a saw. This invention, which greatly facilitates labor, excited the envy of his master, and instigated him to put Talus to death privately. We are told that, being asked, when he was burying the body, what he was depositing in the earth, he replied, 'A serpent.' This suspicious answer discovered the murder; and thus, adds the historian, a snake was the cause of the invention, of the murder, and of its being found out.

The saws of the Grecian carpenters had the same form, and were made in the like ingenious manner as ours are at present. This is fully shown by a painting still preserved among the antiquities of Herculaneum. Two genii are represented at the end of a bench, which consists of a long table that rests upon two four-footed stools. The piece of wood which is to be sawn through is secured by cramps. The saw with which the genii are at work has a perfect resemblance to our frame saw. It consists of a square frame, having in the middle a blade, the teeth of which stand perpendicularly to the plane of the frame. The piece of wood which is to be sawn extends beyond the end of the bench, and one of the workmen appears standing, and the other sitting

on the ground. The arms, in which the blade is fastened, have the same form as that given to them at present. In the bench are seen holes, in which the cramps that hold the timber are struck, and the ends of them reach below the boards that form the top of it.

The most beneficial and ingenious improvement of this instrument was, without doubt, the invention of saw-mills; which are now generally driven either by steam, by water, or by the wind. Mills of the first kind were erected so early as the fourth century, in Germany, on the small river Roer, or Raer, for though Ausonius speaks of water-mills for cutting stone, and not timber, it cannot be doubted that these were invented later than mills for cutting out deals, or that both kinds were erected at the same time. Pliny conjectures that the mill for cutting stone was invented in Caria; at least he knew no building incrustated with marble of greater antiquity than the palace of king Mausolus, at Halicarnassus. This edifice is celebrated by Vitruvius for the beauty of its marble; and Pliny gives an account of the kinds of sand used for cutting it; for it is the sand, he says, and not the saw, which produces that effect. The latter presses down the former, and rubs it against the marble; and the coarser the sand is, the longer will be the time required to polish the marble which has been cut by it. Notwithstanding these facts there is no account in any of the Greek or Roman writers of a mill for sawing wood; and, as the writers of modern times speak of saw-mills as new and uncommon, it would seem that the oldest construction of them has been lost, or that some important improvement has made them appear entirely new. Becher says that saw-mills were invented in the seventeenth century. In this he erred; for when settlers were conveyed to the island of Madeira, which was discovered in 1420, saw-mills were erected also, for the purpose of sawing into planks the various species of excellent timber with which the island abounded, and which were afterwards transported to Portugal. About the year 1427 the city of Breslau had a saw-mill, which produced a yearly rent of three marks; and in 1490 the magistrates of Erfurt purchased a forest, in which they caused a saw-mill to be erected, and they rented another mill in the neighbourhood besides. Norway, which is covered with forests, had the first saw-mill about the year 1530. This mode of manufacturing timber was called the new art; and, because the exportation of deals was by these means increased, that circumstance gave occasion to the deal-tithe, introduced by Christian III. in the year 1545. Soon after the celebrated Henry Canzau caused the first mill of this kind to be built in Holstein. In 1552 there was a saw-mill at Joachimsthal, which, as we are told, belonged to Jacob Geusen, mathematician. In the year 1555 the bishop of Ely, ambassador from Mary queen of England to the court of Rome, having seen a saw-mill in the neighbourhood of Lyons, the writer of his travels thought it worthy of a particular description. In the sixteenth century, however, there were mills with different saw-blades, by which a plank could be cut into several deals at the same time. The first saw-mill was erected in Holland

at Saardam, in the year 1596; and the invention of it is ascribed to Cornelius Cornelissen. Perhaps he was the first person who built a saw-mill at that place, which is a village of great trade, and has still a great many saw-mills, though the number of them is becoming daily less; for within the last thirty years 100 have been given up. The first mill of this kind in Sweden was erected in the year 1653. At present that kingdom possesses the largest perhaps ever constructed in Europe, where a water-wheel, twelve feet broad, drives at the same time seventy-two saws.

In England saw-mills had at first the same fate that printing had in Turkey, the ribbon-loom in the dominions of the church, and the crane in Strasburg. When attempts were made to introduce them they were violently opposed, because it was apprehended that the sawyers would be deprived by them of their means of getting a subsistence. For this reason it was found necessary to abandon a saw-mill erected by a Dutchman near London, in 1663; and in the year 1700, when one Houghton laid before the nation the advantages of such a mill, he expressed his apprehension that it might excite the rage of the populace. What he dreaded was actually the case in 1767 or 1768, when an opulent timber-merchant, by the desire and approbation of the Society of Arts, caused a saw-mill, driven by wind, to be erected at Limehouse, under the direction of James Haushield, who had learned, in Holland and Norway, the art of constructing and managing machines of that kind. A mob assembled and pulled the mill to pieces; but the damage was made good by the nation, and some of the rioters were punished. A new mill was afterwards erected, which was suffered to work without any molestation, and which gave occasion to the erection of others. It appears, however, that this was not the only mill of the kind then in Britain; for one driven also by wind had been built at Leith, in Scotland, some years before.

Saw-mills, as they are now constructed, are of two kinds, according as the saws employed affect their operation by a circular or by a reciprocating motion. Circular saw-mills are the most simple in their construction. At a manufactory for hollow masts, on the Surrey side of Westminster bridge, are several of them. In one of the simplest, a wheel is turned by a horse, which gives motion to a pinion on a horizontal shaft; a spur-wheel is fixed on the shaft, and turns a pinion on another horizontal shaft, on which a wheel is fixed in the room above the machine, and the bearings for the gudgeons of the shaft are supported on the joists of the floor: by means of an endless strap passing round this wheel, and round a pulley on the spindle of the circular saw, a rapid motion is given to the saw: it is fixed on a spindle by a shoulder, against which it is held by another moveable shoulder pressed tight by its nut, on the end of the spindle which is tapped into a screw to receive it. The saw has a circular hole through the middle fitting tight upon the spindle, so as to cause them to turn together. The ends of the spindle are pointed, and that point nearest the saw works in

a hole made in the end of a screw, screwed in a bench of stout planks, and well braced together; the other turns in a similar screw passed through a cross beam mortised between two vertical beams extending from the floor to the ceiling: one of the beams can be raised or lowered in its mortises by wedges put both above and below its tenons. In order to adjust the plane of the saw to the plane of the bench, there is a long parallel ruler, which can be set at any distance from the saw, and fixed by means of screws going through circular grooves cut through the bench. In using the machine, the ruler is to be set the proper distance from the saw of the piece of wood to be cut, and as the saw turns round, a workman slides the end of a piece of wood to it, keeping its edge against the guide or ruler, that it may cut straight. We have witnessed the operation, which is as neat as it is expeditious and ingenious. When the saw requires sharpening, one of the screws at the end of its spindle must be turned back: the spindle and saw can be then removed, and may be fixed in a common vice to whet it, in the same manner as a common saw; the outsides of the teeth are not filed to leave a surface perpendicular to the plane of the saw, but inclined to it, and in the same direction that each tooth so filed is bent in the setting; by this means, the saw, when cutting, first takes away the wood at the two sides of the kerf, leaving a ridge in the middle of it, the use of which is to keep the saw steady in a right line, that it may not have a tendency to get out of the straight line in any place where the wood is harder at one side than on the other. The most important machinery of this kind that we have seen is, unquestionably, at Portsmouth, for the manufacturing of ships' blocks.

The great cross-cutting saw may be thus described.—The tree subjected to the action of this machine is placed on a long frame or bench raised a little from the floor, and at the end of it is erected a frame, composed of vertical posts and cross timber, in the manner of a small and low door-way; through this frame the end of the tree is drawn by the capstan above-mentioned its end projecting as much from the surface of the frame as is intended to be cut off; and it is fastened in the frame from rolling sideways, by a lever, which can be readily made to press upon it and hold it down. The saw itself is a straight blade, fixed into a wooden handle or pole at each end, to lengthen it; one of these handles is connected by a joint to the upper end of a lever, bent like an L, and having its centre beneath the floor: the horizontal arm of the lever is connected by a spear-rod, with a crank on the end of a spindle near the ceiling of the room, the motion of which is regulated by a fly-wheel. By this means the saw has a reciprocating motion from right to left, nearly in a horizontal position, and exactly across the log it is to cut off, imitating in its motion the carpenter's hand-saw, considering his arm as the arm of the bent or L lever. The teeth of the saw are of course on the lower side of the blade, and are sloped so as to cut in drawing towards the lever. It rises and falls freely upon its joint at the end of the lever, and can be lifted up by the handle, at the opposite

end of the blade, to take it off its work, which it follows up by its own weight. The machine being at rest is prepared for work, by fixing the log in the frame as before mentioned, so that the surface of the frame intersects the log at the place where it is intended to be cross-cut. The saw, which was before lifted up by its handle, to be clear above the log, is now suffered to rest upon it, in the place where the cut is to be made; and, to guide it at first setting in, the back of the saw is received in a saw kerf, made in the end of a piece of board, which is attached to the frame over the saw, but slides up and down in a groove to reach the saw at any height, according to the thickness of the log lying beneath it. Being thus prepared, the machine is put in action by a rope or strap which turns the fly-wheel and its crank. This, giving a vibration to the bent or L lever, causes the saw to reciprocate horizontally across the tree, until it cuts it through: it follows up its cut by its own weight alone, but the attendant can at any time lift up the saw from its work, though its motion continues, by means of a rope which suspends the handle of the saw, when required. As the saw gets into the tree it quits the guide above-mentioned, which becomes the less necessary as the saw goes deeper; a saw having no tendency to alter its first course, when cutting across the grain of the wood. We admire the simplicity of this machine, which nevertheless executes its work with much accuracy and expedition. It might be very usefully employed in many situations where great manual labor is spent in cross-cutting large logs of timber.

The cross-cutting circular saw.—This machine is for similar purposes, and stands close by the former. It is a circular saw, whose spindle is so mounted as to move in any direction parallel to itself; the saw all the while continuing in the same plane, and revolving rapidly upon its axis, cuts the wood it is presented to, and as it admits of being applied at first on one side, and then on another side of the tree, a saw of moderate dimensions will be sufficient to divide larger trees than could otherwise be done by it.

The great reciprocating saw for cutting up trees lengthwise.—In this machine the saw works vertically: it has an horizontal carriage, on which the timber is fastened; this passes through a vertical frame with grooves, in which another frame slides up and down in the manner of a window-sash, and has the saw stretched in it. The saw-frame is moved up and down by means of a crank on an axis beneath the floor, which is turned by means of an endless rope. At every time the saw rises and falls, it turns a ratchet-wheel round, by means of a click, a few teeth; and this has on its axis a pinion, working a rack attached to the carriage of the tree, which by this means is advanced: at every stroke, the saw makes a proper quantity for another cut. The saw-frame is adapted to hold several saws parallel to each other, for sawing a tree into several boards at once, when required.

Saw-mills, for cutting blocks of stone, are moved horizontally. When a completely cylindrical pillar is to be cut out of one block of stone, the first thing will be to ascertain in the

block the position of the axis of the cylinder: then lay the block so that such axis shall be parallel to the horizon, and let a cylindrical hole of from one to two inches diameter be bored entirely through it. Let an iron bar, whose diameter is rather less than that of this tube, be put through it, having just room to slide freely to and fro as occasion may require. Each end of this bar should terminate in a screw, on which a nut and frame may be fastened. The nut-frame should carry three flat pieces of wood or iron, each having a slit running along its middle nearly from one end to the other, and a screw and handle must be adapted to each slit; by these means the frame-work at each end of the bar may readily be so adjusted as to form equal isosceles or equilateral triangles; the iron bar will connect two corresponding angles of these triangles, the saw to be used two other corresponding angles, and another bar of iron, or of wood, the two remaining angles, to give sufficient strength to the whole frame. This construction, it is obvious, will enable the workmen to place the saw at any proposed distance from the hole drilled through the middle of the block; and then, by giving the alternating motion to the saw-frame, the cylinder may at length be cut from the block, as required. This method was first pointed out in the collection of machines approved by the Paris academy. If it were proposed to saw a conic frustum from such a block, then let two frames of wood or iron be fixed to those parallel ends of the block which are intended to coincide with the bases of the frustum, circular grooves being previously cut in these frames to correspond with the circumferences of the two ends of the proposed frustum; the saw being worked in these grooves will manifestly cut the conic surface from the block. This is the contrivance of Sir George Wright.

The best method of drilling the hole through the middle of the proposed cylinder seems to be this:—On a carriage, running upon four low wheels, let two vertical pieces (each having a hole just large enough to admit the borer to play freely) be fixed two or three feet asunder, and so contrived that the pieces and holes to receive the borer may, by screws, &c., be raised or lowered at pleasure, while the borer is prevented from sliding to and fro by shoulders upon its bar, which are larger than the holes in the vertical pieces, and which, as the borer revolves, press against those pieces. Let a part of the boring-bar between the two vertical pieces be square, and a grooved wheel with a square hole of a suitable size be placed upon this part of the bar; then the rotatory motion may be given to the bar by an endless band, which shall pass over this grooved wheel and a wheel of a much larger diameter in the same plane, the latter wheel being turned by a winch handle in the usual way. As the boring proceeds, the carriage with the borer may be brought nearer the block, by levers and weights, in the same manner as in pipe-making.

SAXE (Maurice, count), was born in 1696. He was the natural son of Frederick Augustus II., elector of Saxony, and king of Poland, and of the countess of Königsmarc, a Swedish lady,

celebrated for her wit and beauty. He was educated with Frederick Augustus, the electoral prince, afterwards king of Poland. He served his first campaign in the army commanded by prince Eugene and the duke of Marlborough, when only twelve years old. He signalised himself at the sieges of Tournay and Mons, and particularly at the battle of Malplaquet. During the campaign of 1710 prince Eugene and the duke of Marlborough paid many public encomiums to his merit. Next year the young count accompanied the king of Poland to the siege of Stralsund, the strongest place in Pomerania, and displayed the greatest intrepidity. He swam across the river in sight of the enemy, with a pistol in his hand. His valor shone no less conspicuously on the bloody day of Gaedelbusck, where he commanded a regiment of cavalry. He had a horse killed under him, after he had three times rallied his regiment, and led them on to the charge. Soon after that campaign, his mother prevailed on him to marry the countess of Lubin, a lady both rich and beautiful. This union lasted but a short time. In 1721 the count procured a dissolution of the marriage; a step of which he afterwards repented. In 1717 he went to Hungary, where the emperor had an army of 15,000 men under prince Eugene. Young count Saxe was present at the siege of Belgrade, and at a battle which the prince gained over the Turks. On his return to Poland, in 1718, he was made a knight of the golden eagle. The wars in Europe being concluded by the treaties of Utrecht and Passarowitz, count Saxe went to France. He spent his time during the peace, in studying mathematics, fortification, and mechanics. At sixteen he invented a new exercise, which was taught in Saxony with the greatest success. Having obtained a regiment in France, in 1722, he formed it according to his new plan. In 1726 the states of Courland chose him for their sovereign. But both Poland and Russia rose in arms to oppose him. The czarina wished to bestow the duchy on prince Menzikoff. Menzikoff sent 800 Russians to the new chosen duke in his palace. Count Saxe, who had only sixty men, defended himself with astonishing intrepidity. The siege was raised, and the Russians obliged to retreat. Soon after he retired to Usmatz, and prepared to defend his people against the two hostile nations. Here he remained with only 300 men, till the Russian general approached at the head of 4000 to force his retreat. That general invited the count to a conference, during which he intended to surprise him, and take him prisoner. The count, informed of the plot, avoided the conference. About this time he wrote to France for men and money. Madame le Couvreur, a famous actress, pawned her jewels and plate, and sent him 40,000 livres. The count, unable to defend himself against Russia and Poland, was obliged in 1729 to leave his new dominions and retire into France. Count Saxe, thus stript of his territories, devoted himself to the study of mathematics. He composed also, in thirteen nights, and during the intervals of an ague, his *Reveries*, which he corrected afterwards. The death of the king of Poland his father, in 1733, kindled

a new war in Europe. His brother, the elector of Saxony, offered him the command of all his forces, but he preferred the French service, and repaired to the duke of Berwick, who was encamped on the Rhine. The count, at the head of a regiment of grenadiers, forced the enemy's lines, and by his bravery decided the victory. He behaved at the siege of Philipsburg with no less intrepidity. For these services he was, in 1734, rewarded with the rank of lieutenant-general. Peace was concluded in 1736; but the death of the emperor Charles VI. kindled a new war. Prague was besieged by the count in 1741, near the end of November, and taken by assault. The conquest of Egra followed a few days after: and Charles VII. wrote a congratulatory letter to Saxe with his own hand. In 1744 he was made marshal of France, and commanded a part of the French army in Flanders. During that campaign he displayed the greatest military conduct. Though the enemy was superior in number, he watched their motions so skilfully that they could do nothing. In January 1745 an alliance was concluded at Warsovia, between the queen of Hungary, the king of England, and the states of Holland. He went soon after, though exceedingly ill, to take the command of the French army in the Low Countries. When the battle of Fontenoy was fought, M. Saxe was at the point of death, yet he caused himself to be put into a litter, and carried round all the posts. During the action he mounted on horseback, though very weak. The victory of Fontenoy, owing entirely to his vigilance and capacity, was followed by the reduction of Tournay, Bruges, Ghent, Oudenarde, Ostend, Ath, and Brussels: this last city was taken on the 28th of February 1746; and very soon after the king sent to the marshal a letter of naturalisation in the most flattering terms. The succeeding campaigns gained him additional honors. After the victory of Raucoux, which he gained on the 11th of October 1746, the king of France made him a present of six pieces of cannon. He was, on the 12th of January 1747, created marshal of all the French armies, and, in 1748, commander-general of all those parts of the Netherlands which he had conquered. Holland now began to tremble for her safety. Maestricht and Bergen op Zoom had already fallen, and nothing but misfortunes seemed to attend the further prosecution of the war. The states general therefore offered terms of peace, which were accepted, and a treaty concluded on the 18th of October 1748. M. Saxe retired to Chambord, a country seat which the king of France had given him. Some time after he went to Berlin, and, on his return to France, he spent his time among men of learning, artists, and philosophers. He died of a fever, on the 30th of November 1750, aged fifty-four. His life had been, he said, an excellent dream. He was remarkably careful of the lives of his men. One day a general officer was pointing out to him a post which would have been of great use. It will only cost you, says he, a dozen grenadiers. That would do very well, replied the marshal, were it only a dozen lieutenant-generals. He had been educated and died in the Lutheran religion. His heart was put into a silver gilt box,

and Louis XV. was at the charge of his funeral. His corpse was interred with great splendor in the Lutheran church of St. Thomas, at Strasburg, on the 8th of February, 1751. The best edition of his *Reveries* was printed at Paris 1757, in 2 vols. 4to. It was compared with the original MS. in the king's library. It is accompanied with many designs exactly engraved, and a Life of the Author. M. d'Espagnac published the count's life, in 2 vols. 12mo.

SAXIFRAGA, saxifrage, in botany, a genus of the digynia order and decandria class of plants; natural order thirteenth, succulentæ: *cal.* quinquepartite: *cor.* pentapetalous: *caps.* birostrated, unilocular, and polyspermous. There are thirty-eight species; of which the most remarkable are these:—

1. *S. granulata*, or white saxifrage, which grows naturally in the meadows in many parts of England. The roots of this plant are like grains of corn, of a reddish color without; from which arise kidney-shaped hairy leaves, standing upon pretty long foot-stalks. The stalks are thick, a foot high, hairy, and furrowed; these branch out from the bottom, and have a few small leaves like those below, which sit close to the stalk: the flowers terminate the stalk, growing in small clusters; they have five white petals, enclosing ten stamina and the two styles. There is a variety of this with double flowers, which is very ornamental.

2. *S. oppositifolia* grows naturally on the Alps, Pyrenees, and Helvetian mountains: it is also found pretty plentifully growing upon Ingleborough Hill in Yorkshire, Snowdon in Wales, and some other places. It is a perennial plant, with stalks trailing upon the ground, and are seldom more than two inches long, garnished with small oval leaves standing opposite, which lie over one another like the scales of a fish: they are of a brown-green color, and have a resemblance of heath. The flowers are produced at the end of the branches, of a deep blue; and thus make a pretty appearance during their continuance, which is great part of March and the beginning of April.

3. *S. punctata*, London pride, grows naturally on the Alps, and also in great plenty on a mountain of Ireland called Mangerton in the county of Kerry. The roots of this are perennial; the leaves are oblong, oval, and placed circularly at bottom. They have broad, flat, furrowed foot-stalks, and are deeply crenated at their edges, which are white. The stalk rises a foot high, is of a purple color, stiff, slender, and hairy. It sends out from the side on the upper part several short foot-stalks, which are terminated by white flowers spotted with red.

4. *S. pyramidata*, mountain heath, with a pyramidal stalk, grows naturally on the mountains of Italy. The leaves are tongue-shaped, gathered into heads, rounded at their points, and have cartilaginous and sawed borders. The stalk rises two feet and a half high, branching out near the ground, forming a natural pyramid to the top. The flowers have five white wedge-shaped petals, and ten stamina, placed circularly the length of the tube, terminated by roundish purple summits. When these plants are strong,

they produce very large pyramids of flowers, which make a fine appearance. All these species are easily propagated by offsets, or by parting their roots.

SAXIFRAGE, *n. s.* } *Fr.* *saxifrage*; *Lat.* *SAXIFRAGOUS*, *adj.* } *saxum* and *frango*. A plant: dissolvent of the stone. See below.

Saxifrage, quasi *saxum* *frangere*, to break the stone, is applicable to any thing having this property; but it is a term most commonly given to a plant, from an opinion of its medicinal virtues to this effect.

Quincy.

Because goat's blood was found an excellent medicine for the stone, it might be conceived to be able to break a diamond; and so it came to be ordered that the goats should be fed on *saxifragous* herbs, and such as are conceived of power to break the stone.

Browne's Vulgar Errors.

SAXO GRAMMATICUS, descended from an illustrious Danish family, was born about the middle of the twelfth century. Stephen, in his edition of *Saxo Grammaticus*, printed at Soroc, asserts that he must have been alive in 1156, but cannot ascertain the exact place and time of his birth. On account of his learning, Saxo was distinguished by the name of Grammaticus. He was provost of the cathedral church of Roskild, and warmly patronised by the learned and warlike Absolon, the celebrated archbishop of Lunden, at whose instigation he wrote the History of Denmark. His epitaph, a dry panegyric in bad Latin verses, gives no account of the era of his death, which happened, according to Stephens, in 1204. His history, consisting of sixteen books, begins from the earliest accounts of the Danish annals, and concludes with the year 1186. The first part, which relates to the origin of the Danes, and their ancient kings, is full of fables; but the last eight books, and particularly those which regard the events of his own times, deserve the utmost credit. He wrote in Latin: the style, if we consider the barbarous age in which he flourished, is, in general, elegant. Mallet, in his *Histoire de Dannemarc*, vol. i. p. 182, says that Sperling, a writer of great erudition, has proved, in contradiction to the assertions of Stephens and others, that Saxo Grammaticus was secretary to Absolon; and that the Saxo, provost of Roskild, was another person, and lived earlier.

SAXONS, the natives of Saxony, ancient and modern. The ancient Saxons were a brave but fierce people. The Britons, or inhabitants of South Britain, being deserted by the Romans, about the middle of the fifth century, and threatened with utter extirpation by the Scots and Picts, invited the Saxons over from Germany to assist and defend them; in consequence of which a numerous body of them came over under Hengist and Horsa, A. D. 449 or 450; and, repeated emigrations of fresh adventurers successively arriving afterwards, they soon conquered and divided all South Britain, since called England, into seven kingdoms, commonly denominated the Saxon heptarchy. See *ENGLAND*. With regard to the history of the Saxons, previous to the fourth century, we have very few particulars. 'The Saxons,' says Mr. Whitaker, 'have been derived by our historians from very

different parts of the globe; India, the north of Asia, and the forests of Germany. And their appellation has been equally referred to very different causes; the name of their Indian progenitor, the plundering disposition of their Asiatic fathers, and the short hooked weapons of their warriors.' But the real origin of the Saxons, and the genuine derivation of their name, seem clearly to be these:—In the earlier period of the Gallic history, the Celtæ of Gaul crossed the Rhine in considerable numbers, and planted various colonies in the regions beyond it. Thus the Volcæ Tectosages settled on one side of the Hercynian forest and about the banks of the Neckar; the Helvetii upon another, and about the Rhine and Maine; the Boii beyond both; and the Senones in the heart of Germany. Thus also we see the Treviri, the Nervii, the Suevi, and the Marcomanni, the Quadi, the Venedi, and others in that country; all plainly betrayed to be Gallic nations by the Gallic appellations which they bear, and all together possessing the greatest part of it. And, even as late as the conclusion of the first century, we find one nation on the eastern side of this great continent actually speaking the language of Gaul, and another upon the northern using a dialect nearly related to the British. But as all the various tribes of the Germans are considered by Strabo to be γεισησται Γαλαται, or genuine Gauls in their origin; so those particularly, who lived immediately beyond the Rhine, and are asserted by Tacitus to be indubitably native Germans, are expressly denominated Γαλαται, or Gauls, by Diodorus, and as expressly declared by Dio to have been distinguished by the equivalent appellation of Celtæ from the earliest period. And the broad line of nations, which extended along the ocean, and reached to the borders of Scythia, was all known to the learned in the days of Diodorus by the same significant appellation of Γαλαται, or Gauls. Of these, the most noted were the Si-Cambri and Cimbri; the former being seated near the channel of the Rhine, and the latter inhabiting the peninsula of Jutland. The denominations of both declare their original, and show them to have been derived from the common stock of the Celtæ, and to be of the same Celtic kindred with the Cimbri of our own Somersetshire, and the Cymbri or Cambrians of our own Wales. The Cimbri are accordingly denominated Celtæ by Strabo and Appian: and they are equally asserted to be Gauls by Diodorus; to be the descendants of that nation which sacked the city of Rome, plundered the temple of Delphi, and subdued a great part of Europe and some of Asia. Immediately to the south of these were the Saxons, extending from the isthmus of the Chersonesus to the current of the Elbe; and they were equally Celtic in their origin as their neighbours. They were denominated Ambrones, as well as Saxons; and, as such, are included by Tacitus under the general appellation of Cimbri, and comprehended by Plutarch under the equal one of Celto-Scythæ. The name of Ambrones appears particularly to have been Gallic; being common to the Saxons beyond the Elbe, and the Ligurians in Cisalpine Gaul; as both found, to their surprise, on the irruption of the former into Italy with the Cimbri. And, what is

equally surprising, and has been equally unnoticed by the critics, the Welsh distinguish England by the name of Loegr or Liguria, even to the present moment. In that irruption, these Saxons, Ambrones, or Ligurians, composed a body of more than 30,000 men, and were principally concerned in cutting to pieces the large armies of Manlius and Cæpio. Nor is the appellation of Saxons less Celtic than the other. It was originally the same with the Belgic Suessones of Gaul; the capital of that tribe being now entitled Soissons by the French, and the name of the Saxons pronounced Saisén by the Welsh, Sason by the Scots, and Saisénach or Saxsenath by the Irish. And the Suessones or Saxones of Gaul derived their own appellation from the position of their metropolis on a river, the stream at Soissons being now denominated the Aisne, and formerly the Axon; Uess-on, or Axon, importing only waters, or a river, and S-uess-on or S-ax-on the waters of the river. The Suessones, therefore, are actually denominated the Uessones by Ptolemy; and the Saxones are actually entitled the Axones by Lucan. These, with their brethren and allies the Cimbri, having been more formidable enemies to the Romans by land than the Samnites, Carthaginians, Spaniards, Gauls, or Parthians, in the second century applied themselves to navigation, and became nearly as terrible by sea. They soon made themselves known to the inhabitants of the British isles by their piracies in the northern channels, and were denominated by them Lochlyn or Lochlynach; lued-lyn signifying the people of the wave, and the D being quiescent in the pronunciation. They took possession of the Orkney Islands, which were then merely large shoals of land, uncovered with woods, and overgrown with rushes; and they landed in the north of Ireland, and ravaged the country. Before the middle of the third century they made a second descent upon the latter, disembarked a considerable body of men, and designed the absolute subjection of the island. Before the conclusion of it, they carried their naval operations to the south, infested the British Channel with their little vessels, and made frequent descents upon the coasts. And in the fourth and fifth centuries, acting in conjunction with the Picts of Caledonia and the Scots of Ireland, they ravaged all the east and south-east shores of Britain, began the formal conquest of the country, and finally settled their victorious soldiery in Lancashire.

The division of *Germany* into circles took place towards the close of the fifteenth century, when the large tract of country known vaguely by the name of Saxony, was formed into three circles, Westphalia, Upper Saxony, and Lower Saxony. Upper might with more propriety have been styled Eastern Saxony, being bounded by Poland, Silesia, and Lusatia on the east, and by Bohemia and Franconia on the south. Its extent was about 43,000 square miles; its population about 4,000,000. It comprised the electorates of Saxony and Brandenburg, the duchy of Pomerania, and a number of small principalities. The name of Upper is to be understood as implying a surface of such comparative elevation as to cause several rivers (the Elbe, Spree, and

others) to flow to the westward towards Lower Saxony. That country, which might have been termed Western Saxony, had Westphalia and the Rhine to the west, and Sleswick with the Baltic to the north. Its area contained 26,000 square miles, and comprised the electorate of Hanover, the duchies of Mecklenburg, Brunswick, and Holstein, the free towns of Hamburg, Bremen, Lubeck, with a number of small states. In 1806 the distinction of circles was finally abolished, and the names of Upper and Lower Saxony are now of use only in history.

SAXONY, a modern kingdom of Europe, is situated towards the north-east of Germany, and bounded on the south by Bohemia, and on the north by the Prussian states. Previous to 1814 it contained 2,000,000 of inhabitants (exclusive of the part of Poland subject to this crown); but it was reduced by the congress of Vienna. At present its divisions, extent and population, are,

	Square miles.	Population.
Circle of Meissen	1600	300,000
Leipsic	1460	207,000
Erzgebirge	2175	460,000
Vogtland	700	90,000
Part of Merseburg	73	10,000
Upper Lusatia	1180	170,000
Total	7188	1,237,000

The length of Saxony is 140 miles, its greatest breadth about seventy-five.

No part of Europe in the same latitude enjoys a milder climate. Towards the north-east of the frontier line, and in a quarter where the lofty range of the Erzgebirge is succeeded by a lower, called the Wohlische Kanin, the Elbe issues from Bohemia. The other considerable rivers are the two Elsters, the two Muldas, and the Queiss, all rising in the south of Saxony, and flowing northward, but not navigable here. The Elbe, on the other hand, is navigable, and, by its course through the centre of the country, affords a noble conveyance for merchandise. The mountainous districts in the south contain extensive forests, which are kept up with care as the supply of fuel for the mines. Coal and turf are used for domestic fuel. In the southern and mountainous parts the valleys only are well cultivated; but in the level districts, particularly the circles of Meissen and Leipsic, the products are wheat, barley, oats, and other grain, tobacco and hops. Vines are found in a few situations.

The number of sheep is large, and great care has been bestowed on the Merino rams, first imported about the year 1768; the Saxon wool, indeed, has been rendered, by good management, the best in Germany. Hogs are also numerous.

Few countries equal Saxony in mineral riches. The rocks of the Erzgebirge furnished Werner with the facts on which he founded a system of geology. The basis of the Erzgebirge is granite, covered by gneiss, mica, and clay slate in succession. Between these are strata, containing

metallic ores. The rocks, called in this country weiss-stein (white-rock), contain a variety of heterogeneous substances, such as feldspar, mica, garnet, and cyanite. Basalt is found in various parts, towering above the others in lofty polygonal columns. The topaz occurs frequently, and there are found also chrysolites, amethysts, chalcidones, cornelians, agates, jasper, garnets, and tourmalins; serpentine, asbest, amianthus, barrytes, and fluates of lime. The porcelain clay in the neighbourhood of Meissen is well known; here are also fullers'-earth, terra-sigillata, and other argillaceous minerals. There are also a few silver mines. The lofty primitive mountains abound in iron; the secondary in copper and lead. Next to these are arsenic, cobalt, antimony, manganese, zinc, sulphur, alum, vitriol, and borax.

The manufactures and trade are of great extent, and are somewhat similar to those of England. The weaving of linen is an employment of old date, and is carried on in almost every village of the kingdom, but more particularly in Upper Lusatia, at Zittau, Bautzen, and Herrnhut. Woollens are likewise manufactured extensively, and cotton spinning and weaving on a good scale. The machinery used in Saxony, though inferior to the English, has of late years been much improved; labor also is cheap. There are silk manufactures on a small scale at Leipsic and other towns. Tanneries are more general, and paper manufactories are not inconsiderable. Every town of consequence has its breweries and distilleries. The manufactures connected with the mines are of course of considerable extent. At Dresden there are foundries of cannon and balls. Cobalt is made into smalts and blue dye in several towns in the mining district; other places are noted for the manufacture of verdigris and green dye.

The exports from Saxony consist in wool and minerals; linen, yarn, woollens, and lace. The imports are silk, flax, cotton, coffee, sugar, wine, and in certain seasons corn. The most trading place is Leipsic, which is remarkable both for its half-yearly fairs, and for being the centre of the book trade.

Saxony reckons among its inhabitants a great majority of Lutherans, but the reigning family have been Catholics since 1697. The institutions for education in this country are numerous and well conducted, it being a common remark that in no country, except Scotland and the Pays de Vaud, are the lower classes so generally taught to read and write. In no country of equal extent is the number of printing and book establishments so great. Halle now belongs to Prussia, but Leipsic remains to Saxony, and maintains its reputation. The German character predominates among this people, as is evinced, among other things, by the minuteness with which they too often treat an insignificant subject; also in the more creditable points of the general modesty of their females.

The revenue of Saxony, after defraying all local expenses, probably exceeds £1,000,000 sterling, and Saxony has long been burdened with a national debt. The army, which in this country was never large in proportion to its po-

pulation, is on a peace establishment of 12,000 men, the best disciplined part of whom are cavalry and artillery.

After being, during many centuries, an electorate, Saxony was formed in 1806 into a kingdom, in consequence of the occupancy of Prussia by Buonaparte. This change of title was not accompanied by an extension of prerogative, the sovereign continuing to share the legislative functions with the states. The states are divided into two houses, viz. the prelates and nobles in one, and in the other the country gentry and deputies of the towns. The higher offices of administration are entrusted to a cabinet council, a board of finance, a military board, a high court of appeal for judicial questions, and an upper consistory for ecclesiastical. Each circle has a court of justice, and offices for the transaction of provincial business. The peasantry are here in the enjoyment of complete personal freedom.

The king, as a member of the Germanic confederation, has the fourth rank in the smaller, and four votes in the larger assembly.

Saxony remained neutral in the war of 1740 between Prussia and Austria. In that of 1756 she was tempted to take part by Austria; but, instead of an accession of territory, she saw her dominions ravaged and many of her subjects ruined. The peace of 1763 left her country loaded with an enormous debt. In the war of 1793 the contingent furnished by Saxony against France was not large, and no decided part was taken in the war, until 1806, when the elector sent all his troops to the support of the king of Prussia. The overthrow of that power enabled Buonaparte to attach the Saxons to his cause. The title of elector was changed to that of king. Prussian Poland was added to the Saxon dominions, and in 1809 was nearly doubled by cessions from Austria. But these acquisitions led to disastrous results. The Russians re-occupied Poland in the beginning of 1813, and, joined by the Prussians, made Saxony the scene of the great struggle against Buonaparte. Many of the people, however, flattered themselves that their attachment to the cause of Germany, evinced by the defection of their troops from the French army on the 18th October, would secure the integrity of the territory. The interval between the battle of Leipsic and the decision of the congress of Vienna (nearly eighteen months) was balanced between hope and fear, and cruel was the disappointment of the Saxons, on finding that the northern and eastern part, containing no less than 850,000 inhabitants, was to be transferred to Prussia. The king protested against this dismemberment; but, dreading bloodshed, he thought proper to acquiesce.

SAXONY, a province of the Prussian states, situated to the west of Brandenburg, and north of the kingdom of Saxony. It comprises almost the whole of the cessions made by the latter power at the congress of Vienna, the principalities to the north of the duchy of Anhalt, and to the west of the rivers Elbe and Havel; so that the whole now forms an area of 9830 square miles, with more than 1,000,000 of inhabitants. It is divided into the governments of Magdeburg, Merseburg, and Erfurt, and forms a

distinct military division; the chief town is Magdeburg.

This province is in general level, the only hills being part of the Harz, in the south-west corner, and a detached part of the Thuringian forest. The rest is varied only by insignificant elevations. The soil, however, varies, being in some places dry and sandy, and in others a heavy loam. No part of the Prussian states possesses a more fertile land and good husbandry. There are some large forests, but in the far greater part wood is scarce. The objects of cultivation are corn, hemp, flax, and chicory for making coffee. Pit coal and metals are found in the mountains of the Harz; porcelain clay in the level ground in the south; but the product hitherto most profitable is salt obtained from brine springs by evaporation. The richest of these springs is in the government of Merseburg, where it is often difficult to find pure water for drinking. The inhabitants are almost all Protestants, except in the little district called the Eichsfeld. Having enjoyed the benefits of an enlightened government, both under Prussia and Saxony, they are in general active and industrious. The commerce is insignificant.

SAY, *v. a., v. n. & n. s.* } Sax. *recgan*; Belg.

SAY'ING, *n. s.* } *seggan*; Teut. *sagen*.

To speak; utter in words; allege; repeat: to pronounce; utter; relate: as a noun-substantive, a speech, and (abridged from ASSAY) a sample; trial: saying is an expression; a word; a proverb.

And hise brithren *seiden* to him, *passe fro hennis*, and go into Judee, that also thi disciplis seen thi werkis that thou doist. *Wiclif Jon. 7.*

Speak unto Solomon; for he will not *say* thee nay. *1 Kings.*

He said moreover, I have somewhat to *say* unto thee; and she said, *Say* on. *Id.*

Say nothing to any man, but go thy way. *Mark.*

Moses fled at this *saying*, and was a stranger in Midian. *Acts.*

Then shall be *said* or sung as follows.

Common Prayer.

So good a *say* invites the eye,

A little downward to espy

The lively clusters of her breast. *Sidney.*

Say it out, Diggon, whatever it hight. *Spenser*

With flying speed, and seeming great pretence,
Came messenger with letters which his message *said*. *Faerie Queene.*

Some obscure precedence, that hath before been *sain*. *Shakspeare.*

Since thy outside looks so fair and warlike,
And that thy tongue some *say* of breeding breathes,
By rule of knighthood I disdain. *Id.*

I thank thee, Brutus,
That thou hast proved Lucilius's *saying* true. *Id.*

The council-table and star-chamber hold, as Thucydides *said* of the Athenians, for honourable that which pleased, and for just that which profited. *Clarendon.*

Many are the *sayings* of the wise,
Extolling patience as the truest fortitude. *Milton.*

Say first what cause
Moved our grand parents to fall off? *Id.*

King John succeeded his *said* brother in the kingdom of England and duchy of Normandy. *Hale.*

This gentleman having brought that earth to the publick *say* masters, and upon their being unable to

bring it to fusion, or make it fly away, he had procured a little of it, and with a peculiar flux separated a third part of pure gold. *Boyle.*

Others try to divert the troubles of other men by pretty and plausible *sayings*, such as this, that if evils are long, they are but light. *Tillotson.*

After all can be said against a thing, this will still be true, that many things possibly are which we know not of. *Id.*

The lion here has taken his right measures, that is to say, he has made a true judgment. *L'Estrange.*

We poetick folk, who must restrain Our measured *sayings* in an equal chain, Have troubles utterly unknown to those, Who let their fancy loose in rambling prose. *Prior.*

The sacred function can never be hurt by their *sayings*, if not first reproached by our doings. *Atterbury.*

And who more blest, who chained his country; say, Or he whose virtue sighed to lose a day? *Pope.*

He no sooner said out his *say*, but up rises a cunning snap. *Id.*

Say, Stella, feel you no content, Reflecting on a life well spent? *Swift.*

Of some propositions it may be difficult to say whether they affirm or deny; as when we say, Plato was no fool. *Watts.*

SAY (Samuel), an English dissenting minister, was born in 1675. After acting as chaplain and preacher in Andover and Yarmouth, he was settled at Lowestoft for eighteen years. He next became colleague to the Rev. Samuel Baxter, at Ipswich, for nine years, and at last, in 1734, succeeded the celebrated Dr. Edmund Calamy at Westminster; where he died April 12th, 1743, aged sixty-eight. A volume of his poems was published in 4to., 1743, with two essays in prose, On the Harmony, Variety, and Power of Numbers; which have been much admired. These were published for the benefit of his daughter. He wrote several other tracts.

SAY, in commerce, a kind of serge much used abroad for linings, and by the religious for shirts; with us it is used for aprons by several sorts of artificers, being usually dyed green.

SAYANSKIE, a chain of mountains in Siberia, forming a prolongation of the Altai, and a line of separation between Siberia and Chinese Tartary. They extend between the Upper Yenisei and the lake Baikal, and consist chiefly of naked rocks of a red granite. They are divided into two ranges, one of which, bordering on the Yenisei, derives its name from that river, the other from the city of Krasnoïarsk.

SAYPAN, one of the Ladrone Islands, about twenty miles in circumference. According to some it does not afford the same refreshments to ships that touch there as Tinian, though Anson, by whom it was visited, says that it presents an aspect not in any respect less agreeable. Voyagers in general agree in giving Tinian the preference to Saypan, both in regard to extent and beauty. Long. 145° 55' E., lat. 15° 13' N.

SBIRRI, from Ital. *shirri*, an archer, a name given to a class of armed police in Italy, resembling the French gens d'armes in every thing but their usefulness. They patrol with a large cocked hat, armed with a fusil, pistols, and invariably with a poniard. They are under the immediate command, and subject to the orders of, the different intendants or governors of provinces, and, in small towns, under those of the

magistrates. The *shirri* are employed like our Bow Street officers, in taking up thieves and assassins, whom they are authorised to lodge in the different prisons, and at whose execution they must personally attend. These men are, in general, despised, and not much feared by the people; they are often accused of being in communication with the leaders of the various gangs of robbers and assassins that infest Italy, particularly the Appennine mountains.

SCAB, *n. s.* } Sax. *scæb*; Ital. *scabbia*; }
SCABBED, *adj.* } Lat. *scabies*. An incrustation
SCABBY, } formed over a sore; a dis-
SCABIOUS. } ease of animals: the adjectives all follow the sense of the noun-substantive.

Her writhled skin, as rough as mapple rind,
 So *scabby* was, that it would have loathed all woman-kind. *Faerie Queene.*

What's the matter you dissentious rogues,
 That rubbing the poor itch of your opinion,
 Make yourselves *scabs*? *Shakspeare. Coriolanus.*
 I would thou did'st itch from head to foot, and I had the scratching of thee, I would make thee the loathsome *scab* in Greece. *Shakspeare.*

The briar fruit make those that eat them *scabbed*. *Bacon.*
 That free from gout thou may'st preserve thy care,
 And clear from *scabs* produced by freezing air. *Dryden.*

To you such *scabb'd* harsh fruit is given, as raw
 Young soldiers at their exercising gnaw. *Id.*
 A *scabby* tetter on their pelts will stick.
 When the raw rain has pierced them to the quick. *Id.*

One of the usurers, a head man of the city, took it in dudgeon to be ranked, cheek by jowl, with a *scab* of a currier. *L'Estrange.*

In the spring *scabious* eruptions upon the skin were epidemical, from the acidity of the blood. *Arbuthnot on Air.*

This vap'ring *scab* must needs devise
 To ape the thunder of the skies. *Swift.*
 If the grazier should bring me one wether fat and well fleeced, and expect the same price for a whole hundred, without giving me security to restore my money for those that were lean, shorn, or *scabby*, I would be none of his customer. *Id.*

SCAB'BARD, *n. s.* Germ. *schap*—Junius; Goth. *skalpen*. The sheath of a sword.

Enter fortune's gate,
 Nor in thy *scabbard* sheath that famous blade,
 'Till settled be thy kingdom and estate. *Fairfax.*

What eyes! how keen their glances! you do well to keep 'em veiled; they are too sharp to be trusted out o' th' *scabbard*. *Dryden's Spanish Fryar.*

SCABIOSA, *scabious*, in botany, a genus of the monogynia order and tetrandria class of plants, natural order forty-eighth, aggregate. Common *cal.* polyphyllous; proper, double superior; the receptacle paleaceous or naked. The most remarkable species are,—

1. *S. arvensis*, the meadow *scabious*, which grows naturally in many places of Britain. It has a strong, thick, fibrous root, sending out many branching stalks, which rise to the height of three feet. The lower leaves are sometimes almost entire, and at others they are cut into many segments almost to the midrib. The flowers are produced upon naked foot-stalks at the end of the branches; they are of a purple color, and have a faint odor.

2. *S. succisa*, or devil's bit, grows naturally in

woods and moist places. This has a short tap-root, the end of which appears as if it was bitten or cut off, whence the plant has its name. The leaves are open and spear-shaped, and smooth; the stalks are single, about two feet high, garnished with two leaves at each joint; they generally send out two short foot-stalks from their upper joint, standing opposite, which are terminated by purple flowers. Both these have been recommended as aperient, sudorific, and expectorant; but the present practice has no dependence on them.

SCABROUS, *adj.* Fr. *scabreux*; Lat. *scaber*. Rough; rugged; pointed on the surface; harsh.

Lucretius is *scabrous* and rough in these; he seeks them, as some do Chaucerists, which were better expunged. *Ben Jonson.*

Urine, black and bloody, is occasioned by something sharp or *scabrous* wounding the small blood-vessels; if the stone is smooth and well bedded, this may not happen. *Arbuthnot.*

SCABWOIT. See SCABIOSA.

SCÆVOLA, in botany, a genus of the monogynia order and pentandria class of plants: cor. monopetalous; the tube slit longitudinally; the border quinquefid and lateral. The fruit is a plum inferior and monospermous; the nucleus bilocular. Species three, natives of India.

SCAFFOLD, *n. s.* } French *eschafaut*;
SCAF'OLDAGE, } of Lat. *scabellum*. A

SCAF'OLDING. } temporary stage or gallery: particularly the stage erected for the execution of malefactors: the other two substantives are synonymous.

Fortune, smiling 'at her fortune therein, that a scaffold of execution should grow a scaffold of coronation. *Sydney.*

Pardon

The flat unraised spirit, that hath dared
On this unworthy scaffold to bring forth
So great an object. *Shakspeare. Henry V.*

A strutting player doth think it rich
To hear the wooden dialogue and sound,
'Twixt his stretch'd footing and the scaffoldage. *Shakspeare.*

These outward beauties are but the props and
scaffolds
On which we built our love, which, now made
perfect,
Stands without these supports. *Denham's Sophy.*

The throng
On banks and scaffolds under sky might stand. *Milton.*

Send forth your lab'ring thought;
Let it return with empty notions fraught,
Of airy columns every moment broke,
Of circling whirlpools, and of spheres of smoke:
Yet this solution but once more affords
New change of terms and scaffolding of words. *Prior.*

What are riches, empire, power,
But steps by which we climb to rise, and reach
Our wish? and, that obtained, down with the scaffold
folding
Of sceptres and of thrones. *Congreve.*

Sickness, contributing no less than old age to the shaking down this scaffolding of the body, may discover the inward structure. *Pope.*

Sylla added three hundred commons to the senate; then abolished the office of tribune, as being only a

scaffold to tyranny, whereof he had no further use. *Swift.*

SCAGLIOLA, in architecture, a kind of Italian composition in imitation of marble, variously colored according to the species the artist intends to represent. It is laid on brick in the manner of stucco, and worked off with iron tools, or formed by moulds into friezes, architectural borders, &c. This manufacture was introduced into this country by Mr. Coade, and is now carried on with great success.

SCALA (Bartolomeo), an eminent Italian writer, who flourished when literature was reviving in Europe. He was born about 1424, and was the only son of a miller; but, going early to Florence, Cosmo de Medicis gave him education. He studied the law; became LL.D., and frequented the bar. On Cosmo's death, in 1464, Peter de Medicis employed him in the service of the republic, in the most important negotiations. In 1471 he was made a citizen of Florence; in 1472 he was ennobled and made chancellor. In 1484 he was sent on an embassy to pope Innocent VIII., whom he pleased so well that the pope made him a Roman knight and senator. He published some of his orations, among which were the following:—1. Pro Imperatoris militaribus signis dandis Constantio Sfortiæ imperatori; 1481; 2. Apologia contra vituperatores Florentiæ; 1496, folio; 3. De Historia Florentina; Libri iv. 4. Vita di Vitahani Borromeo; Rome, 1677, 4to. He died in Florence in 1497.

SCALA NOVA, the old Neapolis, a well built sea-port town of Asia Minor, three leagues from the site of the ancient Ephesus. The fortifications are about three-quarters of a mile in circumference. To the north is a suburb, in which alone the Christians are permitted to dwell. The population is reckoned by Tournefort, at 1000 Turkish families, 600 Greek, ten Jew, and sixty Armenian. The town carries on a considerable trade in grain, coffee, and cloth, from Egypt, Smyrna, and Salonica. The neighbourhood yields a considerable quantity of wine. Forty miles south of Smyrna.

SCALADE', *n. s.* } Fr. *scalade*; Span. *scala-*
SCALA'DO. } *luda*, from Latin *scalv*, a ladder. A storm given to a place by raising ladders against the walls.

What can be more strange than that we should within two months have won one town of importance by *scalado*, battered and assaulted another, and overthrown great forces in the field? *Bacon.*

Thou raisedst thy voice to record the stratagems, the arduous exploits, and the nocturnal *scalade* of needy heroes, the terror of your peaceful citizens.

Arbuthnot's History of John Bull.

SCALADO, OR SCALADE, in the art of war, is an assault made on the wall or rampart of a city, or other fortified place, by means of ladders, without carrying on works in form, to secure the men.

SCALARY, *adj.* From Lat. *scala*. Proceeding by steps like those of a ladder.

He made at nearer distances certain elevated places and *scalary* ascents, that they might better ascend or mount their horses. *Broune.*

SCALD, *v. a., n. s., & adj.* } Span. *escalder* ;
 SCALD'HEAD, *n. s.* } Ital. *scallare* ; of
 SCALL. } Lat. *calidus*. To
 burn with hot liquor : scurf on the head ; paltry ;
 sorry : scurvy : scaldhead, a leprous disease of
 the head : scall is leprosy ; morbid baldness.
 It is a dry *scall*, a leprosy upon the head.

Lev. xiii. 30.

Upon thy bald hede maist thou have the *scall*.

Chaucer.

Her head altogether bald,
 Was overgrown with scurf and filthy *scald*.

Spenser.

O majesty !
 When thou dost pinch thy bearer, thou dost sit
 Like a rich armour worn in heat of day
 That *scalds* with safety. *Shakspeare. Henry IV.*

Saucy lictors
 Will catch at us like strumpets, and *scald* rhymers
 Ballad us out o'tune. *Shakspeare.*

Here the blue flames of *scalding* brimstone fall,
 Involving swiftly in one ruin all. *Cowley.*

That I grieve, 'tis true ;
 But 'tis a grief of fury, not despair !
 And, if a manly drop or two fall down,
 It *scalds* along my cheeks, like the green wood,
 That, spitting in the flame, works outward into
 tears. *Dryden's Cleomenes.*

It depends not on his will to persuade himself,
 that what actually *scalds* him, feels cold. *Locke.*

In Oxfordshire the sour land they fallow when
 the sun is pretty high, which they call a *scalding*
 fallow. *Mortimer.*

Warm cataplasms discuss ; but *scalding* hot may
 confirm the tumour : heat, in general, doth not
 resolve and attenuate the juices of a human body ;
 for too great heat will produce concretions.

Arbuthnot on Aliments.

The serum is corrupted by the infection of the
 touch of a salt humour, to which the scab, pox, and
scaldhead are referable. *Floyer.*

The best thing we can do with Wood is to *scald*
 him ;

For which operation there's nothing more proper
 Than the liquor he deals in, his own melted copper.
Suiff.

SCALD CREAM, sometimes also called clouted
 cream, a method of preparing cream for butter.
 Mr. Feltham gives the following account of it :—
 The purpose of making scald cream is for but-
 ter superior to any which can be procured from
 the usual raw cream, being preferable for flavor
 and keeping. As leaden cisterns would not
 answer for scalding cream, the dairies mostly
 adopt brass pans, which hold from three to five
 gallons of the milk ; and that which is put into
 those pans one morning stands till the next
 when, without disturbing it, it is set over (on a
 trivet) a steady brisk wood fire, devoid of smoke,
 where it is to remain from seven to fifteen
 minutes, according to the size of the pan, or the
 quantity in it : the precise time for removing it
 from the fire must be particularly attended to,
 which is, when the surface begins to wrinkle or
 to gather in a little, showing signs of boiling ;
 it is then instantly to be taken off, and placed
 in the dairy until the next morning, when the
 fine cream is thrown up, and may be taken for
 the table, or for butter, into which it is now
 soon converted by stirring it with the hand.
 Some know when to remove it from the fire by
 sounding the pan with the finger, it being then

less sonorous ; but this is only acquired by ex-
 perience. Dr. Hales observes that this method
 of preparing milk will take off the taste it
 sometimes acquires from the cows' feeding on
 turnips, cabbages, &c.

SCALDS, in the history of literature, a name
 given by the ancient inhabitants of the northern
 countries to their poets ; in whose writings their
 history is recorded. See BARDS.

SCALE, *n. s. & v. a.* Sax. *scale* ; Belg. *schael* ;
 Island. *skal* ; Goth. *skal*. A balance ; the dish
 of a balance : hence the sign *Libra* : to measure ;
 compare.

If thou tak'st more
 Or less than a just pound, if the *scale* turn
 But in the estimation of a hair,
 Thou diest. *Shakspeare. Merchant of Venice.*

Here's an equivocator, that could swear, in both
 the *scales*, against either *scale*. *Shakspeare.*

You have found,
Scaling his present bearing with his past,
 That he's your fixed enemy. *Id. Coriolanus.*

The world's *scales* are even ; when the main
 In one place gets, another quits again. *Cleveland.*
 Juno pours out the urn, and Vulcan claims
 The *scales*, as the just product of his flames. *Creech.*

Long time in even *scale*
 The battle hung. *Milton's Paradise Lost.*
 The *scales* are turned, her kindness weighs no
 more
 Now than my vows. *Waller.*

In full assemblies let the crowd prevail ;
 I weigh no merit by the common *scale*,
 The conscience is the test. *Dryden.*

If we consider the dignity of an intelligent being,
 and put that in the *scales* against brute inanimate mat-
 ter, we may affirm, without overvaluing human nature,
 that the soul of one virtuous and religious man is of
 greater worth and excellency than the sun and his
 planets. *Bentley's Sermons.*

Collect at evening what the day brought forth,
 Compress the sum into its solid worth,
 And, if it weigh the importance of a fly,
 The *scales* are false, or algebra a lie. *Cowper.*

SCALE, *n. s., v. a. & v. n.* } Fr. *escaille* ; Lat.
 SCALED, *adj.* } *squama*. The la-
 SCALY. } mina of a fish's

coat ; any thing exfoliated or disquamated : to
 strip of scales ; to pare off a surface : the adject-
 ives signify squamous ; having scales : to peel
 off in thin particles.

Raphael was sent to *scale* away the whiteness of
 Tobit's eyes. *Tob. iii. 17.*

Half my Egypt was submerged, and made
 A cistern for scaled snakes.

Shakspeare. Antony and Cleopatra.

Those that cast their shell are the lobster and
 crab : the old skins are found, but the old shells
 never ; so as it is like they *scale* off, and crumble
 away by degrees. *Bacon.*

He puts him on a coat of mail,
 Which was made of a fish's *scale*. *Drayton.*

Take jet and the *scales* of iron, and with a wet fea-
 ther, when the smith hath taken an heat, take up the
scales that fly from the iron, and those *scales* you
 should grind upon your painter's stone. *Peacham.*

The river horse and *scaly* crocodile. *Milton.*

Standing aloof, with lead they bruise the *scales*,
 And tear the flesh of the incensed whales. *Waller.*

His awful summons they so soon obey ;
 So hear the *scaly* herd when Proteus blows,
 And so to pasture follow through the sea. *Dr. n.*

If all the mountains were *scaled*, and the earth made even, the waters would not overflow its smooth surface.

Burnet.

A *scaly* fish with a forked tail.

Woodward.

When a *scale* of bone is taken out of a wound, burning retards the separation.

Sharp's Surgery.

SCALE, *n.s.* & *v.a.* Lat. *scala*. A ladder; means of ascent; the act of storming by ladders; regular gradation; series of musical or other degrees, or notes; any thing marked at equal distances: to climb by ladders; to mount.

Often have I *scaled* the craggy oak,
All to dislodge the raven of her nest:

How have I wearied, with many a stroke,
The stately walnut-tree, the while the rest

'Under the tree fell all for nuts at strife!

Spenser.

They assailed the breach, and others with their
scaling ladders *scaled* the walls.

Knolles's History of the Turks.

They take the flower o' the Nile

By certain *scale* i' the pyramid: they know

By the height, the lowness, or the mean, if dearth
Or foison follow.

Shakespeare. Antony and Cleopatra.

Love refines

The thought, and heart enlarges; hath his seat

In reason, and is judicious; is the *scale*

By which to heavenly love thou mayest ascend.

Milton.

Others to a city strong

Lay siege, encamped; by battery, *scale*, and mine

Assaulting.

Id. Paradise Lost.

The map of London was set out in the year 1658,
by Mr. Newcourt, drawn by a *scale* of yards.

Graunt.

Heaven with these engines had been *scaled*,

When mountains heaped on mountains failed.

Waller.

The bent of his thoughts and reasonings run up
and down this *scale*, that no people can be happy but
under good governments.

Temple.

When the bold Typhons *scaled* the sky,

And forced great Jove from his own heaven to fly,

The lesser gods all suffered.

Dryden.

The *scale* of the creatures is a matter of high speculation.

Grew.

On the bendings of these mountains the mark of
several ancient *scales* of stairs may be seen, by which
they used to ascend them.

Addison on Italy.

We believe an invisible world, and a *scale* of
spiritual beings, all nobler than ourselves.

Bentley's Sermons.

All the integral parts of nature have a beautiful
analogy to one another, and to their mighty original,
whose images are more or less expressive, according
to their several gradations in the *scale* of beings.

Cheyne's Philosophical Principles.

Far as creation's ample range extends,

The *scale* of sensual mental powers ascends.

Pope.

SCALE, a mathematical instrument consisting
of several lines drawn on wood, brass, silver,
&c., and variously divided according to the pur-
poses it is intended to serve; whence it acquires
various denominations, as the plain scale, diago-
nal scale, plotting scale, &c.

SCALE, in architecture and geography, a line
divided into equal parts, placed at the bottom of
a map or draught, to serve as a common measure
to all the parts of the building, or all the dis-
tances and places of the map.

SCALE, in music, sometimes denominated a
gamut, a diagram, a series, an order, a diapason.
It consists of the regular gradations of sound,

by which a composer or performer whether in
rising or descending may pass from any given
tune to another. These gradations are seven.
When this order is repeated, the first note of the
second is contemporaneous with the lowest note of
the first; the second of the former with the se-
cond of the latter; and so through the whole
octave. The second order, therefore, is justly
esteemed only a repetition of the first. For
this reason the scale among the moderns is some-
times limited to an octave; at other times ex-
tended to the compass of any particular voice or
instrument. It likewise frequently includes all
the practical gradations of musical sound, or the
whole number of octaves employed in composi-
tion or execution, arranged in their natural
order. See *MUSIC*.

SCALIGER (Julius Cæsar), a learned critic,
born at the castle of Ripa, in the Veronese, in
1484; and said by himself to have been de-
scended from the ancient princes of Verona.
He learned the Latin tongue in his own country;
and in his twelfth year was presented to the em-
peror Maximilian, who made him one of his
pages. He served that emperor seventeen years,
and gave signal proofs of his valor and conduct
in several expeditions. He was present at the
battle of Ravenna in April 1512, in which he
lost his father Benedict Scaliger, and his brother
Titus; on which his mother died with grief:
when, being reduced to necessitous circumstances,
he entered into the order of the Franciscans, and
applied himself to study at Bologna; but soon
after took arms again, and served in Piedmont.
At which time a physician persuaded him to
study physic, which he did at his leisure hours,
and also learned Greek; and at last the gout de-
termined him, at forty years of age, to abandon
a military life. He soon after settled at Agen,
where he was naturalised in 1523, married, and
applied himself seriously to his studies. He
learned first the French tongue; and then made
himself master of the Gascon, Italian, Spanish,
German, Hungarian, and Slavonian. Mean-
while he supported his family by the practice of
physic. He did not publish any of his works
till he was forty-seven years of age; when he
soon gained a name in the republic of letters.
He had a graceful person, and a strong memory.
He died of a retention of urine in 1558. He
wrote in Latin, 1. A Treatise on the Art of Poe-
try. 2. Exercitations against Cardan: which
works are much esteemed. 3. Commentaries on
Aristotle's History of Animals, and on Theo-
phrastus on Plants. 4. Some Treatises on Physic.
5. Letters, Orations, Poems, and other works in
Latin.

SCALIGER (Joseph Justus), one of the most
learned critics and writers of his time; the son
of the above, was born at Agen, in France, in
1540. He studied in the college of Bourdeaux,
after which his father employed him in trans-
cribing his poems; by which he obtained such
a taste for poetry that before he was seventeen
years old he wrote a tragedy upon the subject
of Oedipus. He went to Paris in 1559, with a
design to apply himself to the Greek language.
For this purpose he for two months attended the
lectures of Turnebus; and afterwards shut him-

self up, and by constant application for two years gained a perfect knowledge of that language; after which he applied to the Hebrew, which he learned by himself with great facility. He made no less progress in the sciences; and his writings procured him the reputation of one of the greatest men of the age. He embraced the reformed religion at twenty-two years of age. In 1563 he attached himself to Lewis Casteignier de la Roch Pazay, whom he attended in several journeys; and in 1593 was offered the place of honorary professor of the university of Leyden, which he accepted. He died of a dropsy in that city in 1609. He was a man of great temperance; and was never married. He published many works, the principal of which are, 1. Notes on Seneca's Tragedies, on Varro, Ausonius, Pompeius Festus, &c. 2. Latin Poems. 3. A Treatise de Emendatione Temporum. 4. Eusebius's Chronicle with Notes. 5. Canones Isagogici; and many other works. The collections entitled Scaligeriana were collected from his conversations by one of his friends; and, being ranged into alphabetical order, were published by Isaac Vossius.

SCALLOP, *n. s.* Fr. *cscalop*. A fish with a hollow pectinated shell.

So the emperor Caligula,
That triumphed o'er the British sea,
Engaged his legions in fierce bustles
With periwinkles, prawns, and muscles,
And led his troops with furious gallops,
To charge whole regiments of *scallops*. *Hudibras*.

The sand is in Scilly glistening, which may be occasioned from freestone mingled with white *scallop* shells. *Mortimer*.

SCALLOP, in ichthyology. See **PECTEN**. In the Highlands of Scotland, the great scallop shell is made use of for the skimming of milk. In old times it had a more honorable place; being admitted into the halls of heroes, and was the cup of their festivity when the tribe assembled in the hall of their chieftain.

SCALMARTIN ROCKS, rocks of Ireland, on the coast of Down county, Ulster, in the harbour of Donaghadee. Though they are so smooth that vessels seldom suffer on them, yet in high tides and storms they are dangerous.

SCALP, *n. s.* & *v. a.* Belg. *schelpe*, a shell; Ital. *scalpo*. The skull or cranium; to take off the scalp.

High brandishing his bright dew-burning blade,
Upon his crested *scalp* so sore did smite,
That to the scull a yawning wound it made.

Fuerie Queene.

White beards have armed their thin and hairless *scalps*,

Against thy majesty. *Shakspeare. Richard II.*

The hairy *scalps*

Are whirled aloof, while numerous trunks bestrow
The ensanguined field. *Phillips.*

If the fracture be not complicated with a wound of the *scalp*, or the wound is too small to admit of the operation, the fracture must be laid bare by taking away a large piece of the *scalp*.

Sharp's Surgery.

We seldom inquire for a fracture of the skull by *scalping*, but that the *scalp* itself is contused.

Sharp.

SCALPA, one of the Western Islands of Scotland, lying in the sound between the Isle of

Sky and Pomona, about five miles long and from two to three broad. It is barren and rocky. In the highest part of it, is a rock of petrified moss, in which are a variety of shells; and great quantities of shells are found several feet under ground. It lies one mile east of Sky.

SCALPA FLOW, a large expanse of water among the Orkney Islands, resembling a small sea, about fifty miles in circumference; surrounded by twelve islands, through which are several outlets to the Pentland Frith, Atlantic and German Oceans. During war it is a great thoroughfare for vessels coming north; and abounds with safe harbours and roadsteads for vessels of the largest size. The chief entrance from the west is through Hoy-mouth, and from the east through Holme Sound. The tide at its entrance into Scalpa Flow is remarkably rapid, but soon subsides.

A **SCALPEL** is a kind of knife used in anatomical dissections and operations in surgery.

SCALPING, in military history, a barbarous custom practised by the American Indians, of taking off the tops of the scalps of their enemies' skulls with their hair on. They preserve them as trophies of their victories, and are rewarded by their chiefs according to the number of scalps they bring in.

SCAMANDER, or **SCAMANDROS**, a celebrated river of Troas, rising at the east end of Mount Ida, and running into the sea below Sigæum. Homer says it was called Xanthus by the gods. The goddesses Juno, Minerva, and Venus, are fabled to have bathed in it, previous to their appearing before Paris, in the contest for the golden apple. The Simois runs into it. It was a custom among the Phrygian brides to bathe themselves before marriage in this river. But this superstitious ceremony was abrogated, in consequence of Cimon an Athenian's having assumed the disguise of a river god, and deflowering Callirhoe, a noble virgin, at that time betrothed. 'The origin of this river,' says Dr. Clarke, 'is not like the source of ordinary streams, obscure and uncertain; of doubtful locality and indeterminate character; ascertained with difficulty, among various petty subdivisions in swampy places, or amidst insignificant rivulets, falling from different parts of the same mountain, and equally tributary; it bursts at once from the dark womb of its parent, in all the greatness of the divine origin assigned to it by Homer. Our ascent, as we drew near to the source of the river, became steep and stony. Lofty summits towered above us, in the greatest style of Alpine grandeur; the torrent, in its rugged bed below, all the while foaming upon our left. Presently we entered one of the sublimest natural amphitheatres the eye ever beheld; and here the guides desired us to alight. The noise of waters silenced every other sound. Huge craggy rocks rose perpendicularly to an immense height; whose sides and fissures to the very clouds, concealing their tops, were covered with pines, growing in every possible direction, among a variety of evergreen shrubs, wild sage, hanging ivy, moss, and creeping herbage. Enormous plane-trees waved their vast branches above the torrent. As we approached its deep gulf, we beheld several cas-

eades all of foam, pouring impetuously from chasms in the naked face of a perpendicular rock. It is said the same magnificent cataract continues during all seasons of the year, wholly unaffected by the casualties of rain or melting snow.

SCAMANDER, in fabulous history, the son of Corybas and Demotice, who brought a colony from Crete into Phrygia, and settled at the foot of Mount Ida, where he established the festivals of Cybele. Being afterwards drowned in the Xanthus, the river was named after him. He was succeeded by his son Teucer: Diod. 4.

SCAMBLE, *v. n.* Ital. *scambilare*, from Lat. *scambus*. To be turbulent or rapacious; to scramble.

Have fresh chaff in the bin,
And somewhat to *scamble* for hog and for hen.

Thusser.

Scambling, out facing, fashion-mongering boys
That lie, and cog, and flout, deprave and slander.

Shakespeare.

He was no sooner entered into the town but a *scambling* soldier clapt hold of his bridle, which he thought was in a begging or a drunken fashion.

Wotton.

Some *scambling* shifts may be made without them.

More.

My wood was cut in patches, and other parts of it *scambled*, and cut before it was at its growth.

Mortimer.

SCAMMONIATE, *adj.* From scammony. Made with scammony, a resinous juice.

It may be excited by a local *scammoniate*, or other acrimonious medicines.

Wiseman's Surgery.

SCAMMONY, a resinous gum, brought into this country from Aleppo, in light spongy masses, easily friable, of a shining ash-color verging to black; when powdered of a light gray or whitish color: an inferior sort is brought from Smyrna, in more compact ponderous pieces, of a darker color, and full of sand and other impurities. This juice is chiefly of the resinous kind; proof spirit totally dissolves it, the impurities only being left. It has a faint unpleasant smell, and a bitterish, somewhat acrimonious taste. Scammony is an efficacious and strong purgative. Some have condemned it as unsafe, and laid sundry ill qualities to its charge; the principal of which is, that its operation is uncertain, a full dose proving sometimes ineffectual, whilst at others a much smaller one occasions dangerous hypercatarses. This difference is owing to the different circumstances of the patient, and not to any ill quality or irregularity of operation of the medicine: where the intestines are lined with an excessive load of mucus, the scammony passes without exerting itself upon them; where the natural mucus is deficient, a small dose of this or any other resinous cathartic irritates and inflames. Many have endeavoured to abate the force of this drug, and correct its imaginary virulence, by exposing it to the fume of sulphur, dissolving it in acid juices, &c.: but this can only destroy a part of the medicine, without altering the rest. Scammony in substance, judiciously managed, needs no corrector: if triturated with sugar or almonds, it becomes sufficiently safe and mild. It may likewise be dissolved by trituration in a strong decoction of

liquorice, and then poured off from the fæces; the college of Wirtemberg assures us that by this treatment it becomes mildly purgative, without any inconveniences; and that it also proves inoffensive to the palate. The common dose is from three to ten grains. According to the analysis of Vogel, Scammony consists of

SCAMMOZZI, (Vincent), a celebrated Italian architect and writer, born at Vicenza in 1552. He travelled through most parts of Europe, and was much employed in the chief cities of Italy. He wrote a celebrated work, entitled *Idea della Architettura Universale*, 2 vols. folio, Venice, 1615. He died at Venice in 1616, aged sixty-four.

SCAMPER, *v. n.* Goth. *skampa*; Ital. *scampare*. To fly with speed or trepidation.

A fox seized upon the fawn, and fairly *scampered* away with him.

L'Estrange.

Be quick, nay, very quick, or he'll approach,
And, as you're *scampering*, stop you in your coach.

King.

You will suddenly take a resolution, in your cabinet of Highlanders, to *scamper* off with your new crown.

Addi on.

Close behind his heel

Now creeps he slow; and now, with many a frisk
Wide-*scampering*, snatches up the drifted snow
With ivory teeth, or ploughs it with his snout;
Then shakes his powdered coat, and barks for joy.

Cowper.

SCAN, *v. a.* Fr. *scandre*; Lat. *scando*. To examine a verse by counting the feet: examine nicely or formally.

So he goes to heaven,
And so am I revenged: that would be *scanned*.

Shakespeare. Hamlet.

The rest the great architect
Did wisely to conceal: and not divulge
His secrets to be *scanned* by them, who ought
Rather admire.

Milton's Paradise Lost.

They scan their verses upon their fingers. *Walsh.*
Sir Roger exposing his palm, they crumbled it
into all shapes, and diligently *scanned* every wrinkle
that could be made in it.

Addison.

Every man has guilt, which he desires should not be rigorously *scanned*; and therefore, by the rule of clarity and justice, ought not to do that which he should not suffer.

Government of the Tongue.

One moment and one thought might let him scan
The various turns of life, and fickle state of man.

Prior.

The actions of men in high stations are all conspicuous, and liable to be *scanned* and sifted.

Atterbury.

At the final reckoning, when all men's actions shall be *scanned* and judged, the great King shall pass his sentence, according to the good men have done, or neglected to do.

Calamy.

SCANDAL, *n. s. & v. a.* } *Fr. scandale; Lat. scandalum; Greek σκανδαλον.* Op-
 SCANDALIZE, *v. a.* } probrium; offence
 SCANDALOUS, *adj.* } given by the faults
 SCANDALOUSLY, *adv.*
 SCANDALOUSNESS, *n. s.*
 of others; aspersion; calumny: to charge falsely;
 reproach: this is also sometimes the sense of scan-
 dalize; at others it means to offend by some sup-
 posed crime: the adjective, adverb, and noun-
 substantive follow the senses of scandal.

I demand who they are whom we scandalize by
 using harmless things! Among ourselves that agree
 in this use, no man will say that one of us is offen-
 sive and scandalous unto another. *Hooker.*

Nothing scandalous or offensive unto any, especi-
 ally unto the church of God: all things in order, and
 with seemliness. *Id.*

If black scandal, or foul-faced reproach,
 Attend the sequel of your imposition,
 Your mere enforcement shall acquittance me
 From all the impure blots and stains thereof. *Shakspeare. Richard III.*

I do fawn on men, and hug them hard,
 And after scandal them. *Id. Julius Cæsar.*

Something savouring
 Of tyranny, which will ignoble make you,
 Yea, scandalous to the world. *Id. Winter's Tale.*
 Thou dost appear to scandalize
 The publick right and common cause of kings. *Daniel.*

It had the excuse of some bashfulness, and care
 not to scandalize others. *Hammond on Fundamentals.*

Whoever considers the injustice of some ministers,
 in those intervals of parliament, will not be scanda-
 lized at the warmth and vivacity of those meetings. *Clarendon.*

His lustful orgies he enlarged
 Even to the hill of scandal, by the grove
 Of Moloch homicide. *Milton's Paradise Lost.*

My known virtue is from scandal free,
 And leaves no shadow for your calumny. *Dryden.*

Many were scandalized at the personal slander
 and reflection flung out by scandalizing libellers. *Addison.*

In the case of scandal, we are to reflect how men
 ought to judge. *Rogers's Sermons.*

You know the scandalous meanness of that pro-
 ceeding, which was used. *Pope.*

Shun their fault, who, scandalously nice,
 Will needs mistake an author into vice. *Id.*

His discourse at table was scandalously unbecom-
 ing the dignity of his station; noise, brutality, and ob-
 sceneness. *Swift.*

SCANDALUM MAGNATUM, in law, is a de-
 famatory speech or writing, to the injury of a
 person of rank; for which a writ, that bears this
 name, is granted for the recovery of damages.

SCANDERBEG, the surname of George Cas-
 triot, king of Albania, a province of Turkey in
 Europe. He was delivered up with his three elder
 brothers as hostages, by their father, to Amurath
 II., sultan of the Turks, who poisoned his brothers,
 but spared him on account of his youth, being
 likewise pleased with his juvenile wit and hand-
 some person. In a short time he became one of
 the most renowned generals of the age; and, re-
 volt from Amurath, he joined Hunniades, a
 most formidable enemy of the Turks. He de-
 feated the sultan's army, took Amurath's secre-
 tary prisoner, obliged him to sign and seal an
 order to the governor of Croia, the capital of
 Albania, to deliver up the citadel and city to the

bearer of that order, in the name of the sultan.
 With this forced order he repaired to Croia;
 and recovered the throne of his ancestors, and
 maintained the independency of his country
 against the numerous armies of Amurath and
 his successor Mohammed II., who was obliged
 to make peace with him in 1461. He then went
 to the assistance of Ferdinand of Arragon, at the
 request of pope Pius II., and by his assistance
 Ferdinand gained a complete victory over his
 enemy the count of Anjou. Scanderbeg died in
 1467.

SCANDINAVIA, a general name for the
 countries of Norway, Sweden, and Denmark.
 The inhabitants of these countries, in former
 times, were excessively addicted to war. From
 their earliest years they applied themselves to
 the military art, and accustomed themselves to
 cold, fatigue, and hunger. Even the very sports
 of youth and childhood were dangerous. They
 consisted in taking frightful leaps, climbing up
 the steepest rocks, fighting naked with offensive
 weapons, wrestling with the utmost fury; so that
 it was usual to see them terrible in the combat
 at the age of fifteen. At this early age the young
 men became their own masters; when they re-
 ceived a sword, a buckler, and a lance. This
 ceremony was performed at some public meet-
 ing. One of the principal men of the assembly
 named the youth in public; after which he was
 obliged to provide for his own subsistence, and
 was either now to live by hunting, or by joining
 in some incursion against the enemy. Great
 care was taken to prevent the young men from
 too early connexions with the female sex; and
 indeed they could have no hope to gain the af-
 fection of the fair, but in proportion to the cou-
 rage and address they had shown in their military
 exercises. Accordingly, in an ancient song, we
 find Bartholin, king of Norway, extremely sur-
 prised that his mistress should prove unkind, as
 he could perform eight different exercises. The
 children were generally born in camps; and,
 being injured from their infancy to behold nothing
 but arms, effusion of blood, and slaughter, they
 imbibed the cruel disposition of their fathers;
 and, when they broke forth upon other nations,
 behaved rather like furies than human creatures.
 The laws of this people, in some measure, re-
 sembled those of the ancient Lacedæmonians.
 They knew no virtue but bravery, and no vice
 but cowardice. The greatest penalties were in-
 flicted on such as fled from battle. The laws of
 the ancient Danes declared such persons infam-
 ous, and excluded them from society. Among
 the Germans, cowards were sometimes suffo-
 cated in mud; after which they were covered over
 with hurdles, to show, says Tacitus, that though
 the punishment of crimes should be public, there
 are certain degrees of cowardice and infamy which
 ought to be buried in oblivion. Frotho king of
 Denmark enacted, by law, that whoever solicited
 an eminent post, ought upon all occasions to
 attack one enemy, to face two, to retire only one
 step back from three, and never to make an
 actual retreat till assaulted by four. The rules
 of justice were adapted and warped to these
 prejudices. War was looked upon as a real act
 of justice, and force was thought to be an incon-

testable title over the weak, and a visible mark that God had intended them to be subject to the strong. Lastly, their religion, by annexing eternal happiness to the military virtues, gave the utmost possible degree of vigor to that propensity which these people had for war, and to their contempt of death, of which many instances are recorded. Harold, surnamed Blaatand, or Blue-tooth, a king of Denmark, who lived in the beginning of the ninth century, had founded on the coasts of Pomerania a city named Julin or Jomsburg. In this colony it was forbidden to mention the word fear, even in the most imminent dangers. No citizen of Jomsburg was to yield to any number of enemies, however great. The sight of inevitable death was not to be an excuse for showing the smallest apprehension. Neither was this intrepidity peculiar to the inhabitants of Jomsburg; it was the general character of all the Scandinavians. To die with his arms in his hand was the ardent wish of every free man; and the high idea which they had of this kind of death led them to dread such as proceeded from old age and disease. The warriors who found themselves lingering in disease, often availed themselves of their few remaining moments to shake off life, by a way that they supposed to be more glorious. Some of them would be carried into a field of battle that they might die in the engagement; others slew themselves. Many procured this melancholy service to be performed by their friends, who considered it as a most sacred duty.

SCANDIX, shepherd's needle, or Venus comb, in botany, a genus of the digynia order, and pentandria class of plants; natural order forty-fifth, umbellatæ: cor. radiating; the fruit subulated; the petals emarginated; the florets of the disc frequently male. The most remarkable species is the

S. odorata, with angular furrowed seeds. It is a native of Germany, and has a very thick perennial root, composed of many fibres of a sweet aromatic taste, like aniseed, from which come forth many large leaves that branch out somewhat like those of fern, whence it is named sweet fern. The stalks grow four or five feet high, are fistulous and hairy; the flowers are disposed in an umbel at the top of the stalk, are of a white color, and have a sweet aromatic scent. This species is easily propagated by seeds, which, if permitted to scatter, will supply an abundance of young plants, that may be put into any part of the garden, and require no cure.

SCANIA, or Skenoxen, a province of South Gothland, Sweden, bounded on the south by the Baltic, and on the west by the Sound. The latter separates it from Denmark. Its length from north to south is above sixty-five miles, its breadth from east to west above fifty. It comprises the most pleasant, as well as most fertile, country in Sweden; and consists of gentle eminences, which, in the interior, are covered with wood, and of fertile plains and valleys, producing abundance of corn and pasturage. Cattle and horses are considerably larger here than in the northern provinces of Sweden. The principal mineral products are alum, sulphur, coal, chalk, and lead. The inhabitants also export oak tim-

ber, hemp, and cordage, as well as horses, sheep, and cattle. The fisheries are productive. Scania was in remote ages independent; it was afterwards in the possession of Denmark, but was ceded to Sweden, along with the adjoining provinces of Blekingen and Halland, at the peace of Roschild, in 1658. The Danes attempted to re-conquer it after the adventures of Charles XII.; but an army of 50,000 peasants baffled their attempts. It is now divided into the provinces or lars of Christianstadt and Malmöhus. Population 260,000.

SCANNING, in poetry, the measuring of verse by feet, in order to see whether or not the quantities be duly observed. Thus an hexameter verse is scanned by resolving it into six feet; a pentameter, by resolving it into five feet, &c.

SCANT, <i>v. a., adj., & adv.</i>	Sax. <i>geþreccan</i> to break; Goth. <i>skaut</i> . To limit; straiten: the adjective signifies scarce; limited: hence not liberal; wary: as an adverb (obsolete), scarcely; hardly: scanty is narrow; confined; small: hence poor; not copious or full; sparing: the adverb and noun-substantive corresponding: scantlet and scantling signify a small piece or pattern; a small or given quantity: scanty is synonymous with scant, adverb, and scantness with scantiness.
SCANTY, <i>adj.</i>	
SCANTILY, <i>adv.</i>	
SCANTINESS, <i>n. s.</i>	
SCANTLET,	
SCANTLING,	
SCANTLY, <i>adv.</i>	
SCANTNESS, <i>n. s.</i>	

You think
I will your serious and great business *scant*,
For she is with me. *Shakspeare. Othello.*
From this time,
Be somewhat *scant* of your maiden presence. *Id.*

He spoke
Scantily of me, when perforce he could not
But pay me terms of honour. *Id.*
The success,
Although particular, shall give a *scantling*
Of good or bad unto the general. *Id.*

The people, beside their travail, charge, and long attendance, received of the bankers *scant* twenty shillings for thirty. *Camden's Remains.*

England, in the opinion of the popes, was preferred, because it contained in the ecclesiastical division two large provinces, which had their several legati nati; whereas France had *scantly* one. *Id.*

They need rather to be *scanted* in their nourishments than replenished to have them sweet.

Bacon's Natural History.
White is a penurious colour, and where moisture is *scant*: so blue violets, and other flowers, if they be starved, turn pale and white. *Bacon.*

He was a man fierce, and of no evil disposition, saving that he thought *scantiness* of estate too great an evil. *Hayward.*

A single violet transplant:
The strength, the colour, and the size,
All which before was poor and *scant*,
Redoubles still and multiplies. *Donne.*
A wild pamphlet, beside other malignities, would
scant allow him to be a gentleman. *Wotton.*
We *scant* read in any writer, that there have been
seen any people upon the south coast.

Abbot's Description of the World.
Reduce desires to narrow *scantlings* and small proportions.
Taylor's Rule of Holy Living.

To find out that,
In such a *scant* allowance of star-light,
Would over task the best land-pilot's art. *Milton.*

While the world was but thin, the ages of mankind were longer; and, as the world grew fuller, so their lives were successively reduced to a shorter *scantlet*, till they came to that time of life which they now have. *Hale.*

Looking on things through the wrong end of the perspective, which *scants* their dimensions, we neglect and condemn them. *Glanville's Scepis.*

Did we but compare the miserable *scantness* of our capacities with the vast profundity of things, truth and modesty would teach us wary language. *Id.*

I am *scanted* in the pleasure of dwelling on your actions. *Dryden.*

Virgil has sometimes two of them in a line; but the *scantiness* of our heroic verse is not capable of receiving more than one. *Id.*

A *scantling* of wit lay gasping for life, and groaning beneath a heap of rubbish. *Id.*

My eager love, I'll give myself the lye;
The very hope is a full happiness,
Yet *scantly* measures what I shall possess. *Id.*

'Tis hard to find out a woman that's of a just *scantling* for her age, humour, and fortune, to make a wife of. *L'Estrange.*

In this narrow *scantling* of capacity, we enjoy but one pleasure at once. *Locke.*

As long as one can increase the number, he will think the idea he hath a little too *scanty* for positive infinity. *Id.*

Their language being *scanty* and accommodated only to the few necessities of a needy simple life, had no words in it to stand for a thousand. *Id.*

Alexander was much troubled at the *scantiness* of nature itself, that there were no more worlds for him to disturb. *South.*

There remained few marks of the old tradition, so they had narrow and *scanty* conceptions of Providence. *Woodward.*

O'er yonder hill does *scant* the dawn appear. *Gay.*

Now *scantier* limits the proud arch confine,
And scarce are seen the prostrate Nile and Rhine:
A small Euphrates through the piece is rolled
And little eagles wave their wings in fold. *Pope.*

They with such *scanty* wages pay
The bondage and the slavery of years. *Swift.*

In illustrating a point of difficulty, he not too *scanty* of words, but rather become copious in your language. *Watts.*

A. Patriots, alas! the few that can be found,
Where most they flourish upon English ground,
The country's need have *scantily* supplied,
And the last left the scene when Chatham died. *Cowper.*

SCAPE, *v. a., v. n., & n. s.* Contracted from escape. To miss; avoid; shun; not to incur; to fly; get away: an escape.

What, have I *scaped* love-letters in the holyday time of my beauty, and am I now a subject for them? *Shakspeare.*

I spoke of most disastrous chances,
Of hair-breadth *scapes* in the imminent deadly breach. *Id.*

No natural exhalation in the sky,
No force of nature, no distempered day,
But they will pluck away its natural cause,
And call them meteors, prodigies, and signs. *Id.*

Having purposed falsehood, you
Can have no way but falsehood to be true!
Vain lunatick, against these *scapes* I could
Dispute, and conquer, if I would. *Denne.*

What can 'scape the eye
Of God all-seeing?
Thou lurk'st

Milton.

In valley or green meadow, to way-lay
Some beauty rare, Calisto, Clymene;
Too long thou laid'st thy *scapes* on names adored. *Id.*

Could they not fall unspied on the plain,
But slain revive, and, taken, *scape* again? *Dryden.*

SCAPE-GOAT, in Jewish antiquity, the goat which was set at liberty on the day of solemn expiation. For the ceremonies on this occasion, see Levit. xvi. 5, 6, &c. Some say that a piece of scarlet cloth, in form of a tongue, was tied on the forehead of the scape-goat.—Hoff. Lex. Univ. in voc. Lingua. Many have been the disputes among the interpreters concerning the meaning of the word scape-goat; or rather of Azazel, for which scape-goat is put in our version of the Bible. Spencer believes Azazel to be a proper name, viz. that of the evil spirit, to which he conceives the goat to have been devoted. He observes that the ancient Jews used to substitute the name Samael for Azazel; and many of them have ventured to affirm that at the feast of expiation they were obliged to offer a gift to Samael to obtain his favor. Thus also the goat, sent into the wilderness to Azazel, was understood to be a gift or oblation. Some Christians have been of the same opinion. But Spencer thinks that the genuine reasons of the ceremony were, 1. That the goat, loaded with the sins of the people, and sent to Azazel, might be a symbolical representation of the miserable condition of sinners. 2. God sent the goat thus loaded to the evil dæmons, to show that they were impure, thereby to deter the people from any conversation or familiarity with them. 3. That the goat sent to Azazel, sufficiently expiating all evils, the Israelites might the more willingly abstain from the expiatory sacrifices of the Gentiles. Le Clerc is of opinion that Azazel was the name of a place, either a mountain or a cliff, at which the goat waited, and thence, as the rabbins say, was cast down and slain. But the most common opinion is, that Azazel is a name given to the goat itself, on account of its being let go, as being derived from *ἄζ* gnez or az, goat, and *ἄζ* azel, he hath gone away. Thus it was understood by our translators, who render it scape-goat; the Septuagint likewise render it ἀποπομαος, and the Vulgate emissarius.

SCAPEMENT, in clock and watch work, a general term for the method, whatever it may be, of communicating the impulse of the wheels to the pendulum or balance. The ordinary scapements consist of the swing-wheel and pallets only; but modern improvements have added other levers or detents, chiefly for the purposes of diminishing friction, or for detaching the pendulum from the pressure of the wheels during part of the time of its vibration. See WATCHES.

SCAP'ULA, *n. s.* Lat. *scapula*. The shoulder blade.

The heat went off from the parts, and spread up higher to the breast and *scapula*. *Wiseman.*

The humours dispersed through the branches of the axillary artery to the *scapulary* branches. *Id. of Uleers.*

The viscera were counterpoised with the weight of the *scapular* part. *Derham.*

SCAPULA, in anatomy. See ANATOMY.

SCAPULA (John), the reputed author of a Greek lexicon, noted only for a gross act of literary fraud. Being employed by Henry Stephens as a corrector to his press, while he was publishing his *Thesaurus Linguae Graecae*, Scapula extracted those words and explanations which he reckoned most useful, comprised them in one volume, and published them as an original work, with his own name. The compilation and printing of the *Thesaurus* had cost Stephens immense labor and expense; but it was so much admired by those learned men to whom he had shown it, and seemed to be of such essential importance to the acquisition of the Greek language, that he reasonably hoped his labor would be rewarded by success, and the money he had expended would be repaid by a rapid and extensive sale. But, before his work came abroad, Scapula's abridgment appeared; which, from its size and price, was quickly purchased, while the *Thesaurus* itself lay neglected in the author's hands. The consequence was, a bankruptcy on the part of Stephens, while he who had occasioned it was enjoying the fruits of his treachery. Scapula's Lexicon was first printed in 1570, in 4to. It was afterwards enlarged and published in folio, and has gone through several editions. Its success is, however, not owing to its superior merit, but to its price and commodious size. Stephens charges the author with omitting many important articles. He accuses him of misunderstanding and perverting his meaning; and of tracing out absurd and trifling etymologies, which he himself had been careful to avoid. Doctor Busby would never permit his scholars at Westminster School to make use of Scapula's lexicon.

SCAPULAR, in anatomy, the name of two pairs of arteries, and as many veins.

SCAPULAR, or SCAPULARY, a part of the habit of several religious orders in the church of Rome, worn over the gown as a badge of peculiar veneration for the Blessed Virgin. It consists of two narrow slips or breadths of cloth covering the back and the breast, and hanging down to the feet. The devotees of the scapulary celebrate their festival on the 10th of July.

SCAR, *n. s. & r. a.* Fr. *escarre*; Gr. *ισχαρα*. A mark made by a hurt; a cicatrix: to mark in this way.

Yet I'll not shed her blood,
Nor scar that whiter skin of her's than snow,
And smooth as monumental alabaster. *Shakspeare*.
Scratch thee but with a pin, and there remains
Some scar of it. *Id.* As You Like It.

The soft delicious air,
To heal the scars of these corrosive fires,
Shall breathe her balm. *Milton*.

It may be struck out of the omniscience of God,
and leave no scar nor blemish behind. *More*.

This earth had the beauty of youth and blooming nature, and not a wrinkle, scar, or fracture on all its body. *Burnet*.

In a hemorrhage from the lungs, stypticks are often insignificant; and if they could operate upon the affected part, so far as to make a scar, when that fell off, the disease would return. *Arbuthnot on Diet*.

The boughs gave way, and did not tear
My limbs; and I found strength to bear
My wounds, already scarr'd with cold—
My bonds forbade to loose my hold. *Byron*.

SCARAB, *n. s.* Fr. *scarabée*; Lat. *scarabæus*. A beetle; an insect with sheathed wings.

A small scarab is bred in the very tips of elm-leaves: these leaves may be observed to be dry and dead, as also turgid, in which lieth a dirty, whitish, rough maggot, from which proceeds a beetle.

Derham's Physico-Theology.

SCARABÆUS, the beetle, in zoology, a genus of insects of the coleoptera order. The antennæ are of a clavated figure, and fissile longitudinally: the legs are frequently dentated. See ENTOMOLOGY. The wing-cases prevent the various injuries their real wings might sustain by rubbing or crushing against the sides of their abode. These, though they do not assist flight, yet keep the internal wings clean and even, and produce a loud buzzing noise when the animal rises in the air. The scarabæus sacer is very often found on Egyptian monuments. It is represented on the Isiac table; and is frequent among hieroglyphics: it passed as the symbol of immortality, and as the emblem of the sun. Another species was consecrated to Isis, and indicated the moon; its two horns resembling the crescent of that planet. According to Caylus, the Egyptians were in the constant habit of giving the shape of the scarabæus to their amulets or rings.

1. *S. capricornus*, the small gilded capricorn, is of a true gold color, but in some lights has a cast of green and purple. It is often found among reeds by the banks of rivers (Lister). A variety of this species, but which Lister makes a distinct species, called the yellow capricorn, has a large black spot on each of the cases of the wings. It is found among the dry hay in April.

2. *S. carnifex*, which the Americans call the tumble-dung, is all over of a dusky black, and, though not much larger than the common black beetle, is the strongest of the beetle kind. Their excellent smell directs them in flights to excrements, which they form into round balls or pellets, in the middle of which they lay an egg. These pellets, in September, they convey three feet deep in the earth, where they lie till the approach of spring, when the eggs are hatched and burst their nests, and the insects find their way out of the earth. They assist each other with indefatigable industry in rolling these globular pellets to the place where they are to be buried. This they perform with the tail foremost by shoving along the ball with their hind feet. They are always accompanied by other beetles of a larger size, and of a more elegant structure and color. The breast of this is covered with a shield of a crimson color, and shining like metal; the head is of the like color, mixed with green; and on the crown of the head stands a shining black horn, bending backwards. Hence these are called the kings of the beetles, though they partake of the same dirty drudgery with the rest.

3. *S. cerambyx*, the musk beetle, is one of the most beautiful of the English beetles. The male is much smaller than the female, and is of a mixed color of purple and gold; the female is more of a green color; the horns of the males also consist of longer joints; and in both sexes the horns hang over the back, and are longer

than the whole body. They are found among old willows, and often in the very wood. They are most numerous in July. They make a mournful sound when taken. See ENTOMOLOGY.

4. *S. Hercules*, the elephant beetle, is the largest of this kind hitherto known; and is found in South America, particularly in Guinea and Surinam, as well as about the river Orinoko.

SCARAMOUCHE, *n. s.* Fr. *escaramouche*, A buffoon in motley dress.

It makes the solemnities of justice pageantry, and the bench reverend puppets, or *scaramouches* in scarlet. Collier.

SCARBOROUGH, a town of Yorkshire, in the North Riding, seated on a steep rock, almost inaccessible except towards the west. On the top of this rock is a large green plain, with two wells of fresh water springing out of the rock. The town is well built; the principal streets are spacious and well paved, and the houses in general have a handsome appearance. A fine range of buildings on the cliff, commands a charming view. There is a commodious quay, and one of the finest harbours in the kingdom; to which belong many ships employed in the coal trade, from Newcastle to London. The harbour is protected by vast piers, extending a considerable way into the sea. A barrack has been erected here, with a strong battery of eighteen-pounders to protect the shipping. Scarborough has an excellent hospital for the widows of poor seamen, maintained by a rate on vessels, and a small deduction from seamen's wages; also an asylum for aged and infirm persons; an amicable society for clothing and educating about seventy boys and girls; a Lancasterian school, and numerous other benevolent institutions. It is a town corporate, governed by two bailiffs, a recorder, two coroners, four chamberlains, and thirty-six common councilmen, and has sent two members to parliament since the reign of Edward I. who are elected by the corporation. It has been principally frequented on account of its mineral waters, called the Scarborough Spa. The spring was under the cliff, part of which fell down in 1737, and the water was lost; but, in clearing away the ruins to rebuild the wharf, it was recovered. These waters are chalybeate and purging. When they are poured out of one glass into another, they throw up a number of air bubbles; and if they are shaken for some time in a phial close stopped, and the phial be suddenly opened before the commotion ceases, they emit an elastic vapor, with an audible noise, which shows that they abound in carbonic acid gas. At the fountain they have a brisk, pungent, chalybeate taste; but they lose their chalybeate virtues by exposure and by keeping. A person resides at the spa during the season, and receives a subscription from each person, one-eighth of which goes to the water servers, &c., and the rest to the corporation. Assemblies and balls are held at Scarborough as at Tunbridge. See MINERAL WATERS.

SCARCE, *adj. & adv.* } Ital. *scarso*; of Lat. SCARCELY, *adv.* } *carco*. Scanty; not SCARCENESS, *n. s.* } plentiful; rare: scantily; hardly: with SCARCITY.

difficulty: this is also the sense of scarcely: scarceness and scarcity mean want, scantiness, smallness of quantity; rareness.

A thing which we so little hoped to see, that even they which beheld it were scarcely believed their own senses. Hooker.

They that find fault with our store, should be least willing to reprove our scarcity of thanksgivings. Id.

When we our betters see bearing our woes, We scarcely think our miseries our foes. Shakespeare.

Scarcity and want shall shun you;

Ceres' blessing so is on you. Id.

You neither have enemies, nor can scarce have any. Dryden.

He scarcely knew him, striving to disown

His blotted form, and blushing to be known. Id.

Raphael writes thus concerning his Galatea:—To paint a fair one, 'tis necessary for me to see many fair ones; but, because there is so great a scarcity of lovely women, I am constrained to make use of one certain idea, which I have formed in my fancy. Id. Dugresnou.

A Swede will no more sell you his hemp for less silver, because you tell him silver is scarcer now in England, and therefore risen one-fifth in value, than a tradesman of London will sell his commodity cheaper to the Isle of Man, because money is scarcer there. Locke.

Corn does not rise or fall by the differences of more or less plenty of money, but by the plenty and scarcity that God sends. Id.

Age, which unavoidably is but one remove from death, and consequently should have nothing about it but what looks like a decent preparation for it, scarce ever appears, of late days, but in the high mode, the flaunting garb, and utmost gaudery of youth. South.

The scarcest of all is a Pescennius Niger on a medallion well preserved. Addison.

In this grave age, when comedies are few,

We crave your patronage for one that's new,

And let the scarceness recommend the fare. Id.

They drink very few liquors that have not lain in fresco, insomuch that a scarcity of snow would raise a mutiny at Naples. Id.

Since the value of an advantage is enhanced by its scarceness, it is hard not to give a man leave to love that most which is most servicable.

Collier on Pride.

SCARE, *v. a.* } Italian, *scorare*—Skinner: SCARECROW, } Goth. *skoar*, fright—Thom- SCAREFIRE. } son. To frighten; terrify: to strike with sudden fear: the compounds corresponding.

Therewith the scarecrow waxed wondrous proud,

Through fortune of his first adventure fair,

And with big thundering voice reviled him loud. Spenser.

They have scared away two of my best sheep, which, I fear, the wolf will sooner find than the master. Shakespeare.

We must not make a scarecrow of the law,

Setting it up to fear the birds of prey,

And let it keep one shape, 'till custom make it

Their perch, and not their terror. Id.

Many of those great guns, wanting powder and shot, stood but as cyphers and scarecrows. Raleigh.

Scarecrows are set up to keep birds from corn and fruit; and some report that the head of a wolf, whole, dried, and hanged up in a dove-house, will scare away vermin. Bacon.

The wing of the Irish was so grievously either galled or scared therewith, that, being strangers,

and in a manner neutrals, they had neither good heart to go forward, nor good liking to stand still, nor good assurance to run away. *Hayward.*

The drum and trumpet, by their several sounds, serve for many kind of advertisements; and bells serve to proclaim a *scarf*, and in some places water-breaches. *Holder.*

A *scarerow* set to frighten fools away. *Dryden.*

Let wanton wives by death be scar'd:

But, to my comfort, I'm prepar'd. *Prior.*

One great reason why men's good purposes so often fail, is, that when they are devout, or scared, they then in the general resolve to live religiously. *Calamy's Sermons.*

SCARF, *n. s. & v. a.* } Fr. *cscarfê*. Any

SCARF'SKIN. } thing that hangs loose upon the shoulders or dress: the epidermis.

The matrons flung their gloves,
Ladies and maids their scarfs and handkerchiefs,
Upon him as he passed. *Shakspeare. Coriolanus.*

Will you wear the garland about your neck, or under your arm like a lieutenant's scarf?

Shakspeare.

My sea-gown scarf about me in the dark
Groped I to find them out. *Id. Hamlet.*

How like a younker, or a prodigal
The scarfed bark puts from her native bay,
Hugg'd and embraced by the strumpet wind! *Id.*

Come, feeling night,
Scarf up the tender eye of pitiful day. *Id.*

Iris there, with humid bow,
Waters the' odorous banks, that blow
Flowers of more mingled hew
Than her purfled scarf can shew. *Milton.*

Titian, in his triumph of Bacchus, having placed Ariadne on one of the borders of the picture, gave her a scarf of a vermilion colour upon a blue drape. *Dryden.*

The ready nymphs receive the crying child:
They swathed him with their scarfs. *Id.*

My learned correspondent writes a word in defence of large scarves. *Spectator.*

The scarf-skin, being uppermost, is composed of several lays of small scales, which lie thicker according as it is thicker in one part of the body than another: between these the excretory ducts of the milary glands of the true skin open. *Cheyne.*

Put on your hood and scarf, and take your pleasure. *Swift.*

SCARFING, a term in carpentry, by which is meant the joining of two beams of wood together to increase the length. See CARPENTRY.

SCARFSKIN. See ANATOMY.

SCARIFY, *v. a.* } Fr. *scarifier*; Latin

SCARIFICATION, *n. s.* } *scarifico*. To let blood
SCARIFIER. } by incisions of the skin: the act of doing so: the agent or instrument.

Hippocrates tells you, that, in applying of cups, the scarification ought to be made with crooked instruments. *Arbuthnot.*

Washing the salts out of the eschar, and scarifying it, I dressed it. *Wiseman's Surgery.*

You quarter foul language upon me, without knowing whether I deserve to be cupped and scarified at this rate. *Spectator.*

SCARLET, *n. s. & adj.* Fr. *cscarlate*; Ital. *scarlato*. A color compounded of red and yellow; cloth dyed with a scarlet color; of this color

If we live thus tamely,
To be thus jaded by a piece of scarlet,
Farewel nobility. *Shakspeare. Henry VIII.*

I conjure thee,
By her high forehead, and her scarlet lip.

Shakspeare.

The Chinese, who are of an ill complexion, being olivaster, paint their cheeks scarlet. *Bacon.*

As a bull

Amid' the circus roars; provoked from far
By sight of scarlet and a sanguine war. *Dryden.*

The scarlet honour of your peaceful gown. *Id.*

Would it not be insufferable for a learned professor, and that which his scarlet would blush at, to have his authority of forty years standing in an instant overturned? *Locke.*

SCARLET (see DYEING), in painting in water colors, minium mixed with a little vermilion produces a good scarlet; but if a flower in a print is to be painted a scarlet color, the lights as well as the shades should be covered with minium, and the shaded parts finished with carmine, which will produce an admirable scarlet.

SCARLET is a beautiful bright red color given to cloth, either by a preparation of kermes, or more completely by the American cochineal. Professor Beckmann, in the second volume of his History of Inventions, has drawn the following conclusions:—1. That scarlet, or the kermes dye, was known in the east in the earliest ages, before Moses, and was a discovery of the Phœnicians in Palestine. 2. Tola was the ancient Phœnician name used by the Hebrews, and even by the Syrians; for it is employed by the Syrian translator, Isaiah, chap. i. ver. 18. Among the Jews, after their captivity, the Aramaean word zehorti was more common. 3. The Arabs received the name kermes, with the dye, from Armenia and Persia, where it was indigenous, and had been long known; and that name banished the old name in the east, as the name scarlet has in the west. About 1643 a Fleming named Kepler established the first dye-house for scarlet in England, at the village of Bow, near London; and on that account the color was called, at first, by the English, the Bow dye. In 1667 another Fleming, named Brewer, invited to England by king Charles II. with the promise of a large salary, brought this art to great perfection. There are three kinds of scarlet: one, called Venetian scarlet, dyed with hermes; another, dyed with cochineal; and the third with gum lac. The first of these is chiefly used for tapestry, and is remarkably permanent.

SCARLET FEVER. See MEDICINE.

SCARMAGE, or } For skirmish. Spen-
SCARMOGE, *n. s.* } ser.

Such cruel game my scarmages disarms;
Another war, and other weapons, I
Do love, when Love does give his sweet alarms.

Spenser.

SCARPANTO, or Kojé, the ancient Carpathos, an island in the Mediterranean, between Candia and Rhodes. It is for the most part rocky and mountainous, but contains several good harbours, iron mines, and quarries of marble. Long. 26° 50' E., lat. 35° 44' N.

SCARRON (Paul), a famous French burlesque writer, was the son of a counsellor in parliament.

and was born in Paris about the end of 1610, or beginning of 1611. His father marrying a second wife, he was compelled to assume the ecclesiastical habit. At the age of twenty-four he visited Italy, and after his return to Paris continued a life of reckless dissipation. But in 1638 while attending the carnival at Mens, of which place he was a canon, having dressed himself as a savage, his singular appearance excited the curiosity of the children of the town. They followed him in multitudes, and he was obliged to take shelter in a marsh, and this wet and cold situation produced a numbness which totally deprived him of the use of his limbs, which he never again recovered. He took up his residence in Paris, and the loss of his health was followed by the loss of his fortune, in a lawsuit with his step-mother; and mademoiselle de Hauteport, compassionating his misfortunes, procured for him an audience of the queen. The poet requested to have the title of valetudinarian to her majesty. The queen smiled, and Scarron considered the smile as the commission to his new office. Cardinal Mazarine gave him a pension of 500 crowns; but that minister having received disdainfully the dedication of his *Typhon*, the poet immediately wrote a *Mazarinade*, and the pension was withdrawn. He then attached himself to the prince of Condé, and celebrated his victories. He at length formed the extraordinary resolution of marrying, and was accordingly, in 1651, married to madame d'Aubigne (afterwards the celebrated madame de Maintenon), then only sixteen years of age. 'At that time,' says Voltaire, 'it was considered as a great acquisition for her to gain for a husband a man who was disfigured by nature, and very little enriched by fortune.' She restrained by her modesty his indecent buffooneries, and the literary men who had formerly resorted to his house again frequented it. But he lived with so little economy that his income was soon reduced to a small annuity, and what he styled his marquissate of Quinet, i. e. the profits of his publications, which were printed by one Quinet. Though Scarron wrote comedies, he had not patience to study the rules of dramatic poetry. It was the fashion of the times to pillage the Spanish writers. Scarron was acquainted with that language, and he found it easier to use materials already prepared, than to invent new subjects. The great success of his *Jodelet Maitre* was a great allurements to him. The comedians who acted it requested more of his productions. They were written with little toil, and procured him large sums. Christina, queen of Sweden, when she visited Paris, was anxious to see Scarron. 'I permit you,' said she to Scarron, 'to fall in love with me. The queen of France has made you her valetudinarian, and I create you my Roland.' Scarron did not long enjoy that title; as he died on the 14th of October, 1660, aged fifty-one. His works have been collected and published by Bruzen de la Martiniere, in 10 vols. 12mo., 1737. These are, 1. The *Aeneid* travestied, in eight books. 2. *Typhon*, or the Gigantomachia. 3. Many comedies; as *Jodelet*, or the Master Valet; *Jodelet cuffed*; *Don Japhet d'Armenie*; *The Scholar of Salamanca*. He also wrote other

pieces in verse. 4. His *Comic Romance*, in prose, merits attention. It is written with much humor and purity of style. 5. *Spanish Novels* translated into French. 6. A volume of *Letters*. 7. *Poems*; consisting of Songs, Epistles, Stanzas, Odes, and Epigrams. Scarron can raise a laugh on the most serious subjects; but his sallies are rather those of a buffoon than the effusions of ingenuity and taste. He is continually falling into the mean and the obscene.

SCATH, *v. a. & n. s.* } Sax. *ſceaðan*, *ſcea-*
SCATH'FUL, *adj.* } *ðan*. To waste; damage; destroy: the damage or waste done: the adjective corresponding. Both the verb and noun are now obsolete.

The ear that budded fair is burnt and blasted,
And all my hoped gain is turned to *scath*. *Spenser*.

He bore a spiteful mind against king Edward, doing him all the *scath* that he could, and annoying his territories. *Id.*

They placed them in Rhodes, where daily doing great *scath* to the Turk, the great warrior Soliman, with a mighty army, so overlaid them, that he won the island from them. *Knolles*.

A bawbling vessel was he captain of,
For shallow draught, and bulk unprizable,
With which such *scathful* grapple did he make,
That very envy, and the tongue of loss,
Cried fame and honour on him. *Shakspeare*.

Still preserved from danger, harm, and *scath*,
By many a sea and many an unknown shore. *Fairfax*.

As when Heaven's fire
Hath *scathed* the forest oaks, or mountain pines,
With singed top their stately growth, though bare
Stands on the blasted heath. *Milton's Paradise Lost*.

SCATTER, *v. a.* } Sax. *ſcætepan*; Belg.
SCATTER'INGLY, *adv.* } *ſchatteren*. To throw
SCATTER'LING, *n. s.* } loosely about; sprinkle; squander: the adverb corresponding: scatterling is a vagabond; one that has no home or settled habitation. An elegant word, says Johnson, but disused.

Samuel came not to Gilgal, and the people were scattered from Saul. *I Sam. xiii. 8.*

A king that sitteth in the throne of judgment,
scattereth away all evil with his eyes. *Prov. xx. 8.*

Such losels and scatterlings cannot easily, by any ordinary officer, be gotten, when challenged for any such fact. *Spenser*.

Sound diffuseth itself in rounds; but if that which would scatter in open air be made to go into a canal, it gives greater force to the sound. *Bacon*.

The Spaniards have here and there scatteringly, upon the sea-coasts, set up some towns. *Abbot*.

Adam by this from the cold sudden damp
Recovering, and his scattered spirits returned. *Milton*.

Those drops of prettiness, scatteringly sprinkled amongst the creatures, were designed to defecate and exalt our conceptions, not to inveigle or detain our passions. *Boyle*.

Why should my muse enlarge on Libyan swains,
Their scattered cottages and ample plains? *Dryden*.

Teach the glad hours to scatter, as they fly,
Soft, quiet, gentle love, and endless joy. *Prior*.

Corruption, still
Voracious, swallowed what the liberal hand
Of beauty scattered o'er the savage year. *Thomson*.

The sun
Shakes from his noon-day throne the scattering clouds. *Id*

SCAVENGER, *n. s.* From Sax. *peagan*, to shave, perhaps to sweep. Once a petty magistrate, whose province was to keep the streets clean: now the laborer employed in removing filth.

Since it is made a labour of the mind, as to inform men's judgments, and move their affections, to resolve difficult places of Scripture, to decide and clear off controversies, I cannot see how to be a butcher, scavenger, or any other such trade does at all qualify men for this work. *South.*

Fasting's Nature's scavenger. *Baynard.*
Dick the scavenger, with equal grace,
Flirts from his cart the mud in Walpole's face. *Swift.*

SCAURUS (M. Æmilius), a Roman consul, who distinguished himself by his eloquence at the bar, as well as by his victories in Spain as a general. He was sent against Jugurtha, but was suspected of having been bribed by that monarch. He, however, conquered the Ligurians, and, during his censorship, built the Milvian bridge at Rome, and paved the Æmilian road. He wrote several books, particularly his own life, but none of them are extant.

SCAURUS (M. Æmilius), son of the preceding, is famous for having erected a large and grand theatre at Rome, while he was ædile. It was so capacious that it would contain 30,000 spectators; it was supported by 360 columns of marble, and adorned with 3000 brazen statues.

SCELERAT, *n. s.* Lat. *sceleratus*. A villain; a wicked wretch. A word introduced unnecessarily from the French by a Scottish author.

Scelerats can by no arts stifle the cries of a wounded conscience. *Cheyne.*

SCELERATUS, in Roman antiquity, the name given a street in Rome, formerly called Cyprius, from the horrible wickedness of Tullia, the wife of Tarquin II., who ordered her charioteer to drive her chariot over the body of her wounded father. See **ROME**. Also the name of a plain at Rome, near the Colline gate, so named from the Vestal Minucia being buried alive in it for adultery.

SCENE, *n. s.* Fr. *scene*; Lat. *scena*; Gr.

SCEN'RY. { *σκηνη*. The stage; a theatre of dramatic poetry: hence the general appearance of any action; a display; a series; part of a play: the words are nearly synonymous.

The king is set from London, and the scene is now transported to Southampton. *Shakspeare.*

The alteration of scenes feeds and relieves the eye, before it be full of the same object. *Bacon.*

Cedar and pine, and fir and branching palm,
A sylvan scene; and as the ranks ascend
Shade above shade, a woody theatre
Of stateliest view. *Milton.*

To make a more perfect model of a picture, is, in the language of poets, to draw up the *scenery* of a play. *Dryden.*

A mute scene of sorrow, mixt with fear:
Still on the table lay the unfinished cheer. *Id.*

If his characters were good,
The scenes entire, and freed from noise and blood,
The action great, yet circumscribed by time,
The words not forced, but sliding into rhyme,
He thought, in hitting these his business done. *Id.*

He must gain a relish of the works of nature, and

be conversant in the various scenery of a country life. *Addison.*

Eternity! thou pleasing, dreadful thought!
Through what variety of untried beings,
Through what new scenes and changes must we pass! *Id.*

Say, shepherd say, are these reflections true?
Or was it but the woman's fear that drew
This cruel scene, an just to love and you? *Prior.*

Our author would excuse these useful scenes
Begotten at his entrance. *Granville.*

The progress of the sound, and the scenery of the bordering regions, are imitated from Æn. vii. on the sounding the horn of Ælecto. *Pope.*

To complete
The scene of desolation, stretched around
The grim guards stand. *Thomson.*

'Tis well, if looked for at so late a day,
In the last scene of such a senseless play.
True wisdom will attend his feeble call,
And grace his action ere the curtain fall. *Couper.*

SCENE, in its primary sense, denoted a place where dramatic pieces and other public shows were exhibited. The original scene for acting of plays was as simple as the representations themselves; it consisted only of a plain plot of ground proper for the occasion, which was in some degree shaded by the neighbouring trees, whose branches were made to meet together, and their vacancies supplied with boards, sticks, and the like; and, to complete the shelter, these were sometimes covered with skins, and sometimes with only the branches of other trees, newly cut down and full of leaves. Afterwards **more** artificial scenes, or scenical representations, were introduced, and paintings used instead of the objects themselves. Scenes were then of three sorts; tragic, comic, and satiric. The tragic scene represented stately magnificent edifices, with decorations of pillars, statues, and other things suitable to the palaces of kings. The comic exhibited private houses with balconies and windows, in imitation of common buildings; and the satiric was the representation of groves, mountains, dens, and other rural appearances; and these decorations either turned on pivots, or slid along grooves.

SCENE is also a part or division of a dramatic poem. Thus plays are divided into acts, and acts are subdivided into scenes. Whenever, therefore, a new actor appears, or an old one disappears, the action is changed into other hands; and therefore a new scene then commences.

SCENICK, *adj.* Fr. *scenique*, from *scene*. Dramatic; theatrical.

With *scenick* virtue charm the rising age. *Anon.*

SCENOGRAPHICAL, *adj.* Gr. *σκηνη*,
SCENOGRAPHICALLY, *adv.* { and *γραφω*.

Drawn in perspective.

If the workman be skilled in perspective, more than one face may be represented in our diagram *scenographically*. *Mortimer.*

SCENT, *n. s.* & *v. a.* Fr. *sentir*, to smell; Ital. *sentire*. The power of smelling; the smell; the object of smell; chase by the smell: to smell; to perfume.

Belman cried upon it at the meekest loss,
And twice to-day picked out the dullest scent. *Shakspeare.*

The plague, they report, hath a *scent* of the smell
of a mellow apple. *Bacon.*

Good *scents* do purify the brain,
Awake the fancy, and the wits refine. *Davis.*

Exulting, 'till he finds their nobler sense
Their disproportioned speed does recompense;
Then curses his conspiring feet, whose *scent*
Betrays that safety which their swiftness lent. *Denham.*

Partake
The season, prime for sweetest *scents* and airs. *Milton.*

So *scented* the grim feature, and upturned
His nostrils wide into the murky air,
Sagacious of his quarry from so far. *Id.*
He gain'd the observations of innumerable ages,
and travelled upon the same *scent* into Æthiopia. *Temple.*

Balm, from a silver box, distilled around,
Shall all bedew the roots, and *scent* the sacred
ground. *Dryden.*

Actæon spies
His opening hounds, and now he hears their cries;
A generous pack, or to maintain the chase,
Or snuff the vapour from the *scented* grass. *Addison.*

Cheerful health,
His duteous handmaid, through the air improved,
With lavish hand diffuses *scents* ambrosial. *Prior.*
A hunted hare treads back her mazes, crosses and
confounds her former track, and uses all possible
methods to divert the *scent*. *Watts.*

The crystal waters round us fa'
The merry birds are lovers a',
The *scented* breezes round us blow,
A' wandering w' me Davie. *Burns.*

SCPTICS, an ancient sect of philosophers, founded by Pyrrho, who, according to Laetius, had various other denominations. From their master they were called Pyrrhonians; from the distinguishing tenets or characteristic of their philosophy they derived the name of Aporetici, from ἀπορειν, to doubt; from their hesitation they were called ephetici, from ἐπεχειν, to stay or keep back; and lastly, they were called zetetici, or seekers, from their never getting beyond the search of truth. That the sceptical philosophy is absurd can admit of no dispute in the present age; and that many of the followers of Pyrrho carried it to the most ridiculous height is no less true. But we cannot believe that he himself was so extravagantly sceptical as has sometimes been asserted, when we reflect on the particulars of his life, which are still preserved, and the respectful manner in which we find him mentioned by his contemporaries, and writers of the first name who flourished soon after him. The truth, as far as at this distance of time it can be discovered, seems to be, that he learned from Democritus to deny the real existence of all qualities in bodies, except those which are essential to primary atoms, and that he referred every thing else to the perceptions of the mind produced by external objects; in other words, to appearance and opinion. All knowledge of course appeared to him to depend on the fallacious report of the senses, and consequently to be uncertain; and in this notion he was confirmed by the general spirit of the Eleatic school in which he was educated. He was further confirmed in his scepticism by the subtleties of the Dialectic schools, in which he had been

instructed by the son of Stilpo; choosing to overturn the cavils of sophistry by recurring to the doctrine of universal uncertainty, and thus breaking the knot which he could not unloose; for, being naturally and habitually inclined to consider immoveable tranquillity as the great end of all philosophy, he was easily led to despise the dissensions of the dogmatists, and to infer from their endless disputes the uncertainty of the questions on which they debated; controversy, as it has often happened to others, becoming also with respect to him the parent of scepticism. Pyrrho's doctrines, however new and extraordinary, were not totally disregarded. He was attended by several scholars, and succeeded by several followers, who preserved the memory of his tenets. The most eminent of his followers was Timon, in whom the public succession of professors in the Pyrrhonic school terminated. In the time of Cicero it was almost extinct, having suffered much from the jealousy of the dogmatists, and from a natural aversion in the human mind to acknowledge total ignorance, or to be left in absolute darkness. The disciples of Timon, however, still continued to profess scepticism, and their notions were embraced privately at least by many others. The school itself was afterwards revived by Ptolemæus, a Cyrenian, and was continued by Enesidemus, a contemporary of Cicero, who wrote a treatise on the principles of the Pyrrhonic philosophy, the heads of which are preserved by Photius. A system of philosophy thus founded on doubt, and clouded with uncertainty, could neither teach tenets of any importance, nor prescribe a certain rule of conduct; and accordingly we find that the followers of scepticism were guided entirely by chance. As they could form no certain judgment respecting good and evil, they accidentally learned the folly of eagerly pursuing any apparent good, or of avoiding any apparent evil; and their minds of course settled into a state of undisturbed tranquillity, the grand postulatam of their system. In the schools of the sceptics we find ten distinct topics of argument urged in support of the doctrine of uncertainty; with this precaution, however, that nothing could be positively asserted, either concerning their number or their force. These arguments chiefly respect objects of sense; they place all knowledge in appearance; and, as the same things appear very different to different people, it is impossible to say which appearance most truly expresses their real nature. They likewise say that our judgment is liable to uncertainty from the circumstance of frequent or rare occurrence, and that mankind are continually led into different conceptions concerning the same thing by custom, law, fabulous tales, and established opinions. On all these accounts they think every human judgment is liable to uncertainty; and concerning any thing they can only assert that it seems to be, not that it is what it seems. This doubtful reasoning, if reasoning it may be called, the sceptics extended to all the sciences in which they discovered nothing true, or which could be absolutely asserted. In all nature, in physics, morals, and theology, they found contradictory opinions, and inexplicable or incomprehensible

phenomena. In physics the appearances they thought might be deceitful; and, respecting the nature of God and the duties of morality, men were, in their opinion, equally ignorant and uncertain. But scepticism has not been confined to the ancients and to the followers of Pyrrho. Numerous sceptics have arisen in modern times, varying in their principles, manners, and character, as chance, prejudice, vanity, weakness, or indolence prompted them. The great object, however, which they seem to have had in view was to overturn, or at least to weaken, the evidence of analogy, experience, and testimony; some of them have even attempted to show that the axioms of geometry are uncertain, and its demonstrations inconclusive. Most of our readers must be well acquainted with the essays of Hume, and with the able confutations of them by doctors Reid, Campbell, Gregory, and Beattie, who have likewise exposed the weakness of the sceptical reasonings of Des Cartes, Malbranche, and other philosophers of great fame in the same school.

SCÉPTRE, *n. s.* } *Fr. sceptre*; *Lat. scep-*
SCÉPTERED, *adj.* } *trum.* The ensign of
royalty borne in the hand: the adjective corresponding.

Nor shall proud Lancaster usurp my right,
Nor hold the *sceptre* in his childish fist.

Shakspeare.

How, best of kings, do'st thou a *sceptre* bear!
How, best of poets, do'st thou laurel wear!
But two things rare the fates had in their store,
And gave thee both, to shew they could no more.

Ben Jonson.

The court of Rome has, in other instances, so well attested its good menagery, that it is not credible crowns and *sceptres* are conferred gratis.

Decay of Piety.

I sing the man who Judah's *sceptre* bore
In that right hand which held the crook before.

Cowley.

The parliament presented those acts which were prepared by them to the royal *sceptre*, in which were some laws restraining the extravagant power of the nobility.

Clarendon.

The *sceptered* heralds call
To council, in the city-gates.

Milton's Paradise Lost.

A shilling dipt in the bath may go for gold among the ignorant, but the *sceptres* on the guinea show the difference.

Dryden.

To Britain's queen the *sceptered* suppliant bends,
To her his crowns and infant race commends.

Tickel.

The Lily's height bespoke command,

A fair imperial flower;

She seemed designed for Flora's hand,

The *sceptre* of her power.

Couper.

Became religion, and the heart ran o'er
With silent worship of the great of old!—

The dead but *sceptered* sovereigns, who still rule

Our spirits from their urns.

Byron.

The **SCÉPTRE** is a kind of royal staff, or baton, born on solemn occasions by kings, as a badge of their command and authority. Nicod derives the word from the Greek *σκηπτρον*, which he says originally signified 'a javelin,' which the ancient kings usually bore as a badge of their authority. But *σκηπτρον* does not properly signify a javelin, but a staff to rest upon, from *σκηπτω*, 'I lean upon.' Accordingly, in the sim-

licity of the earlier ages of the world, the sceptres of kings were no other than long walking staves: and Ovid, in speaking of Jupiter, describes him as resting on his sceptre (*Met. i. v. 178*). The sceptre is an ensign of royalty of greater antiquity than the crown. The Greek tragic and other poets put sceptres in the hands of the most ancient kings they ever introduce. Justin observes that the sceptre, in its original, was an hasta, or spear. He adds, that, in the most remote antiquity, men adorned the hastæ or sceptres as immortal gods; and that it was upon this account, that, even in his time, they still furnished the gods with sceptres.—Neptune's sceptre is his trident. In process of time, the king's sceptre became covered with ornaments in copper, ivory, gold, or silver, and also with symbolical figures. The sceptre borne by the Roman emperors, as on their medals, &c., is surmounted, when these princes are in the consular habit, with a globe topped by an eagle. Phocas is imagined to have been the first who added a cross to his sceptre; and his successors even substituted the former emblem for the latter, bearing ornamented crosses alone. Richard Cœur de Lion held in his right hand a golden sceptre surmounted by a cross, and, in his left, a golden baton, topped by the figure of a dove. Tarquin the Elder was the first who assumed the sceptre among the Romans. Le Cendre tells us, that, in the first race of the French kings, the sceptre was a golden rod, almost always of the same height with the king who bore it, and crooked at one end like a crozier. Frequently instead of a sceptre, kings are seen on medals with a palm in their hand.

SCHAAF (Charles), a learned German, born at Nuys, in the electorate of Cologne, in 1646. His father was major in the army of the landgrave of Hesse-Cassel. He studied divinity at Duisbourg; and, having acquired the oriental languages, became professor in that university in 1677. In 1679 he was invited to Leyden in the same capacity, where he settled and died in 1729, of an apoplexy. He published several works on oriental learning; of which the principal is his *Grammatica Chaldaica et Syriaca*.

SCHIEFFERA, in botany, a genus of the tetrandria order, and diœcia class of plants: *cal.* quadripetalous: *cor.* quadripetalous, quinquepetalous, and often wanting; the fruit is a bilocular berry with one seed. Of this there are two species:

1. *S. completa*, and *S. latiflora*, both natives of Jamaica; and growing in the lowlands near the sea.

SCHÆSBURG, a district of Transylvania, belonging to the Saxons, lying along the great Kockel. It contains 210 square miles, with about 20,000 inhabitants. Though hilly, it has no high mountains, and is divided into the Upper and Lower Circles, both of which have good pasture and vines.

SCHÆSBURG, or **SEGESVAR**, a town of Transylvania, situated near the Great Kockel. It is divided into the Upper and Lower Town. The former stands on a hill, nearly 250 feet in height, and is fortified; the latter is built on the plain, and open. The inhabitants are chiefly Lutherans,

and have here four churches, with a gymnasium. The principal employments are the weaving of linen, and spinning cotton. The environs produce vines and other fruit. The present town was begun in 1178; but several ruins, and a number of medals found, show that it was occupied by the Romans. Forty-seven miles E. S. E. of Clausenburg, and 120 north-east of Temesvar. Inhabitants 6000.

SCHAFFHAUSEN, a fine town in the north of Switzerland, situated near the frontiers of Suabia, on the Rhine. Its buildings are the large parish church of St. John, an academy with seven professors, besides other teachers, the town library, town-hall, and market house. The transit trade of this place has long been considerable, owing chiefly to its situation about a league above the celebrated cataract of the Rhine, which necessitates all the goods brought down the river to be landed here. The manufactures are of silk, cotton, and leather, and are considerable, and the wine raised in the neighbourhood forms also an article of export. A wooden bridge of ingenious construction, is here thrown across the Rhine, and forms the only channel of communication between this town and the rest of Switzerland. It is 360 feet in length, and consists of two very wide arches. It was first erected in 1758, after the repeated destruction by inundations of the preceding stone bridge; and though burnt by the French troops, in their retreat in 1799, has been rebuilt. Twenty-five miles west of Constance, and fifty east by north of Bale.

SCHAFFHAUSEN, a canton in the north of Switzerland, with an extent of 170 square miles, a number of small hills, but no mountains, except one called the Randen. The climate is temperate, the soil various, and the products wheat, barley, oats, vines and other fruits. The towns and manufactures are inconsiderable. The inhabitants are, with few exceptions, Calvinists. Population 32,000.

SCHALCKEN (Godfrey), an eminent Dutch painter, born at Dort in 1643. He was a disciple of Gerard Douw, whose style he adopted. He resided some time in London, and painted the portrait of king William III. by candle light, the king holding the candle. He was equally eminent in history. He died in 1706.

SCHATEN (Nicolas), a learned Jesuit, who flourished in the seventeenth century. He wrote several works, but that for which he is most celebrated is his History of Lower Germany. It is esteemed very correct, and abounds with interesting researches. He died about 1697.

SCHATZK, a town in the interior of European Russia, in the government of Tambov, on Schata. It has a considerable traffic in hemp, hardware, and silk. Ninety-six miles north of Tambov, and 216 south-east of Moscow. Inhabitants 5700. Long. 41° 56' E., lat. 54° 26' N.

SCHAUENBURG, a district of Hesse, in the north-west of Germany, situated at a distance from the rest of the elector's territories, and consisting of the south and east parts of the principality of Schauenburg-Lippe. Its area is about 210 square miles. It is in general level and fertile. In its government it is independent

of the other states of the electorate. Population 24,000.

SCHAUENBURG, or SCHAUMBURG-LIPPE, a principality of the German empire, in Westphalia, worth about £22,000 annually, bounded by Hanover, Prussian Westphalia, and the province of Schauenburg belonging to Hesse-Cassel. Its extent is above 210 square miles. Population 24,000. The soil is fertile, both for tillage and pasturage. The chief manufactures are thread and linen.

SCHEDULE, *n. s.* Fr. *schedule*; Lat. *schedula*. A small scroll; a list or inventory.

The first published *schedules* being brought to a grave knight, he read over an unsavory sentence or two, and delivered back the libel. *Hooker.*

I will give out *schedules* of my beauty; it shall be inventoried, and every particle and utensil labelled to my will. *Shakspeare.*

All ill, which all
Prophets or poets spake, and all which all
Be annexed in *schedule* unto this by me,
Fall on that man!

Donne.

A SCHEDULE is a scroll of paper or parchment annexed to a will, lease, or other deed; containing an inventory of goods, or some other matter omitted in the body of the deed. The word is a diminution of the Latin *scheda*, or Greek *σχῆδη*, a leaf or piece of paper.

SCHÉELE (Charles William), an eminent Swedish chemist, born in 1742, at Stralsund. When very young he received the usual education at a private school; and at a very early age showed a strong desire to follow the profession of an apothecary. With Mr. Bauch, an apothecary at Gottenburg, he passed an apprenticeship of six years, and laid the first foundation of his knowledge. Among the various books which he read, on chemical subjects, Kunkel's Laboratory was his favorite. He repeated many of the experiments in that work privately in the night, when the rest of the family were asleep. A friend of Scheele's had also excited his attention to experiments in chemistry by advising him to read Neuman's Chemistry. After his departure from Gottenburg in 1765 he obtained a place with Kalstrom, an apothecary at Malmo. In 1767 he went to Stockholm, and in 1773 to Upsal, where he had free access to the University Laboratory. Here also he commenced the friendship which subsisted between him and Bergman. During his residence at this place, Prince Henry of Prussia, accompanied by the duke of Sunderland, visited Upsal, and went to see the Acade-mical Laboratory, and Scheele was appointed by the university to exhibit some chemical experiments to them; and he showed some of the most curious processes in chemistry. In 1777 Scheele was appointed by the Medical College to be apothecary at Koping, where he showed his abilities. When he was at Stockholm he discovered the fluoric acid; and whilst at Upsal, he made many experiments to prove its properties. At the same place he began his series of experiments on manganese. At Koping he finished his Dissertation on Air and Fire; a work which the celebrated Bergman most warmly recommended in the friendly preface which he wrote for it. The theory which Scheele endeavours to

prove in this treatise is, that fire consists of pure air and phlogiston. The author's merit in this work was sufficient to obtain the approbation of the public; as the ingenuity displayed in handling so delicate a subject, and the many new and valuable observations dispersed through the treatise, justly entitled the author to that fame which his book procured him. The English translation is enriched with the notes of Richard Kirwan. Scheele now diligently employed himself in contributing to the Transactions of the Academy at Stockholm. He first pointed out a new way to prepare the salt of benzoïn. In the same year he discovered that arsenic, prepared in a particular manner, partakes of all the properties of an acid, and has its peculiar affinities to other substances. In a Dissertation on Flint, Clay, and Alum, he clearly overturned Beaume's opinion of the identity of the siliceous and argillaceous earths. He published also an Analysis of the Human Calculus. He published an excellent dissertation on the different sorts of ether. His investigation of the coloring matter in Prussian blue, the means he employed to separate it, and his discovery that alkali, sal ammoniac, and charcoal, mixed together, will produce it, are strong marks of his penetration and genius. The valuable discoveries of this great philosopher, many of which are to be found in the Transactions of the Royal Society at Stockholm, are too numerous for us to attempt to give a list of them. Most of his essays have been published in French by madame Picardet, and M. Morveau of Dijon. Dr. Beddoes also made a very valuable English translation of the greater part of Scheele's dissertations, to which he has added some useful and ingenious notes. His last dissertation was his very valuable observations on the acid of the gall-nut. See GALLIC ACID. The character of Scheele, as a chemist, is too generally established to need any eulogium. He mixed but little with society; as, when his profession permitted him, he was employed in his experimental enquiries. His chemical apparatus was neither neat nor convenient; his laboratory was small and confined; nor was he particular in regard to the vessels which he employed in his experiments, so that it is surprising how such discoveries, and such elegant experiments, could have been made under such disadvantages. He understood none of the modern languages except the German and Swedish; so that he was compelled to wait till discoveries were conveyed to him through the slow channel of translation. An offer was made to him of an annuity of £300 if he would settle in this country; but death put an end to this project. He died in May 1786.

SCHEFFER (John), a learned German, born at Strasburg in 1621. He became eminent as a critic on Greek and Latin authors. Being obliged to leave his native country on account of the wars in 1648 he retired to Sweden, where queen Christina was patronising all men of letters. He was soon after professor of eloquence and politics at Upsal; honorary professor royal of the law of nature and nations; and assessor of the royal college of antiquities; and at last librarian of the university of Upsal. He published several learned works; particularly *De Militia Navali Veterum*. He died in 1679.

SCHEGKIUS (James), a learned German physician and professor, of the seventeenth century, born at Schorndorf, in the duchy of Wirtemberg. He was first appointed professor of philosophy in Tübingen; and afterwards professor of medicine for thirteen years. He wrote several works on philosophy, medicine, and theology; of which the most celebrated is his work *De Animæ Principatu*; an cordi, an cerebri, tribunus.

SCHNEIDER (Christopher), a German mathematician, astronomer, and jesuit, eminent as the first who discovered spots on the sun, was born at Schwaben in the territory of Middleheim in 1575. He first discovered these dark places on the sun's disk in 1611, and made observations on these phenomena at Rome, until at length, reducing them to order, he published them in one volume folio in 1630. He wrote also other tracts, relating to mathematics and philosophy, and died in 1690.

SCHELD, or SCHELD, a large river of the Netherlands, which, rises in the French department of the Aisne, and flows in a northerly direction by Cambray, Bouchain, and Denain, to Valenciennes, where it becomes navigable. From Valenciennes it diverges to Conde and Tournay, inclining to the north-east, after which it flows nearly north, passes Oudenarde, and reaches Ghent, where it is joined by the Lys. From Ghent it winds to Antwerp; and, being now swelled into a wide river, becomes divided into the two branches of East and West Scheldt, both of which discharge themselves into the German Ocean. It is of a slow current, hence well called by Goldsmith 'the lazy Scheldt,' and of a small body of fresh water, but in the lower part of its course, of great importance to navigation. The Dutch, to increase the commerce of Amsterdam, kept it long blocked by two forts. It has been free only since 1795. The number of merchant vessels that entered it in 1815 was 1006, of which 500 were British. The whole length of its course is about 200 miles.

SCHNELESTADT, or SCHLETTSTADT, a town in the east of France, department of the Lower Rhine, on a canal that communicates with the Meuse. It is covered on one side by marshes, and on the other it is strongly fortified. It has some manufactures of tobacco, caps, stockings, salt-petre, potash, soap, and earthenware. The art of glazing earthenware is said to have been invented here. It was confirmed to France at the peace of Westphalia in 1648. Population 7500. Twenty-five miles south-west of Strasburg.

SCHNELLINGS (William), an eminent Dutch painter, born at Amsterdam in 1631. He painted history and landscapes, but chiefly excelled in sea pieces. His chief work is a picture of Charles II. embarking for England, at the Restoration; in which the figures are well grouped. He died in 1678.

SCHNELLINGS (Daniel), a younger brother of William, was born at Amsterdam in 1633. He was also reputed a good landscape painter. He died in 1701.

SCHEME, *n. s.* } Gr. *σχημα*. A plan; com-
SCHEMER, } bination of various things
SCHEMATISM. } into one view or design; a

system; a combination of the aspects of the heavenly bodies.

It is a *scheme* and face of heaven,

As th' aspects are disposed this even. *Hudibras.*

It hath embroiled astrology in the erection of *schemes*, and the judgment of death and diseases.

Browne.

Were our senses made much quicker, the appearance and outward *scheme* of things would have quite another face to us, and be inconsistent with our well-being.

Locke.

He forms the well concerted *scheme* of mischief; 'Tis fix'd, 'tis done, and both are doomed to death.

Rowe.

The haughty monarch was laying *schemes* for suppressing the ancient liberties, and removing the ancient boundaries of kingdoms.

Atterbury.

The stoical *scheme* of supplying our wants by lopping off our desires, is like cutting off our feet when we want shoes.

Swift.

Every particle of matter, whatever form or *schematicism* it puts on, must in all conditions be equally extended, and therefore take up the same room.

Creech.

Hope calculates its *schemes* for a long and durable life; presses forward to imaginary points of bliss, and grasps at impossibilities; and consequently very often ensnares men into beggary, ruin, and dishonour.

Addison.

SCHERNITZ, or **SELMECZ-BANJA**, a well-built and large mining town of Hungary, stands in the midst of the most picturesque scenery, a few miles from the Raab, and contains a number of good houses and tolerably wide streets. It contains, including the suburb of Bela-Banja, about 23,000 inhabitants, of whom 12,000 are employed about the mines of Schemnitz, the most extensive in Hungary. The extent of ground containing the ores is calculated at five or six miles square, and includes the town, which is undermined. The works are now at a great depth, the old tunnel for drawing off the water being nearly 1100 feet below the surface, and the new still lower. Schemnitz is a favorable situation for a mining school, and there has been here one of celebrity since the middle of the eighteenth century. A fund for experiments is allowed by government. Forty-six miles north of Gran, and eighty-three east north of Presburg.

SCHESIS, *n. s.* Gr. *σχέσις*. Habitudo; state of any thing with respect to other things.

f that mind which has existing in itself from all eternity all the simple essences of things, and consequently all their possible *scheses* or habitudes, should ever change, there would arise a new *schesis* in the mind, which is contrary to the supposition. *Norris.*

SCHUCHZERIA, in botany, lesser flowering rush, a genus of the trigynia order, and hexandria class of plants; natural order fifth, tripetaloideæ: *cal.* sexpartite: *cor.* none; styles none: *caps.* three inflated and monospermous. Species one only, a native of Europe.

SCHIAVONA (Andrew), a celebrated painter, born at Sebenico, in Dalmatia, in 1522. His parents were so poor that they could not procure him a master; but, being merely employed as a servant about a painter's shop, he rose by the force of his own genius to a high degree of fame. He showed great taste in his drapery and the attitudes of his figures. He died at Venice in 1582.

SCHICKARD (William), professor of Hebrew in the university of Tubingen, was born in 1592. He wrote various learned works: as, 1. A Hebrew Grammar entitled *Hiorologium Schickardi*; 2. *De Jure Regio Judæorum*, Leipzig, 1674, 4to.; 3. *Series Regum Persiæ*, Tubing. 1621, 4to. He died of the plague in 1635, aged forty-three.

SCHIDONE (Bartholomew), an eminent history and portrait painter, born at Modena in 1560. He studied in the school of the Caracci, but adopted the style of Corregio. His genius was great, but he lost its advantages by gaming. He died in 1616.

SCHIECH. See **SHEIK**.

SCHIEDAM, a considerable town of the Netherlands, in South Holland, situated on the river Schie, a short way from its influx into the Maese. It is noted for its very numerous distilleries of gin (Hollands), of which there are no less than 200 in the town. This article forms its chief export; but the inhabitants take part also in the herring fishery. Population 9000. Schiedam has a small harbour, and is four miles west of Rotterdam, and six south by east of Delft.

SCHILLER (Frederick), was born November 10th, 1759, at Marbach in Wirtemberg, where his father was a lieutenant in the service of the duke. While a boy Schiller was distinguished by uncommon ardor of imagination; and he was sent to the military school at Stuttgart called Charles's Academy. Schiller was originally destined for the profession of surgery, and prosecuted that study with great zeal, especially anatomy and physiology, which opened an extensive field to his highly inquisitive mind. His first publication was his *Robbers*, which was ordered to be suppressed, principally on account of the following passage:—'This ruby I drew from the finger of a rascal whom I threw down at the feet of his sovereign in the chase. By adulation he had raised himself from the lowest rank to be the favorite of the prince; the fall of his neighbour was the means of his greatness, and the tears of orphans assisted in his elevation. This diamond I took from another of the crew, who sold honors and offices to the highest bidder, and pushed from his door the dejected patriot.' It will be recollected that Schiller lived in the same country where Schubart languished for eight years of horror in the fortress of Hohenasperg. Schiller, therefore, did not think it advisable to await the decision of his own fate, especially as he had inserted an obnoxious poem on tyranny in Schubart's chronicle. He fled to Mannheim. Here he at first had recourse to his surgical attainments for a subsistence. He was appointed surgeon to a regiment, till his friends opened for him a career more adapted to his talents, and procured him the post of dramatist to the theatre of Mannheim. The fruits of this appointment are, *The Conspiracy of Fiesco*, and *Intrigue and Love*. The Rhenish Thalia likewise deserves to be mentioned. Schiller however was not quite contented with his situation; and, without other fortune, the fortune of his genius inspired him with confidence in himself, and his fame gave him reason to hope that he should

everywhere meet with friends. He left Manheim for Mentz, where he had the good fortune to become acquainted with the duke of Weimar, to whom he read the first act of his *Don Carlos*. Soon after this interview he visited Saxony, where Dresden captivated him by its treasures of art, its rich library, and the men of genius whom he found there. His *Don Carlos*, which he continued during his residency at Dresden, was soon interrupted. He began to read every thing that related to Philip; the library of Dresden afforded him abundant materials; and he became imperceptibly so deeply interested that he neglected poetry for a time, and attended solely to history, to which we are indebted for his *Revolt of the Netherlands* from the Spanish Government. At Leipsic, or rather at Gohlis, a charming village near that city, where he passed a summer with M. Goschin, he continued and completed his *Don Carlos*. From Leipsic Schiller removed to Weimar, where Weiland, whom he for a time assisted in the publication of the *German Mercury*, received him with cordiality. Some years afterwards Schiller was appointed professor of history at Jena, and taught that science with almost unexampled applause. That he might be able to study and to labour with less interruption, he reversed the order of nature. However singular it may appear, it is not the less true, that at the evening he might be found at his breakfast, and at midnight deeply engaged in business. The stamp of midnight is in fact strikingly impressed on many of his compositions. At length, however, Goethe invited him back to Weimar, where he composed his *Maid of Orleans*, of the first representation of which at Leipsic the following account is given by an eye-witness and a friend of Schiller: 'I repaired,' says he, 'from Lanchstadt to Leipsic, and should not have repented the journey, had I only witnessed the respect paid to Schiller, in a manner perhaps unparalleled in the annals of the German stage. Notwithstanding the heat, the house was crowded almost to suffocation. No sooner had the curtain dropped at the conclusion of the first act, than a thousand voices exclaimed, as with one mouth, 'Long live Frederick Schiller!' and the sound of drums and of trumpets joined in the expression of universal applause. The modest author returned thanks from his box with a bow, but all the spectators had not been able to obtain a sight of the object of their admiration. You may therefore conceive how, when the play was over, all thronged out of the house to see him. The extensive space from the theatre to the Ranstadt gate was crowded with people. He came out, and in a moment a passage was cleared. 'Hats off!' exclaimed a voice; the requisition was universally complied with; and thus the poet proceeded through multitudes of admiring spectators, who all stood uncovered, while parents in the back ground raised their children in their arms, and cried, That is Schiller.' This distinguished writer died in 1805.

SCHILLING (Diebold), a native of Soleure, in Switzerland, the greffier of a tribunal in Berne, in the fifteenth century. He wrote in the German language, A History of the War between

the Swiss and Charles le Temeraire, Duke of Burgundy; which was published at Berne in 1743, in folio. The author was present in almost all the battles he describes.

SCHINUS, in botany, Indian mastic, a genus of the decandria order, and diœcia class of plants; natural order forty-third, dumosa: MALE CAL. quinquefid; the petals five: FEMALE, flower the same as in the male; the berry trilocous. Species two, natives of Peru and Brasil.

SCHISM, *n. s.* } Fr. *schisme*; Gr. }
SCHISMATICAL, *adj.* } *σχίσμα*. A separa-
SCHISMAT'ICALLY, *adv.* } tion or division in
SCHISMATIC, *n. s.* } the church: the derivatives corresponding.

No known heretick nor *schismatich* should be suffered to go into those countries. Bacon.

Set bounds to our passions by reason, to our errors by truth, and to our *schisms* by charity.

King Charles.
By these tumults all factions, seditions, and *schismatical* proposals against government, ecclesiastical and civil, must be backed. Id.

Thus you behold the *schismatic's* bravadoes: Wild squeaks in squibs, and Calamy in grenado's.

Butler.
Oppose *schisms* by unity, hypocrisy by sober piety, and debauchery by temperance. Sprat.

Here bare anathemas fall but like so many bruta fulmina upon the obstinate and *schismatical*, who are like to think themselves shrewdly hurt by being cut off from that body which they chuse not to be of, and so being punished into a quiet enjoyment of their beloved separation. South.

When a *schism* is once spread, there grows at length a dispute which are the *schismatics*: in the sense of the law the *schism* lies on that side which opposes itself to the religion of the state. Swift.

The *schismatics* united in a solemn league and covenant to alter the whole system of spiritual government. Id.

SCHISM is chiefly used of separations happening from diversity of opinions among people previously of the same religion and faith. Among ecclesiastical authors, the great schism of the west is that which happened in the times of Clement VII. and Urban VI., which divided the church for forty or fifty years, and was at length ended by the election of Martin V., at the council of Constance. The Romanists number thirty-four schisms in their church. They bestow the name English schism on the reformation of religion in this kingdom. Some of the church of England apply the term schism to the separation of the nonconformists, viz. the presbyterians, independents, and anabaptists, for further reformation.

SCHLICHTINGIUS (Jonas, De Bukowic), a Unitarian author, born in Poland in 1596; where he preached till he was expelled by the diet of Warsaw, in 1647. He then retired to Muscovy, and settled at Zullichaw; where he died in 1661. His works were printed at Amsterdam in 1766.

SCHMIDT (Erasmus), a learned German, born at Delitzsch in Misnia, in 1560. He became professor of Greek and mathematics at Wirtenberg, where he taught these sciences with great reputation for many years, and died in 1637. He published an edition of Pindar, with a Latin

version and a commentary in 4to. 1616: also editions with learned notes of Lycophron, Dionysius, Periegetes, and Hesiod; which last was published at Geneva in 1693.

SCHNEEBERG, a town of Saxony, fifty-three miles W.S.W. of Dresden, and seven W.N.W. of Schwarzenberg. It contains 4400 inhabitants; has several public schools, and some manufactures, of which that of smalts is the largest in Saxony: others are connected with the neighbouring mines. The quantity of gold extracted from these is said to have been formerly considerable. At present the chief products of the mines are silver, cobalt, bismuth, iron, some tin and lead.

SCHOEFFER (Peter), a German painter, who flourished in the middle of the fifteenth century, and was one of the latest improvers of the art, by the discovery of the matrix in type-founding.

SCHIOENOBATES, (from the Greek, *σχοινογ*, a rope, and *βαινω*, I walk), a name which the Greeks gave to their rope-dancers: by the Romans called funambuli. The schœnobates were slaves whose masters profited by entertaining the people with their feats of activity. Mercurialis de arte gymnasticâ, lib. iii. gives us five figures of schœnobates engraven after ancient stones.

SCHIOENUS, in botany, bastard cyprus, marsh, or round rush, a genus of the monogynia order, and triandria class of plants; natural order third, calamariæ. The glumes are paleaceous, univalved, and thickset: cor. none; and only one roundish seed between the glumes. Species forty, natives chiefly of the Cape.

SCHIOEPFLIN (John Daniel), a learned German, born at Sulzburg, in the Brigaw, in 1694, He became professor of history in the Lutheran university of Strasburg. He was offered the same professorship at Francfort on the Oder, at Upsal in Sweden, at the famed university of Leyden, and was invited to Petersburg, by the czarina to be historiographer imperial, but he preferred Strasburg. In 1725 he pronounced a congratulatory oration in the name of the university before king Stanislaus, on the marriage of his daughter with the king of France; which was printed with some other tracts. He died at Strasburg in 1771.

SCHOL'AR, *n. s.* } Fr. *ecolier*; Lat. *scho-*
SCHOL'ARSHIP, } *laris, scholar*. A dis-
SCHOLAS'TIC, *adj.* } ciple; one who learns

cilioussness: the compounds do not appear to need explanation.

Una her besought to be so good
As in her virtuous rules to school her knight.

Faerie Queene.

Fair Una 'gan Fidelia fair request,
To have her knight unto her schoolhouse placed.

Spenser.

Many times that which deserveth approbation would hardly find favour, if they which propose it were not to profess themselves *scholars*, and followers of the ancients.

Hooker.

The favour of proposing there, in convenient sort, whatsoever ye can object, which thing I have known them to grant, of *scholastick* courtesy unto strangers, never hath nor ever will be denied you.

Id.

Adrian VI. was some time *schoolmaster* to Charles V.

Knolles.

He's gentle, never *schooled*, and yet learned.

Shakspeare.

You shall go with me;
I have some private *schooling* for you both.

Id.

Schoolboys' tears take up

The glasses of my sight.

Id.

Is all forgot?

All *schooldays* friendship, childhood, innocence? *Id.*

My cousin William is become a good *scholar*: he is at Oxford still, is he not?

Id.

I, thy *schoolmaster*, have made thee more profit

Than other princes can, that have more time

For vainer hours, and tutors not so careful.

Id.

The king, though no good *schoolman*, converted one of them by dispute.

Bacon.

If a man's wit be not apt to distinguish or find differences, let him study the *schoolmen*.

Id.

To spend too much time in studies, is sloth; to make judgment wholly by their rules, is the humour of a *scholar*: they perfect nature, and are perfected by experience.

Id.

Sir Francis Bacon was wont to say, that those who left useful studies for useless *scholastick* speculations, were like the Olympick gamesters, who abstained from necessary labours, that they might be fit for such as were not so.

Id.

The ancient sophists and rhetoricians lived till they were an hundred years old; and so likewise did many of the grammarians and *schoolmasters*, as Orbilius.

Id.

No crazed brain could ever yet propound,
Touching the soul, so vain and fond a thought;

But some among these masters have been found,
Which in their *schools* the self-same thing had taught.

Davies.

He grins, smacks, shrugs, and such an itch en-
dures,

As 'prentices or *schoolboys*, which do know

Of some gay sport abroad, yet dare not go.

Donne.

To *schoolmen* I bequeath my doubtfulness,

My sickness to physicians.

Id.

Scholastic education, like a trade, does so fix a man in a particular way, that he is not fit to judge of any thing that lies out of that way.

Burnet's Theory.

The first principles of Christian religion should not be forced with *school* points and private tenets.

Saunderson.

My end being private, I have not expressed my conceptions in the language of the *schools*.

Digby.

I would render this intelligible to every rational man, however little versed in *scholastic* learning.

Id. on Bodies.

Let no man be less confident in his faith, concerning the great blessings God designs in these divine mysteries, by reason of any difference in the

several *schools* of Christians, concerning the consequent blessings thereof.

Taylor.

This same *scholar's* fate res angusta domi, hinders the promoting of learning.

Wilkins.

This place should be *school* and university, not needing a remove to any other house of *scholarship*.

Milton.

Both sides charge the other with idolatry, and that is a matter of conscience, and not a *scholastic* nicety.

Stillingfleet.

Their age the same, their inclinations too,
And bred together in one *school* they grew. *Dryden.*

School your child,

And ask why God's anointed he reviled. *Id.*

Thy flattering method on the youth pursue;

Joined with his *schoolfellow's* by two and two:

Persuade them first to lead an empty wheel,

In length of time produce the laboring yoke. *Id.*

Such precepts I have selected from the most considerable which we have from nature, that exact *schoolmistress*.

Id.

A man may find an infinite number of propositions in books of metaphysics, *school* divinity, and natural philosophy, and know as little of God, spirits, or bodies, as he did before.

Locke.

The emulation of *schoolfellow's* often puts life and industry into young lads.

Id.

To watch occasions to correct others in their discourse, and not slip any opportunity of shewing their talents, *scholars* are most blamed for.

Id.

A father may see his children taught, though he himself does not turn *schoolmaster*.

South's Sermons.

No moralists or casuists, that treat *scholastically* of justice but treat of gratitude, under that general head as a part of it.

South.

The *scholars* of the Stagyritye,

Who for the old opinion fight,

Would make their modern friends confess

The difference but from more to less. *Prior.*

My *schoolmistress*, like a vixen Turk,

Maintains a lazy husband by our work.

Gay.

If this be *schooling*, it is well for the considerer:

I'll engage that no adversary of his shall in this sense ever *school* him.

Atterbury.

Unlearned, he knew no *schoolman's* subtle art;

No language, but the language of the heart. *Pope.*

It pities my very heart to think that a man of my master's understanding, and great *scholarship*, who had a book of his own in print, should talk so outrageously.

Id.

Once he had heard a *schoolboy* tell,

How Semele of mortal race

By thunder died.

Swift.

Writers on that subject have turned it into a composition of hard words, trifles, and subtilities, for the mere use of the *schools*, and that only to amuse men with empty sounds.

Hutts.

Men of nice palates could not relish Aristotle, as he was drest up by the *schoolmen*.

Baker.

Warped by the world in Disappointment's *school*,

In words too wise, in conduct there a fool:

Too firm to yield, and far too proud to stoop,

Doomed by his very virtues for a dupe,

He cursed those virtues as the cause of ill,

And not the traitors who betrayed him still. *Byron.*

A SCHOLIAST, or commentator, is a grammarian who writes scholia, or notes, &c., upon ancient authors who have written in the learned languages.

SCHOLION, *n. s.* Lat. *scholium*. A note;

SCHOLIUM, } an explanatory observa-

SCHOLIAST, } tion: Hooker only uses

SCHOLY. } scholy in this sense:

scholiast is a writer of such notes.

Hereunto have I added a certain gloss or *scholium*, for the exposition of old words, and harder phrases, which manner of glossing and commenting will seem strange in our language.

Spenser.

That *scholy* had need of a very favourable reader, and a tractable, that should think it plain construction, when to be commanded to the word, and grounded upon the word, are made all one. *Hooker.*

The title of this satyr, in some ancient manuscripts, was the reproach of idleness; though in others of the *scholiasts*, 'tis inscribed against the luxury of the rich.

Dryden.

What Gellius or Stobæus cooked before,
Or chewed by blind old *scholiasts* o'er and o'er.

Pope.

Some cast all their metaphysical and moral reasoning into the method of mathematicians, and bring every thing relating to these abstracted or practical sciences under theorems, problems, postulates, *scholiums*, and corollaries.

Hutts.

SCHOMBERG (Frederick Armand duke of), a distinguished officer, the son of count Schomberg, by an English lady, daughter of lord Dudley, was born in 1608. He entered into the military life under Frederick Henry prince of Orange, and served under his son William II. of Orange. He then repaired to the court of France, where his reputation was so well established that he obtained the government of Gravelines, Furnes, and the adjacent countries. The French court soon after sent Schomberg to assist the Portuguese against the Spaniards, which he effectually did. The court of Spain was compelled to solicit peace in 1668, and to acknowledge the right of the house of Braganza to the throne of Portugal. For his services he was created count Mentola in Portugal; and a pension of £5000 was bestowed upon him, with the reversion to his heirs. In 1673 he came over to England to command the army; but, the English being then disgusted with the French nation, Schomberg was suspected; and therefore returned to France, which he soon left, and went to the Netherlands. In June 1676 he compelled the prince of Orange to raise the siege of Maestricht; and was raised to the rank of marshal of France. Upon the revocation of the edict of Nantes, when the persecution commenced against the Protestants, Schomberg, who was of that persuasion, requested leave to retire into his own country. This was refused; but he was permitted to take refuge in Portugal, where he had reason to expect he would be kindly received on account of past services. But the bigotry of the Portuguese, though it did not prevent them from accepting assistance from a heretic when their kingdom was threatened with subversion, would not permit them to give him shelter when he came for protection. The inquisition interfered, and obliged the king to send him away. He then went to Holland, and the elector of Brandenburg made him governor of Ducal Prussia, and commander in chief of his forces. When the prince of Orange sailed to England, to take possession of its crown, Schomberg obtained permission from the elector to accompany him. In April 1689 he was made K. G., and naturalised by act of parliament; and in May following was created a baron, earl, marquis, and duke of Eng-

and, by the title of baron Teys, earl of Brentford, marquis of Harwich, and duke of Schomberg. The house of commons voted to him £100,000, as a reward for his services. Of this he only received a small part; but after his death a pension of £5000 a year was bestowed upon his son. In August 1689 he was sent to Ireland to reduce that kingdom. When he arrived he found himself at the head of an army consisting only of 12,000 foot and 2000 horse, while king James commanded an army three times as numerous. Schomberg thought it dangerous to engage with so superior a force, and, being disappointed in his promised supplies from England, remained on the defensive. He posted himself at Dundalk, about five or six miles from James, who was encamped at Ardee. For six weeks he remained in this position, without attempting to give battle, while, from the wetness of the season, he lost nearly the half of his army. Schomberg was much blamed for not coming to action; but had he risked an engagement, and been defeated, Ireland would have been lost. At the famous battle of the Boyne, which decided the fate of James, Schomberg passed the river at the head of his cavalry, defeated eight squadrons, and broke the Irish infantry. When the French Protestants lost their commander, Schomberg went to rally and lead them on to charge. While thus engaged, a party of king James's guards passed Schomberg in attempting to rejoin their own army. They attacked him with great fury, and gave him two wounds in the head. The wounds were not dangerous, but the French Protestants, thinking their general was killed, fired upon the guards, and shot him dead. He was buried in St. Patrick's cathedral.

SCHONBURG, a county of Saxony, which belonged to Bohemia till the treaty of Teschen, in 1779, when it was ceded to Saxony. It adjoins the circles of Leipsic and the Erzgebirge, has an extent of about 340 square miles, and a population of 61,000.

A **SCHOOL** is a public place, wherein the languages, the arts, or sciences are taught. See **EDUCATION**. The Latin *schola*, according to Du Cange, signifies discipline and correction; he adds that it was anciently used, in general, for all places where several persons met together, to study, converse, or do any other matter. Accordingly, there were *scholæ palatinæ*, being the several posts wherein the emperor's guards were placed; *schola scutariorum*, *schola gentiliū*, &c. At length the term passed also to civil magistrates; and, accordingly, in the code we meet with *schola chartulariorum*, *schola agentium*, &c.; and even to ecclesiastics, as *schola cantorum*, *schola sacerdotum*, &c.

SCHOONER, in naval affairs, a small vessel with two masts, whose main-sail and fore-sail are suspended from gaffs, reaching from the mast towards the stern, and stretched out below by booms, whose foremost ends are hooked to an iron, which clasps the mast so as to turn therein as upon an axis, when the after-ends are swung from one side of the vessel to the other.

SCHOREL (John), a Flemish painter, who was also a musician and linguist, born in 1495, at Schore in Holland. He studied under Al-

bert Durer; and travelled into Germany, where a friar prevailed on him to accompany him to Jerusalem, where he painted several relics of antiquity. On his return he visited Venice and Rome, where pope Adrian VI. appointed him superintendent of the buildings at Belvidere. On Adrian's death he returned to the Netherlands, and refused an offer from Francis I. of France, to settle in Paris. He died in 1562.

SCHORNDORF, a neat town of Wirtemberg, on the Rems, seventeen miles east of Stuttgart. The chief manufacture is coarse woollens. The environs have always been noted for their wine. Inhabitants 3500.

SCHIOTIA, in botany, a genus of the monogynia order, and decandria class of plants; natural order thirty-third, lomentaceæ: *CAL.* semiquinquefid: *COR.* with five petals, which are equal; the tube is turbinate, caraceous, and persistent. The legumen pedicelled, and contains two seeds; there is only one species, viz.

S. speciosa, the African lignum vitæ.

SCHOTTUS (Andrew), a learned Jesuit, born at Antwerp, in 1552. He studied at Louvain, and afterwards went to Paris; whence he travelled into Spain, and became professor of Greek at Toledo. He published several tracts, and died at Antwerp in 1629.

SCHOTTUS (Gaspar), professor of mathematics, at Wirtemberg, who first published an account of Guericke's discovery of the Air-pump, in 1657, in a work entitled *Mechanica Hydraulico-Pneumatica*. In 1664 he published a more full account of it, in his *Technica Curiosa*, a curious collection of all the wonderful experiments, &c., then known in Europe.

SCHOUTEN'S ISLAND, an island on the east coast of Van Diemen's Land, consisting almost entirely of lofty black mountains, separated by deep reaches.

SCHOUWEN, an island of the province of Zealand, at the mouth of the Scheldt. Its extent, fifteen miles in length and five in breadth, was formerly greater, a part of it having been overflowed by the sea. In 1809 it was occupied by the British forces. The chief town is Zierikzee.

SCHREVELIUS (Cornelius), a laborious Dutch critic and writer, born at Haerlem, in 1615; who has given the public some editions of the ancient authors more elegant than correct: his Greek Lexicon is esteemed the best of all his works. He died in 1667.

SCHROETER (John Samuel), an eminent musician born in Saxony. He came to London in 1774, with his father, who was also a musician, but of no great eminence. But young Schroeter improved himself under the famous Emanuel Bach; and some time after composed a set of Lessons for the Piano-forte, which Napier published, and paid him liberally for the copyright. This raised his fame, and procured him several scholars. After the publication of his first set of Concertos, he obtained the lead in all musical entertainments. About this time he married a young lady, who was his pupil, through whom he became entitled to a large fortune; but her friends threatening him with the terrors of the court of chancery, he gave up his claim, for

an annuity of £500, with this condition, that he should perform no more in public. But the prince of Wales not long after appointed him one of his band of music with a liberal salary. His last Set of Sonatas, with an elegant accompaniment for the violin and violincello, were composed at the desire of the prince, to whom it was dedicated. He died in 1785.

SCHULTENS (Albert), professor of Hebrew and of the eastern languages at Leyden, was born at Groningen, where he studied till 1706, and continued his studies at Leyden and Utrecht. He at length applied himself to the study of Arabic; in which he made great progress. A short time after he became minister of Wassenar, and two years after professor of the eastern tongues at Francker. At length he was invited to Leyden, where he taught Hebrew and the eastern languages with great reputation till his death, in 1750. His principal works are, 1. A Commentary on Job, 2 vols. 4to. 2. A Commentary on the Proverbs. 3. *Vetus et regia via Hebraizandi*. 4. *Animadversiones Philologicae et Criticae ad varia loca Veteris Testamenti*. 5. A Treatise on Hebrew roots. 6. An excellent Hebrew grammar, &c. Schultens discovered in his works sound criticism and much learning. He maintained, in opposition to Gousset and Driessen, that to have a perfect knowledge of Hebrew it is necessary to join with it, not only the Chaldee and Syriac, but more particularly the Arabic.

SCHUMEG, or **SOMOGYI-VARMEGYE**, a palatinate of Hungary, between the Balaton lake and the Drave. Its area is 2430 square miles; generally level, and in many places marshy, and unhealthy. The inhabitants are of very various races, and there are many Jews. The county takes its name from the old castle of Somogy or Schumeg, but the chief town is Kaposvar. Population 170,000.

SCHUMLA, **SCHUMNA**, or **CIUMLA**, a large and very strong town in the north-east of European Turkey, on the road from Constantinople to Wallachia. It is situated in the province of Silistria, about fifty miles south of the Danube, which is here in the lower part of its course. It is supposed to occupy the site of the ancient Marcianopolis. In general not well built, it still contains many handsome mosques and baths. Its castle is one of the chief Turkish posts (indeed the principal one) between Adrianople and the Russian frontier. The importance of this place altogether has never been more decidedly evinced than in the recent struggle for the possession of it, between Russia and Turkey. The population, as in other Turkish towns, is unascertained by any ancient register, but is said to amount to 30,000. Its trade consists chiefly in the wine of the country, the manufacture of hardware, and in consequence of German cloth being cheap here in the manufacture of cloth for the Turkish metropolis. From the marshy nature of the neighbouring country, strangers, it is said, cannot remain here even a few days without being seized with intermittent fever. The great natural features of this part of Turkey are the Danube and the long mountain range of Balkan, the ancient *Hæmus*. They extend from west to east, in a direction nearly parallel, at a distance of about

100 miles; and Schumla stands half way between them. On the east, at the distance of seventy miles, is the Euxine; on the west the interior of Bulgaria.

SCHUYLKILL, a river of Pennsylvania, United States, which rises in Luzerne county, north-west of the Kittatinny mountains, through which it passes, runs south-east into the Delaware, six miles below Philadelphia. It is 140 miles long, and navigable for boats for ninety. The Tulpehocken, a navigable stream, flows into the Schuylkill one mile and a half above Reading. There are falls on the river five miles above Philadelphia, and Swedes falls a little below Norristown. A canal, connecting the Swatara with the Tulpehocken will unite the waters of the Schuylkill with those of the Susquehanna.

SCHWALBEA, in botany, a genus of the angiospermia order, and didynamia class of plants: *cal.* quadrifid, with a superior lobe; the lowermost longest, and emarginated. Species one only, a North American plant, with a fine dark red flower.

SCHWARTS, or **SCHWARTZ** (Cornelius), an eminent history painter, born at Ingolstadt in 1550, who was distinguished by the appellation of the German Raphael. He learned the first principles of the art in his own country, but finished his studies at Venice; when he not only made the works of Titian his models, but received some personal instructions from that illustrious master. His performances were soon in high esteem, and he was invited by the elector of Bavaria to his court, and appointed his principal painter. He died in 1594; and his most capital works, as well in fresco as in oil, are in the palace at Munich, and in the churches and convents.

SCHWARTZ (Bartholemew or Bertholet), a native of Friburg in Germany, who flourished in the thirteenth and fourteenth centuries, and is remarkable for being the discoverer of gunpowder, in 1320.

SCHWARTZ (Christian Frederick), a missionary to the East Indies, born at Sonnenburg, in the Newmark, October 26th, 1726, went to Halle in 1746, and entered at the University, by the advice of the ex-missionary Schulze. When he had continued his oriental studies for a-year and a half, he was persuaded to go out to the East and proceeded to England with two other gentlemen destined for the same service: in July 1750 they arrived at Tranquebar. Mr. Schwartz, in 1767, was taken into the service of the English Society for the promotion of Christian knowledge, when he removed to Trichinopoly; and there and at Tanjore passed the remainder of his life. At both places he also received from the government of Madras £100 a-year, as garrison preacher, which sum he is said to have expended in building a church at Trichinopoly, &c. He was held in high esteem by the Hindoos; and the rajah of Tanjore made him tutor to his son. He died February 13th, 1796, at Tanjore, and his body was interred in his own church.

SCHWARTZENBERG, a small principality of Franconia, in the dominions of Bavaria. Its area is somewhat less than 100 square miles. The prevailing religion is Lutheran. The princes

of this house are descended from one of the oldest families in Franconia, and owe their revenue and political power less to this principality than to their extensive domains in Bohemia and other parts of Germany. The total population on their estates, or in towns in which they hold property, is computed at 130,000. The head of the house was made a prince of the empire in 1670, but mediatised in 1806.

SCHWARTZBURG, a district in the interior of Germany, divided into two counties. One of them adjoining Saxe-Gotha, the other, farther to the south, is near the Russian province of Erfurt. The area of the whole is 1166 square miles; very hilly, but interspersed with fertile valleys, extending along the banks of the rivers. The forests are extensive, and contain mines of iron, alum, and cobalt; also quarries of marble, freestone, and slate. The manufactures are insignificant. The princes of Schwartzburg are of great antiquity, and divided into the two branches of Sondershausen and Rudolstadt, residing respectively at the towns of these names. Both are members of the Germanic body, under the constitution of 1815; and the territories of both are nearly equal in population and income (that is each numbers about 50,000 subjects). Each county has its cabinet, its treasury, and its distinct courts of justice.

SCHWEIDNITZ, a principality of the Prussian province or government of Reichenbach, bounded on the south by Bohemia, and including a territorial extent of not quite 1000 square miles, partly hilly, and partly level: it produces corn in large quantities; and the flocks of sheep and manufacturing villages are numerous. Inhabitants 180,000.

SCHWEITZ, or SCHWYZ, a canton of Switzerland, lying contiguous to the lakes of Zug and Lucerne. Its extent is about 466 square miles, surrounded by Alpine mountains, between which are a few valleys. The chief mountains are Rigi in the south-west corner, above 6000 feet in height; Prigel in the south-east, above 5500; and Mytten, situated between the two, of 6300 feet. The soil and climate of course are fitter for pasturage than for tillage. Manufactures are almost unknown. Inhabitants about 30,000. Here, in the beginning of the fourteenth century, the standard of the Swiss liberty was first erected, and this petty canton had the honor of giving a name to the confederation, and the inhabitants made a spirited but unavailing resistance to the French in 1798, and suffered severely in 1799, when Switzerland became the theatre of war.

SCHWENKFIELDIA, in botany, a genus of the monogynia order, and pentandria class of plants: *cal.* quinquefid: *cor.* funnel-shaped: stigma parted into five: the berry quinquelocular, with a number of seeds. Of this there are three species, viz. *S. aspera*, and *S. cinerea*, both natives of Guiana. *S. hirta* is a native of Jamaica. The leaves of all of them are remarkably rough, and stick to the fingers or clothes.

SCHWENKIA, in botany, a genus of the monogynia order, and diandria class of plants: *cor.* almost equal, plaited at the throat, and glandulous; there are three barren stamina: *caps.* bi-

locular and polyspermous. Species one only, a Guiana plant.

SCHWERIN, the capital of the duchy of Mecklenburg-Schwerin, is situated on the west side of the lake of this name, and surrounded with a rampart. It is divided into the Old Town, the New Town, the Moor, and the suburbs. The grand ducal palace is situated on an island in the lake: it is fortified, and communicates with the town by a draw-bridge; its ornaments are the picture gallery and park. Of Schwerin, the chief buildings and institutions are the high church, formerly a cathedral, two other Lutheran churches, a Catholic church, poor house, orphan house, infirmary, and synagogue. The manufactures are trifling: but brewing and distilling are carried on to some extent. In 1759 this town was taken by the Prussians, after a bombardment, and laid under a heavy contribution; and occupied in 1806 by the French. Population 8500. Sixty miles east of Hamburg, and seven-teen south of Wismer.

SCIACCA, or XACCA, a large sea-port on the south-west of Sicily, in the Val di Mazzara, called anciently *Thermæ Selinuntia*, from the warm baths on the east side of the town. It is situated at the foot of St. Calagere, and has a good appearance from a distance. It is still surrounded by a wall, and contains 12,000 inhabitants.

SCIÆNA, in ichthyology, a genus belonging to the order of thoracici. The membrane of the gills has six rays; the opercula and whole head are scaly. There are five species, the following is the most worthy of notice:

S. umbra, sea-crow, or umbre, of a black color, in shape resembling a perch; ventral and anal fins black, as if dyed with ink; back variegated with undulating lines, of dark brown and blue; snout sharp; mouth capacious. This fish is caught in the Mediterranean, and sold under the name of umbrino in the markets of Rome.

SCIATHERICAL, *adj.* } Fr. *sciaterique*;
SCIATHERIC. } Greek *σκαθηρικος*.

Belonging to a sun-dial.

There were also, from great antiquity, *sciatheretical* or sun-dials, by the shadow of a stile or gnomon denoting the hours; an invention ascribed unto Anaximenes by Pliny.

SCIATICA, *n. s.* } Fr. *sciatique*; Lat. *is-*
SCIAT'IC, } *chiadica passio*. The hip
SCIAT'ICAL, *adj.* } gout.

Thou cold *sciatica*,
Cripple our senators, that their limbs may halt
As lamely as their manners. *Shakspeare. Timon.*

The Scythians, using continual riding, were generally molested with the *sciatica* or hip-gout.

Browné's Vulgar Errors.
In 'obstinate *sciatical* pains, blistering and cauteries have been found effectual. *Arbuthnot.*

Racked with *sciatick*, martyred with the stone,
Will any mortal let himself alone? *Pope.*

SCIENCE, *n. s.*, } Fr. *science*; Latin
SCIENTIAL, *adj.* } *scientia*. Knowledge;
SCIENTIFIC, } that part of our know-
SCIENTIFICALLY, *adv.* } ledge which is built
on principles in particular. See below: *scient-*
tial means productive of science: *scientific*
pertaining to, or indicating or producing demon-
strative knowledge: the adverb corresponding.

No science doth make known the first principles whereon it buildeth; but they are always taken as plain and manifest in themselves, or as proved and granted already, some former knowledge having made them evident.

Hooker.

I present you with a man
Cunning in music and the mathematics,
To instruct her fully in those sciences. *Shakspeare.*

If we conceive God's sight or science, before the creation, to be extended to all and every part of the world, seeing every thing as it is, his prescience or foresight of any action of mine, or rather his science or sight, from all eternity, lays no necessity on any thing to come to pass, more than my seeing the sun move hath to do in the moving of it. *Hammond.*

No where are there more quick, inventive, and penetrating capacities, fraught with all kind of scientific knowledge. *Howel.*

From the tree her step she turned;
But first to reverence done, as to the power
That dwelt within; whose presence had infused
Into the plant scientific sap, derived
From nectar, drink of gods. *Milton's Paradise Lost.*

The indisputable mathematics, the only science
Heaven hath yet vouchsafed humanity, have but few
votaries among the slaves of the Stagirite.

Glanville's Scopsis.

Natural philosophy proceeding from settled principles, therein is expected a satisfaction from scientific progressions, and such as beget a sure or rational relief.

Broune's Vulgar Errors.

Science perfects genius, and moderates that fury of the fancy which cannot contain itself within the bounds of reason. *Dryden.*

The systems of natural philosophy that have obtained are to be read more to know the hypotheses, than with hopes to gain there a comprehensive, scientific and satisfactory knowledge of the works of nature. *Locke.*

Sometimes it rests upon testimony, because it is easier to believe than to be scientifically instructed. *Id.*

No man, who first traffics into a foreign country has any scientific evidence that there is such a country, but by report, which can produce no more than a moral certainty; that is, a very high probability, and such as there can be no reason to except against. *South.*

Good sense, which only is the gift of Heaven,
And, though no science, fairly worth the sev'n. Pope.
So you arrive at truth, though not at science.

Berkley.

SCIENCE, in philosophy, denotes any doctrines deduced from self evident principles. Sciences, according to Locke, may be properly divided as follows:—1. The knowledge of things, their constitutions, properties, and operations; this, in a little more enlarged sense of the word, may be called *φυσική*, or natural philosophy; the end of which is speculative truth. See PHILOSOPHY and PHYSICS.—2. The skill of rightly applying these powers, *πρακτική*. The most considerable under this head is ethics, which is the seeking out those rules and measures of human actions that lead to happiness, and the means to practise them (see MORAL PHILOSOPHY); and the next is mechanics, or the application of the powers of natural agents to the uses of life. See MECHANICS. 3. The doctrine of signs, *σημειωτική*; the most usual of which being words, it is aptly enough termed logic. See LOGIC. This, says Mr. Locke, seems to be the most general, as well as natural, division of the objects of our understand-

ing; for a man can employ his thoughts about nothing but either the contemplation of things themselves for the discovery of truth; or about the things in his own power, which are his actions, for the attainment of his own ends: or the signs the mind makes use of both in the one and the other, and the right ordering of them for its clearer information. All which three, viz. things as they are in themselves knowable, actions as they depend on us in order to happiness, and the right use of signs in order to knowledge, being toto cælo different, they seem to be the three great provinces of the intellectual world, wholly separate and distinct one from another.

SCILLA, the squill, in botany, a genus of the monogynia order and hexandria class of plants, natural order tenth, coronariæ: cor. hexapetalous and deciduous; the filaments filiform. The most remarkable species is the

S. maritima, or sea onion, whose roots are used in medicine. Of this there are two sorts, one with a red and the other with a white root; which are supposed to be accidental varieties, but the white are generally preferred for medicinal use. The roots are large, somewhat oval-shaped, composed of many coats lying over each other like onions; and at the bottom come out several fibres. From the middle of the root arise several shining leaves, which continue green all the winter, and decay in the spring. Then the flower stalk comes out, which rises two feet high, and is naked half way, terminating in a pyramidal thyrse of flowers, which are white, composed of six petals, which spread open like the points of a star. This grows naturally on the sea shores, and in the ditches, where the salt water flows with the tide. Sometimes the roots which are bought for use put forth their stems and produce flowers, as they lie in the druggists' shops. This root is very nauseous to the taste, intensely bitter, and so acrimonious, that it ulcerates the skin if much handled. Taken internally, it powerfully stimulates the solids, and promotes urine, sweat, and expectoration. If the dose is considerable, it proves emetic and purgative. It yields the whole of its virtues to aqueous and vinous menstrua, and likewise to vegetable acids.

SCILLY ISLES, a cluster of small islands and rocks situated in the Atlantic Ocean, nearly ten leagues west of the Land's End. These islands were first called Cassiterides, or the Tin Isles, from their being rich in that metal. Strabo says these islands were ten in number, lying close together, of which only one was uninhabited; the people led an erratic life, lived upon the produce of their cattle, wore an under garment which reached down to their ankles, and over that another, both of a black color, girt round a little below the breast with a girdle, and walked with staves in their hands. The riches of these islands were tin and lead, which, with the skins of their cattle, they exchanged with the Phœnicians for earthenware, salt, and utensils made of brass. Other ancient writers style these islands Hesperides, from their western situation, and Oestrymnides, asserting that the land was extremely fertile, as well as full of mines; and that the people, though very brave, were addicted to commerce, and boldly passed the seas

in their leather boats. The Romans were exceedingly desirous to obtain a share in this commerce, which the Phœnicians as carefully labored to prevent, by concealing their navigation to these islands. At length, however, the Romans prevailed; and Publius Crassus, coming thither, was so well pleased with the industry and manners of the people, that he taught them various improvements, as well in working their mines, which till that time were but shallow, as in carrying their merchandise to different markets. We find them called in the itinerary of Antoninus, *Sigdeles*; by Sulpitius, *Sillenæ*; and by Solinus they are termed *Silures*. All we know of them after this period is, that their tin trade continued, and that sometimes state prisoners were exiled hither as well as to other islands. When the legions were withdrawn, and Britain with its dependencies left in the power of the natives, these islands shared the same lot with the rest. As to the appellation which from this period prevailed, the ordinary way of writing it is *Sully*; in records we find it spelt *Silly*, *Silley*, or *Scilley*; but we are told the old British appellation was *Sulleh*, or *Sylleh*, which signifies rocks consecrated to the sun. Nothing is recorded of them from the fifth to the tenth century. It is, however, supposed, that within this space they were almost destroyed by an earthquake, attended with a sinking of the earth, by which most of their lowlands, and of course the greatest part of their improvements were covered by the sea, and those rich mines of tin which had rendered them so famous swallowed up in the deep. They have a tradition in Cornwall, that a very extensive tract of country called the *Lioness*, in the old Cornish *Lethousow*, supposed to lie between that country and *Scilly*, was thus lost; and many concurrent circumstances render this probable. In reference to these islands, the case is still stronger; for at low ebbs their stone enclosures are still visible from almost all the isles. The fertility of the islands is mentioned in all the ancient accounts. There is mention made of a breed of wild swine, and the inhabitants had great plenty of fowl and fish. But, notwithstanding the fertility of the country, it was but thinly peopled, because they were liable to be often spoiled by French or Spanish pirates. In time of war, the importance of these islands is conspicuous. In 1651 Sir John Grenville took shelter in them with the remains of the Cornish cavaliers. The depredations committed by his frigates soon made it evident that *Scilly* was the key of the English commerce; and the clamors of the merchants thereupon rose so high that the parliament was forced to send a fleet of fifty sail, with a great body of land forces on board, under Sir George Ayscue and admiral Blake, who, with great difficulty, and considerable loss, made themselves masters of *Trescow* and *Brehar*; where they erected those lines and fortifications near the remains of the old fortress called *Oliver's Castle*. But at length they granted Sir John Grenville a most honorable capitulation, as the surest means to recover places of such consequence. On the 22nd of October, 1707, several ships were wrecked on these rocks. It was thick foggy weather, and the night was extremely dark,

when the British fleet under Sir Cloudesley Shovel, returning from an unsuccessful expedition against *Toulon*, mistaking these rocks for land, struck upon them. The Association, in which Sir Cloudesley was, with his lady's two sons, several other persons of distinction, and 800 brave men, struck first, and went immediately to the bottom: the *Eagle*, under captain Hancock, soon shared the same fate: the *Romney* and the *Firebrand* were also lost, but the two captains and twenty-five men were saved. The rest of the fleet escaped, having notice of the fate of these ships. There are five of these islands now inhabited. The largest of these is *St. Mary's*, which is two miles and a half in length, about one mile and a half in breadth, and between nine and ten miles in compass. On the west side there projects an isthmus. Beyond this there is a peninsula, which is very high; and upon which stands *Star Castle*, built in 1593, with some outworks and batteries. On these there are upwards of sixty pieces of cannon mounted; and for the defence of which there is a garrison. Under the castle barracks and lines stands *Hugh Town*, built so low as to be subject to inundations. A mile within land stands *Church Town*, which, besides the church consists of a few houses only, with a court house. About two furlongs east of this lies the *Old Town*, where there are more houses, and some of them very convenient dwellings. *Treslaw* lies two miles directly north of *St. Mary's*. It was formerly styled *St. Nicholas's Island*; and was at least as large as *St. Mary's*, though at present about half the size. The remains of the abbey are yet visible. There are about ten stone houses, with a church, which compose the *Dolphin Town*; an old castle built in the reign of Henry VIII., called *Oliver's Castle*; and a block-house raised out of the ruins of that castle. This island is noted for producing plenty of the finest *samphire*, and the only tin works that are now visible are found in it. A mile to the east of *Trescow*, and about two miles from the most northern part of *St. Mary's*, lies the isle of *St. Martin's*, not much inferior in size to that of *Trescow*. *St. Martin's* produces corn, affords the best pasture in these islands, and feeds a great number of sheep. *St. Agnes*, which is also called the *Light-house Island*, lies nearly three miles south-west of *St. Mary's*: and is, though small, well cultivated, fruitful in corn and grass.—The only inconvenience is the want of good water; the great advantage consists in having several good coves or small ports, where boats may lie in safety. The light-house is the principal ornament and great support of the island, which stands on the most elevated ground, built with stone from the foundation to the lantern, which is fifty-one feet high. *Brehar*, or, as pronounced, *Bryer Island*, lies north-west of *St. Mary's*, and west of *Trescow*, to which, when the sea is very low, they sometimes pass over on the sand. It is very mountainous, abounds with sea and land fowls, excellent *samphire*, and a great variety of medical herbs. The air of these islands is equally mild and pure; their winters are seldom subject to frost or snow. When the former happens it lasts not long; and the latter never lies upon the ground. The heat of their

summers is much abated by sea-breezes. They are indeed frequently incommoded by sea fogs, but these are not unwholesome. The soil is very good, and produces grain of all sorts (except wheat, of which they had anciently plenty) in large quantities. They still raise a little wheat, but the bread made of it is unpalatable. They eat, for this reason, chiefly what is made of barley. Potatoes prosper, and roots of all kinds, pulse, and sallads, grow well; dwarf fruit-trees, gooseberries, currants, raspberries, &c., under proper shelter, thrive exceedingly; but they have no trees. They have wild fowls of all sorts, from the swan to the snipe; and a particular kind called the hedge chicken, which is not inferior to the ortolan; also tame fowls, puffins, and rabbits, in great numbers. Their black cattle are small, but well tasted, though they feed upon sea-weed. Their horses are small, but strong and lively. They have also large flocks of fine sheep, whose fleeces are good, and their flesh excellent. St. Mary's harbour is very safe and capacious, having that island on the south; the eastern islands, with that of St. Martin, on the east; Treseaw, Brehar, and Samson, to the north; St. Agnes, and several small islands, to the west. Ships ride here in three to five fathoms water, with good anchorage. Into this harbour there are four inlets, viz. Broad Sound, Smith's Sound, St. Mary's Sound, and Crow Sound; so that hardly any wind can blow with which a ship of 150 tons cannot safely sail through one or other of them, Crow Sound only excepted, where they cannot pass at low water, but at high tide there is from sixteen to twenty-four feet in this passage. There are also two other harbours, viz. New Grynsey, which lies between Brehar and Treseaw, where ships of 300 tons may ride securely; and Old Grynsey, between Treseaw, St. Helen's, and Theon, for smaller ships. The former is guarded by the batteries at Oliver's Castle; the latter by the blockhouse on the east side of Treseaw, called Dover. In this harbour, and in all the little coves of the several isles, prodigious quantities of mackerel may be caught in their season; also soal, turbot, and plaice; and ling, which, from its being a thicker fish, mellow, and better fed, is very justly preferred to any caught nearer our own coasts. Salmon, cod, and pollock, are in great plenty, and pilchards in vast abundance. The alga marina, fucus or sea weed, serves to feed both their small and great cattle, manures their lands, is burned into kelp, is sometimes preserved, sometimes pickled, and is in many other respects very beneficial to the inhabitants. The civil government is administered by the court of twelve; in which the commander in chief, the proprietors' agent, and the chaplain, have their seats in virtue of their offices: the other nine are chosen by the people. These decide or compromise all differences; and punish small offences by fines, whippings, &c.; except for the soldiers, there is no prison in the islands. But, in case of capital offences, the criminals may be transported to the county of Cornwall, and there brought to justice. The great importance of these islands arises from their advantageous situation, as looking equally into St. George's Channel, which divides Great Bri-

tain from Ireland, and the English Channel, which separates Britain from France. For this reason, most ships bound from the southward strive to make the Scilly Islands, to steer their course with greater certainty. It is very convenient also for vessels to take shelter amongst them; which prevents their being driven to Milford Haven, or some port in Ireland, if the wind is strong at east; or, if it blows hard at north-west, from being forced back into some of the Cornish harbours, or even on the French coasts.

SCIMITAR, *n. s.* See **CIMETER**. A short sword with a convex edge.

I'll heat his blood with Greekish wine to-night,
Which with my scimitar I'll cool to-morrow.

Shakspeare.

SCINTILLATION, *n. s.* Lat. *scintillatio*. The act of sparkling; sparks emitted.

He saith the planets' *scintillation* is not seen, because of their propinquity. *Glanville's Scopsis.*

These *scintillations* are not the accension of the air upon the collision of two hard bodies, but rather the inflammable effluences discharged from the bodies collided. *Browne.*

With airy lens the scattered rays assault;
And bend the twilight round the dusky vault;
Ride, with broad eye and *scintillating* hair,
The rapid fire-ball through the midnight air.

Darwin.

SCIO, the ancient Chios, an island of the Grecian Archipelago, thirty miles in length, from ten to eighteen in breadth, and ninety in circumference, composed of high mountains, which are rendered, by the industry of the inhabitants, very productive. The plain, extending for some leagues round the town, is celebrated for its extraordinary beauty and fertility. Here also are some quarries of a reddish freestone. The air is good, though, from its great communication with other places, it is much exposed to the plague. Corn raised is not sufficient for the consumption, and herbage is so scarce that they give their cotton shrubs to the cattle after the cotton is gathered, and preserve the dried leaves of the vines for them in winter. This want renders all animal food dear, except goat's flesh. See **GREECE**.

SCIRO, the capital of the above island, situated in a shallow bay on its eastern coast. Here is a good road for the largest shipping, and a mole, which forms a tolerable harbour. The castle is a large Venetian fort, which has been used as a place of confinement for state prisoners. To the east of the present city is the Palao Castro, or old town. The population is stated at 35,000. Long. 25° 54' E., lat. 38° 23' N.

SCIOLIST, *n. s.* Lat. *sciolus*. One who knows many things superficially.

I could wish these *sciolous* zelotists had more judgment joined with their zeal. *Houel.*

'Twas this vain idolizing of authors which gave birth to that silly vanity of impertinent citations; these ridiculous fooleries signify nothing to the more generous discerners, but the pedantry of the affected *sciolists*. *Glanville's Scopsis*

These passages were enough to humble the presumption of our modern *sciolists*, if their pride were not as great as their ignorance. *Temple.*

SCIOM'ACHY, *n. s.* Fr. *schiamachie*; Gr. *σκια* and *μαχη*. Battle with a shadow. It should be written *sciamachy*.

To avoid this *sciomachy*, or imaginary combat of words, let me know, Sir, what you mean by the name of tyrant? *Cowley.*

SCION, *n. s.* Fr. *scion*. A small twig taken from one tree to be engrafted into another.

Sweet maid, we marry
A gentle *scion* to the wildest stock;
And make conceive a bark of baser kind
By bud of nobler race. *Shakspeare. Winter's Tale.*

March, is drawn, in his left hand blossoms, and
scions upon his arm. *Peacham.*

The *scions* are best of an old tree.

Mortimer's Husbandry.

SCIOPPIUS (Gaspar), a learned German writer of the seventeenth century, born at Neumark, in the Upper Palatinate, in 1576. He studied at the university, and, at the age of sixteen, became an author. He abjured the system of the Protestants, and became a Roman Catholic about 1559. He possessed all those qualities which fitted him for making a distinguished figure in the literary world; imagination, memory, profound learning, and invincible impudence. But he neither showed respect to his superiors, nor decency to his equals. Joseph Scaliger, above all others, was the object of his satire. That learned man, having drawn up the history of his own family, and deduced its genealogy from princes, was severely attacked and ridiculed by Scioppius. Scaliger in his turn wrote a book entitled *The Life and Parentage of Gaspar Scioppius*. This inflamed Scioppius still more: he collected all the calumnies thrown out against Scaliger, and formed them into a huge volume. He treated with great contempt James I., king of England, in his *Ecclesiasticus*, &c., and in his *Collyrium Regium Britanniae Regi, graviter ex oculis laboranti munere missum*. He had also the audacity to abuse Henry IV. of France in a most scurrilous manner, on which account his book was burned at Paris. Provoked by his insolence to their sovereign, the servants of the English ambassador assaulted him at Madrid, and chastised him severely. For his furious assaults upon the most eminent men he was called the Cerberus of literature. He died on the 19th November, 1649, aged seventy-four, at Padua, the only retreat which remained to him. 400 books are ascribed to him, which discover great genius and learning. The chief of these are, 1. *Verisimilium Libri IV.* 1596, in 8vo. 2. *Commentarius de Arte Critica*, 1661, in 8vo. 3. *De sua ad Catholicos Migratione*, 1660, in 8vo. 4. *Notationes Criticae in Phædrum, in Priapeia, Patavii*, 1664, in 8vo. 5. *Suspectarum Lectionum Libra V.* 1664, in 8vo. 6. *Classicum belli sacri*, 1619, in 4to. 7. *Collyrium regium*, 1611, in 8vo. 8. *Grammatica Philosophica*, 1644, in 8vo. 9. *Relatio ad Reges et Principes de Stratagematibus Societatis Jesu*, 1641, in 12mo. This last was published under the name of Alphonso de Vargas.

SCIOTO, a river of the United States, which rises in Ohio, near the sources of the Sandusky. Its course is east by south; and it passes by Columbus, Cocleville, and Chillicothe, and runs

into the Ohio, at Portsmouth, in lat. 38° 34' N., 352 miles below Pittsburgh. It is navigable for large keel boats to Columbus, and for canoes almost to its head. There is a convenient portage between it and the Sandusky of four miles.

SCIPIO, the cognomen of a celebrated family in ancient Rome, who were a branch of the Cornelian family, and by their bravery and other virtues rose to the highest honors in the republic. This surname was derived from *scipio*, a staff, because one of their ancestors had led his father when blind, and been to him as a walking staff.

Scipio (Cnaeus Cornelius), Asina, was consul A. U. C. 492, and 498. During his first consulship he was defeated in a naval battle, and lost seventeen ships; but in 493 he took Aleria, in Corsica, and defeated the Carthaginians under Hanno, in Sardinia, took 200 of their ships, and the city of Panormum in Sicily.

Scipio (Cnaeus), and **Scipio** (Publius), sons of Asina. In the beginning of the second Punic war Publius was sent with an army into Spain to oppose Hannibal; but, hearing that Hannibal had gone to Italy, he endeavoured by quick marches to stop him. Hannibal, however, defeated him near the Ticinus, where he would have lost his life had not his son (afterwards the famed Africanus) bravely defended him. He again went into Spain, where he gained several memorable victories over the Carthaginians and inhabitants. His brother Cnaeus shared the command with him, but, though at first successful, their confidence proved their ruin. They divided their army, and soon after Publius was furiously assailed by the Carthaginians under Mago and the two Asdrubals. Publius was killed, and his army cut to pieces. The victors immediately fell upon Cnaeus, from whom 30,000 Celtiberians had just revolted. He retired to a hill and defended himself bravely, but was overpowered by numbers.

Scipio (Publius Cornelius), surnamed Africanus, was the son of Publius. He first distinguished himself at the battle of Ticinus, as above mentioned; and, after the fatal battle of Cannæ, when some Romans proposed to abandon Italy to the victors, he made his countrymen swear eternal fidelity to Rome, and enact that the first who should repeat such a proposal should be put to death. So early as in his twenty-first year he was made ædile. On the slaughter of the Roman armies under his father and uncle, Scipio was sent to avenge their deaths; and within four years he expelled the Carthaginians from Spain, and reduced it to a Roman province. After these signal victories he was called home to defend Rome against Hannibal, but gave it as his opinion that Hannibal could only be conquered in Africa. On this he was elected consul and sent to Africa, where his conquests were as rapid as in Spain; the Carthaginians under Asdrubal were totally routed; and Hannibal called [home] from the gates of Rome. These two great generals met soon after, but could come to no terms of agreement. The battle of Zama was therefore fought, where Scipio was so successful that 20,000 Carthaginians were killed, and as many made prisoners; while the Romans lost only 2000. Peace was demanded, and granted, but

upon the most humiliating terms. On his return to Rome Scipio was honored with a triumph, and with the agnomen of Africanus. In the conquest of Spain a princess of uncommon beauty was taken prisoner. Scipio, hearing that she had been betrothed to a young Spanish prince, not only restored her inviolate to her parents and lover, but sent rich presents along with her. By his generous conduct he made not only that prince, but Masinissa, Syphax, and others, the friends of Rome. He married Æmilia, daughter of the celebrated Paulus Æmilius, who fell at the battle of Cannæ; and died at his country seat at Liternum, about A. A. C. 181, aged only fifty-one. His widow raised a mausoleum to his memory, and placed upon it his statue with that of Ennius. The Romans venerated, when dead, the virtues of the man they were unjustly jealous of when living.

SCIPIO (Lucius Cornelius), surnamed Asiaticus, was the brother of the preceding, and accompanied him in his expeditions into Spain and Africa. He was rewarded with the consulship for his services, A. U. C. 562: and was sent against Antiochus, king of Syria; whom, with the assistance and advice of his brother Africanus, he completely defeated in a battle at Magnesia, near Sardis, wherein Antiochus lost 50,000 infantry and 4000 cavalry, and soon after submitted. On his return to Rome, Scipio was decreed a triumph and the surname of Asiaticus. But, notwithstanding his victories and disinterested conduct, Cato the censor accused him of having received money from Antiochus, which he had not accounted for. This produced an enquiry, and a prejudiced judge decided against Scipio and his two lieutenants. But, upon confiscating his property, the whole effects of Scipio did not amount to near the sum he was charged with. His friends and tenants, in this distress, made him liberal offers, which he generously declined. He was soon sent to settle the disputes between Eumenes and Seleucus, which he accomplished; and, on his return, the Romans, ashamed of their former injustice, rewarded his merits with such uncommon liberality, that Asiaticus was enabled to celebrate games in honor of his victory for ten successive days. He died about A. A. C. 170.

SCIPIO (Publius Cornelius), Æmilianus, the son of Paulus Æmilius, the conqueror of Perseus, was adopted by his cousin Publius Cornelius Scipio, the son of Scipio Africanus and Æmilia. He first appeared in the Roman army under his father; and distinguished himself as a legionary tribune in Spain, where he killed a Spanish giant, and obtained a mural crown at the siege of Interetia. Soon after he was made ædile, and elected consul, though under the usual age qualifying for these high offices. He was then sent to Africa to finish the third Punic war, which he carried on and completed, till he had accomplished the inhuman decree of Cato and the senate, by the total destruction of that city, republic, and people, A. A. C. 147. Æmilianus is said, in the midst of his victory, to have wept over the miseries of this unfortunate people; it had been better had he saved them. Another commission, equally horrible and bloody, the

same Scipio was, a few years after this, employed by the senate to execute upon the brave but unfortunate inhabitants of Numantia in Spain; and which he executed with equal success and equal horrors, A. A. C. 133. For these conquests Æmilianus was honored with two triumphs, and the double titles of Africanus junior, and Numantinus. Yet his popularity was short. He incurred the displeasure of the people by vindicating the murder of his cousin and brother-in-law, their favorite, Tiberius Gracchus. He was afterwards accused by his enemies of aspiring to the dictatorship. Not long after he was found strangled in his bed; which was said to have been done by the triumviri, Papirius Carbo, Caius Gracchus, and Fulvius Flaccus, on account of his opposition to the Sempronian Law; and his wife Sempronia was accused of having admitted the assassins into his bed chamber. This murder was committed A. A. C. 128.

SCIPIO (C. Cornelius, Nasicæ), was the son of Cnaeus Scipio. He was at first refused the consulship, though supported by the interest of Africanus, but afterwards obtained it; when he was sent against the Boii, whom he conquered, and was decreed a triumph. He was also successful in an expedition into Spain. It is recorded to his honor, that when the image of the goddess Cybele was brought from Phrygia, the senate decreed, that one of their body, who was most eminent for purity of morals, should be delegated to meet the goddess at Ostia, and Nasicæ was appointed, as best suiting that character. Nasicæ also distinguished himself as an orator, and the friend of persecuted virtue, by his zeal in confuting the invidious calumnies invented against his relations Africanus and Asiaticus.

SCIRPUS, in botany, rush grass, a genus of the monogynia order, and triandria class of plants, natural order third, calamariæ: glumes paleaceous, and imbricated all round: cor. none, and only one beardless seed. Species sixty-seven, nine of which are common in the bogs and marshes of our own country.

SCIRRHUS, *n. s.* Fr. *scirrhe*. This should be written skirrhus, says Johnson, not merely because it comes from *σκιρρος*, but because *c* in English has before *e* and *i* the sound of *s*. See SKEPTICK. An indurated gland.

Any of these three may degenerate into a *scirrhus*, and that *scirrhus* into a cancer. *Wiseman.*

How they are to be treated when they are strumous, *scirrhus*, or cancerous, you may see. *Id.*

The difficulty of breathing, occasioned by *scirrhus* of the glands, is not to be cured.

Arbutnot on Diet.

SCIRRHUS, in surgery and medicine, is a hard tumor of any part of the body, void of pain, and exceedingly apt to degenerate into cancers. See SURGERY.

SCISSOR, <i>n. s.</i> , or	} This word is variously written, as it is supposed to be derived by different writers; of which some write <i>cissors</i> , from <i>cædo</i> or <i>incido</i> ; others <i>scissors</i> , from <i>scindo</i> ; and some <i>cisars</i> , <i>cizars</i> , or <i>scissars</i> , from Fr. <i>cisaur</i> ; Thomson says Fr. <i>ciscaur</i> , from Lat. <i>scindo</i> . A
SCISSORS,	
SCISSIBLE, <i>adj.</i>	
SCISSILE,	
SCISSION, <i>n. s.</i>	
SCISSURE.	

small pair of shears: scissible and scissile mean capable of being cut by any instrument of this kind: scission, the act of cutting: scissure, the cut made.

His beard they have singed off with brands of fire;

And ever, as it blazed, they threw on him
Great pails of puddled mire to quench the hair:
My master preaches patience to him, and the while
His man with *scissors* nicks him for a fool.

Shakespeare.

The differences of impressible and not impressible, *scissible* and not *scissile*, and many other passions of matter, are plebeian notions.

Bacon.

The breach seems like the *scissures* and ruptures of an earthquake, and threatens to swallow all that attempt to close it, and reserves its cure only for omnipotence.

Decay of Piety.

Wanting the *scissors*, with these hands I'll tear,
If that obstruct my flight, this load of hair.

Prior.

When the lawyers and tradesmen brought extravagant bills, Sir Roger wore a pair of *scissors* in his pocket, with which he would snip a quarter of a yard off nicely.

Arbuthnot.

Animal fat is a sort of amphibious substance, *scissible* like a solid, and resolvable by heat.

Id.

Nerves may be wounded by *scission* or puncture: the former way they are usually cut through, and wholly cease from action,

Wiseman's Surgery.

SCIURUS, in botany, a genus of the monogynia order, and diandria class of plants: CAL. quinque-dentate: COR. bilabiated: the filaments are barren: CAPS. five, and joined together: bivalved, unilocular, with one seed. Of this there is only one species, viz.

S. aromatica, a native of Guiana.

SCIURUS, in zoology, the squirrel, a genus of quadrupeds belonging to the order of glires. It has two fore-teeth in each jaw, the superior ones shaped like wedges, and the inferior ones sharp pointed. Some species of this genus are provided with hairy membranes extended from the fore to the hind legs, by which they are enabled to bear themselves in the air, when leaping from one tree to another; from this circumstance the genus is very properly broken into two subdivisions, distinguished by the want or possession of this membrane. The former are called *sciuri* scandentes, or climbing squirrels; the latter *petauri*, or flying squirrels. Mr. Kerr enumerates thirty-one species, and twelve varieties of the former; and eight species with two varieties of the latter. The following are the chief:—

1. *S. Abyssinicus*, the Abyssinian squirrel, is of a rusty black color on the back; the fore feet and belly gray; the tail one foot and a half long. It inhabits Abyssinia. It is thrice the size of the common species; the nose and soles of the feet are flesh-colored. One was purchased by Thénart in Arabia from an Abyssinian. It was good-natured and sportive; eat of every thing but flesh, and cracked the hardest almonds.

2. *S. æstuans*, the Brazilian squirrel, is of a dusky color, tinged with yellowish on the upper part of the body; the inside of the legs and belly yellow, with a white stripe along the middle of the belly; the tail is round and annulated with black and yellow. They inhabit Brasil and Guiana. The ears are plain and roundish, the fur soft, the head and body eight inches, the tail ten.

3. *S. albipes*, the white-legged squirrel, has ears slightly tufted with black hair; the head, upper parts of the body, sides, and toes, reddish brown; the under parts and legs white, as well as the face, nose, under side of the neck, inside of the ears, breast, belly, fore legs, and inside of the hind thighs; the tail is long and covered with dusky hair, much shorter than in the common species. They inhabit Ceylon.

4. *S. anomalus*, the Georgian squirrel, is of a yellow color, mixed with dusky on the upper parts and tail; the under parts a dull tawny; the ears plain and rounded, flame yellow, whitish within; the circumference of the mouth is white; the tip of the nose black; the cheeks tawny; the whiskers and region of the eyes dusky. This species is larger than the common squirrel; they inhabit Georgia in Asia.

5. *S. bicolor*, the Javan squirrel, has the upper parts of the body black, the under tawny; the thumbs are provided with large round flat nails; the ears are plain, hairy, and sharp pointed. The head and body are about a foot long; the tail is a foot, tipped with black; the under parts are light brown; the hind feet black; the claws on the fore feet sharp, except the nail on the fifth toe; the thumbs are very short. They inhabit Java.

6. *S. Capensis*, the Cape squirrel, is of a pale ferruginous color on the upper parts of the body, mixed with black; with a white line from the shoulder, along each side; the tail is black in the middle, and hoary at the sides; the ears are scarcely apparent, whence M. Pennant calls it the earless dormouse. This species never climbs trees, but burrows in the ground, forming a warm nest, with a round hole; in which it lodges, closing up the orifice. It feeds on bulbous roots, especially potatoes; it is very tame, and never offers to bite; walks on its hind feet; often lies flat on its belly, and flirts up its tail. The head is flat, with a blunt nose, full black eyes, divided upper lip, and long whiskers; the belly and feet a dirty white; there is a white line above each eye; the toes are long and distinct, with a large knob on each foot for a thumb; the claws are long; the hind legs black and naked behind. It is the size of the common squirrel, but much broader and flatter. They are found near Mount Sneeborg, 800 miles north of the Cape of Good Hope.

7. *S. cinereus*, the gray squirrel, with plain ears; hair of a dull gray color, mixed with black, and often tinged with dirty yellow: belly and inside of the legs white; tail long, bushy, gray, and striped with black; size of a half grown rabbit. It inhabits the woods of northern Asia, North America, Peru, and Chili; is very numerous in North America, and does incredible damage to the plantations of maize, running up the stalks and eating the young ears; they are proscribed by the provinces, and a reward of threepence per head given for every one that is killed. They make their nests in hollow trees, with moss, straw, wool, &c., feed on maize in the season, and on pine-cones, acorns, and mast of all kinds; form holes underground, and there deposit a large stock of winter provision; descend from the trees, and visit their magazines

when in want of meat; are particularly busy at the approach of bad weather; during the cold season keep in their nest for several days together; seldom leap from tree to tree, only run up and down the bodies; their hordes are often destroyed by swine; and, when their magazines are covered with deep snow, the squirrels often perish for want of food; they are not easily shot, nimbly changing their place when they see the gun levelled; have the actions of the common squirrel; are easily tamed; and their flesh is esteemed very delicate. Their furs, which are imported under the name of *petit-gris*, are valuable, and used as linings to cloaks.

8. *S. erythraus*, the ruddy squirrel, is of a yellow color, mixed with dusky, on the upper parts; the under parts blood-red mixed with tawny; the tail the same, with a longitudinal blackish stripe; the ears slightly tufted. It is larger than the common squirrel; the fore paws have a large protuberance instead of a thumb. They inhabit India.

9. *S. flavus*, the fair squirrel, with the body and tail of a flaxen color; of a very small size, with plain round ears and rounded tail. Inhabits the woods near Amadabad, the capital of Guzerat, in great abundance, leaping from tree to tree. Linné says it is an inhabitant of Carthagea in South America.

10. *S. Hudsonius*, the Labradore squirrel, is of a ferruginous color along the back, the sides paler, and the belly ash color mottled with black; the tail is like the back, but barred and tipped with black; the ears are plain. It is smaller than the common squirrel, and apt to vary in color to a gray. They inhabit the pine forests of Labradore, and round Hudson's Bay.

11. *S. Indicus*, the Bombay squirrel, is of a dull purple color on the head, back, sides, and upper parts of the legs and thighs; the belly and lower parts yellow; the tail tipped with orange; the ears tufted. The head and body are sixteen inches long; the tail seventeen. They inhabit India, near Bombay.

12. *S. Madagascarensis*, the Madagascar squirrel, in the slowness of its pace and general manners resembles the sloth; but in the form of its tail, the number and form of its toes, five on each foot, and the number and arrangement of its teeth, it is more nearly allied to the squirrel. It lives in holes under ground; is slothful, timid, and sleeps much; it feeds chiefly on worms, picked from the hollows of trees by its toes. The middle toe on the fore feet is very long and naked; the thumb on the hind feet has a flat rounded nail. The ears are large, flattened, black, and covered thickly with rough-hair; the face has two bunches of hair above the eyes, on the nose and cheeks, and under the chin; the fur is of two sorts, an under downy fleece-like wool, of a pale tawny, with longer straight black hairs intermixed, the face and throat are of a pale whitish tawny color; the tail is flattened, about eighteen inches long, covered with thick set white hair from the base to the middle, and the rest black; the toes on the fore paws are long; four of the claws on the hind feet are hooked and sharp-pointed. They inhabit the east side of Madagascar.

13. *S. maximus*, the Malabar squirrel, is of a red brown color on the upper parts; the under parts and tail black; the ears lightly tufted. It is about the size of a large cat; has small erect ears, long hair, strong black claws; and a small protuberance instead of a thumb on the fore paws, with a flat nail. They inhabit the Malabar coast, and province of Mace in India; feed chiefly on the milk of the cocoa nut, and have a loud sonorous voice.

14. *S. niger*, the black squirrel, with plain ears; sometimes wholly black, but often marked with white on the nose, the neck, or end of the tail; the tail shorter than that of the cinereus, the body equal. They inhabit the north of Asia, North America, and Mexico; breed and associate in separate troops; are equally numerous with the cinereus, commit as great ravages among the maize, make their nests in the same manner, and form magazines for winter food. The finest are taken near the lake Baikal, which are the best in all Siberia; these continue black the whole year, the others grow rusty in summer.

15. *S. palmarum*, the palm squirrel, is of a mixed black and red color, with three longitudinal yellow stripes on the back and sides; the tail is encircled with coarse dirty yellow hair, and is barred with black.—Shreber. This species inhabit the hot regions of Asia and Africa; live much on cocoa nuts, and are fond of the sury, or palm wine, whence the Dutch call them *suriatsjje*, or little cats of the sury. They are only three inches long; the tail is as long, and is carried erect, the ears are short, broad, and fringed with hair at the edges; an obscure pale yellow stripe runs along the back, and other two on each side. The hair on the head, back, and sides, is a mixed black and red; on the thighs and legs redder; on the belly pale yellow.

16. *S. petaurus australis*, the southern flying squirrel, is the largest and most elegant of all the flying squirrels; its most remarkable characteristic is the rounded thumbs or great toes of the hind feet, which are furnished with a flattened nail, while all the other toes, five to each foot, have sharp hooked claws; the two toes next this are united by the skin, but have separate claws; the color is a fine sable, or deep gray-brown, on the upper parts, darkest on the middle of the back, and the under parts are nearly white; the edges of the membrane are somewhat scalloped, and of a lighter color; the fur is exquisitely soft and beautiful; the tail is long and bushy, thickly clothed with very soft loose hair, longest towards the outer end; the ears are longish, and there is a black streak over each eye. They inhabit New South Wales.

17. *S. petaurus petaurista*, the Indian flying squirrel, or flying cat, has a tail longer than the body, flattened, and very full of long hair. This species is eighteen inches long from nose to rump; the head is rounded; the whiskers and claws are black; the female has six teats on the breast and belly; the eyes have long narrow pupils like those of a cat. They inhabit the islands of the Indian Ocean. There are two varieties.

18. *S. petaurus sagitta*, the arrow or Java flying squirrel, with a small round head, cloven

upper lip; small blunt ears, two small warts at the utmost corner of each eye, with hairs growing out of them: neck short: four toes on the fore feet, and, instead of a thumb, a slender bone two inches and a half long, lodged under the lateral membrane, serving to stretch it out: thence to the hind legs extends the membrane, which is broad, and a continuation of the skin of the sides and belly: there are five toes on the hind feet; and on all the toes sharp compressed bent claws: the tail is covered with long hairs disposed horizontally; color of the head, body, and tail, a bright bay, in some parts inclining to orange: breast and belly of a yellowish-white: length, from nose to tail, eighteen inches; tail fifteen. They inhabit Java, and others of the Indian islands: leap from tree to tree as if they flew, and will catch hold of the boughs with their tails. Niewhoff, p. 354, describes this under the name of the flying cat, and says the back is black.

19. *S. petaurus volans*, the European flying squirrel, has round naked ears, full black eyes, and a lateral membrane from the fore to the hind legs: tail with long hairs disposed horizontally, longest in the middle; its color above, a brownish ash, beneath, white tinged with yellow. They are much less than the common squirrel: inhabit Finland, Lapland, Poland, Russia, and North America; live in hollow trees; sleep in the day; during the night are very lively; are gregarious, numbers being found in one tree; leap from bough to bough, sometimes at the distance of ten yards. This action has improperly been called flying, but the animal cannot go in any other direction than forward; and even then cannot keep an even line, but sinks considerably before it can reach the place it aims at: sensible of this, the squirrel mounts the higher in proportion to the distance it wishes to reach: when it would leap, it stretches out the fore-legs, and, extending the membranes, becomes specifically lighter than it would otherwise be, and thus is enabled to spring farther than other squirrels that have not this apparatus. When numbers leap at a time, they seem like leaves blown off by the wind. Their food is the same as the other squirrels. They are easily tamed; and bring three or four young at a time.

20. *S. petaurus volucella*, the American flying squirrel, is of a brownish color on the upper parts; the belly white, tinged with yellow; the tail is flattened, broadest at the middle, and ends in a point. This species is easily tamed; it is about five inches long from nose to rump, with a round tail of four inches; the head is thickish; the eyes are black, large, and prominent; the ears roundish, transparent, almost naked, of a brownish ash color; the whiskers black, and longer than the head; the neck is short. The fur is very fine and soft, of an ash color, with white tips on the upper parts; on the lower, white and ash all around. The membrane extends from the ears to the fore and hind legs, adhering as far as to the toes; it includes a peculiar bone which is attached to the wrist, and helps to stretch it out in flying; on the hind legs it extends to the ancles. By this membrane the animal supports itself in the air, as if flying, for a considerable way; and it swims nearly in the

same manner. This species inhabit the temperate and warm parts of North America, living in societies in the woods, and feeding on fruits and seeds, which they procure in the evening, as they sleep much during the day.

21. *S. striatus*, the ground-squirrel, with plain ears; ridge of the back marked with a black streak; each side with a pale yellow stripe, bounded above and below with a line of black: head, body, and tail, of a reddish brown; the tail the darkest; breast and belly white; nose and feet pale red; eyes full. They inhabit the north of Asia, but are found most numerous in the forests of North America. They never run up trees except they are pursued, and find no other means of escaping; they burrow and form their habitations under ground, with two entrances, that they may get access to the one in case the other is stopped up. Their retreats are formed with great skill, in form of a long gallery, with branches on each side, each of which terminates in an enlarged chamber, as a magazine to store their winter provisions in; in one they lodge the acorns, in another the maize, in a third the hickory nuts, and in the last their favorite food the chinquapin chestnut. They very seldom stir out during winter, as long as their provisions last; but, if these fail, they will dig into cellars where apples are kept, or barns where maize is stored, and do a great deal of mischief; but at that time the cat destroys great numbers, and is as great an enemy to them as to mice. During the maize harvest they are very busy in biting off the ears, and filling their mouths so full with the corn that their cheeks are quite distended. They give great preference to certain food; for if, after filling their mouths with rye, they happen to meet with wheat, they fling away the first, that they may indulge in the last. They are very wild, bite severely, and are scarcely ever tamed; the skins are of little use, but are sometimes brought over to line cloaks.

22. *S. vulgaris*, the common squirrel, has ears terminated with long tufts of hair; large, lively, black eyes; head, body, legs, and tail, of a bright reddish brown; breast and belly white; hair on each side the tail lies flat. In Sweden and Lapland it changes, in winter, into gray. In Russia it is sometimes found black. In many parts of England there is a beautiful variety, with milk-white tails. This species inhabit Europe and North America, the northern and the temperate parts of Asia: and a variety is even found as far south as the isle of Ceylon. It is a lively, active animal; lives always in woods: in the spring, the female is seen pursued from tree to tree by the males, feigning an escape from their embraces; makes its nest of moss and dried leaves between the fork of two branches; brings from three to seven young at a time; has two holes to its nest; stops up that on the side the wind blows, which was remarked by Pliny; lays in a hoard of winter provision, such as nuts, acorns, &c.; in summer, feeds on buds and young shoots; is particularly fond of those of fir, and the young cones; sits up to eat, and uses its fore-feet as hands; covers itself with its tail; leaps to a surprising distance; when disposed to cross a river, a piece of wood often serves as its boat, its tail

forming the sail. Boys frequently nurse this beautiful and active animal under cats. 'There are three creatures, the squirrel, the field-mouse, and the bird called the nuthatch, which live much on hazel nuts; and yet they open them each in a different way. The first, after rasping off the small end, splits the shell in two with his long fore feet, as a man does with his knife; the second nibbles a hole with his teeth, as regular as if drilled with a wimble, and yet so small that one would wonder how the kernel can be extracted through it: while the last pecks an irregular ragged hole with its bill; but as this artist has no paws to hold the nut firm while he pierces it, like an adroit workman he fixes it, as it were in a vice, in some cleft of a tree, or in some crevice, when, standing over it, he perforates the stubborn shell.'—White's Selborne. They are preyed on by martins and other animals of the mustela and viverra tribes: also by serpents and birds of prey. Mr. Kerr describes six varieties.

23. *S. vulpinus*, the vulpine or fox squirrel, of the planter, is of a large size, and ruddy color, mixed with black and dirty white, and has plain ears. It inhabits Virginia, and is the size of a small rabbit. The fur is coarse; the throat and insides of the thighs and legs are black; the tail is shorter than that of the common squirrel; and of a dull yellow color, mixed with black and reddish at the tip, as are also the ears.

SLAVI, or SLAVI, the ancient inhabitants of Slavonia or Slavonia. This name originally signified illustrious.

SLAVONIA, a province in the south of the Austrian empire, which, in official documents, bears the title of the kingdom of Slavonia. It is long and narrow, the Drave and Danube running along its northern frontiers, and separating it from Hungary; while the Save, also a great river, extends along its southern confines, dividing it from Turkey. Its area is about 6600 square miles; population about 530,000. It lies between 45° and 46° of N. lat.; and, being a frontier province, its inhabitants are exempt from taxes, but subject (see the article HUNGARY) to military duty. The mountainous tracks are barren in dry years, and in the low grounds there are many districts too marshy for cultivation; but the greatest part of the country produces wheat, barley, maize, flax, hemp, and madder. The fruits are chestnuts, plums, and vines; also figs, almonds, and other products of a warm climate. The forests contain the finest oak. Domestic animals are reared with little care, and vast numbers of hogs are found in the woods. Of wild animals, the bear, the wolf, the fox, the polecat, and the vulture are common. Equal mischief is experienced from insects, which multiply surprisingly in the heats of summer, and it sometimes happens that a continuance of southerly winds brings a swarm of locusts from Turkey. The mineral treasures of Slavonia have not been explored. The only minerals known to exist in large quantities are salt, limestone, sulphur and coal. The manufactures are insignificant.

Slavonia formed part of the ancient Illyria, and derives its present name from a tribe of Selavi or Slavi, who settled here in the sixth

century. Then the Venetians, having acquired possession of Dalmatia, extended their conquests hither. It remained alternately subject to them and to the Hungarians, until overrun by the Turks, in whose possession it continued about 170 years.

SCLERANTHUS, in botany, German knot-grass, or Knawel, a genus of the digynia order, and dodecandria class of plants; natural order twenty-second, Caryophyllæ: *cal.* monophyllous: *cor.* none: there are two SEEDS contained in the calyx; species three, natives of this country.

SCLERIA, in botany, a genus of the tetrandria order, and monœcia class of plants; natural order fourth, graminæ: *cal.* a gluma, with from two to six valves; the flowers are numerous; the SEEDS a sort of nut, small, oblong, and shining. There are six species, all natives of the West Indies.

SCLEROTIC, *adj.* *Fr.* *sclerotique*; *Gr.* *σκληρος*. Hard; an epithet of one of the coats of the eye.

The ligaments observed in the inside of the sclerotic tunics of the eye, serve instead of a muscle, by their contraction, to alter the figure of the eye.

Ray on the Creation.

SCOFF, *v. n. & n. s.* } *Belgic* *schoppen*; }
SCOFF'ING, *n. s.* } *Goth. skimp.* } To treat
SCOFF'INGLY, *adv.* } with insolent ridicule,
or contemptuous language, with *at*: the noun-substantive and adjective corresponding.

With *scoff's* and scorns, and contemptuous taunts,
In open market-place produced they me.

Shakspeare. Henry VI.

Sell when you can; you are not for all markets:
Cry the man mercy, love him, take his offer;
Foul is the most foul, being found to be a *scoffer*.

Shakspeare.

Of two noblemen of the west of England, the one was given to *scoff*, but kept ever royal cheer in his house; the other would ask of those that had been at his table, Tell truly, was there never a flout or dry blow given?

Bacon.

There is no greater argument of a light and inconsiderate person, than prophaneity to *scoff* at religion.

Tillotson.

Our answer, therefore, to their reasons is No; to their *scoffs*, nothing.

Holder.

Consider what the apostle tells these *scuffers* they were ignorant of; not that there was a deluge, but he tells them that they were ignorant that the heavens and the earth of old were so and so constituted.

Burnet's Theory of the Earth.

How could men surrender up their reason to flattery, more abusive and reproachful than the rudest *scoffs*, and the sharpest invectives?

South.

Such is love.

And such the laws of this fantastic empire,
The wanton boy delights to bend the mighty,
And *scoffs* at the vain wisdom of the wise.

Rowe.

Divers have hoarded themselves among these profane *scuffers*, not that they are convinced by their reasons, but terrified by their contumelies.

Government of the Tongue.

Aristotle applied this hemistick *scoffingly* to the sy-cophants at Athens.

Broome.

Some little souls, that have got a smattering of astronomy or chemistry for want of a due acquaintance with other sciences, make a *scoff* at them all, in comparison of their favourite science.

Watts.

SCOLD, *v. n. & n. s.* Saxon *scyls*; Belgic *scholden*. To quarrel clamorously and rudely; rate with the tongue; a scold is a skilful, or properly a practised person in the use of that weapon.

Pardon me, 'tis the time that ever
I'm forced to scold. *Shakspeare. Coriolanus.*

They attacked me, some with piteous moans,
others grinning, and only shewing their teeth, others
ranting, and others scolding and reviling.

Stillingfleet.

Sun-burnt matrons mending old nets;
Now singing shrill, and scolding oft between;
Scolds answer foul-mouthed scolds. *Swift.*

For gods, we are by Homer told,
Can in celestial language scold. *Id.*

A shrew in domestic life is now become a scold in
politics. *Addison's Freeholder.*

SCOLOPAX, in ornithology, a genus of birds belonging to the order of grallæ. The back is cylindrical, obtuse, and longer than the head; the nostrils are linear; the face is covered; and the feet have four toes. There are numerous species, of which the following are a selection:

1. *S. ægocephala*, the godwit, weighs twelve ounces and a half, the length is sixteen inches; the breadth twenty-seven; the bill is four inches long, turns up a little, black at the end, the rest a pale purple; from the bill to the eye is a broad white stroke; the feathers of the head, neck, and back, are of a light reddish brown, marked in the middle with a dusky spot; the belly and vent feathers white, the tail regularly barred with black and white. The six first quill-feathers are black; their interior edges of a reddish brown; the legs in some are dusky, in others of a grayish blue, which perhaps may be owing to different edges; the exterior toe is connected as far as the first joint of the middle toe with a strong serrated membrane. The male is distinguished from the female by some black lines on the breast and throat. These birds are taken in the fens, in the same season and in the same manner with the ruffs and reeves (see *TRINGA*); and when fattened are esteemed a great delicacy, and sell for 2s. 6d. or 5s. a piece. A stale of the same species is placed in the net. They appear in small flocks on our coast in September, and continue with us the whole winter; they walk on the open sands like the curlew, and feed on insects.

2. *S. arquata*, the curlew, frequents our sea-coasts and marshes in winter, in large flocks, walking on the open sands; feeding on shells, frogs, crabs, and other marine insects. In summer they retire to the mountainous and unfrequented parts of the country, where they pair and breed. Their eggs are of a pale olive color, marked with irregular but distinct spots of pale brown. Their flesh is very rank and fishy; they differ much in weight and size; some weighing thirty-seven ounces, others not twenty-two: the length of the largest to the tip of the tail, twenty-five inches; the breadth three feet five inches; the bill is seven inches long: the head, neck, and coverts of the wings, are of a pale brown; the middle of each feather black; the breast and belly white, marked with narrow oblong black lines: the back is white, spotted with a few black strokes: the quill feathers are black, but the inner webs spotted with white; the tail is white, tinged with red, and beautifully barred with

black; the legs are long, strong, and of a bluish gray color: the bottoms of the toes flat and broad, to enable it to walk on the soft mud in search of food.

3. *S. calidris*, the red-shank, is found on most of our shores; in the winter time it conceals itself in the gutters, and is generally found single, or at most in pairs. It breeds in the fens and marshes, and flies round its nest when disturbed, making a noise like a lapwing. It lays four eggs, whitish tinged with olive, marked with irregular spots of black chiefly on the thicker end. It weighs five ounces and a half: the length is twelve inches, the breadth twenty-one; the bill nearly two inches long, red at the base, black towards the point. The head, hind part of the neck, and scapulars, are of a dusky ash-color, obscurely spotted with black; the back is white, sprinkled with black spots; the tail elegantly barred with black and white; the cheeks, under side of the neck, and upper part of the breast are white, streaked downward with dusky lines; the belly white; the exterior webs of the quill-feathers are dusky; the legs long, and of a fine bright orange color; the utmost toe connected to the middle toe by a small membrane; the innermost by another still smaller.

4. *S. gallinago*, the common snipe, the length to the end of the tail is nearly twelve inches; the breadth about fourteen; the bill is three inches long, of a dusky color, flat at the end, and often rough like shagreen above and below. The head is divided lengthways with two black lines, and three red, one of the last passing over the middle of the head, and one above each eye; between the bill and the eyes is a dusky line; the chin is white; the neck is varied with brown and red. The scapulars are beautifully striped lengthways with black and yellow; the quill-feathers are dusky; but the edge of the first is white, as are the tips of the secondary feathers: the quill-feathers next the back are barred with black and pale red; the breast and belly are white; the coverts of the tail are long, and almost cover it; they are of a reddish-brown color. The tail consists of fourteen feathers, black on their lower part, then crossed with a broad bar of deep orange, another narrow one of black; and the ends white or pale orange. The legs pale green; the toes divided to their origin. In the winter time snipes are very frequent in all marshy and wet grounds, where they lie concealed in the rushes, &c. In summer they disperse to different parts, and are found in the midst of the highest mountains as well as of the low moors; their nest is made of dried grass; they lay four eggs of a dirty olive color, marked with dusky spots. When they are disturbed much, particularly in the breeding season, they soar to a vast height, making a singular bleating noise; and, when they descend, dart down with vast rapidity: it is also amusing to observe the cock, while his mate sits on her eggs, poise himself on her wings, making sometimes a whistling and sometimes a drumming noise. Their food is the same with that of the woodcock; their flight very irregular and swift, and attended with a shrill scream. These birds are found in every quarter of the globe, and in very various climates.

5. *S. glottis*, the greenshank, is in length to the end of the tail fourteen inches; to that of the toes twenty; its breath twenty-five. The bill is two inches and a half long; the upper mandible black, straight, and very slender; the lower reflects a little upwards; the head and upper part of the neck are ash-colored, marked with small dusky lines pointing down; over each passes a white line; the coverts, the scapulars, and upper part of the back, are of a brownish ash-color; the quill-feathers dusky, but the inner webs speckled with white; the breast, belly, thighs, and lower part of the back, are white; the tail is white, marked with undulated dusky bars: the inner coverts of the wings finely crossed with double and treble rows of a dusky color. It is a bird of an elegant shape, and small weight in proportion to its dimensions, weighing only six ounces. The legs are very long and slender, and bare two inches above the knees. The exterior toe is united to the middle toe, as far as the second joint, by a strong membrane which borders their sides to the very end.—These birds appear on the English coast and wet grounds in the winter time in but small numbers.

6. *S. rusticola*, the woodcock, during summer inhabits the Alps of Norway, Sweden, Polish Prussia, and the northern parts of Europe: they all retire from those countries the beginning of winter, as soon as the frosts commence; which force them into milder climates, where the ground is open, and adapted to their manner of feeding. They live on worms and insects, which they search for with their long bills in soft grounds and moist woods.—Woodcocks generally arrive here in flocks, taking advantage of the night or a mist: they soon separate; but, before they return to their native haunts, pair. They feed and fly by night; beginning their flight in the evening, and return the same way to their day retreat. They leave England in the end of February or beginning of March; though they sometimes continue longer. These birds appear in Scotland first on the eastern coasts, and make their progress from east to west. Our species of woodcock is unknown in North America: but a kind is found that has the general appearance of it; but is scarcely half the size, and wants the bars on the breast and belly. The length nearly fourteen inches; and the breadth twenty-six; the bill is three inches long, dusky towards the end, reddish at the base; tongue slender, long, sharp, and hard at the point; the eyes large, and placed near the top of the head, that they may not be injured when the birds thrusts its bill into the ground; from the bill to the eyes is a black line; the forehead is a reddish ash-color; the crown of the head, the hind part of the neck, the back, the covert of the wings, and the scapulars, are prettily barred with a ferruginous red, black, and gray; but on the head the black predominates: the quill feathers are dusky, indented with red marks. The chin is of a pale yellow; the whole under side of the body is of a dirty white, marked with numerous transverse lines of a dusky color. The tail consists of twelve feathers, dusky or black on the one web, and marked

with red on the other; the tips above are ash-colored, below white. The legs and toes are livid; the latter divided almost to their very origin, having only a very small web between the middle and interior toes; as those of the two species of snipes found in England.

SCOLOPENDRA, in zoology, a genus of insects belonging to the order of aptera. The feet are very numerous, being as many on each side as there are joints in the body; the antennæ are setaceous: there are two jointed pappi, and the body is depressed.—These insects are very formidable and noxious in the warm countries, where they grow to the length of a quarter of a yard or more, though in this climate they seldom grow above an inch long. The scolopendra is also called the centipes from its number of feet. In the East Indies it grows to six inches in length, and as thick as a man's finger: it consists of many joints; and from each joint proceeds a leg on each side: they are covered with hair, and seem to have no eyes; but there are two feelers on the head, with which they find out the way they are to pass: the head is very round, with two small sharp teeth, with which they inflict wounds that are very painful and dangerous. Some of the species live in holes in the earth; others under stones, and among rotten wood; so that the removing of these is exceedingly dangerous in the countries where the scolopendræ breed. The scolopendra forficata is the largest in this country, of a dun color, smooth, and composed of nine scaly segments, without reckoning the head. The feet are fifteen in number on each side, and the last longer than the rest, and turned backwards, form a kind of forked tail. The antennæ are twice the length of the head, and consist of forty-two short segments. The insect's progressive motion is very quick, and sometimes serpentine. It is found under stones on the ground, under flower-pots and garden boxes.

SCOLYMUS, in botany, golden thistle; a genus of the polygamia æqualis order, and syn-genesia class of plants; natural order forty-ninth, compositæ: receptacle paleaceous: CAL. imbricated and prickly, without any pappus. Species three, natives of Barbary and the United States of Europe.

SCOMBER, the mackerel, in ichthyology, a genus belonging to the order of thoracici. The head is smooth and compressed, and there are seven rays in the gill membrane. There are twenty-two species; the most remarkable are the following:—

1. *S. communis*, the common mackerel, a summer fish of passage that visits our shores in vast shoals. It is less useful than other species of gregarious fish, being very tender, and unfit for carriage; but it may be preserved by pickling and salting. See *FISHERY*. It was greatly esteemed by the Romans, because it furnished the garum, a sort of pickle that gave a high relish to their sauces; and was also used medicinally. This fish is easily taken by a bait; but the best time is during a fresh gale of wind, which is thence called a mackerel gale. In the spring the eyes of mackerel are almost covered with a white film; during which period they are half

blind. This film grows in winter, and is cast the beginning of summer. It is not often that a mackerel exceeds two pounds in weight, yet there have been instances of some that weighed upwards of five. The nose is taper and sharp pointed; the eyes large; the jaws of an equal length; the teeth small, but numerous. The form of this fish is very elegant. The body is a little compressed on the sides: towards the tail it grows very slender, and a little angular. It is a most beautiful fish when alive; nothing can equal the brilliancy of its color, which death impairs, but does not wholly obliterate.

2. *S. thunnus*, the tunny. These fish are caught in nets, and amazing quantities are taken; for they come in vast shoals, keeping along the shores. They frequent our coasts, but not in shoals, like the tunnies of the Mediterranean. They are not uncommon in the lochs on the west coast of Scotland; where they come in pursuit of herrings; and often during night strike into the nets, and do considerable damage. When the fishermen draw them up in the morning, the tunny rises at the same time towards the surface, ready to catch the fish that drop out. On perceiving it, a strong hook, baited with a herring and fastened to a rope, is instantly flung out, which the tunny seldom fails to take. As soon as hooked it loses all spirit; and after a very little resistance submits to its fate. It is dragged to the shore and cut up, either to be sold fresh to people who carry it to the country markets, or preserved salted in large casks. The pieces, when fresh, look exactly like raw beef; but when boiled turn pale, and have something of the flavor of salmon. One mentioned by Mr. Pennant weighed 460lbs. The fish was seven feet ten inches long: the greatest circumference five feet seven; the least near the tail one foot six. The body was round and thick, and grew suddenly very slender towards the tail, and near that part was angular. The irides were of a plain green; the teeth very minute. The tail was in form of a crescent; and two feet seven inches between tip and tip. The skin on the back was smooth, very thick, and black. On the belly the scales were visible. The color of the sides and belly was silvery, tinged with cærulean and pale purple: near the tail marbled with gray. On the coast of Scotland they are called mackrelsture; mackrel, from being of that genus; and sture, from the Danish stor, great.

SCOMM, *n. s.* From Lat. *scommā*. A buffoon. A word well out of use.

The *scomms*, or buffoons of quality are volkish in conversation. *L'Estrange*.

SCONCE, *n. s.* Teut. *schantz*; Gotl. *skyn*, to cover. A fort; bulwark; wall protection; a candlestick for a wall.

Such fellows are perfect in the great commanders' names, and they will learn you by rote where services were done; at such and such a *sconce*, at such a breach. *Shakspeare. Henry V.*

Why does he suffer this rude knave now to knock him about the *sconce* with a dirty shovel, and will not tell him of this action of battery? *Id. Hamlet*.

Golden *sconces* hang upon the walls,
To light the costly suppers and the balls.

Dryden's Luc.

Triumphant Umbriel, on a *sconce's* height,
Clapped his glad wings, and sat to view the fight.

Pope.

Put candles into *sconces*.

Swift's Directions to the Butler.

SCONE, or Scoon, an ancient town of Scotland, in Perthshire, remarkable for being the place where the kings were anciently crowned. Here was once an abbey of great antiquity, which was burnt by the reformers at Dundee. Kenneth II. upon his conquest of the Picts in the ninth century, having made Scone his principal residence, delivered his laws, called the Macalpine laws, from a tumulus named the Mote Hill of Scone. The old palace was begun by the earl of Gowrie; but was completed by Sir David Murray of Gospatric, the favorite of king James VI., to whom that monarch had granted it; and the new possessor, in gratitude to his benefactor, put up the king's arms in several parts of the house. It is built around two courts. The dining room is large and handsome; and has an ancient and magnificent chimney piece, and the king's arms, with this motto:—

Nobis hæc invicta miserunt centum sex proavi.

Beneath are the Murray arms. In a small bed-chamber is a medly scripture piece in needlework, with a border of animals, pretty well done, the work of queen Mary during her confinement in Loch Leven Castle. The gallery is about 155 feet long, the top arched, divided into compartments filled with paintings in water colors. Till the destruction of the abbey, the kings of Scotland were crowned here, sitting in the famous marble chair which Edward I. transported to Westminster Abbey, to the great mortification of the Scots, who looked upon it as a kind of palladium. Charles II., before the battle of Worcester, was crowned in the chapel. The old pretender resided for some time at Scone in 1715; and his son paid it a visit in 1745. Such was the palace of Scone, till about the year 1803, that part of it was taken down and rebuilt in a more modern style by the earl of Mansfield. The modern house, including a very small portion of the ancient palace, forms one of the most magnificent houses in Scotland. The church erected in 1784 was taken down, and a new one built in 1804 upon the same plan, decorated with an ancient family seat of the Stormont family, the ancestors of the earl of Mansfield, of very curious workmanship. Scone consists of two streets, one of them very wide, and lies forty-one miles north of Edinburgh, and two from Perth.

SCOOP, *n. s. & v. a.* Fr. *scope*; Swedish *scop*; Belg. *schœpe*. A kind of large ladle; a vessel with a long handle used to throw out liquor; a surgical instrument: to use a scoop; to make hollow or like a scoop.

As by the brook he stood,
He scooped the water from the crystal flood.

Id. Æneid.

They turn upside down hops on malt-kilns, when almost dry, with a scoop. *Mortimer's Husbandry.*

It much conduces how to scare

The little race of birds, that hop
From spray to spray, *scooping* the costliest fruit,
Insatiate, undisturbed.

Philips.

A spectator would think this circular mound had been actually *scooped* out of that hollow space.

Spectator.

Her fore-feet are broad, that she may *scoop* away much earth at a time.

Addison.

Those carbuncles the Indians will *scoop*, so as 'o hold above a pint.

Arbutnot on Ccins.

Endeavour with thy *scoop*, or fingers, to force the stone outwards.

Sharp's Surgery.

The genius of the place

Or helps the ambitious hill the heaven to scale,

Or *scoops* in circling the theatre's vale.

Pope.

Melted Alpine snows

The mountain cisterns fill, those ample stores

Of water *scooped* among the hollow rocks.

Thomson.

SCOPARIA, in botany, a genus of the monogynia order, and tetrandria class of plants, natural order fortieth, personate: cal. quadripartite: cor. the same, and rotaceous: caps. unicellular, bivalved, and polyspermous.

SCOPAS, a celebrated Grecian architect and sculptor, a native of Ephesus, according to Lem-priere. He flourished about A. A. C. 430. He built the famous Mausoleum for Q. Artemisia, which was esteemed one of the seven wonders of the world. See ARTEMISIA. But his chief work was a statue of Venus, which he carried to Rome, where it was esteemed superior even to that of Praxiteles.

SCOPE, *n. s.* Lat. *scopus*. Aim; intention; drift: room; space; liberty.

The *scope* of all their pleading against man's authority is to overthrow such laws and constitutions in the church, as depending thereupon, if they should therefore be taken away, would leave neither face nor memory of church to continue long in the world.

Hooker.

Now was time

To aim their counsels to the fairest *scope*.

Hubbard's Tale.

Your *scope* is as mine own,

So to enforce or qualify the laws,

As to your soul seems good.

Shakspeare. Measure for Measure.

His coming hither hath no further *scope*

Than for his lineal royalties, and to beg

Infranchisement immediate on his knee.

Id. Richard II.

Ah, cut my lace asunder,

That my pent heart may have some *scope* to beat,

Or else I swoon with this dread killing news.

Shakspeare.

Sith 'twas my fault to give the people *scope*,

'Twould be my tyranny to strike and gall them

For what I bid them do.

Id.

As surfeit is the father of much fast,

So every *scope*, by the immoderate use,

Turns to restraint.

Id.

We should impute the war to the *scope* at which it aimeth.

Raleigh.

The *scopes* of land granted to the first adventurers were too large, and the liberties and royalties were too great for subjects.

Darvies on Ireland.

He, in what he counsels, and in what excels,

Mistrustful, grounds his courage on despair

And utter dissolution, as the *scope*

Of all his aim.

Milton's Paradise Lost.

An heroick poet is not tied to a bare representation of what is true, but that he might let himself loose to visionary objects, which may give him a freer *scope* for imagination.

Dryden.

Had the whole *scope* of the author been answerable to his title, he would have only undertaken to prove what every man is convinced of; but the drift of the pamphlet is to stir up our compassion towards the rebels.

Addison.

These theorems being admitted into optics, there would be *scope* enough of handling that science voluminously, after a new manner; not only by teaching those things which tend to the perfection of vision, but also by determining mathematically all kinds of phenomena of colours which could be produced by refraction.

Newton's Opticks.

SCOPOLIA, in botany, a genus of the octandria order, and gynandria class of plants; natural order eleventh, sarmentacea: cal. diphyllous: cor. quadrifid: the antherae coalesce in two columns, one placed above the other. Of this there is only one species, viz. *S. composita*.

SCORBUTICAL, *adj.*

Fr. *scorbutique*;

SCORBUTIC,

Lat. *scorbutus*. Dis-

SCORBUTICALLY, *adv.*

Seased with scurvy:

the adverb corresponding.

Violent purging hurts *scorbutic* constitutions; lenitive substances relieve.

Arbutnot.

A person about forty, of a full and *scorbutical* body, having broke her skin, endeavoured the curing of it; but, observing the ulcer sanious, I proposed digestion.

Iliseman.

A woman of forty, *scorbutically* and hydropically affected, having a sordid ulcer, put herself into my hand.

Id.

SCORCE, *n. s.* Used by Spenser for discourse, or power of reason: in imitation perhaps of the Italians.

Lively vigour rested in his mind,

And recompensed him with a better *scoree*; Weak body well is changed for mind's redoubled force.

Faerie Queene.

SCORCH, *v. a. & v. n.* Saxon *scorchen*; Belg. *schrocken*, burnt. To burn superficially: be dried up or thus burnt.

Power was given to scorch men with fire.

Revelations xvi. 8.

Fire scorcheth in frosty weather.

Bacon's Natural History.

The same that left thee by the cooling stream, Safe from sun's heat, but scorched with beauty's beam.

Fairfax.

The swarthy Africans complain

To see the chariot of the sun

So nigh their scorching country run.

Roscommon.

You look with such contempt on pain,

That languishing you conquer more;

So lightnings which in storms appear

Scorch more than when the skies are clear.

Waller.

I rave,

And, like a giddy bird in dead of night,

Fly round the fire that scorches me to death.

Druden.

The love was made in Autumn, and the hunting followed properly when the heats of that scorching country were declining.

Id.

Scatter a little mungy straw or fern amongst your seedlings, to prevent the roots from scorching, and to receive the moisture that falls.

Mortimer's Husbandry.

The same beams that shine, scorch too.

South.

He, from whom the nations should receive

Justice and freedom, lives himself a slave;

Tortured by cruel change of wild desires,

Lashed by mad rage, and scorched by brutal fires.

Prior.

SCORDISCÆ, or SCORDISCI, an ancient people of Pannonia and Thrace, infamous for their barbarity during the reigns of the Roman emperors. They not only sacrificed their prisoners to their gods, but drank their blood.—Liv. Flor. Strabo.

SCORDIUM, or water germander, in botany, is a species of teucrium.

SCORE, *n. s. & v. a.* Isl. *skora*; Goth. *skor*, a mark or notch. A notch, or long incision; a line drawn; account kept; reason; sake: to mark or set down in account.

Hast thou appointed where the sun should rise,
And with her purple light adorn the skies?
Scored out the bounded sun's obliquer ways,
That he on all might spread his equal rays?

Sandys.
Our forefathers had no other books but the *score*
and the tally: thou hast caused printing to be used.

Shakspeare. Henry VI.

He's worth no more:
They say he parted well, and paid his *score*.

Id. Macbeth.

That thou dost love her, strikes some *scores* away
From the great compt.

Id. All's Well That Ends Well.

He had been prentice to a brewer,
But left the trade; as many more
Have lately done on the same *score*. *Hudibras.*
Universal deluges have swept all away except two
or three persons who begun the world again upon a
new *score*. *Tillotson.*

Your follies and debauches change
With such a whirl, the poets of your age
Are tired, and cannot *score* 'em on the stage;
Unless each vice in short-hand they indite,
Even as noteth prentices whole sermons write.

Dryden.

You act your kindness on Cydaria's *score*. *Id.*
A lion that had got a politick fit of sickness,
wrote the fox word how glad he should be of his
company, upon the *score* of ancient friendship.

L'Estrange.

Does not the air feed the flame? And does not
the flame warm and enlighten the air? Does not the
earth quit *scores* with all the elements, in the fruits
that issue from it? *South.*

If your terms are moderate, we'll never break off
upon that *score*. *Collier on Pride.*

Kings in Greece were disposed by their people
upon the *score* of their arbitrary proceedings.

Swift.

Madam, I know when
Instead of five you *scored* me ten.

Id.

SCORE, *n. s.* Sax. *ƿcop*. Twenty; because
twenty, being a round number, was distinguished
on tallies by a long *score*.

How many *score* of miles may we well ride
'Twixt hour and hour? *Shakspeare. Cymbeline.*
The fewer still you name, you wound the more;
Bond is but one, but Harpax is a *score*. *Pope.*

For some *scores* of lines there is a perfect absence
of that spirit of poetry. *Watts.*

O bid him never tie them mair
Wi' wicked strings o' hemp or hair!
But ca' them out to park or hill,
An' let them wander at their will;
So may his flock increase, an' grow
To *scores* o' lambs, an' packs o' woo'! *Burns.*

SCOR'IA, *n. s.* Lat. *scoria*. Dross; recre-

ment.
By the fire they emit many drossy and *scoriosis*
parts. *Boene.*

The *scoria*, or vitrified part, which most metals,
when heated or melted, do continually protrude to
the surface, and which, by covering the metals in
form of a thin glassy skin, causes these colours, is
much denser than water. *Newton's Opticks.*

SCORIA, among metallurgists, is the dross of
metals in fusion; or the glass often produced
by melting metals and ores: when cold it is
brittle, and not dissoluble in water.

SCORIFICATION, the art of reducing a
body either entirely, or in part, into *scoriae*. It
is used by metallurgists, in order that any metal,
imprisoned in a solid body, may, on account of
its weight, descend and separate itself from it,
and finally, if that be required by itself either
wholly or in part, converted into *scoriae*. It is
often proper to make this scorification in a vessel
that may absorb the *scoriae*, and retain only the
metallic part of the mass. See CUPEL and
ASSAYING.

SCORN, *v. a., v. n., &* French *escorner*;
SCORN'ER, *n. s.* [*n. s.*] Span. *escannir*; Ital.
SCORN'FUL, *adj.* } *scornare*. To des-
SCORN'FULLY, *adv.* } pise; slight; revile;
to scoff; disdain; neglect: the noun substantive,
adjective, and adverb, corresponding.

My friends *scorn* me; but mine eye poureth out
tears unto God. *Job xvi. 20.*

Our soul is filled with the *scorning* of those that
are at ease, and with the contempt of the proud.

Psalms cxxiii. 4.

Surely he *scorneth* the *scorner*, but he giveth grace
unto the lowly. *Proverbs.*

He that sitteth in the heavens shall laugh them to
scorn; the Lord shall have them in derision.

Psalms. Common Prayer.

If he do fully prove himself the honest shepherd
Menalcas his brother and heir, I know no reason
why you should *think scorn* of him. *Sidney.*

They are very active; vigilant in their enterprises,
present in perils, and great *scorners* of death.

Spenser on Ireland.

He said mine eyes were black, and my hair black;
And, now I am remembered, *scorned* at me.

Shakspeare.

We were better parch in Afric's sun
Than in the pride and salt *scorn* of his eyes. *Id.*

He used us *scornfully*; he should have showed us
His marks of merit, wounds received for's country.

Id.

Diogenes was asked in *scorn*, What was the
matter that philosophers haunted rich men, and not
rich men philosophers? He answered, because the one
knew what they wanted, the others did not. *Bacon.*

I've seen the morning's lovely ray
Hover o'er the new-born day
With rosy wings so richly bright,
As if he *scorned* to think of night. *Crashaw.*
This my long sufferance, and my day of grace,
They who neglect and *scorn* shall never taste;
But hard be hardened, blind be blinded, more.

Milton.

Is it not a most horrid ingratitude thus to make a
scorn of him that made us? *Tillotson.*

Every sullen frown and bitter *scorn*
But fanned the fuel that too fast did burn.

Dryden.

The enamoured deity

The *scornful* damsels shuns. *Id.*

The *scorner* should consider, upon the sight of a
cripple, that it was only the distinguishing mercy of
heaven that kept him from being one too.

L'Estrange.

For Numidia's grown a scorn among the nations,
A breach of publick vows. *Addison's Cato.*

They, in the corner's or the judge's seat,
Dare to condemn the virtue which they hate. *Prior.*

With him I o'er the hills had run,
Scornful of winter's frost and summer's sun. *Id.*

The sacred rights of the Christian church are
scornfully trampled on in print, under an hypocritical
pretence of maintaining them. *Atterbury's Sermons.*

Fame, that delights around the world to stray,
Scorns not to take our Argos in the way. *Pope.*

SCORPENA, in ichthyology, a genus of fishes, of the order thoracici. The head is large and sharp; the eyes are near each other; there are teeth in the jaws, palate, and fauces; and there are seven rays in the membrane of the gill. The species are three; viz.

1. *S. horrida*, 2. *S. porcus*, and 3. *S. scrofa*. The largest of these is the *S. scrofa*, of which the following are the distinguishing characters:—Lower lip having two cirri; head large; eyes enormous, pupil black, iris yellow or reddish, with four brown rays, above which are three cirri; mouth large; cheeks and lower jaw cirrous; jaws equal; the tongue and palate armed with sharp, recurved teeth; aperture of the gills large, the cover with two large and many smaller spines; back brown; fins bluish, the rays varied, yellow, and brown, and mostly forked. This fish inhabits the Atlantic, Mediterranean, and Northern Seas; it grows from three to four yards long, and is a most voracious fish, preying not only on other fishes, but also on sea-birds; body whitish-tawny, spotted with brown, and covered with large scales; the flesh is eaten in Italy. This fish is called by the people of Cornwall father-lasher.

SCORPENA is also the name of another fish caught in many parts of the Mediterranean. It seldom grows to more than a pound weight. Its body is long, but not flattened, and is moderately thick. Its head is extremely large, and is armed with prickles, and it grows gradually less from thence to the tail. The prickles about the head are accounted venomous, and the fishermen usually cut them off as soon as the fish is caught. Its tail is rounded at the end. The belly and belly-fins are reddish.

SCORPIO, in entomology, a genus of insects belonging to the order of aptera. It has eight feet, besides two frontal claws; the eyes are eight in number, three on each side of the thorax, and two on the back. It has two claw-shaped palpi, a long jointed tail, with a pointed weapon at the extremity; it has likewise two combs situated between the breast and abdomen. See ENTOMOLOGY. There are several species, all natives of warm climates. Of all the classes of noxious insects, the scorpion is the most terrible, whose size among the insects is enormous, and its sting often fatal. In several parts of the continent of Europe it is but too well known, though it seldom grows above four inches long; but in the warm tropical climates it is seen a foot in length, and in every respect as large as a lobster, which it somewhat resembles in shape. The scorpion's head seems, as it were, jointed to the breast, in the middle of which are seen two eyes: and a little more forward two eyes more,

placed in the fore part of the head; these eyes are so small that they are scarcely perceivable; and it is probable the animal has but little occasion for seeing. The mouth is furnished with two jaws; the undermost is divided into two, and the parts notched into each other, with which it breaks its food, and thrusts it into its mouth; these the scorpion can at pleasure pull back into its mouth, so that no part of them can be seen. On each side of the head are two arms, each composed of four joints; the last of which is large, with strong muscles, and formed in the manner of a lobster's claw. Below the breast are eight legs, each divided into six joints; the two hindmost of which are each provided with two crooked claws, and here and there covered with hair. The belly is divided into seven little rings; from the lowest of which is continued a tail composed of six joints, which are bristly, and formed like little globes, the last being armed with a crooked sting. This is that fatal instrument which renders this insect so formidable; it is long, pointed, hard, and hollow; it is pierced near the base by two small holes, through which, when the animal stings, it ejects a drop of poison, which is white and caustic. The reservoir in which this poison is formed and kept is a small bladder near the tail. If this bladder be greatly pressed the venom will be seen issuing out through the two holes above mentioned; so that it appears, that when the animal stings, the bladder is pressed, and the venom issues through the two apertures into the wound. Galen observes that a person who had not witnessed the fact would not suppose that so small an injury as the sting of a scorpion, or the bite of a poisonous spider, could produce the violent effects which they do in the whole body. He says the aculeus or sting of a scorpion ends in the minutest point; and has no perforation through which any poison can pass into the wound. Yet, he says, we must suppose the venom to be some spiritual substance or moisture, in which a great power is concentrated in a small compass. 'Before I had an opportunity,' says Dr. Moseley, 'of examining this subject, my respect for the opinion of Galen made me doubt the accuracy of Leuwenhoek, Redi, Mead, and others, who assert that there is an aperture near the cuspis of a scorpion's sting; and that through this aperture a liquid poison is injected when a wound is inflicted. Repeated experiments, with the best glasses, have never enabled me to discover any foramen or opening whatever.' There are few animals more formidable, or more truly mischievous, than the scorpion. As it takes refuge in a small place, and is generally found sheltering in houses, it must frequently sting those among whom it resides. In some of the towns of Italy, and in France, in the ci-devant province of Languedoc, it is a terrible enemy; but its malignity in Europe is trifling, when compared to what the natives of Africa and the east are known to experience. In Batavia, where they grow twelve inches long, there is no removing any piece of furniture without the utmost danger of being stung by them. Bosman assures us that along the Gold Coast they are often found larger than a lobster; and that their

sting is inevitably fatal. In Europe, however, they are by no means so large, so venomous, or so numerous. The general size of this animal does not exceed two or three inches. Maupertuis, who made several experiments on the scorpion of Languedoc, found it by no means so invariably dangerous as had till then been represented. He provoked one of them to sting a dog in three places of the belly, where the animal was without hair. In about an hour after the poor animal appeared greatly swollen, and became very sick; he then cast up whatever he had in his bowels, and for about three hours continued vomiting a whitish liquid. The belly was always greatly swollen when the animal began to vomit; but this operation always seemed to abate the swelling, which alternately swelled, and was thus emptied for three hours successively. The poor animal after this fell into convulsions, bit the ground, dragged himself along upon his fore feet, and at last died, five hours after being bitten. He was not partially swollen round the place which was bitten, as is usual after the sting of a wasp or a bee; but his whole body was inflated, and there only appeared a red spot on the places where he had been stung. Some days after, however, the same experiment was tried upon another dog, and even with more aggravated cruelty, yet the dog seemed in no way affected by the wounds; but, howling a little when he received them, continued alert and well after them; and soon after was set at liberty without showing the smallest symptoms of pain. So far was this poor creature from being terrified at the experiment, that he left his own master's house to come to that of the philosopher, where he had received more plentiful entertainment. The same experiment was tried by fresh scorpions upon seven other dogs, and upon three hens; but no deadly symptom ensued. Hence it appears, that many circumstances, which are utterly unknown, must contribute to give efficacy to the scorpion's venom. In the trials made by Maupertuis he employed scorpions of both sexes, newly caught and seemingly vigorous and active. These experiments may serve to show that many of the boasted antidotes which are given for the cure of the scorpion's sting, owe their success rather to accident than their own efficacy. They only happened to cure when their sting was no way dangerous; but in cases of actual malignity they might probably be utterly unserviceable. The scorpion of the tropical climates, being much larger than the former, is probably much more venomous. Helbigius, however, who resided for many years in the east, assures us that he was often stung by the scorpion, and never received any material injury from the wound; a painful tumor generally ensued, but he always cured it by rubbing the part with a piece of iron or stone, as he had seen the Indians practise before him, until the flesh became insensible. Seba, Moore, and Bosman, however, give a very different account of the scorpion's malignity; and assert that, unless speedily relieved, the wound becomes fatal. No animal in the creation seems endued with such an irascible nature; they have often been seen, when taken and put into a place of security, to exert all their rage

against the sides of the glass vessel that contained them. They will attempt to sting a stick when put near them, and attack a mouse or a frog, while those animals are far from offering any injury. Maupertuis put three scorpions and a mouse into the same vessel together, and they soon stung the little animal in different places. The mouse, thus assaulted, stood for some time upon the defensive, and at last killed them all, one after another. He tried this experiment, in order to see whether the mouse, after it had killed, would eat the scorpions; but the little quadruped seemed satisfied with the victory, and even survived the severity of the wounds it had received. Wolkemar tried the courage of the scorpion against the tarantula, and enclosed several of both kinds in glass vessels for that purpose. The spider at first used all its efforts to entangle the scorpion in its web, which it immediately began spinning; but the scorpion rescued itself from the danger, by stinging its adversary to death; it soon after cut off, with its claws, all the legs of the spider, and then sucked all the internal parts at its leisure. The fierce spirit of this animal is equally dangerous to its own species, for scorpions are the cruellest enemies to each other. Maupertuis put about 100 of them together in the same glass; and they scarcely came into contact before they began to exert all their rage in mutual destruction; there was nothing to be seen but one universal carnage, without any distinction of age or sex; so that in a few days there remained only fourteen, which had killed and devoured all the rest. He next enclosed a female scorpion, big with young, in a glass vessel, and she was seen to devour them as fast as they were excluded; there was but one only of the number that escaped the general destruction, by taking refuge on the back of its parent; and this soon after revenged the cause of its brethren, by killing the old one in its turn. Such is the terrible and unrelenting nature of this insect. It is even asserted that, when driven to an extremity, the scorpion will destroy itself. The following experiment was ineffectually tried by Maupertuis:—'But,' says Mr. Goldsmith, 'I am so well assured of it by many eye-witnesses, who have seen it both in Italy and America, that I have no doubt remaining of its veracity. A scorpion newly caught is placed in the midst of a circle of burning charcoal, and thus an egress prevented on every side; the scorpion, as I am assured, runs for about a minute round the circle, in hopes of escaping; but, finding that impossible, it stings itself on the back of the head, and in this manner the undaunted suicide instantly expires.' This, however, wants further confirmation. The male and female of this insect are very easily distinguishable; the male being smaller and less hairy. The female brings forth her young alive, and perfect in their kind. Redi, having bought a quantity of scorpions, selected their females, which by their size and roughness, were easily distinguishable from the rest, and putting them in separate glass vessels, he kept them for some days without food. In about five days one of them brought forth about thirty-eight young ones, well shaped, and of a milk white color, which changed every

day more and more into a dark rusty hue. Another female, in a different vessel, brought forth twenty-seven of the same color, and the day following the young ones seemed all fixed to the back and belly of the female. For near a fortnight all these continued alive and well, but afterwards some of them died daily, until, in about a month, they all died except two. Were it worth the trouble, these animals might be kept living as long as curiosity should think proper. Their chief food is worms and insects; and upon a proper supply of these their lives might be lengthened to their natural extent. How long that may be we are not told; but if we may argue from analogy, it cannot be less than seven or eight years; and perhaps, in the larger kind double that duration. As they have somewhat the form of the lobster, so they resemble that animal in casting their shell, or more properly their skin; since it is softer by far than the covering of the lobster, and set with hairs, which grow from it in great abundance, particularly at the joinings. The young lie in the womb of the parent, each covered up in its own membrane, to the number of forty or fifty, and united to each other by an oblong thread, so as to exhibit altogether the form of a chaplet. It seems probable that captivity produces that unnatural disposition in the scorpion which induces it to destroy its young; since, at liberty, it is found to protect them with unceasing assiduity.

SCORPIO, the scorpion, in astronomy, the eighth sign of the zodiac, denoted by the character ♏ . See ASTRONOMY.

SCORPION, *n. s.* French *scorpion*; Latin *scorpio*. A reptile resembling a small lobster, with a very venomous sting.

My father hath chastised you with whips, but I will chastise you with *scorpions*. 1 Kings xii. 11.

Well, forewarning wands

Did seem to say, seek not a *scorpion's* nest.

Shakspeare. Henry VI.

Full of *scorpions* is my mind, dear wife. *Id.* Macbeth.

The squeezing crab and stinging *scorpion* shine.
Dryden.

SCORPION. See SCORPIO.

SCORPION GRASS is a species of *scorpiurus*.

SCORPIURUS, the caterpillar, in botany, a genus of the decandria order, and diadelphia class of plants, natural order thirty-second, papilionaceæ; legume contracted by incisions on the inside betwixt every two seeds revolved round. There are four species, the most remarkable of which is—

S. vermiculata, a native of Italy and Spain. It is an annual plant, with trailing herbaceous stalks, which at each joint have a spatular-shaped leaf with a long foot-stalk. From the wings of the leaves come out the foot-stalks of the flowers, which sustain at the top one yellow butterfly flower, succeeded by a thick twisted pod, having the size and appearance of a larger caterpillar, from whence it had this title. This has long been preserved in the gardens of this country, more on account of its odd shape than for any great beauty. It is propagated by sowing the seeds on a bed of light earth; and, when the plants come up, they must be kept free from weeds and thinned, so that there may be a foot distance between them.

SCORZA (Senibald), an eminent Italian painter and engraver, born at Vollagio, in 1590. He engraved after the designs of the celebrated Albert Durer, with great accuracy. As a painter he excelled in representing animals and flowers. He died in 1631, aged forty-one.

SCORZONERA, viper-grass, in botany, a genus of the polygamia aequalis order, and syngenesia class of plants: natural order forty-ninth, compositæ; receptacle naked; pappus like a plum: cat. imbricated, with scales membranaceous on their margins. The most remarkable species is the—

S. Hispanica, the Spanish, or common viper-grass. It is cultivated in the gardens of this country, both for culinary and medicinal purposes. The root is carrot-shaped, about the thickness of a finger, covered with a dark brown skin, is white within, and has a milky juice. The stalk rises three feet high, is smooth, branching at the top, and garnished with a few narrow leaves, whose base half embraces the stalk. The flowers are of a bright yellow color, and terminate the stalks in scaly empalements composed of many narrow tongued-shaped hermaphrodite florets, lying over each other like the scales of fish, and are of a bright yellow color. After these are decayed, the germen, which sits in the common empalements, turns to oblong cornered seeds, having a roundish ball of feathered down at the top. This plant is propagated by seeds; and must be carefully thinned and kept free from weeds, otherwise the plants will be weak. The roots of the *scorzonera* were formerly much celebrated for their alexipharmic virtues, and for throwing out the small-pox; but have now almost entirely lost their character; however, as they abound with an acrid juice, they may sometimes be of use for strengthening the viscera, and promoting the fluid secretions.

SCOT (Michael), of Balwirie, a learned Scottish author of the thirteenth century. He made the tour of France and Germany; and was received with distinction at the court of the emperor Frederic II. He was skilled in languages; and translated into Latin, from the Arabic, the history of animals, by the celebrated physician Avicenna. He published the whole of the works of Aristotle with notes. He wrote a work on The Secrets of Nature; also a tract On the Nature of the Sun and Moon. He there speaks of the grand operation of the alchemists, and is exceedingly solicitous about the projected powder, or the philosopher's stone. He likewise published *Mensa Philosophica*, a treatise on astrology and chiromancy. He was much admired in his day, and was even suspected of magic; and had Roger Bacon and Cornelius Agrippa for his panegyrists.

Scot (Reginald), a writer in the sixteenth century. He studied at Hart Hall, in the University of Oxford; after which he retired to Smecthe, where he lived a studious life, and died in 1599. He published *The perfect Platform of a Hop-garden*, and *The Discovery of Witchcraft*; in which he showed that the relations concerning magicians and witches are chimerical. This work was not only censured by king James I. in his *Dæmonology*, but by several eminent

divines; and all the copies of it that could be found were burnt.

SCOT, *n. s.* Fr. *scot*. Shot; payment; scot and lot, parish payments.

'Twas time to counterfeit, or that hot termagant Scot had paid me *scot and lot* too.

Shakspeare. Henry IV.

The chief point that has puzzled the freeholders, as well as those that pay *scot and lot*, for about these six months, is, Whether they would rather be governed by a prince that is obliged by law to be good, or by one who, if he pleases, may plunder or imprison?

Addison.

Protopogenes, historians note,

Lived there a Burgess, *scot and lot*. *Prior.*

SCOT AND LOT is a customary contribution laid upon all subjects according to their abilities. Whoever were assessed in any sum, though not in equal proportions, were said to pay scot and lot.

SCOTAL, or SCOTALE, is where an officer of a forest keeps an ale-house within the forest, by color of his office, making people come to his house, and there spend their money for fear of his displeasure. We find it mentioned in the charter of the forest, cap. 8. 'Nullus forestarius faciat Scotallas, vel garbas colligat, vel aliquam collectam faciat,' &c. The word is compounded of scot and ale, and by transposition of the words is otherwise called aleshot.

SCOTCH, *v. a.* Qu. Lat. *qualio*. To cut with shallow incision.

He was too hard for him: directly before Corioli, he *scotcht* and notcht him like a carbonado.

Shakspeare. Coriolanus.

We'll heat 'em into Bench holes; I have yet room for six *scotches* more.

Id. Antony and Cleopatra.

Give him four *scotches* with a knife, and then put into his belly, and these *scotches*, sweet herbs.

Walton's Angler.

Children being indifferent to any thing they can do, dancing and *scotch* *hoppers* would be the same thing to them.

Locke.

SCOTI (Latin), the Scots, the ancient inhabitants of Scotland, mentioned as distinct from the Picts, so early as by Claudian de Hon. 3. Cons. v.

SCOTIA, NOVA, or NEW SCOTLAND, a name that has been given to those British settlements in North America, situated between 43° and 46° lat. N. and between 60° and 67° long. W., bounded by the St. Laurence on the north, by the gulf of St. Laurence and the Atlantic Ocean on the east, by the same ocean on the south, and by Canada and New England on the west. In 1784 this province was divided into two governments. See our article NORTH AMERICA, chap. III. The trade between Great Britain and these provinces consists in the export of linen, woollens, and fishing gear chiefly, for £30,000 a-year, and the import of lumber and fish for £40,000.

The Isle of Sable, twenty-five leagues distant from Cape Canso, the north-east point of Nova Scotia, is composed entirely of sand-hills, in the shape of sugar-loaves, 140 feet high, and white as milk with white transparent stones: it is of a semicircular shape, being ten leagues in circuit, but very narrow. On the north, or concave side, is a shallow lake, five leagues in circumference, and communicating with the sea. It

has no port, but has some ponds of fresh water, and produces juniper, blue-berry bushes, grass, and vetches. Many vessels have been wrecked on this island, and the people have perished of hunger. In order to render it less dangerous, the government of Halifax, in 1809, sent a party of people to settle on it, in order to show fires during bad nights, and to afford assistance to those who may be shipwrecked on it.

The peninsula of Nova Scotia was first settled by the French in 1604, who gave it the name of Acadia. Their original establishment was at Port François, on the west coast, and the first colonists occupied themselves solely in trading with the Indians for furs, or procuring them by the chase themselves. The vicinity of the British colonies of New England, however, produced here, as well as at Canada, a destructive concurrence in the Indian trade; and on the part of the Acadians, similar attempts to irritate the Indians against the English, while the latter retorted on the French settlements, whenever the disputes between the two nations in Europe permitted them to commence open hostilities. After being taken by the English, and restored several times, Acadia was finally ceded to Great Britain by the peace of Utrecht. Very few English, however, settled on it, and, with the exception of change of name to Nova Scotia, no alteration was made in the government; the French colonists being maintained in possession of their laws and religion, and were besides permitted to remain neuter in any wars between France and England. In 1746 the French attempting to regain possession of the province, and the colonists breaking their neutrality, the British government determined to colonise it efficiently, and at the peace of Aix-la-Chapelle (1748) the disbanded officers and soldiers were encouraged to emigrate thither by grants of land according to their respective ranks. These encouragements induced 3750 persons to embark for the colony in 1749, who founded the city of Halifax. The French colonists, fearing a persecution from the new government and colonists, on account of their religion, and being also encouraged by the Canadian government, generally retired from Nova Scotia to that province, while the English, equally anxious to get rid of them, removed the remainder to the other English colonies. In 1769 the population of the colony had increased to 26,000 persons, by emigrations from England and Germany; and in the same year its exports amounted to £30,000. The American war still farther increased the population, by the emigration of loyalists from the insurgent colonies, and gave an extraordinary impulse to its commerce and cultivation, by the demands of the British fleets and armies.

SCOTISTS, a sect of school divines and philosophers, thus called from their founder J. Duns Scotus, a cordelier, who maintained the immaculate conception of the Virgin, or that she was born without original sin, in opposition to Thomas Aquinas and the Thomists. The Scotists and Thomists disagreed about the nature of the divine co-operation with the human will, the measure of divine grace that is necessary to salvation, and other abstruse and minute questions, which it is needless to enumerate.

SCOTLAND.

SCOTLAND, an ancient, and long an independent kingdom of Great Britain, is situated, exclusive of its islands, between $54^{\circ} 37'$ and $58^{\circ} 42'$ N. lat., and between $1^{\circ} 47'$ and $6^{\circ} 7'$ W. long. from London. It contains thirty-three counties, and is bounded south by the Solway frith, and the rivers Esk, Lark, Liddel, and Tweed; on the east and north by the Northern Ocean; and on the west by the waters of the Atlantic. Its greatest length due north and south is 275 miles, and its greatest breadth 147 miles; but its breadth is extremely various, and in one place does not exceed thirty-six miles. The superficial area of the mainland is said to amount to 25,520 square miles, 494 square miles of fresh water lakes, and 5000 square miles of salt-water lochs, or lakes. The islands, comprising the Hebrides on the west, and the Orkneys and Zetland isles towards the north, comprehend an area of 4224 square miles.

I. HISTORY OF SCOTLAND UNTIL THE WITHDRAWMENT OF THE ROMANS.—It is difficult to give any satisfactory account of the origin of the appellation of Scots, from which the country has derived its name. The conjectures of the most eminent antiquaries serve rather to perplex than to clear up the difficulty. All that we know with certainty concerning this appellation is, that it was at first a term of reproach, framed by enemies, rather than assumed by the nation. The Highlanders, the descendants of the ancient Scots, are absolutely strangers to the name, and have been always so. All those who speak the Gaelic language call themselves Albanich or Gael, and their country Alba or Gaeldochd; whence Caledonia, the most ancient name of the country. The Picts, who possessed originally the northern and eastern, and in a later period also the more southern, division of North Britain, were at first more powerful than the Caledonians of the west. It is therefore probable that the Picts were ready to traduce and ridicule their weaker neighbours of Argyle. These two nations spoke the same language, the Gaelic. In that language Scot, or Scode, signifies a corner or small division of a country. Accordingly, a corner of North Britain is the very name which Giraldus Cambrensis gives the little kingdom of Argyle, which the six sons of Muredus king of Ulster were said, according to his information, to have erected in Scotland. Scot in Gaelic is much the same with little or contemptible in English. Others observe, that in the same language the word Scuit signifies a wanderer, and suppose that this may have been the origin of the name of Scot; a conjecture which they think is countenanced by a passage in Amianus Marcellinus (l. xxvii.), who characterises the men by the epithet of *per diversa vagantes*, i. e. roaming. On the whole it appears, that for some one of the reasons couched under the above disparaging epithets, their sneering neighbours, the Picts or the Britons, may have given the appellation of Scots to the ancestors of the Scot-

tish nation. At what time the inhabitants of the west of Scotland became distinguished by this name is uncertain. Porphyrius the philosopher is the first who mentions them, about A. D. 267; and towards the middle of the fourth century we find them mentioned with other British nations, by Ammianus Marcellinus, in the passage above referred to. The territory of the ancient Scots, before the annexation of Pictavia, comprehended all that side of Caledonia, which lies on the north and western ocean, from the frith of Clyde to the Orkneys. Towards the east their dominions were divided from the Pictish territories by the high mountains which run from Dumbarton to the frith of Tain. In process of time, the Scots, under the reign of Kenneth, the son of Alpin, became so powerful as to subdue their neighbours the Picts, and gave their own denomination to all Caledonia, Pictavia, and Valentia; all which are now comprehended under the general name of Scotland.

The origin of the Scots has been warmly disputed by many antiquaries of note; particularly by Macpherson and Whitaker. The first contends that they are of Caledonian, the latter that they are of Irish extraction. The Scots seem to have been originally descended from Britons of the south, or from Caledonians, who, being pressed forward by new colonies from Gaul, till they came to the western shore of Britain, passed over into Ireland, probably about 100 years before the Christian era. About A. D. 320 they returned again into Britain; or at least a large colony of them, under the conduct of Fergus, and settled on the western coasts of Caledonia, from whence they had formerly migrated. As early as the year 340, we find them associated with the Picts in their expeditions to the Roman province; and, for ninety or 100 years after, their ravages are frequently mentioned by the Roman and British writers. The historians of Scotland, like those of all other nations, assume too great an antiquity for their countrymen. By them the reign of Fergus, the first Scottish monarch, is placed in A. A. C. 330. He was the son of Farguhard, an Irish prince; and was called into Scotland by the Caledonians, to assist them against the southern Britons, with whom they were then at war. Having landed on one of the Ebudæ or western isles, he had a conference with the Caledonians, whose language and manners he found to be the same with those of his countrymen. Having then landed in Scotland, and taken the field at the head of his new allies, he engaged the Britons under their king Coilus. Victory declared in favor of the Scots; Coilus was defeated and killed: and from him the province of Kyle first received its name. After this Fergus was declared king of the Scots, with the solemnity of an oath. But having been recalled to Ireland, to quiet some commotions there, he was drowned by a sudden tempest on his return, at a place in Ireland called from him Carrick-Fergus, i. e. Fergus's Rock, in the year 305 B. C.

Fergus I. was succeeded by his brother Feritharis, to the prejudice of his two sons, Ferlegus and Mainus. This was in conformity with a law, by which it was ordained that, whilst the children of their kings were infants, one of their relations, who was reckoned the most fit for the government, should be raised to the throne, but that after his death the sovereignty should return to the sons of the former king. But Ferlegus, impatient for the crown, demanded it from his uncle. The dispute being referred to an assembly of the states, Feritharis was confirmed on the throne, and Ferlegus would have been condemned for sedition had not his uncle interposed. However, he was imprisoned; but, having made his escape, he fled first to the Picts and then to the Britons, to excite them against Feritharis. With both he failed in accomplishing his purpose; but, his uncle being afterwards stabbed in his bed, the suspicion fell upon Ferlegus, who was thereupon set aside from the succession, and died in obscurity, the throne being conferred upon his brother Mainus. Mainus succeeded his uncle A. A. C. 291, and is celebrated for a peaceable and just reign of twenty-nine years; and a treaty with Crinus king of the Picts. He died in 262, and was succeeded by his son Dornadil, who was a great hunter, and instituted the laws of hunting in this country. He died in 233 B. C., and was succeeded by his brother Nothar; who in the twentieth year of his reign, B. C. 213, was killed in a battle with Reuther his nephew; upon which the latter was immediately invested with the sovereignty. A bloody war ensued with the Picts, in which both parties were reduced to the last extremities, and glad to conclude a peace, which continued many years. Reuther died in 187 B. C., the 26th of his reign, and was succeeded by his brother Reutha; who is said to have encouraged trade and manufactures, and to have received an embassy of learned men from Ptolemy king of Egypt. He died 171 B. C., and left the throne to his son Thereus, who, proving a tyrant, was banished, and died at York in 161. His brother Josina succeeded, and cultivated the arts of peace; studying medicine and botany, &c. He reigned twenty-four years, and died 137 B. C., when his son Finnan succeeded. He is celebrated as a wise monarch, and in his reign we find the first beginnings of the Scottish parliament; as he enacted that kings should do nothing without the consent of their grand council.

Finnan died in his thirtieth year, 107 B. C., and was succeeded by his son Durstus, who, proving a cruel tyrant, was killed in battle by his nobles, in the ninth year of his reign. He was succeeded by his brother Even I., who was a wise monarch; and successfully assisted the Picts against the Britons. Even died in his nineteenth year B. C. 79, when the crown was usurped by his bastard son Gillus, who murdered the two sons of Durstus, but was killed in battle two years after. In 77 B. C. Even II., the nephew of Finnan, succeeded Gillus, and built the towns of Innerlochy and Inverness. He overcame Belus king of the Orkneys, who had invaded Scotland, and was succeeded by his son Eder, in 30 B. C., in whose time Julius Cæsar

invaded the southern parts of this island. Eder is said to have assisted the Britons against the common enemy. He was succeeded, after a reign of forty-eight years, by his son Even III., in the year 12 B. C., who is represented as a monster of cruelty and lust. Nor was he less remarkable for his rapaciousness, which at last occasioned a rebellion: he was dethroned, imprisoned, and put to death in his seventh year, 4 B. C. Even was succeeded by Metellanus, nephew of Ederus, a wise and good king, who reigned prosperously thirty-nine years in peace, and was succeeded by his sister's son, the famous Caractacus, A. D. 35, who is celebrated by Boece, Fordun, Monipenny, Buchanan, and all our other ancient historians, as one of the greatest of the Scottish monarchs. See CARACTACUS. The Scottish historians insist that his fame for wisdom, courage, and riches (accumulated during the peaceable reign of his uncle), being very great, he was invited by the Britons to assist them in expelling the Romans, and that upon his arrival at York, to which the Britons had retired after a defeat, he was elected general of the combined troops of the Britons, Scots, and Picts; who, though equally brave and numerous, amounting to 60,000 men, were defeated by the Romans in three different battles; in the last of which, Caractacus's queen, daughter, and brother, were taken prisoners by Vespasian; and soon after he himself was betrayed to the Romans by his step-mother Cartismandua, and carried prisoner to Rome. Being afterwards restored, with his relations, they add that Caractacus reigned in peace till A. D. 55, when he died.

Caractacus was succeeded by his brother Corbred I. who punished the treachery of Cartismandua by burying her alive. Corbred's sister, the famous Woda, or Voadicea, being married to the king of the Britons, and shamefully used by the Romans, being herself whipped, and her daughters violated, Corbred raised an army of Scots and Picts, expelled the Romans out of the north of England, and took Bervick. About this time the Scots were joined by a numerous tribe of the Murrays from Moravia, under their general Roderic, who assisted them in their wars, receiving the county of Murray in reward of their bravery. After this Woda raised an army of 5000 females, it is said, to revenge the cause of her sex, who, joining the combined forces, defeated the Romans, and killed 7000 of them. But Suetonius coming soon after, with a fresh body of 10,000 troops, the combined army was defeated, and Woda killed herself. Corbred returned to Scotland, where he died in peace in the eighteenth year of his reign, A. D. 72; and was succeeded by Dardanus, nephew of Metellanus; who, proving a cruel tyrant, was beheaded by his nobles A. D. 76. He was succeeded by Corbred II., surnamed Galdus, and called by the Roman historians Galgacus, in whose reign the invasion by Agricola happened. Agricola having completed the conquest of the southern parts, and in a great measure civilised the inhabitants, formed a like plan with regard to Scotland. At this time the Caledonians were rendered more formidable than ever they had been.

by the accession of great numbers from the south; for, though the Romans had civilised the greatest part, many of those savage warriors, disdaining the pleasures of a peaceable life, retired to the northward, where the martial disposition of the Scots better suited their inclination. The utmost efforts of valor, however, were not proof against the discipline of the Roman troops and the experience of their commander. In the third year Agricola had penetrated as far as the river Tay; but the particulars of his progress are not recorded. In the fourth he built a line of forts between the friths of Forth and Clyde, to exclude the Caledonians from the south parts of the island; and the year after he subdued those parts which lay to the south and west of his forts, viz. the counties of Galloway, Cantyre, and Argyle, which were then inhabited by a people called Cangi, who, as Tacitus expressly informs us, had never before been known to the Romans. Agricola still pursued the same prudent measures by which he had already secured the possession of such a large tract of country, advancing slowly, and building forts as he advanced, to keep the people in obedience. The Scots, though commanded by their king, who is said to have been well acquainted with the manner of fighting and discipline of the Romans, were yet obliged to retreat; but at last, finding that the enemy made such progress as endangered the subjugation of the whole country, he resolved to cut off their communication with the southern parts, and likewise to prevent all possibility of a retreat by sea. Agricola then divided his troops into three bodies, having a communication with each other. Upon this, Galgacus resolved to attack the weakest of the three, which consisted only of the ninth legion, and lay at that time at a place called Lochore, about two miles from Loch-Leven in Fife. The attack was made in the night: and, as the Romans were both unprepared and inferior in number, the Scots penetrated into the heart of their camp, and were making a great slaughter, when Agricola detached some light armed troops to their assistance; by whom the Caledonians in their turn were routed, and forced to fly to the marshes and inaccessible places, where the enemy could not follow them. This engagement has been magnified by the Roman historians into a victory, though it can scarcely be admitted from the testimonies of other historians. The Romans, however, certainly advanced very considerably, and the Scots as constantly retreated, till they came to the foot of the Grampian mountains, where the Caledonians resolved to make their last stand. In the eighth year of the war, Agricola advanced to the foot of the mountains, where he found the enemy ready to receive him. Tacitus has recorded a speech of Galgacus, which some think he fabricated for him, in which he sets forth the aspiring disposition of the Romans, and encourages his countrymen to defend themselves vigorously, as knowing that every thing valuable was at stake. A desperate engagement ensued. In the beginning the Britons had the advantage by the dexterous management of their bucklers; but Agricola having

ordered three Tungrian and two Batavian cohorts, armed with short swords, and embossed bucklers terminating in a point, to attack the Scots, who were armed with long swords, the latter soon found these weapons useless in a close encounter; and as their bucklers only covered a small part of their bodies, they were easily cut in pieces by their adversaries. The most forward of their cavalry and charioteers fell back upon their infantry, and disordered the centre; but, the Britons endeavouring to out-flank their enemies, the Roman general opposed them with his horse; and the Caledonians were at last routed with great slaughter, and forced to fly into the woods, whither the Romans pursued with so little caution that numbers of them were cut off. Agricola, however, having ordered his troops to proceed more regularly, prevented the Scots from attacking and cutting off his men in separate parties, as they had expected; so that this victory proved the greatest stroke to the Caledonians that they had hitherto received. This battle is supposed by some to have been fought in Strathern, half a mile south from the kirk of Comrie; but others imagine the place to have been near Fortingal Camp, a place somewhat farther on the other side of the Tay. Great as this victory was it seems not to have been productive of any solid or lasting advantage to the Romans; as Agricola, instead of putting an end to the war by the immediate conquest of all Caledonia, retreated into the country of the Foresti, commonly supposed to be Forfarshire, though others imagine it to have been the county of Fife. Here he received hostages from part of the Caledonians; and ordered part of his fleet to sail round Britain, that they might discover whether it was an island or a continent. The Romans no sooner had left that part of the country than the Caledonians demolished all the forts they had raised; and, Agricola being soon after recalled by Domitian, the further progress of the Roman arms was stopped, Galgacus proving superior to any of the successors of that general. Galgacus or Corbredus reigned peaceably after this, till A. D. 110, when he died, in the thirty-fifth year of his reign.

From the time of Agricola to that of Adrian, we know little of the affairs of Scotland, excepting that Lugtacus succeeded his father in 110, and proving a cruel tyrant was killed by his nobles, A. D. 113. He was succeeded by his cousin Mogallus, in whose reign Adrian came into Britain. During this interval the Scots must have entirely driven the Romans out of their country, and reconquered all that tract which lay between Agricola's chain of forts and Carlisle on the west, and Newcastle of Tinnmouth Bar on the east, which Adrian, on visiting Britain, fixed as the north boundary of the Roman dominions. Here he built a wall between the mouth of the Tyne and the Solway Frith, to shut out the barbarians; which did not answer the purpose, as it was only built of turf, and guarded by no more than 18,000 men. See ADRIAN'S WALL. On the departure of Adrian, he left Julius Severus as his lieutenant; but he carried his arms to the north of Adrian's wall; and this

long interval of peace gave so much security to Mogallus that he degenerated into a tyrant, and was murdered by his nobles. The only instance of his tyranny which is recorded, however, is a law by which it was enacted that the estates of such as were condemned should be forfeited to his exchequer, without any part thereof being allotted to their wives and children; an act which subsists almost in its full force to this day in Great Britain and the best regulated European governments. Mogallus was succeeded by his son Conarus, A. D. 149, who, following his father's bad example, was deposed and died in jail, A. D. 163. His cousin Ethod, or Ethodius I., succeeded him, who proved a good monarch, and was successful in several battles against the Romans, under Victorinus, Trebellus, and Pertinax; yet was treacherously murdered by a harper, in his thirty-third year, A. D. 195. The harper was tortured to death. Satrael, Ethod's brother, succeeded him, but becoming tyrannical he was killed by a courtier, in his fourth year, A. D. 199; and was succeeded by his brother Donald I. In the reign of Antoninus Pius the prætor Lollius Urbicus drove the Scots far to the northward, and repaired the chain of forts built by Agricola, which lay between the Carron on the Frith of Forth and Dunglass on the Clyde. These were joined together by turf walls, and formed a much better defence than the wall of Adrian. However, after Antoninus's death, Commodus having recalled Calpurnius Agricola, an able commander, who kept the Scots in awe, a more dangerous war broke out than had ever been experienced by the Romans in that quarter. The Scots, having passed the wall, put all the Romans they could meet with to the sword: but they were soon repulsed by Ulpus Marcellus, a general of consummate abilities, whom Commodus sent into the islands. In a short time the tyrant also recalled this able commander. After his departure, the Roman discipline in Britain suffered a total relaxation; the soldiery grew mutinous, and great disorders ensued: but these were all happily removed by the arrival of Clodius Albinus, a person of great skill and experience in military affairs. His presence for some time restrained the Scots within proper bounds: but, a civil war breaking out between him and Severus, Albinus crossed over to the continent with the greatest part of the Roman forces in Britain; and, meeting his antagonist at Lyons, a dreadful battle ensued, in which Albinus was defeated, and his army cut in pieces. See *ROME*. The absence of the Roman forces gave encouragement to the Scots to renew their depredations, which they did with such success that this emperor became apprehensive of losing the whole island; on which he determined to go in person and quell these troublesome enemies. The army he now collected was far more numerous than any the Romans had ever sent into Britain; and, being commanded by such an able general as Severus, the Scots must have been very hard pressed. The particulars of this important expedition are very imperfectly related; however, we are assured that Severus lost a vast number of men, it is said not less than 50,000, in his march through Scot-

land. Yet he penetrated to the most northern extremity of the island, and obliged the enemy to yield up their arms. On his return, he built a much stronger fortification to secure the frontiers against the enemy than had ever been done before, and which, in some places, coincided with Adrian's wall, but extended farther at each end. But, in the mean time, the Scots provoked by the brutality of the emperor's son Caracalla, whom he had left regent in his absence, again took arms: on which Severus himself took the field, with a design to extirpate the whole nation; for he gave orders to his soldiers 'not to spare even the child in the mother's belly.' But his death, which happened soon after, put a stop to the execution of his revenge; and his son Caracalla ratified the peace with the Scots. During all these important transactions Scotland was governed by Donald I., who was the first Christian king of this country. He also first coined gold and silver, and died in his 18th year, A. D. 216.

Donald was succeeded by Ethodius II., the son of Ethodius I., who, acting tyrannically, was killed by his guards, A. D. 231. His son Athirco succeeded, and, pursuing similar measures, was deserted by his nobles, and killed himself in his twelfth year, A. D. 242. His successor Nathalocus, behaving also tyrannically, was killed by his nobles in his eleventh year, A. D. 253. He was succeeded by Findocus, the son of Athirco, who proved a good monarch, but was killed at a hunting, by the instigation of his brother Carausius, in his eleventh year, A. D. 264. His other brother Donald II. succeeded, but reigned only one year, being killed in battle by Donald III., lord of the Isles, who usurped the throne, and reigned twelve years, but was killed by Crathilinthus, the son of Findocus, A. D. 277, who proved a good monarch. Mean time his uncle Carausius had acquired great fame by his repeated victories over the Romans, and was elected king of the Britons. See *CARAVSIUS* and *ENGLAND*. Crathilinthus died in his twenty-fourth year, A. D. 301, and was succeeded by his cousin Fincormachus, a brave and pious prince, who assisted Octavius, king of the Britons, in a successful battle against the Romans, wherein 16,000 Romans were slain, and 15,000 Britons; for which service Westmoreland and Cumberland were ceded to Scotland. He died in his forty-seventh year, A. D. 348, and was succeeded by Romachus nephew of Crathilinthus, who, for his cruelty, was beheaded by the nobles, A. D. 351. Angusian, another nephew, succeeded, and proved a good prince, but was killed in battle, A. D. 354; and succeeded by Fincormachus, a third nephew of Crathilinthus, who reigned well and conquered the Picts, but was treacherously murdered, A. D. 357, by two Picts, who were tortured to death. He was succeeded by his son, Eugene I., under whom the Roman and Pictish forces were united against the Scots. The Picts were commanded by their king, named Hungus, and the Romans by Maximinus, who murdered Valentinian III., and afterwards assumed the empire. The allies defeated Eugene in the county of Galloway; but, Maximinus being obliged to return southward on account of an insurrection, the Picts were in their

turn defeated by the Scots. Next year, however, Maximus marched against the Scots; who, being now reduced to extremity, brought into the field not only all the men capable of bearing arms, but the women also. In this engagement the Picts would have been utterly defeated, had they not been supported by the Romans; but Eugene being killed, with the greatest part of his nobility, the Scots were defeated; and so well did the conquerors improve their victory, that their antagonists were at last totally driven out of the country. Some of them took refuge in the *Æbudæ* Islands, and some in Scandinavia, but most of them fled to Ireland, whence they made frequent descents upon Scotland.

The Picts were at first highly pleased with the victory they had gained over their antagonists; but being commanded to adopt the laws of the Romans, and to choose no king who was not sent them from Rome, they began to repent of their having contributed to the expulsion of the Scots; and in the year 404, when Aistulphus king of the Goths sent over a body of exiled Scots to Britain, under Fergus, the son of Erthus, and grandson of Ethodius, brother of Eugene I., the Picts immediately joined them against the common enemy. The consequence was, that the Britons were pushed to the last extremity; and the Romans being obliged, by the inundation of northern barbarians who poured in upon them, to recal their forces from Britain, the inhabitants were reduced to a most miserable situation. In the time of Fergus II. they were obliged to give up all the country which lies north of Adrian's wall. Fergus II. is celebrated as not only a brave but a pious prince: but, though often successful against the Romans, he was at last killed in battle by them, in his sixteenth year, A. D. 420. His son Eugene II. succeeded him, and imitated his virtues. He obtained several victories over the Romans and their British allies. In his reign Graham, the founder of the family of that name, who was of the blood royal, and whose daughter was married to Fergus II., performed many brave exploits, and destroyed part of Antoninus's Wall, thence called Graham's Dike. In the seventh year of Eugene the Romans were expelled out of Scotland, after a bloody battle; and soon after left the island. Eugene died in his thirty-first year, A. D. 451, and was succeeded by Dongard his brother. It was in Eugene's reign that the Britons were reduced so low, that they were obliged to write that remarkable letter to Rome entitled 'the groans of the Britons.' This, however, not being attended with success, the Britons were obliged to call in the Saxons to their assistance. By these new allies the Scots were defeated in a great battle, and their king Dongard drowned in the Humber, A. D. 457, which put a stop for some time to these incursions. Hitherto we have seen the Scots very formidable enemies to the southern Britons. But, when the Saxons became the enemies of the Britons, the Scots joined in a strict alliance with the latter; neither does it appear that this league was ever dissolved, though the united efforts of the Scots and Britons were not sufficient to preserve the independency of the latter.

II. HISTORY OF SCOTLAND TO THE REIGN OF KENNETH II.—A series of monarchs followed, of whom little is recorded. Dongard was succeeded by his brother Constantine I., who, becoming tyrannical, was killed by one of his nobles, whose daughter he had ravished: A. D. 479, in his twenty-second year. Congal I. the son of Dongard succeeded him, who conquered the Britons in a bloody battle, wherein 20,000 Britons, with Guythel prince of Wales, were slain. He had afterwards some other battles with the Britons and Saxons, wherein little was gained by either party. He died in his twenty-second year, A. D. 501, and was succeeded by his brother Conranus, who also carried on a war against the Saxons, and, along with the Picts, assisted first king Ambrosius, and afterwards the celebrated king Arthur against them with considerable success. This excellent monarch, however, after all his victories, was murdered by traitors in his own chamber, A. D. 335, in his thirty-fourth year. Conranus was succeeded by Eugene III., whose reign was uncommonly peaceable. He died in his twenty-third year, A. D. 558, and was succeeded by his brother Congal II., who was a pious prince, and died in his eleventh year, A. D. 569. His brother Kinatell succeeded, and reigned well the short time he lived, which was only one year. He was succeeded by Aidanus, the son of Conranus, who joined the Britons against the Saxons. He died in the thirty-fifth year of his age, A. D. 605; and was succeeded by Kenneth I., the son of Congal II., who only reigned one year, and was succeeded by Eugene IV., the son of Aidanus, in 606. He reigned in peace, instituted good laws, and died in his fifteenth year, A. D. 621. He was succeeded by his son Ferquhard I., who, being a vicious tyrant, was deposed by his nobles, and put in prison, where he killed himself, in his eleventh year, A. D. 632. His son Donald IV. succeeded him, and proved a pious and peaceable monarch, but was unfortunately drowned in Loch Ta, while fishing, in his fourteenth year, A. D. 646. He was succeeded by his brother Ferquhard II., who was infamous for his avarice; and died in his eighteenth year, A. D. 664, by the bite of a wolf. Malduinus, the son of Donald IV., succeeded, and was esteemed a pious and just sovereign; but his queen, becoming jealous of him, strangled him in bed, in the twentieth year of his reign, A. D. 684; for which she and her accomplices in the murder were burnt. Eugene V., Malduin's brother, succeeded him, and proved a valiant monarch. He obtained a great victory over Edfred, king of Northumberland, who was killed with 10,000 Saxons, and their ally Bredius king of the Picts fled. Eugene died in his fourth year, A. D. 688. Eugene VI., the son of Ferquhard II., succeeded him, and maintained the character of a religious and peaceable monarch. He only reigned nine years, dying in 697. Amberkeleth, the son of Aidan, succeeded, but was killed in battle by an arrow, in his second year. He was succeeded by his brother Eugene VII., who made peace with Garnard, king of the Picts, who married his daughter Spontana; but she was murdered the year following, in bed, by

two assassins, who had intended to kill her husband. Eugene endowed several churches, and died in his sixteenth year, A. D. 715. Murdach, the son of Amberkeleth, succeeded, and cultivated peace so successfully that he got all differences settled during his reign, among the Britons, Scots, Picts, and Saxons. He also built Whithorn. The venerable Bede flourished in his time. See BEDA. Murdach died in his sixteenth year, and was succeeded by Etsinus, or Ethwin, the son of Eugene VII. A. D. 730, who had a peaceable and prosperous reign of thirty-one years. Eugene VIII., the son of Murdach, succeeded him, A. D. 761, and began his reign with an act of justice, by executing Donald lord of the Isles, and the earl of Galloway, for their crimes; but soon after degenerated so greatly himself, that his nobles conspired against and killed him, in the third year of his reign. Fergus III., the son of Etsinus, succeeded Eugene in 764, and married Ethiolia, daughter of the king of the Picts; but, in the third year of his reign, neglecting her for other women, she murdered him; and his servants being taken up on suspicion, she came into the court, confessed the murder, and stabbed herself. Fergus III. was succeeded by Solvathius, the son of Eugene VIII. in 767; who married a daughter of the king of the Britons, and preserved his kingdom in peace and prosperity for twenty years, when he died of the gout. He was succeeded by the celebrated Achaius, the son of Ethwin, in 787; who, after quelling some insurrections in Scotland and Ireland, entered into a treaty of perpetual amity with Charles the Great, king of France, and emperor of Germany, which treaty continued to be observed inviolably between the two nations, till the accession of James VI. to the throne of England. Achaius strengthened this alliance still farther, by marrying a daughter of Charlemagne, and by sending his brother William, with several noblemen, and 4000 troops, to assist Charles in his various wars, wherein they acquired great honor, upon which our ancient historians expatiate very largely; and inform us that, along with these troops, Achaius sent two learned clerks, John and Clement, who gave the Parisians their first taste for learning, and laid the foundation of the University of Paris; and they add that John was afterwards sent to Pavia, to establish learning in Italy.

After this Achaius reigned in peace, and died of age, in the thirty-second year of his reign; leaving one son, named Alpinus, by his second queen Fergusia, sister of Hungus, king of the Picts; which connexion afterwards proved the foundation of the Scottish king's claim upon the Pictish crown. Meantime Congal II., nephew of Achaius, succeeded him, according to the Scottish rule, A. D. 819. He died in the fifth year of his short but peaceful reign; and was succeeded by Dongal, the son of Solvathius, in 824. Meantime a horrible scene of murder and incest was acted in the royal family of the Picts. Dorstologus, their king, was murdered by his brother Eganus, who married his brother's widow Brenna, who soon after murdered him in his bed to avenge the death of her first husband. The

murder of these two princes gave rise to the next remarkable event in the history of Scotland, viz. the war with the Picts. The occasion of the quarrel was, that Dongal king of Scotland claimed, in the name of prince Alpinus, by a former embassy, a right to the Pictish throne; which, however, was rejected by the Picts: upon which both parties had recourse to arms; but, when every thing was ready for the campaign, Dongal was drowned in crossing the river Spey, in the seventh year of his reign, A. D. 731. At this time the dominions of the Scots comprehended the western islands, together with the counties of Argyle, Knapdale, Kyle, Kintyre, Lochaber, and a part of Breadalbane; while the Picts possessed all the rest of Scotland, and part of Northumberland; so that the Picts seem to have been by much the most powerful people of the two. However the Scots appear to have been superior in military skill; for Alpin, the successor of Dongal, having engaged the Pictish army near Forfar, after an obstinate engagement defeated them, and killed their king, though not without the loss of a great number of his own men. The Picts chose Brudus, the son of their former king, to succeed him; but soon after deposed and put him to death on account of his stupidity and indolence. His brother Kenneth shared the same fate on account of his cowardice; till at last another Brudus, a brave and spirited prince, ascended the throne. Having raised a powerful army, he began with offering terms of peace to the Scots; which, however, Alpin rejected, and insisted upon a total surrender of his crown. Brudus on this endeavoured to procure the assistance of Edwin king of Northumberland. Edwin accepted the money; but, pretending to be engaged in other wars, he refused the assistance which he had promised. Brudus, not dismayed by this disappointment, marched resolutely against his enemies; and the two armies came to an engagement near Dundee. The superior skill of the Scots in military affairs was about to have decided the victory in their favor, when Brudus used the following stratagem to preserve his army from destruction:—He caused all his attendants, and even the women who attended his army, to assemble and show themselves at a distance, as a powerful reinforcement coming to the Picts. This struck the Scots with such a panic that all the efforts of Alpin could not recover them; and they were accordingly defeated with great slaughter. Alpin himself was taken prisoner, and soon after beheaded by order of the conqueror. This execution happened at a place now called Pit-alpy, but in former times Bas-Alpin, which in the Gaelic language signifies the death of Alpin; or, as Monipenny has it, Pas-Alpin, i. e. the head of Alpin. His head was afterwards stuck upon a pole, and exposed on a wall.

Alpin was succeeded by his son Kenneth II., A. D. 834, who, being a brave and enterprising prince, resolved to take a most severe revenge for his father's death. The Scots, however, were so dispirited by their late defeat that they were exceedingly averse to any renewal of the war; while, on the other hand, the Picts were so much elated, that they made a law, by which

it became death for any man to propose peace with the Scots, whom they resolved to exterminate; and some of the nobility were expelled the council on account of their opposition to this law. The consequence was that civil dissensions took place among them, and a bloody battle was fought between the opposite parties before the Scots had thought of making any farther resistance. By these distractions Brudus, who had in vain endeavoured to appease them, was so much affected that he died of grief, and was succeeded by his brother Drusken. The new prince also failed in his endeavours to accommodate the civil differences; so that the Scots, by gaining so much respite, at last began to recover their courage; and some of them, having ventured into the Pictish territories, carried off Alpin's head from Abernethy, the capital of their dominions. In the mean time Kenneth gained over the nobility to his side by the following stratagem; which, however ridiculous, is not incredible, if we consider the superstition of that age. Having invited them to an entertainment, the king introduced into the hall where they slept a person clothed in a robe made of the skins of fishes, which made such a luminous appearance in the dark that he was mistaken for an angel or some supernatural messenger. To add to their terror he denounced, through a speaking-trumpet, the most terrible judgments if war was not immediately declared against the Picts, the murderers of the late king. In consequence of this celestial admonition war was immediately renewed with great vigor. The Picts were not deficient in their preparations, and had now procured some assistance from England. The first battle was fought near Stirling; where the Picts, being deserted by their English auxiliaries, were utterly defeated. Drusken escaped by the swiftness of his horse, and a few days after made application to Kenneth for a cessation of hostilities; but, as the Scottish monarch demanded a surrender of all the Pictish dominions, the treaty was instantly broken off. Kenneth pursued his good fortune, and conquered the counties of Mearns, Angus, and Fife; but, as he marched against Stirling, he received intelligence that these counties had again revolted, and cut off all the garrisons which he had left, and that Drusken was at the head of a considerable army in these parts. On this Kenneth hastened to oppose him, and a negotiation again took place. The result was still unfavorable. Kenneth insisted on an absolute surrender of the counties of Fife, Mearns, and Angus; which being refused, both parties prepared for a decisive battle. The engagement was very bloody and desperate, the Picts fighting like men in despair. Drusken renewed the battle seven times, but at last was entirely defeated and killed, and the counties in dispute became the immediate property of the conqueror. Kenneth did not fail to improve his victory by reducing the rest of the Pictish territories; which he is said to have done with the greatest cruelty, and even to have totally exterminated the inhabitants. The capital, called Camelon (supposed to have been Abernethy), held out four months; but was at last taken by surprise, and every living creature destroyed.

This was followed by the reduction of the Maiden Castle, now that of Edinburgh; which was abandoned by the garrison, who fled to Northumberland. After the reduction of these important places the rest of the country made no great resistance, and Kenneth became master of the whole kingdom of Scotland in the present extent of the word.

III. HISTORY OF SCOTLAND FROM THE CONQUEST OF THE PICTS UNTIL THE DEATH OF ALEXANDER III.—Besides this war with the Picts, Kenneth is said to have been successful against the Saxons, though of these wars we have very little account. Having reigned ten years in peace after his subjugation of the Picts, and composed a code of laws for the good of his people, Kenneth died of a fistula, at Fort Teviot, near Duplin, in Perthshire, A. D. 854. Before his time the seat of the Scottish government had been in Argyleshire; but he removed it to Scone, by transferring thither the famous black stone, supposed to be the palladium of Scotland, and which was afterwards carried off by Edward I. of England, and lodged in Westminster Abbey. Kenneth II., surnamed the Great by some historians, was succeeded by his brother Donald V., who is represented as a man of the worst character; so that the remaining Picts, who had fled out of Scotland were encouraged to apply to the Saxons for assistance, promising to make Scotland tributary to the Saxon power after it should be conquered. This proposal was accepted, and the confederates invaded Scotland with a powerful army, and took the town of Berwick; however, they were soon after defeated by Donald, who took also their ships and provisions. This capture proved their ruin; for, some of the ships being loaded with wine, the Scots indulged themselves so much with that liquor that they became incapable of defending themselves; the consequence of this was that the confederates, rallying their troops, attacked them in that state of intoxication. The Scots were defeated with excessive slaughter; 20,000 of them lay dead on the spot, the king and his principal nobility were taken prisoners, and all the country from the Tweed to the Forth became the property of the conquerors. Still, however, the conquerors were unable to pursue their victory farther, and a peace was concluded, on condition that the Saxons should be masters of all the conquered country. Thus the Forth and Clyde became the southern boundaries of the Scottish dominions. It was agreed that the Forth should from that time forward be called the Scots Sea; and it was made capital for any Scotchman to set his foot on English ground. They were to erect no forts near the English confines, to pay an annual tribute of £1000, and to give up sixty of the sons of their chief nobility as hostages. A mint was erected by the Saxon prince named Osbreth, at Stirling; and a cross raised on the bridge of that place, with the following inscription, implying that this place was the boundary between Scotland and England:—

Anglos a Scotis separat crux ista remotis :
 Arma hic stant Bruti stant Scoti sub hac cruce tuti.
 After the conclusion of this treaty, so humiliating

to the Scots, the Picts, finding that their interest had been entirely neglected, fled to Norway, while those who remained in England were massacred. Donald shared the common fate of unfortunate princes, being dethroned and shut up in prison, where he killed himself, in 858. But the character of Donald, and the whole account of these transactions, rests on the credit of a single author, namely Boece; for other writers represent Donald as a hero, and successful in his wars; but the obscurity in which the whole of this period of Scottish history is involved renders it impossible to determine these matters.

Donald V. was succeeded by his nephew Constantine II., the son of Kenneth II., in whose reign Scotland was first invaded by the Danes, who proved such formidable enemies to the English. This invasion was occasioned by some exiled Picts who fled to Denmark, where they prevailed upon the king of that country to send his two brothers, Hunger and Hubba, to recover the Pictish dominions from Constantine. These princes landed on the coast of Fife, where they committed the most horrid barbarities, not sparing even the ecclesiastics who had taken refuge in the island of May at the mouth of the Forth. Constantine defeated one of the Danish armies commanded by Hubba, near the water of Leven; but was himself defeated and taken prisoner by Hungar, who caused him to be beheaded at a place since called the Devil's Cave, in 874. This unfortunate action cost the Scots 10,000 men; but the Danes seem not to have purchased their victory very easily, as they were obliged immediately afterwards to abandon their conquests, and retire to their own country. However the Danish monuments that are still to be seen in Fife leave no room to doubt that many bloody scenes had been acted here between the Scots and Danes besides that above mentioned. Constantine II. was succeeded by his brother Eth, or his son, as Monipenny styles him, surnamed the Swift-footed, from his agility. Being devoted to luxury, his nobles took him and put him in prison, where he died the third day after of melancholy, in the second year of his reign, A. D. 876. He was succeeded by Gregory the son of Dongal, contemporary with Alfred of England, and both princes deservedly acquired the surname of Great. The Danes at their departure had left the Picts in possession of Fife. Against them Gregory immediately marched, and quickly drove them into the north of England, where their confederates were already masters of Northumberland and York. In their way thither they threw a garrison into the town of Berwick; but this was presently reduced by Gregory, who put to the sword all the Danes, but spared the lives of the Picts. From Berwick Gregory pursued the Danes into Northumberland, where he defeated them, and passed the winter in Berwick. He then marched against the Cumbrians, who, being mostly Picts, were in alliance with the Danes. Them he easily overcame, and obliged to yield up all the lands they had formerly possessed belonging to the Scots, at the same time that he agreed to protect them from the Danes. In a short time, however, Constantine the king of the Cumbrians violated the

convention he had made, and invaded Annandale; but was defeated and killed by Gregory near Lochmaben. After this victory Gregory reduced the counties of Cumberland and Westmoreland, which, it is said, were ceded to him by Alfred the Great; and indeed the situation of Alfred's affairs at this time renders such a cession probable. Gregory next engaged in a war with the Irish, to support Donach, an Irish prince, against two rebellious noblemen. The Irish were the first aggressors, and invaded Galway; but, being repulsed with great loss, Gregory went over to Ireland in person, where the two chieftains, who had been enemies to each other before, now joined their forces to oppose the common enemy. The first engagement proved fatal to one of their chiefs named Brian, who was killed with a great number of his followers. After this victory Gregory reduced Dundalk and Drogheda. On his way to Dublin he was opposed by a chieftain named Corneil, who shared the fate of his confederate, being also killed, and his army entirely defeated. Gregory then became guardian to the young prince whom he came to assist, appointed a regency, and obliged them to swear that they would never admit into the country either a Dane or an Englishman without his consent. Having then placed garrisons in the strongest fortresses, he returned to Scotland, where he built the city of Aberdeen; and died in 894, at his castle of Dundore in the Garioch, in the eighteenth year of his reign.

Gregory was succeeded by Donald VI. the son of Constantine II., who imitated the virtues of his predecessor. The Scottish historians unanimously agree that Northumberland was at that time in the hands of their countrymen; while the English as unanimously affirm that it was subject to the Danes, who paid homage to Alfred. Be this as it will, however, Donald continued to live on good terms with the English monarch, and sent him a body of forces, who proved of considerable advantage to him in his wars with the Danes. The clans of the Murrays and Rosses having invaded each other, and commenced a bloody civil war, Donald came upon them with a great army, and punished the ring-leaders in 903. He died at Forres in 905. He was succeeded by Constantine III., the son of Eth, who married a daughter of the prince of Wales; he also entered into an alliance with the Danes against the English. The reason of this confederacy was that the English monarch, Edward the Elder, finding the Scots in possession of the northern counties of England, made such extravagant demands upon Constantine as obliged him to ally with the Danes to preserve his dominions in security. However, the league subsisted only for two years, after which the Danes found it more for their advantage to resume their ancient friendship with the English. Constantine afterwards appointed the presumptive heir to the Scottish crown, Malcolm, or according to some Eugene, the son of the late king Donald VI., prince of the southern counties, on condition of his defending them against the attacks of the English. The young prince had soon an opportunity of exerting his valor: but, not behaving with the requisite caution, he

was defeated with the loss of almost all his army, he himself being carried wounded out of the field; and, in consequence of this disaster, Constantine was obliged to do homage to Edward for the possessions he had to the south of the Scottish boundary. In the beginning of the reign of Athelstan, the son of Edward the Elder, the northern Danes were encouraged by some conspiracies formed against that monarch to throw off the yoke; and their success was such that Athelstan entered into a treaty with Sithrac the Danish chief, and gave him his daughter in marriage. Sithrac, however, did not long survive his nuptials; and his son Guthred, endeavouring to throw off the English yoke, was defeated, and obliged to fly into Scotland. This brought on a series of hostilities between the Scots and English, which in 938 issued in a general engagement. At this time the Scots, Irish, Cumbrians, and Danes, were confederated against the English. The Scots were commanded by their king Constantine, the Irish by Anlaf, the brother of Guthred the Danish prince, the Cumbrians by their own sovereign, and the Danes by Froda. The generals of Athelstan were Edmund his brother, and Turketil his favorite. The English attacked the entrenchments of the confederates, where the chief resistance they met with was from the Scots. Constantine was in the utmost danger of being killed or taken prisoner, but was rescued by the bravery of his soldiers; however, after a most obstinate engagement, the confederates were defeated with such slaughter that the slain are said to have been innumerable. The consequence was, that the Scots were deprived of all their possessions south of the Forth; and Constantine, quite dispirited by his misfortune, resigned the crown to Malcolm, and retired to the monastery of the Culdees at St. Andrews, where he became a canon, and died five years after, in 943. The distresses which the English sustained in their subsequent wars with the Danes gave the Scots an opportunity of retrieving their affairs; and in 944 Malcolm I., the successor of Constantine, was invested with the sovereignty of Northumberland, on condition of his holding it as a fief of the crown of England, and assisting in defence of the northern border. Soon after the conclusion of this treaty, Malcolm going to the county of Moray, to settle some disturbances, was treacherously murdered in the ninth year of his reign. The murderers were all apprehended, tortured, and put to death. Malcolm was succeeded by his son Indulfus, A. D. 952. In this reign the Danes became extremely formidable by their invasions, which they now renewed with greater fury than ever, being exasperated by the friendship subsisting between the Scots and English monarchs. Haquin, king of Norway, also attempted an invasion, but was defeated by Indulfus. The first descent of the Danes was upon East Lothian, where they were soon expelled, but crossed over to Fife. Here they were again defeated, and driven out; and so well had Indulfus guarded the coasts that they could not find an opportunity of landing; till, having seemed to steer towards their own country, the Scots were thrown off their guard, and the Danes on a sudden made good their land-

ing at Cullen, in Banffshire. Here Indulfus soon came up with them, attacked their camp, and drove them towards their ships; but was killed in an ambuscade, into which he fell during his pursuit, in the ninth year of his reign. He was succeeded by Duffus the son of Malcolm I. A. D. 961, to whom historians gave an excellent character; but, after a reign of five years, he was murdered in 966. He was succeeded by Cullen the son of Indulfus, who had been nominated prince of Cumberland, in his father's lifetime, as heir-apparent to the throne. He is represented as a very degenerate prince; and is said to have given himself up to sensuality in a manner almost incredible, being guilty of incontinence not only with women of all ranks, but even with his own sisters and daughters. The people in the mean time were fleeced to support the extravagance and luxury of their prince. In consequence of this, an assembly of the states was convened at Scone for the resettling of the government; but on his way thither Cullen was assassinated in the fourth year of his reign, near the village of Mothven, by Rohard, or Rodard,thane of Fife, whose daughter he had debauched. The provocations which Cullen had given to his nobility seem to have rendered them totally untractable and licentious; which gave an occasion to a remarkable revolution in the reign of Kenneth III., who succeeded Cullen, A. D. 970. This prince, being a man of great resolution, began with relieving the common people from the oppressions of the nobility, which were now intolerable; and this plan he pursued with so much success that, having nothing to fear from the great barons, he ordered them to appear before him at Lanerk; but the greatest part, conscious of their demerits, did not attend. The king so well dissembled his displeasure that those who came were quite charmed with his affability, and the noble entertainment he gave them; in consequence of which, when an assembly was called next year, the guilty were encouraged to appear as well as the innocent. No sooner had this assembly met, however, than the place of meeting was beset with armed men. The king then informed them that none had any thing to apprehend, excepting such as had been notorious offenders; and these he ordered to be immediately taken into custody, telling them that their submitting to public justice must be the price of their liberty. They were obliged to accept the king's offer, and the criminals were punished according to their deserts. About this time Edgar, king of England, finding himself hard pressed by the Danes, found means to unite the king of Scotland and the prince of Cumberland along with himself in a treaty against the Danes; which gave occasion to a report that Kenneth had become tributary to the king of England. This, however, is utterly denied by all the Scottish historians; who affirm that Kenneth cultivated a good correspondence with Edgar, both because he expected assistance in defending his coasts, and because he intended entirely to alter the mode of succession to the throne. About this time the Danes made a dreadful invasion. Their original intention seems to have been to land on some part of the

English coasts; but, finding them probably too well guarded, they landed at Montrose in Scotland, committing every where the most dreadful ravages. Kenneth at that time was at Stirling, and quite unprepared; however, having collected a handful of troops, he cut off many of the enemy as they were straggling up and down, but could not prevent them from besieging Perth. Nevertheless, as the king's army constantly increased, he resolved to give the enemy battle. The scene of this action was at Luncarty, near Perth. The king is said to have offered ten pounds in silver, or the value of it in land, for the head of every Dane which should be brought him; and an immunity from all taxes to the soldiers who served in his army, provided they should be victorious; but, notwithstanding the utmost efforts of the Scots, their enemies fought so desperately that Kenneth's army fled, and must have been totally defeated, had not the fugitives been stopped by a yeoman, named Thomas, and his two sons, who were coming up to the battle. Buchanan and Boece inform us, that these countrymen were ploughing in a field hard by the scene of action, and, perceiving that their countrymen fled, they loosed their oxen, and made use of the yokes as weapons, with which they first obliged their countrymen to stand, and then fell upon their enemies. The fight was now renewed with such fury on the part of the Scots, that the Danes were utterly defeated; and, after the battle, the king rewarded Thomas with the barony of Errol, in the Carse of Gowrie, ennobled his family, and gave them an armorial bearing of a bloody yoke in a field, alluding to the rustic weapons with which they had achieved this glorious exploit; and gave him also the surname of Hay, because, when weary with the fatigue of his exertions, he had said *Oh Hay!* After this Kenneth stained all his glory by poisoning prince Malcolm, lord of Cumberland, &c., the heir apparent of the crown: and, to secure the succession more effectually in his own family, prevailed on the states to make the succession hereditary, without regard to infancy or age. After this, either the king's conscience persuaded him, or the superstition of the times invented the story, that he heard a voice from heaven, threatening him and his son with vengeance for the murder of the prince. In either case the threatening was fulfilled. In 994 Kenneth was murdered by a lady named Fenella, whose son he had caused to be put to death. The murder was perpetrated in Fenella's castle, at Fettercairn, in the Mearns, where she had persuaded the king to pay her a visit, by an automaton image of the king in brass, which held out a golden apple in its hand; which Fenella desired the king to take, but he had no sooner done so, than the internal springs moved a cross-bow held by the image, and shot the king through the body. His attendants waited long near the place; but, being at length tired out, they broke open the doors, and found their king murdered; upon which they laid the castle in ashes; but Fenella had escaped by a postern.

The throne was then seized by a usurper named Constantine IV. the son of Culen, who,
Vol. XIX.

being killed in battle at Cramond, after a reign of a year and a half, was succeeded by Grim, the son of king Duffus; and he again was defeated and killed by Malcolm the son of Kenneth, the lawful heir of the Scottish throne, A. D. 1004. After this victory, however, Malcolm did not immediately assume the sovereignty; but asked the crown from the nobles, although, by the law passed in the reign of Kenneth, the succession to the throne of Scotland was now hereditary. This they immediately granted, and Malcolm was crowned king, A. D. 1004. He joined himself in alliance with the king of England; and proved so successful against the Danes in England, that Sweno their king resolved to direct his whole force against him by an invasion of Scotland. His first attempt, however, proved very unsuccessful; all his soldiers being cut in pieces, except some few who escaped to their ships, while the loss of the Scots amounted to only thirty men. But in the mean time, Duncan prince of Cumberland, having neglected to pay his homage to the king of England, the latter invaded that country in conjunction with the Danes. Malcolm took the field against them, and defeated both; but while he was thus employed in the south, a new army of Danes landed in the north at the mouth of the Spey. Malcolm advanced against them with an army much inferior in number; and his men, neglecting every thing but the blind impulses of fury, were almost all cut to pieces: Malcolm himself being desperately wounded. By this victory the Danes were so much elated that they sent for their wives and children, intending to settle in this country. The castle of Nairn, then thought almost impregnable, fell into their hands; and the towns of Elgin and Forres were abandoned both by their garrisons and inhabitants. The Scots were every-where treated as a conquered people, and employed in the most servile offices by the haughty conquerors; who, to render the castle of Nairn, as they thought, absolutely impregnable, cut through the small isthmus which joined it to the land. All this time, however, Malcolm was raising forces in the southern counties; and, having at last got an army together, he came up with the Danes at Murtloch, near Balveney, which appears at this day to have been a strong Danish fortification. Here he attacked the enemy; but, having the misfortune to lose three of his general officers, he was again obliged to retreat. However, the Danish general happening to be killed in the pursuit, the Scots were encouraged to renew the fight with such vigor that they obtained at last a complete victory; but suffered so much that they were unable to derive from it all the advantages which might otherwise have accrued. On the news of this ill success, Sweno ordered two fleets, one from England and another from Norway, to make a descent upon Scotland, under Camus, one of his most renowned generals. The Danes attempted to land at the mouth of the Forth; but, finding every place there well fortified, they were obliged to move farther northward, and effected their purpose at Redhead in Angus-shire. The castle of Brechin was first besieged; but, meeting with a stout resistance there, they laid the town and

church in ashes. Thence they advanced to the village of Paubride, and encamped at a place called Karbuddo. Malcolm in the mean time was at hand with his army, and encamped at a place called Barr, in the neighbourhood of which both parties prepared to decide the fate of Scotland; for, as Moray and the northern provinces were already in the possession of the Danes, it was evident that a victory at this time must put them in possession of the whole. The engagement was desperate, and so bloody that the rivulet which proceeds from Loch Tay is said to have had its waters dyed with the blood of the slain; but at last the Danes gave way and fled. There was at that time in the army of Malcolm, a young prince of the name of Keith, who commanded a colony of the Catti, a German tribe, who settled in the north of Scotland, and gave name to Caithness. He pursued Canus; and, having overtaken him, engaged and killed him; but another Scottish officer coming up, disputed with Keith the glory of the action. While the dispute lasted Malcolm came up; who suffered them to decide it by single combat. In this second combat Keith proved also victorious, and killed his antagonist. The dying person confessed the justice of Keith's claim; and Malcolm dipping his finger in his blood marked the shield of Keith with three strokes, pronouncing the words *Veritas vincit*, Truth overcomes, which has ever since been the armorial bearing and motto of the family of Keith. The shattered remains of the Danish forces reached their ships; but being driven back by contrary winds, and provisions becoming scarce, they put ashore 500 men on the coast of Buchan, to procure them some food: but, their communication with the ships being soon cut off, they fortified themselves as well as they could, and made a desperate resistance; but at last were all put to the sword. The place where this massacre happened is still called *Crudane*; being probably an abbreviation of *Cruor Danorum*, i. e. the blood of the Danes, a name imposed on it by the ecclesiastics of those days. Sweno, not yet discouraged, sent his son Canute, afterwards king of England, and one of the greatest warriors of that age (see *CANUTE*), into Scotland, with an army more powerful than any that had yet appeared. Canute landed in Buchan; and, as the Scots were much weakened by such a long continued war, Malcolm thought proper to act on the defensive. But the Scots, who now thought themselves invincible, demanded to be led on to a general engagement. Malcolm complied with their desire, and a battle ensued; in which, though neither party had much reason to boast of victory, the Danes were so much reduced that they willingly concluded a peace on the following terms, viz.—That the Danes should immediately depart Scotland; that as long as Malcolm and Sweno lived neither of them should wage war with the other, or help each other's enemies; and that the field in which the battle was fought should be set apart and consecrated for the burial of the dead. These stipulations were punctually fulfilled by Malcolm, who built in the neighbourhood a chapel dedicated to Olaus, the tutelar saint of these northern nations. After all these glorious exploits, and becoming

the second legislator in the Scottish nation, Malcolm is said to have stained the latter part of his reign with avarice and oppression; in consequence of which he was murdered at the age of eighty, after he had reigned above thirty years. This assassination was perpetrated when he was on his way to Glamis. His own domestics are said to have been privy to the murder, and to have fled along with the conspirators; but, in passing the lake of Forfar on the ice, it gave way with them, and they were all drowned, their bodies being discovered some days after. This account is confirmed by the sculptures upon some stones erected near the spot; one of them which is still called Malcolm's gravestone, and all of them exhibit some rude representations of the murder and the fate of the assassins.

Malcolm II. was succeeded in 1034 by his grandson Duncan I., but he is said to have had another grandson, by a daughter named Dowoda, viz. the famous Macbeth; though some are of opinion that Macbeth was not the grandson of Malcolm, but of Fenella who murdered Kenneth III. The first years of Duncan's reign passed in tranquility, but domestic broils soon took place on the following occasion. Banquo, thane of Lochaber, and ancestor to the royal family of Stuart, acted then in the capacity of steward to Duncan, by collecting his rents; but, being very rigid in the execution of his office, he was way-laid, robbed, and almost murdered. Of this outrage Banquo complained, as soon as he recovered of his wounds and could appear at court. The robbers were summoned to surrender themselves to justice; but, instead of obeying, they killed the messenger. Macbeth represented this in such strong terms that he was sent with an army to reduce the insurgents, who had already destroyed many of the king's friends. This commission he performed with such success that the rebel chief put an end to his own life; after which Macbeth sent his head to the king, and then proceeded with the utmost severity against the insurgents, who were composed of Irishmen, Islanders, and Highlanders. This insurrection was scarcely quelled, when the Danes landed again in Fife; and Duncan put himself at the head of an army, having the thanes Macbeth and Banquo serving under him. The Danes were commanded by Sweno king of Norway, and eldest son of Canute. He proceeded with all the barbarity customary with his nation, putting to death men, women, and children, who fell in his way. A battle was fought between the two nations near Culross, in which the Scots were defeated; but the Danes purchased their victory so dearly that they could not improve it; and Duncan retreated to Perth, while Macbeth was sent to raise more forces. In the mean time Sweno laid siege to Perth, which was defended by Duncan and Banquo. The Danes were so much distressed for want of provisions, that they at last consented to treat of a peace, provided the pressing necessities of the army were relieved. The Scottish historians inform us that this treaty was set on foot to amuse Sweno, and gain time for the stratagem which Duncan was preparing. This was no other than a barbarous contrivance of infusing intoxicating herbs into

the liquors that were sent along with the other provisions to the Danish camp. These soporifics had their intended effect; and, while the Danes were under their influence, Macbeth and Banquo broke into their camp, where they put all to the sword, and it was with difficulty that some of Sweno's attendants carried him on board the only ship of all the fleet that returned to Norway. It was not long, however, before a fresh body of Danes landed at Kinghorn, in Fifeshire; but they were entirely defeated by Macbeth and Banquo. Such of the Danes as escaped fled to their ships; but before they departed they obtained leave to bury their dead in Inchcolm, a small island lying in the Forth, where one of their monuments is still to be seen. Thus ended the formidable invasions of the Danes; after which Duncan applied himself to the administration of justice, and the reformation of the manners of his subjects. Macbeth, however, who had obtained great reputation by his success against the Danes, began to form ambitious designs, and to aspire to the crown itself. The fables relating to his usurpation are so well known, from the tragedy composed by Shakespeare which bears the name of Macbeth, that we need not take notice of them; but only mention the fact, that Duncan, not knowing he had so dangerous an enemy near his person, was murdered at Inverness, in the sixth year of his reign, by Macbeth, who succeeded him in the throne, A. D. 1040. During the greatest part of the reign of the usurper, Malcolm, the true heir to the crown of Scotland, kept close in his principality of Cumberland, without any thoughts of ascending his father's throne. Macbeth for some time governed with moderation, and enacted some excellent laws, but at last became a tyrant. Becoming jealous of Banquo, the most powerful subject in his dominions, he invited him to an entertainment, and caused him to be treacherously murdered. His son Fleance was destined to the same fate, but escaped to Wales. After him Macduff, the thane of Fife, was the most powerful person in Scotland; for which reason, Macbeth determined to destroy him. But Macduff, understanding this, fled to France; and Macbeth cruelly put to death his wife and infant children, and sequestered his estate. Macduff vowed revenge, and encouraged Malcolm to attempt to dethrone the tyrant. Macbeth opposed them with his whole force; but, being defeated in a pitched battle, he took refuge in the most inaccessible places of the Highlands, where he defended himself for two years; but in the mean time Malcolm was acknowledged king of Scotland, and crowned at Scone, A. D. 1055. The war between Macbeth and the new king continued for two years after the coronation of the latter; but at last he was killed in a sally by Macduff. However, the public tranquillity did not end with his life. His followers elected one of his kinsmen named Lullach, surnamed the Idiot, to succeed him: but he, unable to withstand Malcolm, withdrew to the north, where, being pursued, he was killed at Essey, in Strathbogie, after a reign of four months.

Malcolm being now established on the throne, A. D. 1057, began with rewarding Macduff for

his great services; and conferred upon his family four extraordinary privileges:—1. That they should place the king in his chair of state at the coronation. 2. That they should lead the van of all the royal armies. 3. That they should have a regality within themselves: and, 4. That if any of Macduff's family should happen to kill a nobleman unpromptedly, he should pay twenty-four marks of silver, and if a plebeian, twelve. The king's next care was to reinstate in their father's possessions all the children who had been disinherited by the late tyrant; which he did in a convention of his nobles held at Forfar. In the time of William the Conqueror, Malcolm was engaged in a dangerous war with England, the occasion of which was as follows: On the death of Edward the Confessor, Harold II. seized the throne of England, to the prejudice of Edgar Atheling the true heir to the crown. However, he created him earl of Oxford, and treated him with great respect; but, on the defeat and death of Harold, William discovered some jealousy of Edgar. Soon after, William having occasion to pay a visit to his dominions in Normandy, he appointed Edgar to attend him, along with some other noblemen whom he suspected to be in his interest; but, on his return to England, he found the people in a state of such disaffection to his government, that he proceeded with great severity, and great numbers of his subjects were obliged to take refuge in Cumberland and the southern parts of Malcolm's dominions. Edgar had two sisters, Margaret and Christina: these, with his two chief friends, Gospatric and Marteswin, soon made him sensible how precarious his life was under such a jealous tyrant, and persuaded him to make preparations for flying into Hungary or some foreign country. Edgar accordingly set sail with his mother Agatha, his two sisters, and a great train of Anglo-Saxon noblemen; but by stress of weather was forced into the Frith of Forth, where the illustrious exiles landed at the place since called the Queen's Ferry. Malcolm no sooner heard of their landing than he paid them a visit in person; and at this visit became enamoured of the princess Margaret. In consequence of this the chief of Edgar's party repaired to the court of Scotland. William soon made a formal demand of Edgar; and, on Malcolm's refusal, declared war against him. William was the most formidable enemy the Scots had ever encountered, as having not only the whole force of England, but of Normandy at his command. However, as he had tyrannised most unmercifully over his English subjects, they were much more inclined to assist his enemies than himself; and he even found himself obliged to give up the county of Northumberland to Gospatric, who had followed Edgar, upon condition of his making war on the Scots. This nobleman accordingly invaded Cumberland; in return for which Malcolm ravaged Northumberland in a dreadful manner, carrying off an immense booty, and inviting the Irish and Danes to join him: for even at this time the Danes kept up their claims upon the crown of England. The Irish were also interested in advancing the cause of Harold's three sons, who had put themselves

under their protection ; besides their view to obtain plunder. However, as all these views tended to the destruction of William's power, a union was formed against him ; but, when they came to stipulations, the parties disagreed. The three sons of Harold, with a body of Irish, made a descent upon Somersetshire, and defeated a body of English ; but the Irish having obtained an opportunity of acquiring some booty immediately retired with it. The Danes landed at the mouth of the Humber from forty small ships, where they were joined by Edgar and his party ; and had the allies been unanimous, it is probable that William's government would have been overthrown. By this time the latter had taken from Gospatric the earldom of Northumberland, and given it to Robert Cummin one of his Norman barons ; but the Northumbrians having joined Gospatric, and received the Danes as their countrymen, murdered Cummin and all his followers at Durham. After this they laid siege to the forts built by William in Yorkshire : but, not being able to reduce them, the English, Scots, and Danes, united their forces, and took the city of York, and put the garrison of 3000 Normans to the sword ; this success was followed by many incursions and ravages, in which the Danes and Northumbrians acquired great booty. It soon appeared, however, that these allies had the interest of Edgar no more at heart than the Irish : and that all the dependence of this forlorn prince was upon Malcolm and the few Englishmen who had followed his fortune : for the booty was no sooner obtained than the Danes retired to their ships, and the Northumbrians to their habitations. In the mean time William, having raised a considerable army, advanced northwards. He first took a severe revenge upon the Northumbrians ; then reduced the city of York, and put to death a great number of the inhabitants ; when, perceiving that danger was still threatened by the Danes, he bribed them with a sum of money to depart to their own country. Malcolm was now left alone to encounter this formidable adversary ; and, finding himself unable to oppose so great a force, withdrew to his own dominions, where he remained for some time upon the defensive. His second invasion took place in 1071, while William was employed in quelling an insurrection in Wales. He is said at this time to have behaved with the greatest cruelty. Bursting into England by Cumberland he ravaged Teesdale ; and at a place called Hundreds-keld massacred several English noblemen, with all their followers. Thence he marched to Cleveland, in the north riding of Yorkshire ; which he also ravaged with the utmost cruelty, sending back the booty with part of the army to Scotland : after which he pillaged the bishopric of Durham, where he is said not to have spared the most sacred edifices. Meanwhile Gospatric, to whom William had again ceded Northumberland, attempted to make a diversion in his favor by invading Cumberland ; but, being defeated by Malcolm, he was obliged to shut himself up in Bamborough castle ; while the latter returned in triumph to Scotland, where he married the princess Margaret, who proved a most excellent queen. In 1072 William, having

greatly augmented his army, in his turn invaded Scotland. The particulars of the war are unknown ; but it ended to the disadvantage of the Scots, as Malcolm agreed to pay him homage. The English historians contend that the homage was for the whole of his dominions ; but the Scots with more show of reason affirm that it was only for those he possessed south of the Tweed. On the conclusion of the peace a cross was erected at Stanmore in Richmondshire, with the arms of both kings, to serve as a boundary between the possessions of William and the feudal dominions of Malcolm. Part of this monument, called Re-cross, or rather Roy-cross, or the cross of the kings, was entire in the days of Camden. This peace produced the greatest alteration in the manners of the Scots. What chiefly contributed to this was the excellent disposition of queen Margaret, who was, for that age, a pattern of piety and politeness ; and next to this was the number of foreigners who had settled in Scotland ; among whom were some Frenchmen. Malcolm himself, also, was far from being averse to a reformation, and even set the example. During her husband's absence in England queen Margaret had chosen for her confessor one Turgot, whom she also made her assistant in her intended reformation. She began with new-modelling her own court ; into which she introduced the offices, furniture, and manner of living, common in the more polite nations of Europe ; dismissing from her service all who were noted for immorality and impiety. Turgot she charged, on pain of her displeasure, to give his real sentiments on the state of the kingdom, and was informed by him that faction reigned among the nobles, rapine among the commons, and licentiousness among all ranks. Above all, he complained that the kingdom was destitute of a learned clergy. This the queen represented to her husband, and prevailed upon him to set about the work of reformation ; in which, however, he met with considerable opposition. The Scots, accustomed to oppress their inferiors, thought all restrictions of their power were as many steps towards their slavery. The introduction of foreign offices and titles confirmed them in this opinion ; and such a dangerous insurrection happened in Moray and some of the northern counties, that Malcolm was obliged to march against the rebels. He found them indeed very formidable ; but they were so much intimidated by his resolution, that they intreated the clergy who were among them to intercede with the king. Malcolm received their submission, but refused to grant an unconditional pardon. He gave all the common people indeed leave to return to their habitations, but obliged the higher ranks to surrender themselves to his pleasure. Many of the most guilty were put to death, or had their estates confiscated. This severity checked the rebellious spirit of the Scots ; upon which Malcolm returned to his plans. Still, however, he found himself opposed even in those abuses which were most obvious and glaring, and durst not entirely abolish many odious customs. In those days the Scots were without the practice of saying grace after meals, till it was introduced by Margaret, who gave a glass of

wine to those who remained at the royal table and heard the thanksgiving; which gave rise to the term of the grace-drink. Besides this, the terms of the duration of Lent and Easter were fixed; the king and queen bestowed large alms on the poor, and the latter washed the feet of six of their number; many churches, monasteries, &c., were erected, and the clerical revenues augmented. In 1077 Malcolm again invaded England; but with what success is not well known. In 1088, after the death of the conqueror, he again espoused the cause of Edgar Etheling. At the time of Edgar's arrival Malcolm was at the head of a brave and well disciplined army, with which he penetrated a great way into the country of the enemy; and, it is said, returned home with an immense booty. William resolved to revenge the injury, and prepared great armaments both by sea and land for the invasion of Scotland. His success, however, was not answerable to his preparations. His fleet was dashed to pieces by storms, and almost all on board perished. Malcolm had also laid waste the country through which his antagonist was to pass, in such an effectual manner that William lost a great part of his troops by fatigue and famine; and, when he arrived in Scotland, found himself in a situation very little able to resist Malcolm, who was advancing with a powerful army. In this distress Rufus had recourse to Robert de Mowbray earl of Northumberland, who dissuaded him from venturing a battle, but advised him by all means to open a negotiation through the English noblemen who resided with Malcolm. Edgar undertook the negotiation, on condition of his being restored to his estates in England. Malcolm had never yet recognised the right of William Rufus to the throne of England, and therefore refused to treat with him as a sovereign prince; but offered to enter into a negotiation with his brother Robert, surnamed Curt-hose, from the shortness of his legs. The two princes accordingly met; and Malcolm, having shown Robert the disposition of his army, offered to cut off his brother William, and to pay to him the homage he had been accustomed to pay to the Conqueror for his English dominions. But Robert generously answered that he had resigned to William his right of primogeniture in England; and that he had even become one of William's subjects by accepting of an English estate. An interview with William then followed; in which it was agreed that the king of England should restore to Malcolm all his southern possessions, for which he should pay the same homage he had been accustomed to do to the Conqueror, that he should restore to Malcolm twelve disputed manors, and give him likewise twelve merks of gold yearly, besides restoring to Edgar all his English estates. This treaty was concluded in Lothian, according to the English historians; but at Leeds in Yorkshire, according to the Scots. However William considered the terms as so very dishonorable that he resolved not to fulfil them. Soon after his departure Edgar and Robert began to press him to fulfil his engagements; but, receiving only evasive answers, they passed over into Normandy. After their departure William applied himself

to the fortification of his northern boundaries, especially Carlisle, which had been destroyed by the Danes 200 years before. As this place lay within the feudal dominions of Malcolm, he complained of William's proceedings as a breach of the late treaty; and soon after repaired to the English court at Gloucester that he might have a personal interview with the king, and obtain redress. On his arrival William refused him admittance to his presence without paying him homage. Malcolm offered this in the same manner as had been done by his predecessors, that is, on the confines of the two kingdoms; but, this being rejected by William, Malcolm returned to Scotland in a rage, and again prepared for war. The first of Malcolm's military operations now proved fatal to him; but the circumstances of his death are variously related. According to the Scottish historians, having laid siege to Alnwick, he reduced the place to such straits that a knight came out of the castle, having the keys on the point of a spear, and, pretending that he designed to lay them at Malcolm's feet, ran him through the eye with the spear as soon as he came within reach. Prince Edward, the king's eldest son, was mortally wounded in attempting to revenge his father's death. The English historians, on the other hand, contend that the Scots were surprised in their camp, their army entirely defeated, and their king killed. On this occasion the Scottish historians also inform us that the family of Percy received its name; the knight who killed the Scottish king having been surnamed Pierce-eye, from the manner in which he gave that monarch the fatal stroke. Queen Margaret, who was at that time lying ill in the castle of Edinburgh, died four days after her husband.

On the death of Malcolm Canmore, which happened in the year 1093, the throne was usurped by his brother, Donald Bane, or Donald VII., who, notwithstanding the great virtues and glorious achievements of the late king, had been at the head of a strong party during the whole of his reign. The usurper, giving way to the barbarous prejudices of himself and his countrymen, expelled out of the kingdom all the foreigners whom Malcolm had introduced. Edgar himself had long resided at the English court, where he was in high reputation; and, by his interest there, found means to rescue his nephew young Edgar, the king of Scotland's eldest son, out of the hands of the usurper Donald Bane. The favor he showed to him, however, produced an accusation against himself, as if he designed to adopt young Edgar as his son, and set him up as a pretender to the English throne. This accusation was preferred by an Englishman whose name was Orgar; but, as no legal proofs could be obtained, the custom of the times rendered a single combat between the parties unavoidable. Orgar was one of the strongest and most active men in the kingdom; but the age and infirmities of Edgar allowed him to be defended by another. For a long time none could be found who would enter the lists with this champion; but at last one Godwin of Winchester, whose family had been under obligations to Edgar or his ancestors, offered to defend his cause. Orgar was overcome and killed; and, when dying, confess-

ed the falsehood of his accusation. The conqueror obtained all the lands of his adversary, and William lived ever afterwards on terms of the strictest friendship with Edgar. This combat, trifling as it may seem to us, produced very considerable effects. The party of Edgar and his brothers (who had likewise taken refuge at the English court) revived in Scotland to such a degree that Donald was obliged to call in the Danes and Norwegians to his assistance. In order to engage them more effectually, the usurper yielded up to them the Orkney and Shetland islands; but, when his new allies came to his assistance, they behaved in such a manner as to become more intolerable to the Scots than ever the English had been. This discontent was greatly increased when it was found that William designed to place on the throne of Scotland a natural son of the late Malcolm, named Duncan, who had served with reputation in the English armies. Donald attempted to maintain himself on the throne by the assistance of his Norwegian allies; but, being abandoned by the Scots, he was obliged to fly to the isles, to raise more forces: in the meantime Duncan II. was crowned at Scone with the usual solemnity. The Scots were now greatly distressed by two usurpers who contended for the kingdom. One of them however was soon despatched. Malpedir, thane of Mearns, surprised Duncan in the castle of Monteith, and killed him; after which he replaced Donald VII. on the throne. But the affection of the Scots was by this time entirely alienated from Donald, and a manifest intention of calling in young Edgar prevailed. To prevent this, Donald offered the young prince all that part of Scotland which lay south of the Forth; but the terms were rejected, and the messengers who brought them were put to death as traitors. The king of England also, dreading the neighbourhood of the Norwegians, interposed in young Edgar's favor, and gave Atheling the command of an army to restore him. Donald prepared to oppose his enemies with all the forces he could raise; but, deserted by the Scots, he was obliged to flee; and his enemies pursued him so closely that he was soon taken. Being brought before Edgar, he ordered his eyes to be put out, and condemned him to perpetual banishment, in which he died some time after. The credulous historians of this period tell us that this revolution was owing to St. Cuthbert, who appeared to Edgar, informing him that he should prove victorious, if he received his banner from the hands of the canons; which he accordingly did. During his reign a strict friendship subsisted between the courts of England and Scotland; owing to the marriage of Henry I. of England with the princess Matilda, sister to Edgar. This has given occasion to the English historians to assert, that Edgar held the kingdom of Scotland as a feudatory of Henry. A seal has been forged of Edgar sitting on horseback, with a sword in his right hand, and a shield on his left arm, with a border of France: this last circumstance is a sufficient proof of the forgery. After a reign of nine years, Edgar died at Dundee, in 1107; and was succeeded by his brother Alexander I. surnamed the Pierce, from the impetuosity of his

temper. On his accession to the throne, however, the Scots were so ignorant of his true character, on account of his appearance of piety and devotion, that the northern parts of the kingdom were soon filled with bloodshed, by the wars of the chieftains. Alexander immediately raised an army, and, marching into Moray and Ross-shire, attacked the insurgents separately; and, having subdued them all, put great numbers of them to death. He then set himself to reduce the exorbitant power of the nobles. A remarkable instance of this appeared on his return from this expedition. In passing through the Mearns, he met with a widow who complained that her husband and son had been put to death by the young earl their superior. Alexander immediately alighted from his horse, and swore that he would not remount him till he had enquired into the justice of the complaint; and, finding it to be true, the offender was hanged on the spot. These vigorous proceedings prevented all attempts at rebellion; but produced many conspiracies among the profligate part of his subjects. The most remarkable of these took place while the king was engaged in building the castle of Bal-Edgar, so called in memory of his brother, who had laid the foundation. It was situated in the Carse of Gowrie, which formerly belonged to Donald Bane, but came to the crown, either by donation or forfeiture. The conspirators bribed one of the king's chamberlains to introduce them at night into the royal bed-chamber; but Alexander, alarmed at the noise, drew his sword and killed six of them: after which, by the help of a knight named Alexander Carron, he escaped the danger, by fleeing into life. The conspirators chiefly resided in the Mearns, to which Alexander once more repaired, at the head of an army; but the rebels retreated northwards, and crossed the Spey. The king pursued them across that river, defeated them, and brought to justice all that fell into his hands. In this battle Carron distinguished himself so eminently that he obtained the name of Skrimgeour or Skrinzeour, i. e. skirmisher or fighter. The next remarkable transaction of Alexander's reign was his journey into England, where he visited Henry I., whom he found engaged in a war with the Welsh. Henry had planted a colony of Flemings on the borders of the principality, to keep that turbulent people in awe, as well as to introduce into his kingdom the manufactures for which the Flemings were famous. The Welsh, jealous of this colony, invaded England; where they defeated the earl of Chester and Gilbert Strongbow, the two most powerful of the English subjects. Alexander, in virtue of the fealty which he had sworn for the English possessions, readily agreed to lead an army into Wales. There he defeated one of the chieftains, and reduced him to great straits; but could not prevent him from escaping to Griffith, prince of North Wales, with whom he was closely allied. Henry also marched against the enemy, but with much worse success in the field than Alexander; for he lost two-thirds of his army, with almost his whole baggage, by fatigue, famine, and the attacks of the Welsh. This loss, however, he made up in some measure by his policy; for having

raised a jealousy between the two Welsh chiefs, he induced them to conclude a peace, but not without restoring all his lands to the one, and paying a considerable sum of money to the other. Alexander married Sibylla, daughter of William duke of Normandy; but died without issue in 1124, after a reign of seventeen years, and was buried at Dunfermline.

Alexander, dying a bachelor, was succeeded by his youngest brother David; who interfered in the affairs of England, and took part with the empress Maud in the civil war she carried on with Stephen. In 1136 David met his antagonist at Durham; but, as neither party cared to venture an engagement, a negotiation took place, and a treaty was concluded. This, however, was not long observed; for, in 1137, David again invaded England, defeated Stephen at Roxburgh, and forced him to retreat precipitately, after losing one-half of his army. Next year he renewed his invasion; and, though he himself was a man of great mildness and humanity, he suffered his troops to commit such outrages as firmly united the English in opposition to him. His grand nephew William cut in pieces the vanguard of the English army at Clithero; after which he ravaged the country with such cruelty that the inhabitants became exasperated beyond measure against him. New associations were entered into against the Scots; and the English army, receiving great reinforcements from the southward, advanced to Northallerton, where the famous standard was produced. The body of this standard was a kind of box which moved upon wheels, from which arose the mast of a ship surmounted by a silver cross, and round it were hung the banners of St. Peter, St. John de Beverly, and St. Wilfred. Standards of this kind were common at that time on the continent; and so great confidence had the English in this standard that they now thought themselves invincible. They had, however, a much more solid ground of confidence, as being much better armed than their antagonists. The armies met at a place called Culton Moor. The first line of the Scots army was composed of the inhabitants of Galloway, Carric, Kyle, Cunningham, and Renfrew. These, by some historians, are called Picts, and are said to have had a prince of their own, who was a feudatory to David. The second line consisted of Lothian men, by which we are to understand the king's subjects in England as well as the south of Scotland, together with the English and Normans of Maud's party. The third line was formed of the clans under their different chieftains, but who were subject to no regular command, and were always impatient to return to their own country when they had acquired any booty. The English soldiers, having ranged themselves round their standard, dismounted from their horses, to avoid the long lances which the first line of the Scottish army carried. Their front line was intermixed with archers; and a body of cavalry, ready for pursuit, hovered at some distance. The Picts, besides their lances, made use of targets; but, when the English closed with them, they were soon disordered and driven back upon the centre, where David commanded in person. His son made a

gallant resistance, but was at last forced to yield: the last line seems never to have been engaged. David, seeing the victory decided against him, ordered some of his men to save themselves by throwing away their badges, which it seems Maud's party had worn, and mingling with the English; after which he himself, with his shattered forces, retreated towards Carlisle. The English historians say that in this battle the Scots were totally defeated, with the loss of 10,000 men; but this seems not to be the case, as the English did not pursue, and the Scots were in a condition for carrying on the war next year. However, there were now no great exploits performed on either side; and a peace was concluded, by which Henry, prince of Scotland, was put in possession of Huntingdon and Northumberland, and took an oath of fealty to Stephen. David built no fewer than fifteen abbeys: viz. at Holyrood-house, Kelso, Jedburgh, Melrose, Newbottle, Cambuskenneth, Dundrennan, Holm-Cultrane, Kinloss, Dunfermline, Holme in Cumberland, Carlisle, North Berwick, and two at Newcastle; and founded four bishoprics. His son prince Henry died before him, leaving three sons and three daughters. David, called also, from his piety, St. David, continued faithful to his niece the empress as long he lived; and died at Carlisle in 1153, after a glorious reign of above twenty-nine years.

David was succeeded by his grandson Malcolm IV., surnamed the Maiden, on account of his continence. He suppressed several rebellions, banished many of the turbulent Murrays, built the abbeys of St. Andrew's and Cupar in Angus, and died at Jedburgh, in the twelfth year of his reign, A. D. 1165. He was succeeded by his brother William I., surnamed the Lion, who immediately entered into a war with Henry II. of England, on account of the earldom of Northumberland, which had been given up by Malcolm; but Henry, finding his affairs in a very embarrassed situation, consented to yield up this county on William's paying him homage, rather than continue the miseries of war. In 1172 he attempted to avail himself of the unnatural war which Henry's sons carried on against their father, and invaded England. He divided his army into three columns; the first of which laid siege to Carlisle; the second he himself led into Northumberland; and the king's brother, David, advanced with the third into Leicestershire. William reduced the castles of Burgh, Appleby, Warkworth, and Garby, and then joined that division of his army which was besieging Carlisle. The place was already reduced to such straits that the governor had agreed to surrender it by a certain day, provided it was not relieved before that time; on which the king, leaving some troops to continue the siege, invested a castle with some of the forces he had under his command, at the same time sending a strong reinforcement to his brother David; by which means he himself was left with a very small army, when he received intelligence that a strong body of English under Robert de Stuterville and his son were advancing to surprise him. William, sensible of his inability to resist them, retired to Alnwick, to which he instantly laid siege; but

acted in such a careless manner that his enemies, having dressed a party of their soldiers in Scottish habits, took him prisoner, and carried him, with his feet tied under the belly of a horse, to Richmond Castle. He was then carried in chains before Henry to Northampton, and ordered to be transported to the castle of Falaise in Normandy, where he was shut up with other state prisoners. Soon after this an accommodation took place between Henry and his sons, and the prisoners on both sides were set at liberty, William only excepted, who bore his confinement with great impatience. Of this Henry took the advantage, to make him pay homage for the whole kingdom of Scotland, and acknowledge that he held it only as a feu of the crown of England; and, as a security, he was obliged to deliver into the hands of Henry all the principal forts in Scotland: viz. the castles of Roxburgh, Berwick, Jedburgh, Edinburgh and Stirling; William at the same time agreeing to pay the English garrisons which were put into these castles. David, the king's brother, and twenty barons, who were present at the signing of this shameful convention, were put into the hands of Henry as hostages for William's good faith; after which the king was set at liberty, and returned to Scotland. The affairs of Scotland were now in the greatest confusion. The people of Galloway, at the head of whom were two princes, called Othred and Gilbert, had taken the opportunity of asserting their independency on the crown of Scotland; and, having expelled all the Scottish officers out of the country, they demolished the forts which William had erected, and put to death all the foreigners. But, a quarrel ensuing between them, Othred was murdered by Gilbert, who applied to Henry for protection. Henry, to give all possible sanction to the convention betwixt him and William, summoned him to meet him and his son at York. William obeyed the summons, and along with him appeared all the great nobility and landholders; who confirmed the convention of Falaise, swore fealty to Henry, and put themselves and their country under his protection. In the mean time Gilbert, who was at the head of the rebels in Galloway, had offered to put himself and his people under the protection of Henry, and to pay to him 2000 merks of silver yearly, with 500 cows and as many hogs; but Henry, that he might oblige his new feudatory William, refused to have any concern with Gilbert. On this William ordered his general Gilchrist to march against him; which he did with such success that Gilbert was entirely defeated, and Galloway again reduced under the dominion of Scotland. Very soon after this victory Gilchrist fell under the king's displeasure on the following occasion: He had married Matilda, sister to William; and, on suspicion or proof of her incontinence, put her to death at a village called Maynes, near Dundee. The king, being highly displeased at such a gross affront to himself, summoned Gilchrist to take his trial for the murder; but, as the general did not choose to make his appearance, his estates were confiscated, his castles demolished, and himself banished. He took refuge in England; but as it had been agreed in the convention between William and Henry

that the one should not harbour the traitorous subjects of the other, Gilchrist was forced to return to Scotland with his two sons. There they were exposed to all the miseries of indigence, and in perpetual fear of being discovered, so that they were obliged to skulk from place to place. William, on his return from an expedition against a usurper whom he had defeated, observed three strangers, who, though disguised like rustics, appeared to be above the vulgar rank. William was confirmed in this apprehension by seeing them strike out of the high road, and endeavour to avoid notice. He ordered them to be seized and brought before him. The oldest, who was Gilchrist himself, fell upon his knees before him, and gave such a detail of his misfortunes, as drew tears from the eyes of all present; and the king restored him to his former honors and estates. From the family of this Gilchrist that of the Ogilvies is descended. The Scots continued in subjection to the English until the accession of Richard I. This monarch, being a man of romantic valor, zealously undertook an expedition into the Holy Land against the Turks. That he might secure the quiet of his dominions in his absence, he determined to make the king of Scotland his friend; and, for this purpose, he thought nothing could be more acceptable than releasing him and his subjects from that subjection which even the English themselves considered as unjust. However, he determined not to lose this opportunity of supplying himself with a sum of money, which was absolutely necessary in such an expensive and dangerous undertaking. He therefore made William pay him 10,000 merks for this release; after which he entered into a convention, which is still extant, acknowledging that 'all the conventions and acts of submission from William to the crown of England had been extorted from him by unprecedented writings and duress.' This transaction happened in 1139. The generosity of Richard met with a grateful return from William; for when Richard was imprisoned by the emperor of Germany in his return from the Holy Land, the king of Scotland sent an army to assist his regency against his rebellious brother John, who had wickedly usurped the throne of England. For this Richard owned his obligation in the highest degree; and the two monarchs continued in friendship, as long as Richard lived. Some differences happened with king John about the possession of Northumberland and other northern counties; but these were all finally adjusted, to the mutual satisfaction of both parties; and William continued a faithful ally of the English monarch till his death, which happened in 1214, after a reign of forty-nine years.

William was succeeded by his son Alexander II., a youth of sixteen. He revived his claim to Northumberland and the other northern counties of England; but John, supposing that he had now thoroughly subdued the English, not only refused to consider the demands of Alexander, but made preparations for invading Scotland. John had given all the country between Scotland and the river Tees to Hugh de Baliol and another nobleman, upon condition of their defending it against the Scots. Alexander fell upon Nor-

thumberland, which he easily reduced, while John invaded Scotland. Alexander retired to Melrose to defend his own country; upon which John burnt the towns of Wark, Alnwick, and Morpeth, and took the strong castles of Roxburgh and Berwick. He next plundered the abbey of Coldingham, reduced Dunbar and Haddington, ravaging the country as he passed along. His next operation was directed against Edinburgh; but, being opposed by Alexander at the head of an army, he precipitately marched back. Alexander pursued, and John, to cover his retreat, burnt the towns of Berwick and Coldingham. In this retreat John set his men an example of barbarity, by setting fire every morning to the house in which he had lodged the preceding night. In short, such desolation did he spread all around him, that Alexander found it impossible to continue his pursuit; for which reason he marched westward, and invaded England by the way of Carlisle. This town he took and fortified; after which he marched south as far as Richmond, receiving homage from all the great barons as he went along. At Richmond he was again stopped by John's ravages, and obliged to return through Westmoreland to his own dominions. When the English barons found it necessary to put themselves under the protection of Louis, son to the king of France, that prince, among other acts of sovereignty, summoned Alexander to do him homage; but the latter, being then engaged in the siege of Carlisle, which had fallen into the hands of king John, could not attend. In a short time Alexander found himself obliged to abandon this enterprise; after which he laid siege to Barnard castle; but, being baffled here also, marched southwards through the whole kingdom of England, and met Louis at London or Dover, where the prince confirmed to him the rights to Northumberland, Cumberland, and Westmoreland. He continued a faithful ally to Louis and the barons in their wars with John; and in 1216 brought a fresh army to their assistance, when their affairs were almost desperate. This once more turned the scale against John; but, he soon after dying, the English easily became reconciled to the government of Henry III., and the party of Louis dwindled every day, till at last he was obliged to drop all thoughts of being king of England. As long as Louis continued in England, Alexander proved faithful to his interest; but in 1217 he was on such good terms with Henry as to demand his eldest sister, the princess Jane or Joan, for a wife. His request was granted, and in 1221 he espoused the princess, while his eldest sister Margery was married to Hubert de Burgh, justiciary of England, and his second sister to Gilbert earl marshal, the two greatest subjects in England. As long as the queen of Scotland lived, a perfect harmony subsisted between the Scots and English; but in 1239 queen Joan died without children, and Alexander soon after married Mary, the daughter of Egelrand de Courcy, a young and beautiful French lady, by whom he had a son named Alexander, in 1241. From this time a coolness took place between the two courts, and many differences arose; but no hostilities were commenced on either side during the

life of Alexander, who died in 1249, in the thirty-fifth year of his reign.

Immediately after the death of his father, Alexander III. took possession of the throne. He is the first of the Scottish kings of whose coronation we have any particular account. The ceremony was performed by the bishop of St. Andrew's, who girded the king with a military belt, probably as an emblem of his temporal jurisdiction. He then explained in Latin, and afterwards in Gaelic, the laws and oaths relating to the kingdom; and the monarch received them all with great appearance of joy, as he also did the benediction and ceremony of coronation. After the ceremony was performed, a Highlander repeated on his knees before the throne, in Gaelic, the genealogy of Alexander and his ancestors, up to Fergus I., or perhaps Gaelus. In 1250 the king, though only ten years of age, was married to the daughter of Henry, who now thought it a proper opportunity to cause him to do homage for the whole kingdom of Scotland. But Alexander, notwithstanding his youth, replied with great sense and modesty that his business in England was matrimony; that he had come thither under Henry's protection and invitation; and that he was no way prepared to answer such a difficult question. Henry seems to have been encouraged to make this attempt by the distracted state of the Scottish affairs at that time; for, during the minority of the king, the nobility threw every thing into confusion by their dissensions. The Cummins were now become exceedingly powerful; and Alexander II. is blamed by Buchanan for allowing them to obtain such an exorbitant degree of power, by which they were enabled almost to shake the foundations of government. Though the king had refused to do the homage required of him, they imagined that Henry's influence was now too great; and, fearing bad consequences to themselves, they withdrew from York, leaving Henry in full possession of his son-in-law's person. Henry, however, to show that he deserved all the confidence which could be reposed in him, publicly declared, that he dropped all claim of superiority with regard to the crown of Scotland, and that he would ever afterwards act as the father and guardian of his son-in-law; confirming his assurances by a charter. Yet, when Alexander returned to Scotland, he found they had made a strong party against his English connexions. They now exclaimed that Scotland was no better than a province of England; and, having gained almost all the nobility over to this opinion, they kept the king and queen as state prisoners in the castle of Edinburgh. Henry got intelligence of these proceedings; and his queen privately sent a physician whom she could trust, to enquire into her daughter's situation. Having got admittance into the young queen's presence, she gave him a most lamentable account of her situation. She said that the place of their confinement was very unwholesome, in consequence of which their health was in imminent danger; and that they had no concern in the affairs of government. Historians inform us that the Cummins usurped the whole power of the state. Henry did not well know how to act.

If he proceeded at once to violent measures, he was afraid of the lives of his daughter and son-in-law; and, on the other hand, by a more cautious conduct, he left them exposed to the wicked attempts of those who kept them in thralldom, some of whom, he knew, had designs on the crown. By advice of the Scottish royalists, among whom were the earls of Dunbar, Fife, Stratherne, Carrick, and Robert Bruce, Henry assembled his military tenants at York, whence he himself advanced to Newcastle, where he published a manifesto, disclaiming all designs against the peace or independency of Scotland; declaring that the forces which had been collected at York were designed to maintain both; and that all he meant was to have an interview with the king and queen upon the borders. From Newcastle he proceeded to Wark, where he privately despatched the earl of Gloucester, with his favorite John Mansel, and a train of trusty followers, to gain admission into the castle of Edinburgh, which was then held by John Baliol and Robert Ross, noblemen of great influence both in England and Scotland. The earl and Mansel gained admittance into the castle, in disguise, on pretence of their being tenants to Baliol and Ross; and their followers obtained access on the same account, without suspicion, till they were sufficiently numerous to have mastered the garrison, had they met with resistance. The queen immediately informed them of the thralldom and tyranny in which she had been kept; and among other things declared that she was still a virgin, as her jailors obliged her to sleep separate from her husband. The English, being masters of the castle, ordered a bed to be prepared that very night for the king and queen; and Henry, hearing of the success of his party, sent a safe conduct for the royal pair to meet him at Alnwick. Robert Ross was summoned by Henry to answer for his conduct; but, throwing himself at the king's feet, he was punished only by the sequestration of his estate, as was John Baliol, by a heavy fine, which the king of England reserved entirely to his own use. Alexander and his queen were attended to Alnwick by the heads of their party; and when they arrived it was agreed that Henry should act as his son-in-law's guardian; in consequence of which several regulations were made to suppress the exorbitant power of the Cummins. That ambitious family, however, were all this time privately strengthening their party in Scotland, though they outwardly appeared satisfied with the arrangements made. This rendered Alexander secure; so that, being off his guard, he was surprised when asleep in the castle of Kinross, by the earl of Menteith, who carried him to Stirling. The Cummins were joined in this treason by Sir Hugh Abernethy, Sir David Lochore, and Sir Hugh Barclay; and, in the mean time, the whole nation was thrown into the utmost confusion. The great seal was forcibly taken from Robert Stuterville, substitute to the chancellor the bishop of Dunkeld; the estates of the royalists were plundered; and even the churches were not spared. The king at last was delivered by the death of the earl of Monteith, who is said to have been poisoned by his wife to gratify her passion for a young English gentle-

man named John Russel. The earl died at a juncture very critical for Scotland, and his death disconcerted all the schemes of his party, which never afterwards could make head against the royalists. Alexander, being thus restored to the exercise of regal authority, acted with great wisdom and moderation. He pardoned the Cummins and their adherents, upon their submitting to his authority; after which he applied himself to the regulation of his other affairs; but a storm was now ready to break upon him from another quarter. The usurper Donald Bane, brother to Malcolm Canmore, had engaged to deliver up the isles of Orkney and Shetland to the king of Norway, for assisting him in making good his pretensions to the crown of Scotland. Haquin, the king of Norway, at this time alleged that these engagements extended to the delivering up the islands of Bute, Arran, and others in the Frith of Clyde, as belonging to the Western isles; and, as Alexander would not comply with these demands, Haquin appeared with a fleet of 160 sail, having on board 20,000 troops, who landed and took the castle of Ayr. Alexander immediately despatched ambassadors to treat with Haquin; but the latter, flushed with success, would hearken to no terms. He made himself master of the isles of Bute and Arran; after which he passed over to Cunningham. Alexander divided his army into three bodies: The first was commanded by Alexander, high steward of Scotland (the great grandfather of Robert II.), and consisted of the Argyle, Athol, Lenox, and Galloway men. The second was composed of the inhabitants of Lothian, Fife, Merse, Berwick, and Sterling, under Patrick earl of Dunbar. The king himself led the centre, which consisted of the inhabitants of Perthshire, Angus, Mearns, and the northern counties. Haquin, who was an excellent commander, disposed his men in order of battle, and the engagement began at a place called Larg. Both parties fought with great resolution; but at last the Norwegians were defeated with dreadful slaughter, no fewer than 16,000 of them being killed on the spot. The remainder escaped to their ships; which were so completely wrecked, the day after, that Haquin could scarcely find a vessel to carry him with a few friends to Orkney, where he soon after died of grief. In consequence of this victory, Owen king of the Isle of Man submitted to Alexander; and his example was followed by several other princes of the Norwegians. Haquin's son, Magnus, a wise and learned prince, soon after arrived in Scotland with fresh reinforcements, and proposed a treaty; but Alexander, instead of listening to an accommodation, sent the earls of Buchan and Murray, with Alan the chamberlain, and a considerable body of men to the Western Islands, where they put to the sword some of the inhabitants, and hanged their chiefs for having encouraged the Norwegian invasion. In the mean time Magnus returned to Norway: where a treaty was at last concluded between him and Alexander. By this Magnus renounced all right to the contested islands; Alexander at the same time consenting to pay him 1000 merks of silver in the space of two years, and 100 yearly ever after, as an ac-

knowledge for these islands. To cement the friendship more firmly, a marriage was concluded between Margaret the daughter of Alexander, and Eric the son and heir of Magnus, who was also a child; and, some years after, when the parties were of proper age, the marriage was consummated. From this time to the accession of Edward I. of England, we find nothing remarkable in the history of Scotland. That prince, however, proved a more cruel enemy to this country than it had ever experienced. Alexander was present at the coronation of Edward, who was then newly arrived from the Holy Land, where he had been on a crusade. Soon after this Alexander paid him homage for his English estates; particularly for the lands and lordship of Penrith and others, which Henry had given him along with his daughter. He proved an excellent ally to Edward in his wars against the French; and the latter passed the charter by which he acknowledged that the services of the king of Scotland in those wars were not in consequence of his holding lands in England, but as an ally to his crown. Even at this time, however, Edward had formed a design on the liberties of Scotland; for, in the charter just mentioned, he inserted a salvo, acknowledging the superiority by which he reserved his right to the homage of the king of Scotland, when it should be claimed by him or his heirs. The bishop of Norwich suggested this salvo: and this was the reason why Alexander would not perform the homage in person, but left it to be performed by Robert Bruce earl of Carrick; Alexander standing by, and expressly declaring that it was only paid for the lands he held in England. No acts of hostility, however, took place during the life of Alexander, who was killed on the 19th of March, 1285, in the forty-fifth year of his age, by his horse rushing down the black rock near Kinghorn as he was hunting.

IV. HISTORY OF SCOTLAND TO THE DEATH OF JAMES V.—Both before and after the death of Alexander, the great subjects of Scotland seemed to have been sensible of Edward's ambitious designs. On the marriage of Margaret with Eric prince of Norway, the states of Scotland passed an act obliging themselves to receive her and her heirs as queen and sovereigns of Scotland. Edward at that time was in no condition to oppose this measure, in which the Scots were unanimous; and therefore contented himself with forming factions among the leading men of the country. Under pretence of resuming the cross, he renewed his intrigues at the court of Rome, and demanded leave from the pope to collect the tithes in Scotland; but his holiness replied that he could make no such grant without the consent of the government of Scotland. On the death of Margaret, queen of Norway, her daughter, in consequence of the act above-mentioned, was recognised by the states as queen of Scotland. As she was then but two years old, they came to the resolution of excluding from all share in the government, not only Edward I. but their queen's father; and they accordingly established a regency from among their own number, consisting of the six following noblemen; viz. Robert Wishart bishop of Glasgow,

Sir James Cummin of Badenoch, senior, James lord high steward of Scotland, who were to have the superintendancy of all that part of Scotland which lies south of the Forth; William Fraser bishop of St. Andrew's, Duncan M'Duff earl of Fife, and Alexander Cummin earl of Buchan, who were to have the direction of all affairs north of that river. With these arrangements Eric was exceedingly displeased, as considering himself as the only rightful guardian of his own child. He therefore cultivated a good correspondence with Edward, from whom he had received considerable pecuniary favors; and, perceiving that the states of Scotland were unanimous in excluding all foreigners from the management of their concerns, he fell in with the views of the king of England, and named commissioners to treat with those of Edward upon the Scottish affairs. These negotiations terminated in a treaty of marriage between the queen of Scotland and Edward prince of Wales, young as they both were. This alarmed the states of Scotland, who resolved not to suffer their queen to be disposed of without their consent. It was therefore agreed by the commissioners on both sides, to acquaint them with the result of their conference, and to demand that a deputation should be sent up for settling the regency of Scotland, or, in other words, for putting the sovereign power into the hands of the two kings. As the two parties, however, were within the prohibited degrees of consanguinity, being first cousins, a dispensation was applied for to pope Boniface, who granted it on the condition that the peers of Scotland consented to the match. Though the Scottish nobility were very much against this match, they could not refuse their consent to it when proposed by the father and grand-uncle of their young queen. They therefore appointed the bishops of St. Andrew's and Glasgow, with Robert Bruce lord of Annandale, and John Cummin, to attend as their deputies, but with a salvo to all the liberties and honors of the realm of Scotland; to which Edward agreed. These deputies met at Salisbury with those of England and Norway; and it was at last agreed, 1. That the young queen should be sent from Norway (free of all marriage engagements) into England or Scotland. 2. That if the queen came to England she should be at liberty to repair to Scotland as soon as the distractions of that kingdom should be settled: that she should, on her arrival in her own dominions, be free of all matrimonial contracts; but that the Scots should engage not to dispose of her in marriage without her father's or Edward's consent. 3. The Scottish deputies promised to give such security as the Norwegian commissioners should require, that the tranquillity of the nation should be settled before her arrival. 4. That the commissioners of Scotland and Norway, joined with commissioners from England, should remove such regents and officers of state in Scotland as should be suspected of disaffection, and place others in their stead. If the Scottish and Norwegian commissioners should disagree on that or any other head relating to the government of Scotland, the decision was to be left to the arbitration of English commissioners. The party of Edward was

now so strong in Scotland that no opposition was made to the late agreement, in a parliament held at Brechin to deliberate upon the settlement of the kingdom. It is uncertain whether he communicated in form to the Scottish parliament the pope's dispensation for the marriage; but they highly approved of it upon certain conditions to which Edward was previously to agree; but the latter, without waiting to perform any condition, immediately sent for the young queen from Norway. This exceedingly displeased Eric, who was not inclined to put his daughter into the hands of a prince whose sincerity he suspected, and therefore shifted off the departure of the princess till he should hear farther from Scotland. Edward, alarmed at this, had again recourse to negotiation; and ten articles were at last drawn up, in which the Scots took all imaginable precautions for the safety and independency of their country. These articles were ratified by Edward on the 28th of August, 1289; yet, even after the affair of the marriage was fully settled, he lost no time in procuring as strong a party as he could. At the head of these were the bishop of St. Andrew's and John Baliol. That prelate, while he was in England, was highly caressed by Edward, from whom he had great expectations of preferment; and Baliol, having great estates in England, considered the latter as his sovereign. The bishop, on his return to Scotland, acted as a spy for Edward, and carried on with him a secret correspondence, informing him of all public transactions. It appears from this correspondence that the Scots were far from being unanimous as to the marriage. Bruce earl of Annandale suspected that the young queen was dead; and, soon after Michaelmas 1290, assembled a body of forces, and was joined by the earl of Mar and Athol. Intelligence of these commotions was carried to Edward by Baliol; and the bishop of St. Andrew's advised Edward, in case the report of the queen's death should prove true, to march a body of troops towards Scotland, to secure such a successor as he thought proper. Edward, in the mean time, consented to allow ambassadors to be sent from Scotland to bring over the young queen; previous to which he appointed the bishop of Durham to be lieutenant in Scotland for the queen and her future husband; and all the officers there, both civil and military, obliged themselves to surrender their employments and fortresses to the king and queen (that is, to Edward) immediately on their arrival in Scotland. But, while the most magnificent preparations were making for the reception of the young queen, certain intelligence of her death was received.

The Scots were thrown into the utmost consternation by the news of their queen's death; while Edward was as well prepared as if he had known what was to happen. The state of Scotland at this time indeed was to the last degree deplorable. The act of succession established by the late king had no further operation, being determined by the death of the queen; and, since the crown was rendered hereditary, there was no precedent by which it could be settled. The Scots, in general, however, turned their eyes

upon the posterity of David earl of Huntingdon, brother to the two kings, Malcolm IV. and William I., both of whom died without lawful issue. The earl had three daughters; Margaret, the eldest, was married to Alan lord of Galloway; the only issue of which marriage was Dervetil, wife to John Baliol, who had a son John, a competitor for the crown. The second daughter, Isabella, was married to Robert Bruce; and their son Robert was a candidate likewise. The third daughter, Ada, had been married to Henry Hastings, an English nobleman. John Hastings, the son of this marriage, was a third competitor; but, as his claim was confessedly the worst of the three, he only put in for a third of the kingdom, on the principle that his mother was joint-heir with her two sisters. Several other claimants now started up. Florence earl of Holland pretended to the crown, in right of his great-grandmother Ada, the eldest lawful sister of king William; as did Robert de Pynkeny, in the right also of his great-grandmother Margjory, second sister of king William. Six other claimants appeared, very absurdly founding upon their descent from bastards of king William and Alexander II. and III. John Cummin lord of Badenoch derived his claim from a more remote source, viz. Donald Bane, who usurped the crown about 200 years before this time; but he was willing to resign in favor of John Baliol. The latter indeed had surely the best right; and, had the succession been regulated as it now is in all hereditary kingdoms, he would undoubtedly have carried it. Bruce and Hastings, however, pleaded that they were preferable, not only to John Baliol the grandchild of Margaret, but also to Dervetil her daughter and his mother, for the following reason: Dervetil and they were equally related to their grandfather earl David: she was indeed the daughter of his eldest daughter; but she was a woman, they were men; and the male in the same degree ought to succeed to sovereignties, in their own nature impartible, preferably to the female. Notwithstanding this number of candidates, however, it was soon perceived that the claims of all of them might be cut off, excepting two, viz. Baliol and Bruce, of whom the former had the preference with respect to hereditary right, and the latter as to popularity. Baliol had strongly attached himself to Edward's party; which, being by far the most powerful in Scotland, gave him a decided superiority over Bruce. The event was that Edward, by his own party most probably, was appointed to decide between the two competitors. It soon appeared, however, that Edward had no mind to adjudge the crown to any person but himself; for, in an assembly held at Norham on the 10th of May 1291, Brabazon the chief justice of England informed the members: 'That his master was come thither in consideration of the state of the realm of Scotland, which was then without a king, to meet them, as direct sovereign of that kingdom, to do justice to the claimants of his crown, and to establish a solid tranquillity among his people; that it was not his intention to retard justice, nor to usurp the right of any body, or to infringe the liberties of the kingdom of Scotland, but to render to every

one his due. And, to the end this might be done with the more ease, he required the assent of the states *ex abundante*, and that they should own him as direct sovereign of the kingdom; offering, upon that condition, to make use of their counsels to do what justice demanded.' The deputies were astonished at this declaration, and replied that they were by no means prepared to decide on Edward's claim of superiority; but that Edward ought previously to judge the cause between the two competitors, and require homage from him whom he should choose to be king. Edward gave them till next day to consider of his demand. Accordingly, on that day, the assembly was held in Norham church, where the deputies from Scotland insisted upon giving no answer to Edward's demands, which could be decided only by the whole community; representing that numbers of the noblemen and prelates were absent, and that they must have time to know their sense of the affair. On this Edward gave them three weeks; which interval he employed in multiplying claimants to the crown, and in flattering each with hopes, if he would acknowledge his superiority. But when the assembly met, according to appointment, on the 2d of June, they found the place of meeting surrounded by a numerous army of English. Edward had employed the bishop of Durham to draw up the historical evidence of his right to the crown of Scotland; which has since been published. In this paper mention is made of the fealty and homage performed by the kings of Scotland to the Anglo-Saxon kings of England; but no evidence is brought of any such homage being performed. As to the homage performed by the kings of Scotland, from the time of William the Conqueror to that of the dispute between Bruce and Baliol, the Scots never denied it; but they contended with justice that it was performed for the lands held of the crown of England; and that it was as far from any relation to a fealty performed for the crown of Scotland, as the homage paid by the English monarchs to the crown of France was from all relations to the crown of England. With regard to the homage paid by William to Henry II., it was not denied that he performed it for the whole kingdom of Scotland: but they pleaded that it was void, because it was extorted when William was a prisoner; and they produced Richard I.'s charters, which pronounced it compulsive and iniquitous. But Edward was by no means disposed to examine into the merits of these arguments. Instead of this, he closeted the several pretenders to the crown; and, having found them all ready to comply with his measures, he drew up the following charter of recognition to be signed by them all: 'To all who shall hear this present letter: We Florence earl of Holland, Robert de Bruce lord of Annandale, John Baliol lord of Galloway, John Hastings lord of Abergavenny, John Cummin lord of Badenoch, Patrick de Dunbar earl of March, John Vesci for his father Nicholas Soulis, and William de Ross, greeting in the Lord: Whereas we intend to pursue our right to the kingdom of Scotland; and to declare, challenge, and aver the same before him that has most

power, jurisdiction, and reason to try it; and the noble prince Edward, by the grace of God king of England, &c., having informed us, by good and sufficient reasons, that to him belongs the sovereign seigniorship of the same: We therefore promise that we will hold firm and stable his act; and that he shall enjoy the realm to whom it shall be adjudged before him. In witness whereof, we have set our seals to this writing, made and granted at Norham, the Tuesday after the Ascension, in the year of Grace 1291.' Edward then declared, by the mouth of his chancellor, that although, in the dispute which was arisen between the several claimants, touching the succession to the kingdom of Scotland, he acted in quality of sovereign, in order to render justice to whomsoever it was due; yet he did not thereby mean to exclude himself from that hereditary right which in his own person he might have to that crown, and which right he intended to assert and improve when he should think fit: and the king himself repeated this protestation with his own mouth in French. The candidates were then severally called upon by the English chancellor to know whether they were willing to acknowledge Edward's claim of superiority over the crown of Scotland, and to submit to his award in disposing of the same; which being answered in the affirmative, they were then admitted to prove their rights. But this was mere matter of form; for all the force of England was then assembled on the borders to support the claims of Edward, and nothing now remained but to furnish him with a sufficient pretence for making use of it. Observing that the Scots were not so unanimous as they ought to be in recognising his superiority, and that the submission, which the candidates had signed, was not sufficient to carry it into execution, Edward demanded that all the forts in Scotland should be put into his possession, that he might resign them to the successful candidate. Though nothing could be more shameful than a tame compliance with this last demand of Edward, the regency of Scotland without hesitation yielded to it also. Gilbert de Umfraville alone, who had the command of the castles of Dundee and Forfar, refused to deliver them up, until he should be indemnified by the states, and by Edward himself, from all penalties of treason which he might be in danger of incurring. But, though Edward had thus got into his hands the whole power of the nation, he did not think proper to determine every thing by his own authority. Instead of this, he appointed commissioners, and promised to grant letters patent declaring that sentence should be passed in Scotland. It had been all along foreseen that the great dispute would be between Bruce and Baliol; and, though the plea of Cummin was judged frivolous, yet he was a man of too much influence to be neglected, and he agreed tacitly to resign it in favor of Baliol. Edward accordingly made him the compliments of joining him with Baliol in nominating forty commissioners. Bruce was to name forty more; and the names of the eighty were to be given in to Edward in three days; after which the king was to add to them twenty-four of his own

choosing. The place and time of meeting were left in their own option. They unanimously pitched upon Berwick for the place of meeting; but, as they could not agree about the time, Edward appointed the 2d of August following. Soon after this the regents resigned their commissions to Edward; but he returned them, with powers to act in his name; and nominated the bishop of Caithness to be chancellor of Scotland; joining in the commission with him Walter de Hemondesham an Englishman, and one of his own secretaries. Still, however, he met with great difficulties. Many of his own nobles, particularly the earl of Gloucester, were by no means fond of increasing the power of the English monarch by the acquisition of Scotland; and therefore threw such obstacles in his way that he was again obliged to have recourse to negotiation and intrigue, and at last to delay the meeting until the 2d of June in 1292; but during this interval, that he might the better reconcile the Scots to the loss of their liberty, he proposed a union of the two kingdoms; and for this he issued a writ by virtue of his superiority. The commissioners having met on the 2d of June, 1292, ambassadors from Norway presented themselves in the assembly, demanding that their master should be admitted into the number of their claimants, as father and next heir to the late queen. This demand too was admitted by Edward, after the ambassadors had acknowledged his superiority over Scotland; after which he proposed that the claims of Bruce and Baliol should be previously examined, but without prejudice to those of the other competitors. This being agreed to, he ordered the commissioners to examine by what laws they ought to proceed. The discussion of this question was attended with such difficulty, and the opinions on it were so various, that Edward once more adjourned the assembly to the 12th of October following; when the commissioners urged that Edward ought to give justice conformable to the usage of the two kingdoms; but that, if no certain laws or precedents could be found, he might, by the advice of his great men, enact a new law. The succession to the kingdom, they said, might be awarded in the same manner as to other estates and great baronies. Upon this, Edward ordered Bruce and Baliol to be called before him, and both of them urged their respective pleas, and answers, to the following purpose: Bruce pleaded, 1. That Alexander II., despairing of heirs of his own body, had declared that he held him to be the true heir, and offered to prove by the testimony of persons still alive that he declared this with the advice and in the presence of the good men of his kingdom. Alexander III. also had declared to those with whom he was intimate, that, failing issue of his own body, Bruce was his right heir. The people of Scotland had also taken an oath for maintaining the succession of the nearest in blood to Alexander III., who ought of right to inherit, failing Margaret the maiden of Norway and her issue.—Baliol answered that nothing could be concluded from the acknowledgment of Alexander II.; for that he left heirs of his body; but made no answer to what was said of the sentiments of Alexander III., and of the oath made by the Scottish nation to maintain the suc-

cession. 2. Bruce pleaded that the right of reigning ought to be decided according to the natural law, by which kings reign; and not according to any law or usage in force between subject and subject: that, by the law of nature, the nearest collateral in blood has a right to the crown; but that the constitutions which prevail among vassals bind not the lord, much less the sovereign: that although in private inheritances, which are divisible, the eldest female heir has a certain prerogative, it is not so in a kingdom that is indivisible; there the nearest heir of blood is preferable whenever the succession opens.—To this Baliol replied that the claimants were in the court of their lord paramount; and that he ought to give judgment in this case, as in the case of any other tenements, depending on his crown, that is, by the common law and usage of his kingdom, and no other. That, by the laws and usages of England, the eldest female heir is preferred in the succession to all inheritances, indivisible as well as divisible. 3. It was urged by Bruce that the manner of succession to the kingdom of Scotland in former times made for his claim; for that the brother, as being nearest in degree, was wont to be preferred to the son of the deceased king. Thus, when Kenneth Macalpin died, his brother Donald was preferred to his son Constantine, and this was confirmed by several other authentic instances in the history of Scotland.—Baliol answered that, if the brother was preferred to the son of the king, the example proved against Bruce; for that the son, not the brother, was the nearest in degree. He admitted that after the death of Malcolm III. his brother usurped the throne: but he contended that the son of Malcolm complained to his liege lord the king of England, who dispossessed the usurper, and placed the son of Malcolm on the throne; that after the death of that son the brother of Malcolm III. again usurped the throne; but the king of England again dispossessed him, and raised Edgar, the second son of Malcolm, to the sovereignty. 4. Bruce pleaded the example of other countries, particularly Spain and Savoy, where the son of the second daughter excluded the grandson of the eldest daughter.—Baliol answered that examples from foreign countries were of no importance; for that according to the laws of England and Scotland, where kings reign by succession in the direct line, and earls and barons succeed in like manner, the issue of the younger sister, although nearer in degree, excludes not the issue of the eldest sister, although more remote; but the succession continues in the direct line. 5. Bruce pleaded that a female ought not to reign, as being incapable of governing: that at the death of Alexander III. the mother of Baliol was alive; and, as she could not reign, the kingdom devolved upon him, as being the nearest male heir of the blood royal. But to this Baliol replied that Bruce's argument was inconsistent with his claim: for that, if a female ought not to reign, Isabella the mother of Bruce ought not, nor must Bruce himself claim through her. Besides Bruce himself had sworn fealty to a female, the maiden of Norway. The arguments being thus stated on both sides, Edward demanded an answer from the council as to the

merits of the competitors. He also put the following question to them: by the laws and usages of both kingdoms, does the issue of the eldest sister, though more remote in one degree, exclude the issue of the second sister, though nearer in one degree? or ought the nearer in one degree, issuing from the second sister, to exclude the more remote in one degree issuing from the eldest sister? To this it was answered unanimously, that by the laws and usages of both kingdoms, in every heritable succession, the more remote in one degree, lineally descended from the eldest sister, was preferable to the nearer in degree issuing from the second sister. In consequence of this Bruce was excluded from the succession; upon which he entered a claim for one-third of the kingdom: but being baffled in this also, the kingdom of Scotland being determined an indivisible fee, Edward ordered John Baliol to have seisin of Scotland; with this caveat, however, 'That this judgment should not impair his claim to the property of Scotland.'

After so many disgraceful and humiliating concessions on the part of the Scots, John Baliol was crowned king at Scone, on the 30th of November, 1292; and finished the ceremony by doing homage to the king of England. All his submissions, however, could not satisfy Edward, as long as the least shadow of independence remained to Scotland. A citizen of Berwick appealed from a sentence of the Scottish judges appointed by Edward, in order to carry his cause into England. But this was opposed by Baliol, who pleaded a promise made by the English monarch, that he should 'observe the laws and usages of Scotland, and not withdraw any causes from Scotland into his English courts.' Edward replied, that it belonged to him to hear the complaints made against his own ministers; and concluded with asserting his right, not only to try Scottish causes in England, but to summon the king of Scotland, if necessary, to appear before him in person. Baliol had not spirit to resist; and therefore signed a most disgraceful instrument, by which he declared that all the obligations which Edward had come under were already fulfilled, and therefore that he discharged them all. Edward now thought proper to give Baliol some marks of his favor, the most remarkable of which was the sovereignty of the Isle of Man; but it soon appeared that he intended to exercise his own rights in the most provoking manner. Malcolm earl of Fife had two sons, Colban his heir, and another who is constantly mentioned in history by the family name of Macduff.—It is said that Malcolm put Macduff in possession of the lands of Reres and Crey. Malcolm died in 1266; Colban his son in 1270; Duncan the son of Colban in 1288. To this last earl, his son Duncan, an infant, succeeded. During the nonage of this Duncan, grand-nephew of Macduff, William, bishop of St. Andrew's, guardian of the earldom, dispossessed Macduff. He complained to Edward; who, having ordered his cause to be tried, restored him again to possession. Matters were in this state when Baliol held his first parliament at Scone, on the 10th of February, 1292,

when Macduff was cited to answer for having taken possession of the land of Reres and Crey. As his defences did not satisfy the court, he was condemned to imprisonment; but an action was reserved to him against Duncan, when he should come of age, and against his heirs. In all his defence, it is surprising that Macduff should have omitted his strongest argument, viz. that the regents, by Edward's authority, had put him in possession, and that Baliol had ratified all things under Edward's authority. However, as soon as he was set at liberty, he petitioned Baliol for a rehearing; but, this being refused, he appealed to Edward, who ordered Baliol to appear before him in person on the 25th of March, 1293; and, as Baliol did not obey this order, he summoned him again to appear on the 14th of October. In the mean time the English parliament drew up certain standing orders in cases of appeal from the king of Scots. One of these regulations provided, 'that no excuse of absence should ever be received either from the appellant, or the king of Scotland respondent; but that the parties might have counsel if they demanded it.' Though Baliol had not the courage to withstand the second summons of Edward, he behaved with considerable resolution at the trial. The cause of Macduff being come on, Edward asked Baliol what he had to offer in his own defence; to which he replied, 'I am king of Scotland. To the complaint of Macduff, or to ought else respecting my kingdom, I dare not make answer without advice of my people.'—Edward affected surprise at this refusal, after the submissions which Baliol had already made him; but the latter steadily replied, 'In matters respecting my kingdom, I neither dare nor can answer in this place, without the advice of my people.' Edward then desired him to ask a farther adjournment, that he might advise with the nation. But Baliol, perceiving that his doing so would imply an acquiescence in Edward's right of requiring his personal attendance on the English courts, made answer, 'That he would neither ask a longer day, nor consent to an adjournment.'—It was then resolved by the parliament of England that the king of Scotland had offered no defence; that he had made evasive and disrespectful answers; and that he was guilty of manifest contempt of the court. To make recompense to Macduff for his imprisonment, he was ordered damages from the king of Scots, and it was also determined that Edward should enquire, according to the usages of the country, whether Macduff recovered the tenements in question by the judgment of the king's court, and whether he was dispossessed by the king of Scots. The three principal castles of Scotland, with the towns wherein they were situated, and the royal jurisdiction thereof, were further ordered to be taken into the custody of the king, and there remain until the king of Scots should make satisfaction for his contempt and disobedience. Before this judgment was publicly intimated, Baliol is said to have addressed Edward in the following words:—'My lord, I am your liege-man for the kingdom of Scotland; that whereof you have lately treated respects my people no less than myself: I therefore pray you

to delay it until I have consulted my people, lest I be surprised through want of advice: they who are now with me neither will nor dare advise me in absence of the rest of my kingdom. After I have advised with them, I will in your first parliament after Easter report the result, and do to you what I ought.' In consequence of this address, Edward, with consent of Macduff, stopped all proceedings till the day after the feast of Trinity, 1294. But before this term Edward was compelled to suspend all his proceedings by a war which broke out with France. In a parliament held this year by Edward the king of Scotland appeared, and consented to yield up the whole revenues of his English estates for three years to assist Edward against his enemy. He was also requested and ordered by Edward to extend an embargo laid upon the English vessels all over Scotland; this embargo to endure until the king of England's further pleasure should be known. He also requested him to send some troops for an expedition into Gascony, and required the presence and aid of several of the Scottish barons. The Scots, however, eluded these demands of Edward, by pretending that they could not bring any considerable force into the field: and, unable to bear his tyranny any longer, negotiated an alliance with Philip of France. Having assembled a parliament at Scone, they prevailed upon Baliol to dismiss all the Englishmen whom he maintained. They then appointed a committee of twelve, four bishops, four earls, and four barons, by whose advice every thing was to be regulated; and, if we may credit the English historians, watched the conduct of Baliol himself, and detained him in a kind of honorable captivity. However, they could not prevent him from delivering up the castles of Berwick, Roxburgh, and Jedburgh, to the bishop of Carlisle; in whose custody they were to remain during the war between England and France. Notwithstanding this, Baliol concluded the alliance with Philip; by which it was stipulated that the latter should give in marriage the eldest daughter of the count of Anjou to Baliol's son; it was also provided that Baliol should not marry again without the consent of Philip. The king of Scotland engaged to assist Philip in his wars at his own expense, and with his whole power, especially if Edward invaded France; and Philip on his part engaged to assist Scotland, in case of an English invasion. Elated with the hopes of assistance from France, the Scots now invaded Cumberland with a large army, and laid siege to Carlisle. The men abandoned the place; but the women mounted the walls, and drove the assailants from the attack. Another incursion into Northumberland proved almost as disgraceful. Their whole exploits consisted in burning a nunnery at Lamely, and a monastery at Corebridge, though dedicated to their patron St. Andrew; but, having attempted to storm the castle of Harbottle, they were repulsed with loss. In the mean time Edward with an army equal in number to that of the Scots, but much superior on account of its discipline, invaded the east coast of Scotland. Berwick had either not been delivered according to promise, or had been re-

sumed by the Scots, and was now defended by a numerous garrison. Edward assaulted it by sea and land. The ships which began the attack were all either burnt or disabled; but Edward, having led on his army in person, took the place by storm, and cruelly butchered the inhabitants, to the number of 8000, without distinction of sex or age. In this town there was a building called the Red-hall, which certain Flemings possessed by the tenure of defending it at all times against the king of England. Thirty of these maintained their ground for a whole day against the English army; but at night, the building being set on fire, all of them perished in the flames. The same day the castle capitulated; the garrison, consisting of 2000 men, marched out with all the honors of war, after having sworn never to bear arms against England. In the mean time, Baliol, by the advice of his parliament, solemnly and openly renounced his allegiance to Edward, sending the following declaration:—'To the magnificent prince, Edward, by the grace of God king of England, John, by the same grace, king of Scotland. Whereas you, and others of your kingdom, you not being ignorant, or having cause of ignorance, by your violent power, have notoriously and frequently done grievous and intolerable injuries, contempts, grievances, and strange damages against us, the liberties of our kingdom, and against God and justice; citing us, at your pleasure, upon every slight suggestion, out of our kingdom: unduly vexing us; seizing our castles, lands, and possessions, in your kingdom; unjustly, and for no fault of ours, taking the goods of our subjects, as well by sea as land, and carrying them into your kingdom; killing our merchants, and others of our kingdom; carrying our subjects and imprisoning them: for the reformation of which things, we sent our messengers to you, which remain not only unredressed, but there is every day an addition of worse things to them; for now you are come with a great army upon the borders, for the disinheriting us and the inhabitants of our kingdom; and, proceeding, have inhumanly committed slaughter, burnings, and violent invasions, as well by sea as land: we not being able to sustain the said injuries, grievances, and damages any longer, nor to remain in your fealty or homage, extorted by your violent oppression, we restore them to you, for ourself and all the inhabitants of our kingdom, as well for the lands we hold of you in your kingdom as for your pretended government over us.' Edward was presented with this renunciation by the hands of the intrepid Henry, abbot of Aberbrothwick; and, as it was favorable to his political views, he received it rather with contempt than anger. 'The foolish traitor,' said he to the abbot, 'since he will not come to us, we will go to him.' The abbot had been persuaded by his enemies, of whom he had many in Scotland, to present this letter, in hopes that Edward would have put him to death; but he had address enough to escape safe out of his hands, without receiving any other answer. Though this scheme of renunciation had been concerted some time before, declaration was not sent to Edward till after the taking of Berwick.

The fate of Scotland, however, after it, was soon decided. The earl of March had taken part with Edward, but the countess betrayed his castle of Dunbar into the hands of the Scots. Edward sent a chosen body of troops to recover the place. The whole force of Scotland opposed them on the heights above Dunbar; but leaving their advantageous post, and pouring down on their enemies in confusion, they were dispersed and defeated. The castle of Dunbar surrendered at discretion; that of Roxburgh followed the same example; the castle of Edinburgh surrendered after a short siege; and Stirling was abandoned. The Scots, in the mean time, were guilty of the greatest extravagancies. During a short interval between the loss of Berwick and the defeat at Dunbar, an order was made for expelling all the English ecclesiastics who held benefices in England; all the partizans of England, and all neutrals, were declared traitors, and their estates confiscated. But the great successes of Edward soon put an end to these impotent acts of fury. Baliol was obliged to implore the mercy of the conqueror. Divested of his royal ornaments, and bearing a white rod in his hand, he performed a most humiliating penance; confessing that by evil and false counsel, and through his own simplicity, he had grievously offended his liege lord. He recapitulated his various transgressions, in concluding an alliance with France, while at enmity with England; in contracting his son with the niece of the French king; in renouncing his fealty; in attacking the English territories, and in resisting Edward. He acknowledged the justice of the English invasion and conquest; and therefore he, of his own free consent, resigned Scotland, its people, and their homage to his liege lord Edward, 2nd of July 1296.

Edward pursued his conquests, the barons every where crowding in to swear fealty to him, and renounce their allegiance with France. His journey ended at Elgin, whence he returned southward; and, as an evidence of his having made an absolute conquest of Scotland, he carried off from Scone the wooden chair in which the kings were wont to be crowned. Some of the charters belonging to the abbey were carried off, and the seals torn from others. On the 28th of August, 1296, Edward held a parliament at Berwick, where he received the fealty of the clergy and laity of Scotland. Among those who professed their allegiance at this parliament was Robert Bruce the younger, earl of Carrick. After this Edward took the most effectual methods of securing his new conquest. He ordered the estates of the clergy to be restored; and, having received the fealty of the widows of many of the Scottish barons, he put them in possession of their jointure lands, and even made a decent provision for the wives of many of his prisoners. Yet, though in every thing he behaved with great moderation towards the Scots, he committed the government of certain districts, and of the chief castles in the south of Scotland, to his English subjects, of whose fidelity and vigilance he thought himself assured. To conciliate the affections of the clergy, he granted to the Scottish bishops for ever the pri-

vilege of bequeathing their effects by will, in the same manner as that privilege was enjoyed by the archbishops and bishops of England. In honor of the 'glorious Confessor St Cuthbert,' he gave to the monks of Durham an annual pension of £40, payable out of the revenues of Scotland. At last, having settled every thing, as he thought, in tranquillity, he departed for England with all the exultation of a conqueror. The tranquillity established by Edward, however, was of short duration. The government of Scotland at that time required many qualities which his viceregents possessed not. Warrene, earl of Surrey, who had been appointed governor, took up his abode in England, on pretence of recovering his health. Cressingham, the treasurer, was a voluptuous, proud, and selfish ecclesiastic; while Ormesby, the justiciary, was hated for his severity. Under these officers the administration of Edward became more and more feeble; bands of robbers infested the highways, and the English government was universally despised. At this critical moment arose Sir William Wallace, the hero of the Scottish poets, by whom, indeed, his real exploits are so much obscured that it is difficult to give an authentic relation of them. He was the younger son of Wallace of Ellerslie, in the neighbourhood of Paisley. Having been outlawed for some offence (supposed to have been the killing of an Englishman), he associated with a few companions of fortunes equally desperate. Wallace himself was endowed with great strength and courage, and an active and ambitious spirit; by his affability, eloquence, and wisdom, he maintained an authority over the rude and undisciplined multitudes who flocked to his standard. In May 1297 he began to infest the English quarters; and, being successful in his predatory incursions, his party became more numerous, and he was joined by Sir William Douglas. With their united forces these two allies attempted to surprise Ormesby the justiciary, while he held his court at Scone; but he saved himself by a precipitate flight. After this the Scots roved over the whole country, assaulted castles and massacred the English. Their party was joined by many persons of rank; among whom were Robert Wishart bishop of Glasgow, the Steward of Scotland, and his brother Alexander de Lindesay, Sir Richard Lundin, and Sir Andrew Moray of Bothwell. Young Bruce would have been a vast accession to the party; for he possessed all Carrick and Annandale, so that his territories reached from the frith of Clyde to Solway; but the wardens of the western marches of England suspected his fidelity, and summoned him to Carlisle. He obeyed, and made oath on the consecrated host, and on the sword of Becket, to be faithful and vigilant in the cause of Edward; to prove his sincerity he invaded the estate of Sir William Douglas, and carried off his wife and children. However, he instantly repented of what he had done: 'I trust,' said he, 'that the pope will absolve me from an extorted oath;' on which he abandoned Edward, and joined the Scottish army. All this time Edward was in France, not in the least suspecting an insurrection among people whom he imagined he had thoroughly

subdued. As soon as he received the intelligence he ordered the earl of Surrey to suppress the rebels; but he, declining the command on account of his health, resigned it to his nephew, lord Henry Percy. A great army, some say no fewer than 40,000 men, was now assembled, with which Percy marched against the Scots. He found them encamped at Irvine, with a lake in their front, and their flanks secured by entrenchments, so that they could not be attacked without the utmost danger. The Scots, however, ruined every thing by their dissensions. Wallace was envied on account of his many accomplishments, and his companions began to suggest that an opposition to the English could only be productive of farther national destruction. Sir Richard Lundin, an officer of great rank, openly formed a hostile party, and went over to Edward with all his followers. He attempted to justify his treachery, by saying, 'I will remain no longer of a party that is at variance with itself.' Other leaders entered into a negotiation with the English. Bruce, the steward, and his brother Alexander de Lindsay, and Sir William Douglas, acknowledged their offences, and made submissions to Edward. This scandalous treaty seems to have been negotiated by the bishop of Glasgow, and their recantation is recorded in the following words:—'Be it known to all men: whereas we, with the commons of our country, did rise in arms against our lord Edward, and against his peace, in his territories of Scotland and Galloway, did burn, slay, and commit divers robberies; we, therefore, in our own name, and in the name of all our adherents, agree to make every reparation and atonement that shall be required by our sovereign lord; reserving always what is contained in a writing which we have procured from Sir Henry Percy and Sir Robert Clifford, commanders of the English forces; at Irvine, 9th of July, 1297.' To this instrument was subjoined 'Escribe a Sire Willaume,' the meaning of which Lord Hailes supposes to be, that the barons had notified to Sir William Wallace their having made terms of accommodation for themselves and their party. Edward accepted the submission of the Scottish barons who had been in arms, and granted liberty to those whom he had made prisoners in the course of the former year, on condition that they should serve him in his wars against France. The inconstancy of Bruce, however, was so great that acknowledgments of submission or oaths of fealty were not thought sufficiently binding on him; for which reason the bishop of Glasgow, the steward, and Alexander de Lindsay, became sureties for his loyalty and good behaviour, until he should deliver his daughter Marjory as an hostage. Wallace alone refused to be concerned in these shameful submissions; and, with a few resolute followers, resolved to submit to every calamity rather than give up the liberty of his country. The barons had undertaken to procure his submission as well as their own; but, finding that to be impossible, the bishop of Glasgow and Sir William Douglass voluntarily surrendered themselves prisoners to the English. Edward, however, ascribed this surrender, not to any honorable motive but to treachery. He asserted

that Wishart repaired to the castle of Roxburgh under pretence of yielding himself up, but with the concealed purpose of forming a conspiracy to betray that castle to the Scots; and, in proof of this, appealed to intercepted letters. On the other hand, Wallace, ascribing the bishop's conduct to traitorous pusillanimity, plundered his house, and carried off his family captives. Immediately after the defection of the barons at Irvine, Wallace, with his band of determined followers, attacked the rear of the English army, and plundered their baggage; but was obliged to retire, with the loss of 1000 men. He then found himself deserted by almost all the men of eminence and property. His army, however, increased considerably by the accession of numbers of inferior rank, and he again began to act on the offensive. While he employed himself in besieging the castle of Dundee, he was informed that the English army approached Stirling. Wallace, having charged the citizens of Dundee, under the pain of death, to continue the blockade of the castle, hastened with all his troops to guard the important passage of the Forth; and encamped behind a rising ground in the neighbourhood of the abbey of Cambuskenneth. Brian Fitz Allan had been appointed governor of Scotland by Edward; but Warrene, who waited the arrival of his successor, remained with the army. Imagining that Wallace might be induced by fair means to lay down his arms, he despatched two friars to the Scottish camp, with terms of capitulation, 'Return,' said Wallace, 'and tell your masters, that we came not here to treat, but to assert our right, and to set Scotland free. Let them advance, they will find us prepared.' The English, provoked at this answer, demanded impatiently to be led on to battle. Sir Richard Lundin remonstrated against the absurdity of making a numerous army pass by a long narrow bridge in presence of the enemy. He told them that the Scots would attack them before they could form on the plain to the north of the bridge, and thus certainly defeat them; at the same time he offered to show them a ford, which, having crossed with 500 horse and a chosen detachment of infantry, he proposed to come round upon the rear of the enemy, and by this diversion facilitate the operations of the main body. But, this proposal being rejected, the English army began to pass over; which was no sooner perceived by Wallace, than he rushed down upon them, and broke them in a moment. Cressingham the treasurer was killed, and many thousands were slain on the field, or drowned in their flight. The loss of the Scots would have been inconsiderable, had it not been for that of Sir Andrew Moray, the intimate friend and companion of Wallace, who was mortally wounded in the engagement. The Scots are said to have treated the dead body of Cressingham with the utmost indignity.

The victory at Stirling was followed by the surrender of Dundee castle and other places or strength in Scotland; and at the same time the Scots took possession of Berwick, which the English had evacuated. But as a famine now took place in Scotland by the bad seasons and miseries of war, Wallace marched with his whole

army into England, that he might in some measure relieve the necessities of his countrymen by plundering the enemy. This expedition lasted three weeks, during which time the whole country from Cockermouth and Carlisle to the gates of Newcastle was laid waste, with all the fury of revenge and rapacity; though Wallace endeavoured, as far as possible, to repress the licentiousness of his soldiers. In 1298 Wallace assumed the title of 'Governor of Scotland,' in name of king John, and by consent of the Scottish nation; but in what manner this office was obtained is now in a great measure unknown. In a parliament which he convoked at Perth he was confirmed in his authority; and under this title he conferred the constabulary of Dundee on Alexander Scrimgeour and his heirs, on account of his faithful aid in bearing the royal standard of Scotland. This grant is said to have been made with the consent and approbation of the Scottish nobility, 29th March 1298. From this period, however, we may date the very great jealousy which took place between Wallace and the nobles of his party. His elevation wounded their pride; his great services reproached their inactivity in the public cause; and thus the counsels of Scotland were perplexed with distrust and envy, when almost its very existence depended on unanimity. In June 1298 Edward, who had all this time been in Flanders, returned to England, and summoned the Scottish barons, under pain of rebellion, to attend him in parliament; and, on their disobeying his summons, he advanced with his army towards Scotland. His main force, commanded by himself, assembled at Berwick; but a body of troops, under the earl of Pembroke, having landed in the north of Fife, were defeated with great loss by Wallace, on the 12th of June. The same month Edward invaded Scotland by the way of the eastern borders. No place resisted him except the castle of Dirleton. After a resolute defence, it surrendered to Anthony Beck, bishop of Durham. Meanwhile the Scots were assembling all their strength in the interior part of the country. Few barons of eminence repaired to the national standard. They whose names are recorded, were John Comyn of Badenoch, the younger; Sir John Stewart of Bonkill, brother to The Stewart; Sir John Graham of Abercorn; and Macduff, the grand uncle of the young earl of Fife. Robert Bruce again acceded to the Scottish party; and with his followers guarded the important castle of Ayr, which kept the communication open with Galloway, Argyshire, and the isles. The aim of Edward was to penetrate into the west, and there to terminate the war. He appointed a fleet, with provisions, to proceed to the frith of Clyde, and await his arrival in those parts. This precaution was absolutely necessary for the subsistence of his numerous army in a country impoverished and waste. Waiting for accounts of the arrival of his fleet, he established his head quarters at Temple-liston, between Edinburgh and Linlithgow. In the mean time a dangerous insurrection arose in his camp. He had bestowed a donative of wine among his soldiers; they became intoxicated; a national quarrel ensued. In this tumult the

Welsh slew eighteen English ecclesiastics. The English horsemen rode in among the Welsh, and revenged this outrage with great slaughter: and the Welsh, in disgust, separated themselves from the army. It was reported to Edward that they had mutinied, and gone over to the Scots: 'I care not,' said Edward, dissembling the danger, 'let my enemies go and join my enemies; I trust that in one day I shall chastise them all.' Edward was now placed in most critical circumstances. As the fleet with provisions had been detained by contrary winds, he could not venture to advance, neither could he subsist any longer in his present quarters. To retreat would have sullied the glory of his arms, and exposed him to the obloquy and murmurs of a discontented people. Yet he submitted to this hard necessity: and commanded his army to return to the eastern borders. At this moment intelligence arrived that the Scots were advanced to Falkirk. Edward instantly marched against them. His army lay that night in the fields. While Edward slept on the ground, his war-horse struck him and broke two of his ribs. The alarm arose that the king was wounded. They who knew not the cause, repeated the cry, 'The king is wounded; there is treason in the camp; the enemy is upon us.' Edward mounted on horseback, and by his presence dispelled the panic. With a fortitude of spirit superior to pain, he led on his troops: and at break of day the Scottish army was desiered, forming on a stony field, at the side of a small eminence, in the neighbourhood of Falkirk. Wallace ranged his infantry in four bodies. The archers, commanded by Sir John Stewart, were placed in the intervals. The horse, amounting to no more than 1000, were at some distance in the rear. On the front of the Scots lay a morass. Having drawn up his troops in this order, Wallace pleasantly said, 'Now I have brought you to the ring, dance according to your skill.' Edward placed his chief confidence in the numerous and formidable body of horsemen whom he had selected for the Scottish expedition. These he ranged in three lines. The first was led by Bigot, earl marshal, and the earls of Hereford and Lincoln; the second by the bishop of Durham, having under him Sir Ralph Basset of Drayton; the third, intended for a reserve, was led by the king himself. His infantry probably were drawn up behind, to support the cavalry, and to annoy the Scots with their arrows. Bigot, at the head of the first line, rushed on to the charge. He was checked by the morass, which in his impetuosity he had overlooked. This obliged him to incline to the solid ground on his left, towards the right flank of the Scottish army. The bishop of Durham, who led the second line, inclined to the right, turned the morass, and advanced towards the left flank of the Scottish army. He proposed to halt till the reserve should advance. 'To mass, Bishop,' cried Basset, and instantly charged. The shock of the English cavalry on each side was violent, and gallantly withstood by the Scottish infantry; but the Scottish cavalry, dismayed at the number and force of the English men at arms, immediately quitted the field. Stewart, while giving orders to his archers, was

thrown from his horse and slain. His archers crowded round his body and perished with him. Often did the English strive to force the Scottish circle. 'They could not penetrate into that wood of spears,' as one of their historians speaks. By repeated charges, the outermost ranks were brought to the ground. The English infantry incessantly galled the Scots with showers of stones and arrows. Mæduff and Sir John Graham fell. At length the Scots were broken by the numbers and weight of the English cavalry, and the rout became universal. The number of the Scots slain in this battle must have been very great. As is commonly the case, it is exaggerated by the historians of the victors, and reduced too low by those of the vanquished. On the side of the English the loss was inconsiderable. The only persons of note who fell were Brian le Jay, master of the English Templars, and the prior of Torphichen in Scotland, a knight of another order of religious soldiery. The Scots in their retreat burnt the town and castle of Stirling. Edward repaired the castle, and made it a place of arms. He then marched to the west. At his approach, Bruce burnt the castle of Ayr, and retired. Edward would have pursued him into Carrick; but the want of provisions stopped his further progress. He turned into Annandale, took Bruce's castle of Lochmaben, and then departed out of Scotland by the western borders. Here may be remarked the fatal precipitancy of the Scots. If they had studied to protract the campaign, instead of hazarding a general action at Falkirk, they would have foiled the whole power of Edward, and reduced him to the necessity of an inglorious retreat. In 1299 Edward released John Baliol, the unfortunate king of Scotland, whom he had kept close prisoner ever since 1296. Before this time Baliol had used the most disgraceful methods to recover his liberty. He had solemnly declared that 'he would never have any intercourse with the Scots; that he had found them a false and treacherous people; and that he had reason to suspect them of an intention to poison him.' However, notwithstanding all his protestations, Edward still detained him in captivity; but at last released him at the mediation of the pope, though after a singular form. He ordered the governor of Dover to convey him to the French coast, and there to deliver him to the papal nuncio, 'with full power to the pope to dispose of Baliol and his English estate.' In consequence of which he was conveyed to Witsand, delivered to the nuncio in presence of a notary and witnesses, and a receipt taken for his person. Notwithstanding this abject state, however, the Scots continued to own him for their king, and to assert their national independency; and, though the misfortune at Falkirk had deprived them of a very considerable extent of territory, they were still in possession of the whole country beyond the Forth, as well as the county of Galloway.

By general consent William Lamberton, archbishop of St. Andrew's, Robert Bruce earl of Carrick, and John Cummin the younger, were chosen guardians of Scotland in the name of Baliol. Wallace at this time was reduced to the condition of a private man; nor had he any longer

the command of the Scots armies, nor any share in their councils. The new guardians undertook to reduce the castle of Stirling, and Edward prepared to defend it. The Scots posted themselves at the Torwood, and chose their ground so judiciously that Edward could scarcely have raised the siege without dislodging them; which, finding it impossible for him to do, he returned home in disgust. Next year he invaded Scotland on the west side, wasted Annandale, and reduced Galloway; but the Scots, being taught by experience to avoid a general action, chose their posts with such skill that Edward could not penetrate farther; and the same year a truce was concluded with the Scots, to continue till Whitsunday 1301. This year a new competitor appeared for the crown of Scotland. Boniface VIII., in a bull directed to Edward, averred that Scotland belonged anciently, and did still belong, to the holy see; and supported his extravagant claim by some strange authorities; such as, that Scotland had been miraculously converted by the relics of St. Andrew; after which he proceeded to show the futility of Edward's pretensions, and that Scotland never had any feudal dependence on England. He required Edward to set at liberty all the Scottish ecclesiastics, particularly Wishart bishop of Glasgow, and to remove his officers from the patrimony of the church: 'But,' added he, 'should you have any pretensions to the whole, or any part of Scotland, send your proctors to me within six months; I will hear and determine according to justice; I take the cause under my own peculiar cognizance.' This interposition of the pope had probably been procured by Scottish emissaries at the court of Rome; but, however ridiculous his pretensions might be, they afforded matter of very serious consideration to Edward. After spending a whole winter in deliberations, Edward and his parliament made separate answers to the pope. The answer of the parliament stated that 'All England knew that, ever since the first establishment of this kingdom, its kings had been liege-lords of Scotland. At no time had the kingdom of Scotland belonged to the church. In temporals the kings of England are not amenable to the see of Rome. We have with one voice resolved that, as to temporals, the king of England is independent of Rome; that he shall not suffer his independency to be questioned; and therefore that he shall not send commissioners to Rome. Such is, and such, we trust in God, ever will be, our opinion. We do not, we cannot, permit our king to follow measures subversive of that government which we have sworn to maintain, and which we will maintain.' The king entered into a more full refutation of the pope's arguments; and having, as he thought, answered them sufficiently, marched again into Scotland; but, by the mediation of France, another truce was concluded, to last till St. Andrew's day 1302. After the expiration of the truce, Edward sent an army into Scotland, under John de Seagrave. This general divided his troops into three bodies; but, keeping them so far distant that they could not support each other, they were all engaged and defeated in one day by the Scots, near Roslin. This, however, was the last successful ex-

plot of the Scots at this period. The pope deserted them, and the king of France concluded a peace with England, in which all mention of the Scots was industriously avoided; so that they were left alone to bear the whole weight of Edward's resentment, who now invaded their country in person with a mighty army. He met with no resistance in his progress, except from the castle of Brechin, which was commanded by Thomas Maul, a brave and experienced officer. He held out for twenty days against the whole power of the English army; but at last, being mortally wounded, the place capitulated. Thence Edward proceeded northward, according to some historians, as far as Caithness. He then returned towards the south, and wintered in Dunfermline. Here was an abbey of the Benedictines, a building so spacious that, according to an English historian, three sovereign princes, with all their retinue, might have been lodged within its precincts, and the Scottish nobles often held their assemblies here. The English soldiers utterly demolished this magnificent fabric. The only fortress that remained in the possession of the Scots was the castle of Stirling, where Sir William Oliphant commanded. To protect this single place of refuge, Comyn assembled all his forces. He posted his army on the south bank of the river, in the neighbourhood of Stirling, there to make the last stand for the national liberty. The Scots fondly imagined that Edward would attempt to force the passage, as the impetuous Cressingham had attempted in circumstances not dissimilar. But the prudence of Edward frustrated their expectations. Having discovered a ford at some distance, he crossed the river at the head of his whole cavalry. The Scots gave way, and dispersed themselves. All resources but their own courage had long failed them; that last resource failed them now, and they hastened to conciliate the favor of the conqueror. Previous to this Bruce had surrendered himself to John de St. John, the English warden. Comyn and his followers now submitted to Edward. They stipulated for their lives, liberties, and estates; reserving always to Edward the power of inflicting pecuniary mulcts on them as he should see fit. From the general conditions of this stipulation, the following persons were excepted: Wishart, bishop of Glasgow, the Steward, Sir John Soulis, David de Graham, Alexander de Lindesay, Simon Fraser, Thomas Bois, and Wallace. With respect to them, it was provided that the bishop of Glasgow, the Steward, and Soulis, should remain in exile for two years, and should not pass to the north of Trent; that Graham and Lindesay should be banished from Scotland for six months; that Fraser and Bois should be banished for three years from all the dominions of Edward, and should not be permitted, during that space, to repair to the territories of France. 'As for William Wallace, it is agreed, that he shall render himself up at the will and mercy of our sovereign lord the king, if it shall seem good to him.' These were all the conditions that the Scottish nation stipulated for the man who had vanquished the English at Stirling, who had expelled them from Scotland, and who had once set his country free! But

Wallace scorned submission. He lived a freeman; a freeman he was resolved to die. Fraser, who had too oft complied with the times, now caught the same heroic sentiments. But their endeavours to rouse their countrymen were vain. The season of resistance was past. Wallace perceived that there remained no more hope; and sought out a place of concealment, where eluding the vengeance of Edward, he might silently lament over his fallen country. Edward now assembled at St. Andrew's what is called a parliament, where Wallace, Fraser, and the garrison of Stirling, were summoned to appear; and sentence of outlawry was pronounced against them. Edward then prepared to besiege the castle of Stirling; and, foreseeing that the reduction of this place would be attended with difficulty, stripped the abbey of St. Andrew's of the lead which covered it, in order to employ the metal in bullets for his battering machines. Oliphant was solemnly summoned to surrender, but in vain. Edward drew out all his artillery, and battered the walls with stones of 200 lbs. weight. The besieged, however, defended themselves with obstinacy, and killed a great number of the English; but at last they were obliged to surrender; and Edward, looking upon the conquest of Scotland as now complete, set out for York, and thence to Lincoln.

Edward, though he had thus met with all the success he could desire in his expeditions against the Scots, could not but perceive that his dominion over them must be very precarious, as long as he held them in subjection as a conquered people. He resolved therefore once more to renew his attempts for an union of the two kingdoms. He began with taking into favor the bishop of Glasgow, Robert Bruce, and John Mowbray, who, next to Bruce and the Cummings, were the most powerful of the greatest of the Scottish nobility. To them he recommended the settling the affairs of their country, but in such a manner as to leave it in his power to effect the proposed union with England. This scheme, however, was by no means agreeable to Bruce, who had now no other competitor for the crown but Cumming, who was in a great measure incapable of opposing his designs; neither indeed could it ever be made agreeable to the bulk of the nation; and therefore came to nothing at last. Scotland, however, was subdued. Its inhabitants had renounced every idea of asserting their liberty, and only strove to make their count to the conqueror. Wallace alone still remained an exception. Edward, who had received into favor those who had proved traitors over and over again, showed a mean revenge against the only man who discovered a steady and honorable spirit, and whose friendship seemed worth the courting. Ralph de Haliburton, a prisoner, offered his assistance for discovering Wallace; and for this purpose was granted a temporary liberty; but what he did in this very dishonorable employment is unknown. Certain it is that Wallace was discovered and betrayed into the hands of the English by Sir John Menteith. This celebrated and heroic patriot was arraigned at Westminster as a traitor to Edward, and as having burnt villages, stormed castles, and

slaughtered many subjects of England. Wallace denied his ever having been a traitor, and indeed with truth; for he had always been the avowed enemy of Edward, and had not at any time owned allegiance to him. But whatever his defence might have been it was of no avail with a judge who had resolved on his destruction. Wallace was condemned to die a traitor's death, and the sentence was executed with the utmost rigor! In his last moments he asserted that independency which a degenerate nation had renounced. His head was placed on a pinnacle at London, and his mangled limbs were distributed over the kingdom.

After the death of Wallace, Edward thought of nothing but settling the affairs of Scotland as a conquered country; however, he took care to preserve the ancient forms so far as was consistent with the dependent state of the nation. It has been said, indeed, that Edward abrogated all the Scottish laws and customs, and endeavoured to substitute the English in their stead; but this is denied by others. Lord Hales gives at length the record with respect to these laws, for which we refer the inquisitive reader to his work. An indemnity was now granted to the Scots upon certain conditions. Various fines were imposed from one to five years rent of the estates of the delinquents. The person taxed was to pay half his income annually; and thus Umfraville, taxed in five years rent, was allowed ten years to discharge the fine. There was an express reservation to Edward of all the royal demesnes which Baliol might have alienated. There was also an exception for those who were already in custody, and those who had not yet submitted. Thus, after a long and obstinate contest, was Scotland wholly reduced under the dominion of Edward. Within four months, however, that system was overthrown, which the incessant labor of fifteen years had established by craft, dissimulation, and violence, with a waste of treasure, and the effusion of much blood. The causes of this event are related as follows:—Dervegil of Galloway had a son, John Baliol, and a daughter named Marjory. John Comyn was the son of Marjory, and, setting Baliol aside, was heir to the pretensions of Dervegil. He had for many years maintained the contest against Edward; but at last laid down his arms, and swore fealty to the conqueror; and, as Baliol had repeatedly renounced all pretensions to the crown of Scotland, Comyn might now be considered as the rightful heir. His rival in power and pretensions was Bruce, earl of Carrick. This young nobleman's grandfather, the competitor, had patiently acquiesced in the award of Edward. His father, yielding to the times, had served under the English banners. But young Bruce had more ambition, and a more restless spirit. In his earlier years he acted upon no regular plan. By turns the partisan of Edward, and the vicegerent of Baliol, he seems to have forgotten or stifled his pretensions to the crown. But his character developed itself by degrees, and in maturer age became firm and consistent. According to the traditionary report, Bruce made the following proposal to Comyn:—‘Support my title to the crown, and I will give you my estate; or give me your estate, and I will support yours.’ The

conditions were properly drawn out and signed by both parties; but Comyn, either through fear or treachery, revealed the whole to Edward. On this the king showed Bruce the letters of his accuser, and questioned him closely; but the latter found means to pacify him by mild and judicious answers. Notwithstanding this, however, Edward still suspected him, though he dissembled his sentiments, until he should get the brothers of Bruce into his power. The king, having drank freely one evening, informed some of his lords that he had resolved to put Bruce to death next day. The earl of Gloucester, hearing this resolution, sent a messenger to Bruce with twelve pence and a pair of spurs, as if he had meant to restore what he had borrowed. Bruce understood the meaning of his message, and prepared for flight. The ground was covered with snow, which would have discovered his flight; but he ordered, it is said, his farrier to invert the shoes of his horses, and immediately set out for Scotland, in company with his secretary and groom. In his way he observed a foot passenger whose behaviour seemed to be suspicious, and whom he soon discovered to be the bearer of letters from Comyn to the English monarch, urging the death or immediate imprisonment of Bruce. The latter, filled with resentment, immediately beheaded the messenger, and set forward to Lochmaben, where he arrived the seventh day after his departure from London. Soon after this he repaired to Dumfries, where Comyn happened at that time to reside. Bruce requested an interview with him in the convent of the Minorites, where he reproached him with his treachery. Comyn gave him the lie, and Bruce instantly stabbed him; after which he hastened out of the convent and called ‘to horse.’ His attendants, Lindesay and Kirkpatrick, perceiving him pale, and in extreme agitation, enquired how it was with him? ‘Ill,’ replied Bruce, ‘I doubt I have slain Comyn.’ ‘You doubt,’ cried Kirkpatrick; on saying which, he rushed into the place where Comyn lay, and instantly despatched him. Sir Robert Comyn, a relation, attempted to defend his kinsman, and shared his fate. Bruce had now gone so far that it was in vain to think of retracting; and therefore set himself in opposition to Edward in good earnest. The justiciaries were then holding their court at Dumfries; who, hearing what had happened, imagined their own lives to be in danger, and barricaded the doors. Bruce ordered the house to be set on fire: upon which they surrendered; and Bruce granted them leave to depart out of Scotland without molestation. The above account of this catastrophe, taken from the Scottish historians, seems probable; but those of the English writers differ in many particulars. Lord Hales supposes both to be wrong, and that the true circumstances of the quarrel are unknown. The death of Comyn affected the Scots variously, according to their different views and interests. The relations of the deceased viewed it as a cruel assassination, and joined with Edward in schemes of revenge. Some, who wished well to the peace of their country, thought it was better to submit quietly to the English, than to attempt a revolution, which could not be effected without much danger and bloodshed; but, on the other hand, the

friends of Bruce now saw the necessity they were under of proceeding to the coronation of the new king without loss of time. The ceremony was therefore performed at Scone on the 25th of March, 1306, in presence of two earls, the bishops of Andrew's and Glasgow, the abbot of Scone, John de Athol, and John de Menteith. It had been customary, since the days of Macbeth, for one of the family of Fife to put the crown on the king's head; and Bruce found the prepossession of the Scots in favor of this circumstance so strong that he was obliged to seek for an expedient to satisfy them. Macduff, the earl of Fife, was at that time in England, where he had married a near relation of Edward. His sister was wife to the earl of Buchan, one of the heads of the family of Comyn, and consequently the determined enemy of Robert. But, by an uncommon effort of female patriotism, she postponed all private quarrels to the good of her country, and, in her husband's absence, repaired, with all his warlike accoutrements, to Bruce, to whom she delivered them up, and placed the crown upon his head. This crown is said to have been made by Conyers, an Englishman, who narrowly escaped being punished for it by Edward.

The king of England received intelligence of these proceedings with astonishment; and without delay sent a body of troops under Aymer de Valence, earl of Pembroke, to suppress the alleged rebellion. Bruce omitted nothing for his defence. He had always been considered by his countrymen as an accomplished young nobleman, firmly attached to Edward's person and government; and confided in as such by those independent patriots who joined Wallace. But their utmost confidence was now gained by his rendering himself so obnoxious to Edward that no possibility of a reconciliation was left; and he soon saw himself at the head of an army. With these Bruce formed a camp at Methven, near Perth, the head-quarters of the enemy; but knowing the disadvantage under which he labored from the inexperience of his men, he resolved to act upon the defensive. The English general sent Bruce a challenge to fight him, which was accepted; but the day before the battle was to have been fought by agreement, the Scots were attacked by surprise, and totally defeated. Bruce behaved with the greatest valor, and had three horses killed under him. Being known by the slaughter which he made, John Mowbray, a man of great courage and resolution, rushed upon him, and catching hold of his horse's bridle, cried out, 'I have hold of the new made king!' but he was delivered by Christopher Seaton. After the battle many prisoners were hanged and quartered. This disaster almost gave the finishing stroke to the affairs of Bruce. He now found himself deserted by a great part of his followers. The English had taken prisoners great numbers of women whose husbands followed him; and all those were now ordered, on pain of death, to return to their husbands. Thus was Bruce burdened with a number of useless adherents, and found it hard to subsist. The consequence was that most of his men departed with their families, so that in a few days his force

was reduced to 500. With these he retreated to Aberdeen, where he was met by his brother Sir Neil, his wife, and a number of other ladies, the latter of whom he persuaded to retire to his castle of Kildrumney, under the protection of Sir Neil Bruce and the earl of Athol. In the mean time the desertion among Bruce's troops continued, so that now he had with him not more than 200 men; and, as winter was coming on, he resolved to go into Argyshire, where Sir Neil Campbell's estate lay. In his way thither he encountered incredible difficulties; and, some of his followers being cut off at a place called Dalry, the rest were so disheartened that they all forsook him, excepting Sir Gilbert Hay, Sir James Douglas, and a few domestics. Bruce, however, kept up the spirits of his little party by recounting to them the adventures of princes and patriots in circumstances similar to his own. Having crossed Lochlomond in a small crazy boat, he was discovered by his trusty friend the earl of Lenox, who had been proscribed in England, and now lived in a kind of exile on his own estate. The meeting between these friends was very affecting, and drew tears from the eyes of all present. Lenox, who had heard nothing of Bruce's misfortunes, furnished him and his half-famished attendants with plenty of provisions; but being soon made sensible that it was impossible for them to live in a place where they were well known, and surrounded by enemies, Bruce resolved to seek out some more safe habitation. For this purpose Sir Neil Campbell had already provided shipping; but our adventurers had scarcely set sail, when they were pursued by a large squadron of the enemy's fleet. The bark which carried the earl of Lenox escaped with the utmost difficulty to Cantire, where Bruce was already landed; and, at their meeting, both agreed they would never afterwards be separated. In the mean time Edward, having compromised some differences with his English subjects, resumed his old project of entirely subduing Scotland; and his intention appears to have been to divide the lands of such as he suspected of disaffection among his English followers. He ordered a proclamation to be issued, that all who had any title to the honor of knighthood, either by heritage or estate, should repair to Westminster to receive all military ornaments, their horses excepted, from his royal wardrobe. As the prince of Wales came under this denomination, he was the first who underwent the ceremony; which gave him a right to confer the like honor on the sons of above 300 of the chief nobility and gentry of England. The prince then repaired, at the head of this gallant train, to Edward; who received them, surrounded by his nobility, in the most solemn manner. The king then made a speech on the treachery of the Scots, whose entire destruction he vowed. He declared his resolution of once more heading his army in person; and desired, in case of his death, that his body might be carried to Scotland, and not buried till signal vengeance was taken on the perfidious nation. Having then ordered all present to join him within fifteen days, with their attendants and military equipages, he prepared for his journey

northward. He entered the country soon after Bruce's defeat at Methven. The army was divided into two bodies; one commanded by the king, the other by the prince of Wales, and, under him, by the earls of Lancaster and Hereford, with orders to proceed northwards, and penetrate into the countries where the interest of Bruce was strongest. As he passed along, Edward caused all that fell into his hands, whom he suspected of favoring Bruce's party, to be immediately executed. The bishop of Glasgow was the only exception to this barbarity: he was taken, but had his life spared on account of his function. In the mean time, as the prince of Wales continued his march, Bruce's queen began to be alarmed for her safety. She was advised to take sanctuary at the shrine of St. Duthac in Ross-shire; but there she was made prisoner by William earl of Ross, who was of the English party. By Edward's order she was sent to London; her daughter, who was taken at the same time, being shut up in a religious house. The directions for the entertainment of the queen are still preserved. She was to be conveyed to the manor of Brustewick; to have a waiting-woman and a maid-servant, advanced in life, sedate, and of good conversation: a butler, two men servants, and a foot-boy for her chamber, 'sober, not riotous,' to make her bed; three greyhounds when she inclines to hunt; venison, fish, and the fairest house in the manor. In 1308 she was removed to another prison; in 1312 she was removed to Windsor Castle, 20s. per week being allowed for her maintenance. In 1314 she was committed to Rochester Castle, and was not set at liberty till the close of that year. The only fortress which Bruce possessed in Scotland was the castle of Kildrummy; and it was soon besieged by the earls of Lancaster and Hereford. One Osburn treacherously burnt the magazine; by which means the garrison, destitute of provisions, was obliged to surrender at discretion. The common soldiers were hanged; Sir Neil Bruce and the earl of Athol were sent prisoners to Edward, who caused them to be hanged on a gallows fifty feet high, and then beheaded and burnt. The countess of Buchan, who had crowned king Robert, was taken prisoner; as was lady Mary Bruce, the king's sister. Some historians say that Edward ordered these two ladies to be shut up in wooden cages, one to be hung over the walls of the castle of Roxburgh, and the other over those of Berwick, as public spectacles; but lord Hailes tells us that the countess of Buchan was put into close confinement in the castle of Berwick. About this time, also, many others of Bruce's party were put to death; among whom were Thomas and Alexander Bruce, two of the king's brothers, and John Wallace, brother to the celebrated Sir William. Bruce himself, in the mean time, was in such a despicable situation that it was thought he never more could give disturbance; it was even reported that he was dead. All his misfortunes, however, could not intimidate him, or prevent his meditating a most severe revenge upon the destroyers of his family. He first removed to the castle of Dumbarton, where he was hospitably received and entertained by Angus

lord of Kintyre; but, suspecting that he was not safe there, he sailed in three days to Rachrin, a small island on the Irish coast, where he secured himself effectually from the pursuit of his enemies. It was during his stay in this island that the report of his death was generally propagated. Notwithstanding this, his party increased considerably; even when he landed on this island, he was attended by 300 men. However, after having lived secluded for some time, being apprehensive that the report of his death might be generally credited among his friends, it was resolved to attempt the surprise of a fort held by the English under Sir John Hastings, on the isle of Arran. This was performed with success by his two friends Douglas and Sir Robert Boyd, who put the greatest part of the garrison to the sword. The king, hearing of their success, passed over into Arran; but, not knowing where his people resided, is said to have found them out by blowing a horn. He then sent a trusty servant, one Cuthbert, into his own county of Carriek; with orders, in case he found it well affected to his cause, to light a fire on a certain point near his castle of Tunberry, whence it could be discerned in Arran. Bruce and his party perceived the signal, as they thought, and immediately put to sea. Their voyage took up but little time; and, as Bruce had now 400 men along with him, he resolved immediately to act on the offensive. His first exploit was to surprise his own castle of Tunberry, which had been given, along with Bruce's estate, to lord Henry Percy. Him he drove out, along with the English garrison; but, in the mean time, he met with his servant Cuthbert, who gave him disagreeable intelligence. This man had met with very little encouragement in Scotland; in consequence of which he had not lighted the fire agreed upon as a signal of his success, that which Bruce had observed having been kindled by accident. He also told him that the English were in full possession of the country. Soon after this the king was joined by a lady of fortune, who brought along with her forty warriors. By her he was first particularly informed of the miserable fate of his family and relations; which, instead of disheartening, animated him the more with a desire of revenge. However, he did not immediately attempt any thing, but allowed Douglas to make an effort for the recovery of his estate of Douglasdale. In this expedition Douglas was joined by one Thomas Dickson, a man of considerable fortune, and who gave him intelligence concerning the state of the country. By his advice he kept himself private till Palm Sunday, when he and his followers with covered armor repaired to St. Bride's church, where the English were attending divine service. The latter were surprised, but made a brave defence; until being overpowered by numbers they were obliged to yield. Douglas, without farther resistance, took possession of his own castle, which he found well furnished with arms, provisions, and money. He destroyed all that he could not carry with him, and also the castle itself, where he knew that he must have been besieged had he kept it. While Bruce and his friends were thus signalling themselves, and struggling with

the English under so many disadvantages, they met with many difficult adventures related by the Scottish historians; but, as it is now impossible to distinguish the true from the false, we shall pass over the greater part in silence, confining ourselves only to those facts which are important and well authenticated. In 1307 the earl of Pembroke advanced into the west of Scotland to encounter Bruce. The latter did not decline the combat; and Pembroke was defeated. Three days after this, Bruce defeated with great slaughter another English general named Ralph de Monthermer, and obliged him to fly to the castle of Ayr. The king laid siege to the castle for some time, but retired at the approach of succors from England. This year the English performed nothing, except burning the monastery at Paisley. Edward, however, resolved still to execute his utmost vengeance on the Scots, though he had long been retarded by a dangerous indisposition. He was now so weak, however, that he could advance no farther than six miles in four days; after which he expired in sight of Scotland, which he had so often devoted to destruction. With his dying breath he gave orders that his body should accompany his army into Scotland, and remain unburied until the country was totally subdued; but his son caused it to be deposited in Westminster Abbey.

The death of such an inveterate enemy to the Scottish name could not fail of raising the spirits of Bruce and his party; and the inactive and timid behaviour of his successor Edward II. contributed not a little to give them fresh courage. After having granted the guardianship of Scotland to his favorite Piers de Gaveston, earl of Pembroke, whom his father had lately banished, he advanced to Cumnock, on the frontiers of Ayrshire, and then retreated into England; conferring the office of guardian of Scotland upon John de Bretagne, earl of Richmond, a fortnight after he had bestowed it upon Gaveston. He was no sooner gone than Bruce invaded Galloway. The inhabitants refusing to follow his standard, he laid waste the country; but was defeated and obliged to retire northwards by the guardian. In the north he overran the country without opposition; and soon began to move southwards again to repair his late disaster. He was encountered by Comyn, earl of Buchan, with an undisciplined body of English, whom he entirely defeated and dispersed. But about this time he was seized with a grievous distemper, which weakened him so much that no hopes were left of his recovery. In this enfeebled situation he was attacked by the earl of Buchan and John Mowbray, an English commander, who had assembled a body of troops. The armies met at Inverary in Aberdeenshire. Bruce was too weak to support himself, and therefore was held upon horseback by two attendants; but he had the pleasure of seeing his enemies totally defeated, and pursued with great slaughter for many miles: it is reported that the agitation of his spirits on that day proved the means of curing him of his disease. This battle was fought on the 22nd of May, 1308. The king of Scotland now took revenge of his enemies, after

the manner of that barbarous age, by wasting the county of Buchan with fire and sword, and his success had so raised his character that many of the Scots who had hitherto adhered to the English cause now came over to him. Edward, the king's brother, invaded Galloway, and defeated the inhabitants of that country. John de St. John, an English commander, with 1500 horsemen, attempted to surprise him; but Edward, having received timely information of his designs, ordered the infantry to entrench themselves strongly, while he himself, with fifty horsemen well armed, under cover of a thick mist, attacked his enemies and put them to flight. After this he reduced all the fortresses in the country, and totally expelled the English. About this time also, Douglas, when roving about the mountainous parts of Tweedale, surprised and made prisoners Thomas Randolph the king's nephew, and Alexander Stewart of Bowland, who had hitherto continued inimical to the interests of Robert. Randolph was conducted to the king, but talked to him in a haughty strain; upon which his uncle put him into close confinement. The next exploit of Robert was against the lord of Lorn, a division of Argyleshire. It was this nobleman who had reduced the king to such straits after his defeat at Methven; and he now resolved to take ample revenge. Having entered the country, the king arrived at a narrow pass, where the troops of Lorn lay in ambush. This pass had a high mountain on the one side, and a precipice washed by the sea on the other; but Robert having ordered Douglas to make a circuit and gain the summit of the mountain with part of the army, he entered himself with the rest. He was immediately attacked; but Douglas with his men rushed down the hill, and decided the victory in favor of the king; who soon after took the castle of Dunstaffnage, the chief residence of this nobleman. While Robert and his associates were thus exciting the admiration of their countrymen by their exploits, the English were so unsettled and fluctuating in their counsels that their party knew not how to act. Edward still imagined that there was a possibility of reconciling the Scots to his government; and for this purpose he employed William de Lamberton, bishop of St. Andrew's, who, after having been taken prisoner, and carried from one place of confinement to another, had at last made such submissions as procured first his liberty and then the confidence of Edward. This ecclesiastic, having taken a most solemn oath of fidelity to the English monarch, now resolved to ingratiate himself, by publishing against Robert and his adherents a sentence of excommunication, which had been resolved on long before. This, however, produced no effect; and the event was that in 1309, through the mediation of the king of France, Edward consented to a truce with the Scots. This pacific disposition, however, lasted not long. The truce was scarcely concluded when Edward charged the Scots with violating it, and summoned the barons to meet him in arms at Newcastle; yet, probably being doubtful of the event of the war, he empowered Robert de Umfraville, and thence

others, to conclude a new truce; declaring, however, that he did this at the request of Philip king of France, as his dearest father and friend, but who was in no sort to be considered as the ally of Scotland. The new negotiations were soon interrupted. They were again renewed; and, in the beginning of 1310, the truce was concluded, but entirely disregarded by the Scots. The progress of Bruce now became alarming. The town of Perth, a place at that time of great importance, was threatened; and, to relieve it, Edward ordered a fleet to sail up the river Tay; he also commanded the earl of Ulster to assemble a body of troops at Dublin, and thence to invade Scotland; his own barons were ordered to meet him in arms at Berwick. About the end of September he entered Scotland; passed from Roxburgh through the forest of Selkirk to Biggar; thence he penetrated into Renfrew; and, turning back by the way of Linlithgow, he retreated to Berwick, where he continued inactive eight months. During this invasion, Robert had carefully avoided a battle with the English, well knowing that an invasion undertaken in autumn would ruin the heavy armed cavalry, on which the English placed their chief dependence. His cause was also favored by a scarcity which prevailed at this time in Scotland; for, as magazines and other resources of modern war were then unknown, the English army were greatly retarded in their operations, and found it impossible to subsist in the country. The spirit of enterprise had now communicated itself to all ranks of people in Scotland. In 1311 the castle of Linlithgow was surprised by a poor peasant, named William Binnock. The English garrison were secure, and kept but a slight guard; of which Binnock being informed, concealed eight resolute men in a load of hay, which he had been employed to drive into the castle. With these, as soon as the gate was opened, he fell upon the feeble guard, and became master of the place; which was dismantled by Robert, as well as all the other castles taken in the course of the war. Edward now resolved to invade Scotland again; and for this purpose ordered his army to assemble at Roxburgh. But Robert, not contented with acting on the defensive, resolved in his turn to invade England. He accordingly entered that country, and cruelly ravaged the bishopric of Durham. He returned loaded with spoil, and laid siege to Perth. After remaining six weeks before that place, he raised the siege, but returned in a few days, and, having provided scaling ladders, approached the works with a chosen body of infantry. In a dark night he made the attack; and, having waded through the ditch, though the water stood to his throat, he was the second man who reached the top of the walls. The town was then soon taken; after which it was plundered and burnt, and the fortifications levelled with the ground, on the 8th of January, 1312.

Edward was now become weary of the war, and renewed his negotiations for a truce; but they still came to nothing. Robert again invaded England; burnt great part of the city of Durham; and even threatened to besiege Berwick, where the king of England had for the

time fixed his residence. He next reduced the castles of Butel, Dumfries, and Dalswinton, with many other fortresses. The castle of Roxburgh, a place of the utmost importance, then fell into his hands. The walls were scaled while the garrison was revelling on the eve of Lent. They retreated into the inner tower; but their governor a Frenchman, having received a mortal wound, capitulated. Randolph, the king's nephew, was now received into favor, and began to distinguish himself in the cause of his country. He blockaded the castle of Edinburgh so closely that all communication with the neighbouring country was cut off. The place was commanded by one Leland, a knight of Gascony; but the garrison, suspecting his fidelity, imprisoned him in a dungeon, and chose another commander in his stead. One William Frank presented himself to Randolph, and informed him how the walls might be scaled. This man in his youth had resided in the castle; and, having an intrigue with a woman in the neighbourhood, had been accustomed to descend the wall during the night, by means of a ladder of ropes; whence, by a steep and difficult path, he arrived at the foot of the rock. Randolph himself, with thirty men, undertook therefore to scale the castle walls at midnight. Frank was their guide, who still retained a perfect memory of the path, and who first ascended the wall. But, before the whole party could reach the summit, an alarm was given, the garrison ran to arms, and a desperate combat ensued. The English fought valiantly till their commander was killed; after which they threw down their arms. Leland, the former governor, was released from his confinement, and entered into the Scottish service. In 1313 king Robert found the number of his friends still increasing. He was now joined by the earl of Athol, who had lately obtained a grant of lands from Edward. This year, through the mediation of France, the conferences for a truce were renewed. These, however, did not retard the military operations of the Scots. Cumberland was invaded and laid waste; the miserable inhabitants besought Edward's protection; who commended their fidelity, and desired them to defend themselves. In the mean time Robert, leaving Cumberland, passed over into the Isle of Man, which he totally reduced. Edward found great difficulties in raising the supplies necessary for carrying on the war; but at last overcame all these, and by the beginning of 1314 was prepared to invade Scotland with a large army. In March he ordered his ships to be assembled for the invasion; invited to his assistance Eth O'Connor, chief of the Irish of Connaught, and twenty-six other Irish chiefs; summoned them and his subjects in Ireland to attend his standard, and gave the command of these auxiliaries to the earl of Ulster. His barons were summoned to meet him at Berwick on the 12th of June, and 22,000 foot soldiers, from the different counties of England and Wales, were required by proclamation to assemble at Wark. In the mean time the successes of the Scots continued. Edward Bruce had reduced the castles of Rutherglen and Dundee, and laid siege to the castle of Stirling. The governor agreed to surrender, if he was not re-

lieved before the 24th of June, 1314 : and to this Edward agreed, without consulting his brother. The king was highly displeased with this rash treaty, which interrupted his own operations, allowed the English time to assemble their utmost force, and at last obliged him either to raise the siege, or to put all on the event of a single battle. However, he resolved to abide by the agreement, and to meet the English by the appointed day. Having ordered a general rendezvous of his forces between Falkirk and Stirling, he found their number to amount to somewhat more than 30,000, besides upwards of 15,000 of an undisciplined rabble that followed the camp. He determined to wait the English in a field which had the burn or brook of Bannock on the right and Stirling on the left. His chief dread was the strength and number of the English cavalry, and these he took every method to oppose. The banks of the Bannock were steep in many places, and the ground between it and Stirling was partly covered with wood. The king commanded many pits, of about a foot in breadth and two or three feet deep, to be dug in all places where cavalry could have access. From the description given of them, by the historians of those times, there seem to have been many rows of them, with narrow intervals. They were carefully covered with brushwood and sod, so that they would easily be overlooked by a rash and impetuous enemy. He also made use of caltrops, to annoy the horses. On the 23d of June the Scots received intelligence of the approach of Edward, and prepared to decide the fate of their country. The front of their army extended from the Bannockburn nearly to St. Ninians, almost upon the line of the present turnpike road from Stirling to Kilsyth; and the stone in which the king is said to have fixed his standard is still to be seen. Robert commanded all his soldiers to fight on foot. He gave the command of the centre to Douglas and Walter, the grand steward of Scotland; his brother Edward had the command of the right wing, and Randolph of the left; the king himself taking charge of the reserve, which consisted of the men of Argyre, Carrick, and the islanders. In a valley to the rear, west of a rising ground, now called Gilles' Hill, he placed the baggage, and all the useless attendants of his army. Randolph was commanded to be vigilant in preventing the English from throwing succors into the castle of Stirling; but 800 horsemen, commanded by Sir Robert Clifford, made a circuit by the low grounds to the east, and soon approached the castle. The king, perceiving their motions, chid Randolph for his inadvertency, on which the latter hastened to encounter that body. As he advanced, the English wheeled to attack him. Randolph drew up his men in a circular form, presenting their spears on every side. At the first onset Sir William Daynecourt, an English commander of distinguished valor, was killed; but Randolph, who had only a small party with him, was surrounded on all sides. Douglas perceived his danger, and requested the king to let him go to his assistance; Robert at first refused, but afterwards consented with reluctance. Douglas set out without delay; but as he approached he saw the English falling into

disorder; upon which he called on his men to stop, and not diminish the glory of Randolph and his men by sharing their victory. Robert was in front of the line when the English appeared. He was meanly dressed, with a crown above his helmet, and a battle-axe in his hand. Henry de Bohun, an English knight, armed cap-a-pee, rode forward to encounter him. Robert struck his antagonist so violently with his battle-axe that he cleft him down to the chine; after which the English vanguard retreated in confusion. The Scottish generals blamed their king for his rashness in thus encountering Bohun, and he himself, conscious of the justice of their charge, only replied, 'I have broken my good battle-axe.' On Monday, the 24th of June, the whole English army moved on to the attack. The van, consisting of archers and lancemen, was commanded by Gilbert de Clare, earl of Gloucester, nephew to the English king, and Humphry de Bohun, constable of England; but the ground was so narrow that the rest of the army had not sufficient room to expand itself; so that it appeared to the Scots as consisting of one great compact body. The main body was brought up by Edward in person, attended by Aymer de Valence earl of Pembroke, and Sir Giles d'Argentine, two experienced commanders. Maurice, abbot of Inchaffray, placing himself on an eminence, celebrated mass in the sight of the Scottish army. He then passed along the front, barefooted, with a crucifix in his hands, and in few words exhorted the Scots to fight for their rights and liberty. The Scots fell down on their knees, which being perceived by Edward, he cried out, 'They yield! See, they implore mercy.' 'They do,' answered Umfraville, one of his commanders, 'they do implore mercy but not from us. On that field they will be victorious or die.' As both parties were violently exasperated against each other, the engagement began with great fury. The king of Scotland, perceiving that his troops were grievously annoyed by the English archers, ordered Sir Robert Keith the marischal, with a few armed horsemen, to make a circuit, and attack the archers in flank. This was instantly accomplished; and, as the weapons of the archers were useless in a close encounter, they could make very little resistance, at the same time that their flight spread disorder through the whole army. Robert now advanced with the reserve; the whole English army was in the utmost confusion; for the defeat of the archers had decided the victory in favor of the Scots. The young and gallant earl of Gloucester attempted to rally the fugitives, but was thrown from his horse and cut in pieces, which increased the general confusion. At this critical moment, the numerous attendants on the Scottish camp, promoted by curiosity, or the desire of plunder issued from their retirement. The English mistook them for a body of fresh troops coming to the assistance of their enemies, and fled with precipitation on all sides. Many sought refuge among the rocks in the neighbourhood of Stirling castle, and many were drowned in the rivers. Pembroke and Sir Giles d'Argentine had never quitted Edward during the action; but now, seeing the battle irretrievably

lost, Pembroke constrained the king to quit the field. D'Argentine refused to fly. He was a man of great valor, and had a high reputation in Scotland. He is said to have thrice encountered two Saracen warriors at once in Palestine, and to have killed both his adversaries each time. His valor now availed him but little ; for, rushing into the midst of the Scottish army, he was instantly cut in pieces. Douglas, with sixty horsemen, pursued Edward close. At the Torwood he met Sir Lawrence Abernethy, who was hastening to the English rendezvous with twenty horsemen. The latter soon abandoned the cause of the vanquished, and joined Douglas in the pursuit of Edward, who fled to Linlithgow. He had scarcely arrived there, when he was alarmed by the approach of the Scots, and again obliged to fly. Douglas and Abernethy followed him with such assiduity, that (as lord Hales says) *ne vel mingendi locus concederetur* ; but, notwithstanding their utmost efforts, Edward got safe to Dunbar, where he was received by the earl of March, who protected him till he could be conveyed by sea to England, where he met with a more horrible death than if he had been killed in battle. Such was the decisive victory of Bannockburn, the greatest defeat the English ever sustained from the Scots. On the side of the latter no persons of note were slain, except Sir William Vipont and Sir Walter Ross, the favorite of Edward Bruce ; and so grievously was Edward afflicted by the death of this man, that he exclaimed, ' O that this day's work were undone, so Ross had not died ! ' On the English side were slain twenty-seven barons and bannerets, and twenty-two taken prisoners ; of knights there were killed forty-three, and sixty taken prisoners ; of esquires there fell 700 ; but the number of the common men who were killed or taken was never known with any certainty. See **BANNOCK-BURN**. The Welsh who had served in the English army were scattered over the country, and cruelly butchered by the Scottish peasants ; the English, who had taken refuge among the toeks in the neighbourhood of Stirling, surrendered at discretion ; the castle was surrendered, and the privy-seal of England fell into the hands of the king of Scots. The spoils of the English camp were immense, and, along with the ransom of the many noble prisoners who fell into their hands, greatly enriched the conquerors. Robert showed much generosity in his treatment of the prisoners. He set at liberty Ralph de Monthermer and Sir Marmaduke Twerge, two officers of high rank, without ransom ; and by humane and generous offices alleviated the misfortunes of the rest. The dead bodies of the earl of Gloucester and lord Clifford were sent to England, that they might be interred by their friends. There was one Bastan, a Carmelite friar and poet, whom Edward is said to have brought with him in his train, to be spectator of his achievements, and to record his triumphs. Bastan was made prisoner, and obliged to celebrate the victory of Robert over the English. This he did in wretched Latin rhymes, which, however, procured his liberty. After the battle of Bannockburn, the earl of Hereford retreated to the castle of Bothwell, where he was besieged

by Edward Bruce, and soon obliged to surrender. He was exchanged for the wife, sister, and daughter of the king, the young earl of Mar, and the bishop of Glasgow.

The terror of the English after the defeat at Bannockburn is almost incredible. Walsingham asserts that many of them revolted to the Scots, and assisted them in plundering their own country. ' The English,' says he, ' were so bereaved of their wonted intrepidity, that 100 of that nation would have fled from two or three Scotchmen.' Edward Bruce and Douglas entered England on the east side, ravaged Northumberland, and laid the bishopric of Durham under contribution. Thence they proceeded to Richmond, laid Appleby and some other towns in ashes, and returned home laden with plunder. Edward summoned a parliament at York, to concert means for the public security ; and appointed the earl of Pembroke to be guardian of the country between the Trent and the Tweed. Robert, however, sent ambassadors to treat of peace ; but the Scots were too much elated with their good fortune to make concessions, and the English were not yet sufficiently humbled to yield to all their demands. The ravages of war were renewed, and the Scots continued their incursions into England, and levied contributions in different places. In 1315 the English affairs seemed to revive. The Scots indeed plundered Durham and Hartlepool ; but they were repulsed from Carlisle, and failed in an attempt on Berwick. The Irish of Ulster, oppressed by the English government, implored the assistance of Robert, and offered to acknowledge his brother Edward as their sovereign ; who accordingly landed at Carrickfergus on the 25th of May, 1315, with 6000 men. This was an enterprise evidently beyond the power of Scotland to accomplish. However, there were motives which induced Robert to consent. The offer of a crown inflamed the ambition of Edward Bruce, whose impetuous valor made no account of difficulties, however great. It might have been deemed ungenerous, and perhaps impolitic, to have rejected the proposals of the Irish for the advancement of his brother, to whom the king owed more than he could repay. Besides, the invasion of Ireland seemed a proper expedient for dividing the English forces. But the issue proved unfortunate. The king himself had gone over into Ireland, to assist his brother in attempting the subjection of that country ; and during his absence the English had made several attempts to disturb the tranquillity of Scotland. The earl of Arundel invaded the forest of Jedburgh with a numerous army ; but, being drawn into an ambuscade by Douglas, he was defeated with great loss. Edmund de Caillaud, a knight of Gascony and governor of Berwick, invaded and wasted Teviotdale ; but, while he was returning home, loaded with spoil, he was attacked, defeated, and killed by Douglas. Soon after this intelligence was conveyed to Douglas that one Robert Neville had boasted that he would encounter him whenever he saw his banner displayed. Douglas soon gave him an opportunity. He advanced towards Berwick, displayed his banner, and burnt some villages. Neville, provoked at

these ravages, took the field, encountered Douglas, was defeated and killed. By sea the English invaded Scotland, and anchored off Inverkeithing in the frith of Forth, where they soon after landed; 500 men, under the earl and sheriff of Fife, attempted to oppose their landing, but were intimidated by the number of their enemies. William Sinclair, bishop of Dunkeld, happened to meet the fugitives; and having, by his reproaches, obliged them to rally, he led them on again to the charge, and drove the English to their ships with considerable loss. For this exploit Robert conferred the title of the king's bishop on Sinclair; and he was long venerated by his countrymen on this account. In 1317, after king Robert had returned from his Irish expedition, a bull was issued by pope John XXII. commanding a two years' truce between England and Scotland, under pain of excommunication. Two cardinals were sent into Britain to make known his commands; and they were empowered to inflict the highest spiritual censures on Robert Bruce, or whomsoever else they thought proper. About the beginning of September 1317 two messengers were sent to Robert by the cardinals. The king gave them a gracious reception; and, after consulting with his barons, answered that he very much desired a perpetual peace, by the mediation of the cardinals, or any means. He allowed the open letters from the pope, which recommended peace, to be read in his presence, and listened to them with due respect; but he would not receive the sealed letters addressed to Robert Bruce, governor of Scotland, alleging that there might be many of his barons whose names were Robert Bruce, and that these barons might have some share in the government. Unless, therefore, the letters were addressed to him as king of Scotland, he could not receive them without advice of his parliament, which he promised immediately to assemble on the occasion. The messengers attempted to apologise for the omission of the title of king. 'The holy church was not wont,' they said, 'during the dependence of a controversy, to write or say any thing which might be interpreted as prejudicial to the claims of either of the contending parties.' 'Since then,' answered the king, 'my spiritual father and my holy mother would not prejudice the cause of my adversary, by bestowing on me the appellation of king during the dependence of the controversy, they ought not to have prejudiced my cause by withdrawing that appellation from me. I am in possession of the kingdom of Scotland; all my people call me king; and foreign princes address me under that title; but it seems that my parents are partial to their English son. Had you presumed to present letters with such an address to any other sovereign prince, you might perhaps have been answered in a harsher style; but I reverence you as the messengers of the holy see.' The messengers, quite abashed with this reply, requested that he would consent to a temporary cessation of hostilities; but to this he declared that he never would consent, while the English daily invaded and plundered his people. His counsellors told the messengers that the disrespectful omission was owing to the intrigues of

the English at the court of Rome, and hinted that they had received this intelligence from Avignon. When the messengers had informed the cardinals of these proceedings, the latter determined to proclaim the papal truce in Scotland; in which hazardous office they employed Adam Newton, guardian of the monastery of Minorities at Berwick, who was charged with letters to the clergy of Scotland, particularly to the bishop of St. Andrew's. The monk found the king encamped with his army in a wood near Old Cambus, making preparations for assaulting Berwick. Personal access was denied to the king; but the monk proclaimed the truce by the authority of the pope. The king sent him for answer that he would listen to no bulls till he was treated as king of Scotland, and had made himself master of Berwick. The monk, terrified at this answer, requested either a safe conduct to Berwick, or permission to pass into Scotland, and deliver his letters to the Scottish clergy. Both were refused; and he was commanded to leave the country instantly. He set out for Berwick, but in his way thither was attacked by robbers, or some who pretended to be so. By them he was stripped and robbed of all his parchments, together with his letters and instructions; the robbers also tore the pope's bull. In 1318 king Robert proceeded in his enterprise against Berwick. A citizen of Berwick, named Spalding, having been ill used by the governor, resolved to revenge himself; and therefore wrote a letter to a Scottish lord, whose relation he had married, offering on a certain night to betray the town. The nobleman communicated this important intelligence to the king, who commanded him to repair to a certain place with a body of troops; to which place he also gave separate orders to Douglas and Randolph to repair at the same hour, each with a body of troops under his command. The forces, thus cautiously assembled, marched to Berwick, and, assisted by Spalding, scaled the walls, making themselves masters of the place in a few hours. The garrison of the castle, perceiving that the number of Scots was but small, made a desperate sally with the men who had fled into the castle from the town; but, after an obstinate conflict, they were defeated and driven back, chiefly by the extraordinary valor of a young knight, named Sir William Keith, of Galston, on the 28th March 1318. King Robert no sooner heard of the success of his forces against the town than he hastened to lay siege to the castle of Berwick, which was soon obliged to capitulate; after which the Scots entered Northumberland, and took the castles of Wark, Harbottle, and Mitford.

In May 1318 they again invaded England, and penetrated into Yorkshire, burning, in their progress, the towns of Northallerton, Boroughbridge, Scarborough, and Skipton in Craven, and forcing the inhabitants of Rippon to redeem themselves by paying 1000 merks; after which they returned to Scotland with much booty; and, as an English historian expresses it, 'driving their prisoners before them like flocks of sheep.' This year the interposition of the pope was again obtained against Robert; and the two cardinals residing in England were commanded to excom-

municate Robert Bruce and his adherents, on account of his treatment of the messengers of the holy see, and his assault of Berwick, after a truce had been proclaimed by the papal authority. This sentence was accordingly put in execution: and, on messengers being sent from Scotland to Rome, to procure a reversal of the sentence, Edward despatched the bishop of Hereford, and Hugh d'Espencer the elder, to inform his holiness of certain intercepted letters which had been written from Avignon to Scotland; upon which the pope ordered all the Scots residing at Avignon, and all of that place who had corresponded with Scotland, to be taken into custody. The most remarkable transaction of this year, however, was the defeat and death of Edward Bruce in Ireland. His body was quartered, and distributed for a public spectacle over that country: his head was presented to Edward by John lord Birmingham, the commander of the English army. In the mean time Edward, who had summoned a parliament to meet at Lincoln, was obliged to prorogue it on account of the Scottish invasion, and to assemble an army at York for the defence of England. At Michaelmas it was determined, in a parliament held at London, that every city and town in England should furnish a certain proportion of men completely armed. Thus a considerable body of troops was raised; but, when they assembled at York, their party animosities and mutual distrust rose to such a height that a considerable number of them were sent back to their habitations. In 1319 Edward, having succeeded so well with the court of Rome, made similar attempts with other powers, to the prejudice of the Scottish nation. Accordingly he requested the earl of Flanders to prohibit the Scots from entering his country; but to this request he received for reply, that 'Flanders was the common country of all men; I cannot prohibit any merchants from trafficking thither,' said the earl, 'for such prohibition would prove the ruin of my people.' Edward, on this, once more determined to have recourse to war; and with this view commanded his army to assemble at Newcastle-upon-Tyne, on the 24th of July 1319; but first requested the prayers of the clergy for success, and demanded from them a sum of money by way of loan. Every thing being now in readiness, the English army approached Berwick, then under the care of Walter, grand steward of Scotland. This nobleman had long apprehended an attack from the English, and had taken his means of defence accordingly. The English however, confiding in their numbers, made a general assault; but were repulsed on the 7th September, after an obstinate contest. Their next attempt was on the side towards the river. At that time the walls of Berwick were of inconsiderable height; and it was proposed to bring a vessel close to them, whence the troops might enter by a drawbridge. But the Scots annoyed the assailants so much that they could not bring this vessel within the proper distance; and at the ebb of the tide it grounded, and was burnt. The English had then recourse to a new-invented engine which they called a sow. In many particulars it resembled the *testudo arietaria* of the ancients. It was a large fabric of timber,

well-roofed, having stages within it, and in height surpassing the wall of the town. It was moved upon wheels, and served for the double purpose of conducting the miners to the foot of the wall, and armed men to the storm. But this machine was counteracted by one constructed by John Crab, a Flemish engineer. This was a kind of moveable crane, by which great stones might be raised, and then let fall upon the enemy. The English made a general assault on the quarter towards the sea, as well as on the land side; so that the garrison, exhausted by continual fatigue, could scarcely maintain their posts. The great engine moved on to the walls: at length a huge stone struck it with such force that the beams gave way, and, the Scots pouring down combustibles upon it, it was burnt. The English, however, still continued the attack. The steward, with a reserve of 100 men, went from post to post, relieving those who were wounded or unfit for combat. One soldier of the reserve only remained with him when an alarm was given that the English had burnt a barrier at the port called St. Mary's, possessed themselves of the drawbridge, and fired the gate. The steward hastened thither, called down the guard from the rampart, ordered the gate to be set open, and rushed out upon the enemy. A desperate combat ensued, and continued till the close of the day, when the English commanders withdrew their troops. Notwithstanding this brave defence, it was evident that the town could not hold out long; and Robert could not, with any probability of success, attack the fortified camp of the English. He therefore determined to make a powerful diversion in England. By order of the king 15,000 men entered England by the western marches, and laid waste Yorkshire. The archbishop of York hastily collected a numerous body of commons and ecclesiastics, with whom he encountered the Scots at Mitton, near Borough-bridge, in the North Riding of Yorkshire: but the English were instantly routed, and 3000 left dead on the field: a great part of those who fled perished in the river Swale. In this action 300 ecclesiastics are said to have lost their lives.

The news of this successful inroad alarmed the besiegers of Berwick. The barons whose estates lay to the southward remote from the Scottish depredations were eager for continuing the siege. But they were opposed by those of the north; who were no less eager to abandon the enterprise, and return to the defence of their own country. With them the earl of Lancaster concurred in opinion; who, understanding that his favorite manor of Pontefract was exposed to the ravages of the Scots, departed with all his adherents. Edward, upon this, drew off the remainder of his army, and attempted to intercept Randolph and Douglas; but they eluded him, and returned in safety to Scotland. The failure of this last attempt induced Edward seriously to think of peace; and accordingly a truce was concluded on the 21st of December 1319; which interval of tranquillity the Scots made use of to address a manifesto to the pope. This was drawn up in a spirited manner, and made a very considerable impression in the

councils of the pontiff. The pope, seeing that Robert would not be terrified into submission, ordered Edward to make peace with him in the best manner he could. A negociation was accordingly set on foot, which soon terminated ineffectually; the truce was not renewed, and in 1322 a mutual invasion took place. The Scots penetrated into Lancashire by the western marches; and, after plundering the country, returned home with an immense booty; while Edward made great preparations for an expedition into Scotland, which took place in August. In this, however, he was unsuccessful. Robert had caused all the cattle to be driven off, and all the effects of value to be removed; fixing his camp at Culross, on the north side of the Frith of Forth. His orders for removing the cattle were so punctually obeyed that the only prey which fell into the hands of the English was a single lame bull. Edward, however, penetrated nearly as far as Edinburgh; but, his provisions being consumed, many of his soldiers perished for want, and he was obliged at last to retire. On their return, his soldiers burnt the abbey of Holyrood, Melrose, Dryburgh, &c., and killed many of the monks; but, when they returned to England, and again enjoyed a plentiful living, they indulged in such excesses as were productive of a great mortality. One English historian says, almost one-half of the great army which Edward had brought from England with him were destroyed either by hunger or gluttony. As soon as the English retired, they were pursued by the Scots, who laid siege to the castle of Norham. Edward lay at the abbey of Biland in Yorkshire, with a body of troops advantageously posted near. The Scots attempted to surprise the king, and it was with the utmost difficulty that he escaped to York, leaving to the enemy all his baggage and treasure. The English camp was supposed to be accessible only by a narrow pass, but Douglas undertook to force it, and Randolph presented himself as a volunteer in this dangerous service, under his friend Douglas. The Highlanders and men of the Isles climbed the precipice on which the English camp stood, and the enemy were driven out with great loss. The Scots pursued them to the gates of York, wasted the country without control, and returned home unmolested. Edward, disheartened by repeated losses, agreed to a cessation of arms, from the 30th of March 1323, until the 12th of June 1336. It was stipulated that, during its continuance, no new fortresses should be erected in Cumberland, north of the Tyne, or in the counties of Berwick, Roxburgh, or Dumfries; and by a singular article it was provided that, 'Bruce and the people of Scotland might procure absolution from the pope; but, in case there was no peace concluded before the expiration of the truce, that the sentence of excommunication should revive.' The treaty was ratified by Robert, as king of Scotland, 7th of June 1323. Robert's next care was to reconcile himself to the church, and to obtain from the pope the title of king, which had been so long denied him; this at last, with difficulty, was obtained. A son was born this year to the king of Scotland at Dunfermline, and named David.

But scarcely had this future hero come into the world, when a rival began to appear. John Baliol had long been dead; but left a son named Edward, heir to his pretensions. The young prince had resided on his paternal estate in Normandy, neglected and forgotten; but in 1324 was called to the court of England, for the purpose of setting him up as a rival to young David Bruce. The negotiations for peace, however, still went on; but the commissioners made little progress, by reason of the demands for feudal sovereignty still made by the English. The reconciliation with the church was also broken off, by the Scots keeping possession of Berwick. This had been taken during the papal truce; and Robert chose still to lie under the sentence of excommunication rather than to part with such an important fortress.

In the beginning of 1327 Edward II. was deposed and barbarously murdered. He was succeeded by his son Edward III., then in his fifteenth year, who renewed the negotiations for peace, and ratified the truce which his father had made; but hearing that the Scots had resolved to invade England, if a peace was not immediately concluded, he summoned his barons to meet him in arms at Newcastle, and fortified York. We are not informed why the Scots at this time disregarded the truce; however, on the 15th of June 1327, Douglas and Randolph invaded England by the western marches, with an army of 20,000 horsemen. Against them Edward led an army, consisting at the lowest calculation of 30,000 men, who assembled at Durham on the 13th of July. The Scots proceeded with the utmost cruelty, burning and destroying every thing as they went along; and on the 18th of the same month the English discovered them by the smoke and flames which marked their progress. They marched forward in order of battle towards the quarter where the smoke was perceived; but, meeting with no enemy for two days, they concluded that the Scots had retired. Disencumbering themselves then of their heavy baggage, they resolved by a forced march to reach the river Tyne, and, by posting themselves on the north bank, to intercept the enemy on his return. On the 20th of July the cavalry, having left the infantry behind, crossed the river at Halydon: but, before the rest of the army could come up, the river was so swelled by sudden rains that it could no longer be forded; thus the English troops remained divided for several days, without any accommodation for quarters, and in the greatest want of provisions and forage. The soldiers now began to murmur; and it was resolved again to proceed southwards. The king proclaimed a reward of lands, to the value of £100 yearly for life, to the person who should first discover the enemy 'on dry ground, where they might be attacked;' and many knights and esquires swam across the river on this strange errand. The army continued its march for three days without any news of the Scots; but on the fourth accounts of them were brought by Thomas Rokesby, esq., who reported that, 'the Scots had made him prisoner; but that their leaders understanding his business had set him at liberty; saying, that they had remain-

ed for eight days on the same ground, as ignorant of the motions of the English as the English were of theirs, and that they were desirous and ready to combat.' With this man for their guide, the English soon came in view of the Scots. They were advantageously posted on a rising ground, having the river Wre in front, and their flanks secured by rocks and precipices. The English dismounted and advanced, hoping to allure the Scots from their strong post; but in vain. Edward then sent a herald to Randolph and Douglas, with a message in the style of chivalry: 'Either,' says he, 'suffer me to pass the river, and leave me room for ranging my forces; or do you pass the river, and I will leave you room to range yours; and thus shall we fight on equal terms.' To this the Scottish commanders answered, 'We will do neither. On our road hither we have burnt and spoiled the country; and here we are fixed while to us it seems good, if the king of England is offended, let him come over and chastise us.' The armies continued in sight of each other for two days; after which the English, understanding that their enemies were distressed for provisions, resolved to maintain a close blockade, and to reduce them by famine. Next day, however, they were surprised to find that the Scots had secretly decamped, and taken post two miles up the river in ground still stronger, and of more difficult access. The English encamped opposite to them near Stanhope park. At midnight Douglas undertook a most desperate enterprise. With 200 horsemen he approached the English camp, and entered it under the guise of a chief commander calling the rounds. Having thus eluded the sentinels, he passed on to the royal quarters, overthrew every thing that opposed him, and furiously assaulted the king's tent. The domestics of Edward desperately defended their master; and his chaplain with many others of his household were slain. However, the king himself escaped; and Douglas, disappointed of his prey, rushed through the enemy, and effected a retreat with inconsiderable loss. The following day the English learned from a prisoner that orders had been issued in the Scottish camp for all men to hold themselves in readiness that evening to follow the banner of Douglas; on which, apprehending an attack in the night, they prepared for battle, lighting great fires, and keeping a strict watch; but in the morning they were informed by two trumpeters, whom they had taken prisoners, that the Scots had decamped before midnight, and were returning to their own country. This report they could scarcely credit, and the army remained for some hours in order of battle: but at length some scouts, having crossed the river, returned with certain intelligence that the Scottish camp was deserted: which, when Edward was assured of, he burst into tears; for the enterprise, which thus terminated in disappointment and dishonor, had cost an immense sum. His foreign auxiliaries in particular consisted of heavy-armed cavalry; and they were now so much worn out that they could scarcely move: the few living horses were become unserviceable, in a campaign of three weeks; so that they were obliged to procure horses to convey

them to the south of England. Edward, having rested at Durham for some days, marched to York, where he disbanded his army. Barbour, a Scottish historian, relates that there was a morass in the rear of the Scottish camp, which he calls the two mile morass; that the Scots made a way over it with brushwood, removing it as they went along, that the English might not pursue them by the same way. The English narratives are filled with descriptions of the strange appearance of the deserted camp of the Scots. Their pursuers found, we are told, a number of skins stretched between stakes, which served for kettles to boil their meat; and for bread each soldier carried along with him a bag of oatmeal, of which he made cakes, toasting them upon thin iron plates, which appear to have been part of their armour. On the return of Douglas and Randolph, the king led his army against the eastern borders, and besieged the castle of Northampton. However, in 1328, Edward, wearied out with continued losses and disappointments, consented to a perpetual peace between the two kingdoms on the condition—1. That the stone on which the kings of Scotland were wont to sit at the time of their coronation, should be restored to the Scots. 2. The king of England engaged to employ his good offices at the papal court for obtaining a revocation of all spiritual processes depending before the holy see against the king of Scots, or against his kingdom. 3. For these causes, and to make reparation for the ravages committed in England by the Scots, the king of Scots was to pay 30,000 merks to the king of England. 4. Restitution was to be made of the possessions belonging to ecclesiastics in either kingdom, whereof the war might have deprived them. 5. But there was not to be any restitution made of inheritances which had fallen into the hands of the king of England or of the king of Scots, by reason of the war between the two nations, or through the forfeiture of former possessors. 6. Joanna, sister of the king of England, was to be given in marriage to David, the son and heir to the king of Scots; the king of Scots providing the princess in a jointure of £2000 yearly, secured on lands and rents. 7. If either of the parties failed, in performing these conditions, he was to pay £2000 of silver to the papal treasury. This peace, ratified at Northampton, is styled ignominious by the English historians, and the marriage of the Scottish prince to the king of England's sister, that base marriage; because thus all pretensions to sovereignty over Scotland were given up. The marriage of the infant prince was celebrated on the 12th of July 1328. On the 7th of June, 1329, died Robert Bruce, unquestionably the greatest of the Scottish monarchs. His death seems to have been occasioned by the excessive fatigues of military service; and his disease, called by historians of those times a leprosy, was probably an inveterate scurvy, occasioned by his mode of living. He died at the age of fifty-five. He was married to Isabella, daughter of Donald the tenth earl of Mar; by whom he had a daughter named Marjory, married to Walter, the grand steward of Scotland; whose husband died in 1326. The second wife of Robert was Eliza-

beth, the daughter of Aymer de Burgh, earl of Ulster. By her he had a son, David II.; a daughter named Margaret, married to William earl of Sutherland; another, named Matilda, married to Thomas Isaac, esq.; and Elizabeth, married to Sir Walter Oliphant of Gask. He had also a natural son named Robert. That king Robert I. was a man of unquestionable virtue and humanity, as well as unequalled in the knowledge of the military art, is evident from many particulars already related. The only questionable part of his character is his severe punishment of a conspiracy formed against him in 1320; a relation of which, to avoid interrupting our detail of more important matters, we deferred till now.—The chief of the conspirators were William de Soulis, whose ancestor had been a candidate for the crown; the countess of Strathern, and some other persons of rank. The countess discovered the plot; after which Soulis confessed the whole, and was punished with perpetual imprisonment; as well as the countess, notwithstanding her having made the discovery. Gilbert de Malyerb and John de Logie, both knights, and Richard Brown, esq., were put to death as traitors: but the person most lamented was Sir David de Brechin, for his bravery styled the flower of chivalry. He was nephew to the king, and had served with great reputation against the Saracens. To him the conspirators, after having exacted an oath of secrecy, revealed their designs. He condemned their undertaking, and refused to share in it; but did not discover it, on account of the oath he had taken. Yet for this concealment he was tried as a traitor, condemned and executed, without regard to his personal merit or his relation to the king. The conspirators were tried before the parliament at Scone in 1320; and this session, in which so much blood was shed, was long remembered under the name of the black parliament.

After the death of Robert I. the administration was assumed by Randolph, in consequence of an act passed in 1318, by which he was appointed regent in case of the king's death. In his new character he behaved himself in a most exemplary manner: and by impartially discharging the duties of his station, and rigidly administering justice, he secured most perfectly the public tranquillity. The severe exercise of justice was now rendered not only necessary but indispensable. During a long course of war, the people had been accustomed to plunder and bloodshed; and, having now no English enemies to employ them, they robbed and murdered one another. Randolph repressed these crimes by making the counties liable for the robberies committed within their bounds. He gave orders for severely punishing all vagabonds, and obliged them to work for their livelihood; making proclamation that no man should be admitted into any town or borough, who could not earn his bread by his labor. These regulations were attended with the most salutary effects. A fellow who had secreted his own plough irons, pretending that they were stolen, being detected by the sheriff's officers, was instantly hanged. A certain man, having killed a priest, went to Rome, and obtained absolution from the pope;

VOL. XIX.

after which he boldly returned to Scotland. Randolph ordered him to be tried, and, on his conviction, to be executed: 'because,' said he, 'although the pope may grant absolution from the spiritual consequence of sin, he cannot screen offenders from civil punishment.' King Robert, just before his death, had desired that his heart might be deposited in our Saviour's sepulchre at Jerusalem; and on this errand the great commander, Douglas, was employed, who set sail in June, 1330, with a numerous and splendid retinue. He anchored off Sluys in Flanders, the great emporium of the Netherlands, where he expected to find companions in his pilgrimage; but, learning that Alphonso XI. the young king of Leon and Castile, was engaged in a war with Osmyn the Moor, he could not resist the temptation of fighting against the enemies of Christianity. He met with an honorable reception at the court of Spain, and readily obtained leave to enter into what was thought the common cause of Christianity. The Moors were defeated; but Douglas, giving way to his impetuous valor, pursued the enemy too eagerly, and, throwing among them the casket which contained the heart of his sovereign, cried out, 'Now pass thou onward as thou wast wont; Douglas will follow thee or die.' The fugitives rallied and surrounded Douglas; who, with a few of his followers, was killed in attempting to rescue Sir Walter St. Clair of Roslin. His body was brought back to Scotland, and interred in the church of Douglas. His countrymen styled him the good Sir James Douglas. He was one of the greatest commanders of the age; and is said to have been engaged in seventy battles, fifty-seven of which he gained, and was defeated in thirteen.

In November 1331 Edward Baliol began to renew his pretensions to the crown of Scotland, about the time that David II. and his consort Johanna were crowned at Scone. This year differences began also to arise with England. It had been provided, by an article of the treaty of Northampton, that 'Thomas lord Wake of Ledel, Henry de Beaumont, called earl of Buchan, and Henry de Percy, should be restored to their estates, of which the king of Scots, by reason of the war between the two nations, had taken possession.' This article had been executed with respect to Percy, but not to the other two; and, though Edward had repeatedly complained of this neglect, he obtained no satisfaction. Lord Hales has some judicious remarks on this omission, which he ascribes to the political foresight of Randolph. The disinherited barons now resolved to invade Scotland, though their force consisted of only 3000 infantry, and 400 men at arms. Edward would not permit them to enter Scotland by the usual way, as he himself did not yet choose openly to take part in their quarrel. They were therefore obliged to take shipping, and landed at a place called Ravenspur, or Ravensburgh, at the mouth of the Humber, long ago overwhelmed by the sea. Randolph, having intelligence of the English preparations, had marched an army to the frontiers of East Lothian; but, being afterwards informed of the naval armament, he marched northwards; but died at Musselburgh, on the 20th of July 1332.

Donald, earl of Marr, a man whose only merit consisted in his being related to the royal family, was chosen to succeed him in the regency. Edward, in the mean time, fell upon a most curious expedient to show the justice of his cause. In March 1332 he had published a prohibition for any person to infringe the treaty of Northampton: yet the disinherited lords had been suffered to embark, expressly for the purpose of invading Scotland, after this prohibition was published. After they were gone, Henry de Percy was empowered to punish those who should presume to array themselves in contempt of his prohibition; and because he understood that the Scots were arming, in order to repel those invaders whom Edward had indirectly sent against them, he empowered Henry de Percy to arm against them. On the 31st of July Edward Baliol and his associates landed in the neighbourhood of Kinghorn, on the Forth; routed the earl of Fife, who opposed them; and marched next day to Dunfermline. Having then ordered his fleet to wait for him at the mouth of the Tay, he proceeded northwards, and encamped on the Miller's acre at Forteviot, with the river Earn in front. Here his situation was extremely dangerous, and his destruction seemed inevitable. The earl of Marr was encamped with a numerous army on the opposite bank of the river Earn, near Duplin; and another, nearly as numerous, had advanced from the south, through the Lothians and Stirlingshire, and fixed its quarters at Auchterarder, eight miles west of Forteviot. Historians differ as to the number of the two armies. Fordun says that the regent had with him 30,000 men, and the earl of March as many; and that Baliol had between 500 and 600 men at arms, that is, horsemen completely armed. Hemmingford reckons each of the Scottish armies at 40,000, and Baliol's at 500 armed men. Knighton says that Baliol, when he landed in Fife, had 300 armed men, and 3000 more of different sorts; but that he had in all only 2500 men in his camp at Earn. In this desperate situation the English general formed a design of attacking the Scots in their camp. They were directed to a ford by Andrew Murray of Tullibardine. The Scots kept no watch, but abandoned themselves to intemperance and riotous mirth; while their enemies, led by Alexander Mowbray, crossed the river at midnight. Ascending a rising ground, they came unperceived on the right flank of the Scottish army, and made a dreadful slaughter. At the first attack, young Randolph hasted with 300 men at arms to oppose the enemy; and being seconded by Murdoch earl of Monteith, Alexander Fraser, and Robert Bruce, natural son to the late king, he gave a check to the English, and maintained the combat on equal terms. But now the regent himself, along with the whole multitude, rushed forward to battle without the least order; so that, while the hindmost pressed on, the foremost were thrown down and trodden upon. The slaughter lasted many hours, and the remains of this vast army were utterly dispersed. Many men of eminence were killed; among whom were Donald earl of Marr, author of the whole catastrophe; Thomas earl of Moray, Murdoch earl of Monteith, Robert earl of Carrick,

Alexander Fraser, and Robert Bruce. The slaughter of the infantry and of the men at arms was very great; and the most probable accounts make it 2000 men at arms, and upwards of 13,000 common soldiers. The loss of the English was inconsiderable. The day after this victory, Baliol took possession of Perth; and, apprehending an attack from the earl of March, caused the ditch to be cleared, and the town to be fortified with palisadoes. The first information which the earl received of this dreadful defeat was from a soldier, who fled mortally wounded, and had time only to show his wounds, and expire. The earl, on his arrival at the field of battle, found a dreadful confirmation of the soldier's intelligence; but, instead of taking any proper measures, he and his men hurried on headlong to Perth, actuated only by a blind impulse to revenge. At first they designed to assault the place; next they determined to reduce it by famine. This, however, could not be done unless the Scots had been masters at sea. One John Crab, a Flemish engineer (who had distinguished himself by destroying the famous engine called the sow at the siege of Berwick), had continued for many years to annoy the English on the eastern coasts. After the blockade of Perth was formed, he came with ten vessels to the mouth of the Tay, where the English fleet was, and took the ship belonging to Henry de Beaumont; but soon after all his ten vessels were burnt by the English in a general engagement. After this the blockade of Perth was raised, the earl of March disbanded his army, and Edward Baliol was crowned king of Scotland at Scone, on the 24th of September 1332.

The new monarch was no sooner put in possession of the kingdom than he left Perth in the hands of the earl of Fife, while he himself repaired to the southern parts of the kingdom. But the party of king David was far from being extinguished. Baliol was scarcely gone, when Perth was surprised, and its fortifications razed, by James Fraser, Simon Fraser, and Robert Keith. The earl of Fife was made prisoner, with his family and vassals. Andrew Murray of Tullibardine, who had directed the English to a ford on the Earn, was put to death as a traitor. Such of the Scots as still adhered to the interest of their infant prince chose Sir Andrew Murray of Bothwell regent. He was a brave and active man, but had not as yet sufficient force to attempt any thing considerable. In the mean time, Baliol behaved in a most scandalous manner. At Roxburgh, he made a solemn surrender of the liberties of Scotland; acknowledged Edward for his liege lord; and became bound to put him in possession of the town, castle, and territory of Berwick, and of other lands on the marches, extending in all to the yearly value of £2000, 'on account,' as the instrument bears, 'of the great honor and emoluments which we have procured through the sufferance of our lord the king, and by the powerful and acceptable aid which we have received from his good subjects.' He also professed to marry the princess Johanna, whom he considered as only betrothed to David Bruce, and to add £500 to her jointure; and this under the penalty of £10,000 to be appro-

priated as a portion to the lady, or otherwise disposed of for her behoof. He farther engaged to provide for the maintenance of David Bruce as the king of England should advise; and, lastly, he became bound to serve Edward in all his wars, excepting in England, Wales, and Ireland, for the space of a year together, with 200 men at arms. Afterwards, Edward having engaged to maintain him on the throne of Scotland, Baliol bound himself to serve him in all his wars whatever. Though the greatest part of the nation submitted to this shameful treaty, it roused the indignation of those who wished well to their country. John, the second son of Randolph, now earl of Moray by the death of his brother; Archibald, the youngest brother of the renowned Douglas; together with Simon Fraser, assembled a body of horsemen at Moffat in Annandale; and, suddenly traversing the country, assaulted Baliol unexpectedly at Annan. His brother Henry made a gallant resistance for some time; but was at last overpowered with numbers, and killed, with several other persons of distinction. Baliol himself escaped almost naked, with scarcely a single attendant, and fled to England. After his departure, the Scots began to make depredations on the English frontiers. Edward issued a proclamation, in which he solemnly averred that the Scots, by their hostile depredations, had violated the peace of Northampton. Baliol, in the meantime, being joined by some English barons, returned to Scotland; took and burnt a castle where Robert de Colville commanded; and, establishing his quarters in the neighbourhood of Roxburgh, began to make preparations for besieging Berwick. Just after his arrival, Archibald Douglas, with 3000 men, invaded England by the western marches, plundered the country, and carried off much booty; in revenge for which, Sir Anthony de Lucy made an inroad into Scotland, defeated and took prisoner Sir William Douglas, celebrated in history by the appellation of the knight of Liddesdale, whom Edward caused to be put in irons. About the same time, Sir Andrew Murray the regent attacked Baliol, with a view to discomfit him before the reinforcements which he expected out of England could arrive. A sharp conflict ensued at Roxburgh, in which the regent, attempting to rescue a soldier, was taken prisoner; and thus Scotland was at once deprived of its two ablest commanders. Archibald Douglas was now declared regent; and Edward prepared to invade Scotland. He ordered possession to be taken of the Isle of Man in his own name; and soon after made it over to Sir William Montague, who had some claim of inheritance in it. The chief design of Edward, however, was to obtain possession of Berwick, which had been ceded to him by Baliol. This appeared to the Scots a place of no less importance than it did to Edward; and therefore they took all the precautions in their power to prevent the loss of it. The earl of March was appointed to command the castle, and Sir William Keith the town. The Scots made an obstinate defence. At length the regent, with a numerous army, appeared in the neighbourhood. He endeavoured to convey succors into the town, or to provoke the enemies to quit the ad-

vantage of the ground, and engage in battle. But all his efforts were in vain; the English obstructed every passage, and stood on the defensive. The regent then entered Northumberland, wasted the country, and even assaulted Bamborough castle, where Philippa the young queen of England resided. He fondly imagined that Edward III. would have abandoned the siege of Berwick, as his father did, in similar circumstances. Edward nevertheless persevered in his enterprise. During a general assault, the town was set on fire, and great part of it consumed. The inhabitants having experienced the evils of a siege, and dreading the worse evils of a storm, implored the earl of March and Sir William Keith to seek terms of capitulation. A truce was obtained; and it was agreed that the town and castle should be delivered up on terms fair and honourable, unless succors arrived before the hour of vespers on the 19th of July. By the treaty, Sir William Keith was allowed an interview with the regent. He found him with his army in Northumberland; urged the necessity of his return; and showed him that Berwick, if not instantly relieved, was lost for ever. Persuaded by his importunities, the regent resolved to combat the English, and either to save Berwick or lose the kingdom. On the afternoon of the 19th of July the regent prepared for battle. He divided his army into four bodies. The first was led by John earl of Moray, the son of Randolph; but, as he was young and inexperienced in war, James and Simon Fraser, soldiers of approved reputation, were joined with him in the command. The second body was led by the steward of Scotland, a youth of sixteen, under the inspection of his uncle Sir James Stewart of Rosyth. The third body was led by the regent himself, having with him the earl of Carrick and other barons of eminence. The fourth body, or reserve, appears to have been led by Hugh earl of Ross. The numbers of the Scottish army on that day are variously reported by historians. The continuator of Hemingford says, that, besides earls and other lords or other great barons, there were fifty-five knights, 1100 men at arms, and 13,500 of the commons lightly armed, amounting in all to 14,655. With him Knyghton concurs, when his narrative is cleared from the errors of transcribers. The English were advantageously posted on a rising ground at Halydon, with a marshy hollow in their front. Baliol had the command of one of the wings. It had been provided by the treaty of capitulation 'That Berwick should be considered as relieved, in case 200 men at arms forced their passage into the town.' This the Scottish men at arms attempted; but Edward, aware of their purpose, opposed them in person, and repulsed them with great slaughter. The Scottish army rushed on to a general attack; but they had to descend into the marshy hollow before mounting the eminences of Halydon. After having struggled with the difficulties of the ground, and after having been incessantly galled by the English archers, they reached the enemy. Although fatigued and disordered, they fought as it became men who had conquered under Robert Bruce. The English, with equal valor, had great advan-

tages of situation, and were better disciplined. The earl of Ross led the reserve to attack in flank that wing where Baliol commanded; but he was repulsed and slain. There fell with him Kenneth earl of Sutherland, and Murdoch earl of Monteith. In the other parts of the field the events were equally disastrous. The regent received a mortal wound, and the Scots every where gave way. In the field, and during a pursuit for many miles, the number of slain and prisoners was so great, that few of the Scottish army escaped. Besides the earls of Ross, Sutherland, and Monteith, there were among the slain Malcolm earl of Lenox, an aged baron, who had been one of the foremost to repair to the standard of Robert Bruce, and whose exertions were for his country; Alexander Bruce earl of Carrick, who atoned for the short defection from the family of his benefactor; John Campbell earl of Athole, nephew of the late king; James Fraser, and Simon Fraser; John Graham, Alexander Lindesay, Alan Stewart, and many other persons of eminent rank. The Steward had two uncles, John and James. John was killed, and James mortally wounded and made prisoner. Two other Stewarts fought at this battle; viz. Alan of Dreghorn, paternal ancestor of king Charles I. and James of Rosyth, maternal ancestor of Oliver Cromwell. The regent, mortally wounded, and abandoned on the field of battle, only lived to see his army routed and himself a prisoner. This victory was obtained with very inconsiderable loss. The English historians say, that on their side there were killed one knight, one esquire, and twelve foot soldiers. Nor will this appear altogether incredible, as the English ranks remained unbroken, and their archers, at a secure distance, incessantly annoyed the Scottish infantry. According to capitulation, the town and castle of Berwick surrendered. The English king took twelve hostages for the fidelity of the citizens. Thus was the whole of Scotland reduced under the subjection of Baliol, excepting a few fortresses; so that it became necessary to provide for the safety of the young king and queen. Accordingly, they were conveyed to France, where they were honorably entertained. Meanwhile, Baliol employed himself in making new concessions to his liege lord Edward; and in 1334 the work of submission was completed by a solemn instrument drawn up by Baliol, in which he surrendered great part of the Scottish dominions, to be for ever annexed to the crown of England. In this instrument Baliol said, that 'he had formerly become bound to make a grant to Edward of lands on the marches, to the amount of £2000 lands; that the Scottish parliament had ratified his obligation; and that he had accordingly surrendered Berwick and its territory; and now, for completely discharging his obligation, he made an absolute surrender to the English crown of the forests of Jedburgh, Selkirk, and Eterick; of the counties of Roxburgh, Peebles, and Dumfries; together with the county of Edinburgh, and the constabularies of Linlithgow and Haddington.' This extraordinary surrender was made with so much precipitation, that Baliol forgot to except his own private estate out of it. This, however, was restored to

him by Edward. At the same time, Baliol did homage, and swore fealty, 'for the whole kingdom of Scotland and the isles adjacent.'

A quarrel now arose among the disinherited lords, to whom this revolution had been owing, which produced the worst consequences to the interest of Baliol. The brother of Alexander Mowbray died, leaving only daughters. Mowbray having claimed a preference to his nieces, Baliol put him in possession of the inheritance: when Henry Beaumont earl of Buchan, and David Strathbogie or Hastings, earl of Athol, espoused the cause of the ladies; but, perceiving that their solicitations were not heard, they left the court in disgust, and retired to their castles August 1334. Baliol soon perceived his error in offending these two powerful lords; and, to regain their favor, dismissed Mowbray, and conferred on David Strathbogie the whole estates of the young Steward of Scotland. Thus he alienated the affections of Mowbray, and added to the influence of the earl of Athol, who was by far too powerful before. About this time Sir Andrew Murray of Bothwell, having regained his freedom, began to assemble the friends of liberty, and was immediately joined by Mowbray. In a moment every thing was in confusion. Geoffrey Mowbray, governor of Roxburgh, revolted; Henry Beaumont was besieged in his castle of Dundare by Murray and Mowbray, and forced to surrender, but was allowed to depart into England. Richard Talbot, endeavouring to pass into England with a body of troops, was defeated and taken prisoner by Sir William Keith of Galston. The Steward of Scotland, who had lain concealed in the Isle of Bute since the battle of Halydon, passed over to the castle of Dunbarton, which was still remaining, to king David. With the assistance of Dougal Campbell, of Lochow, he made himself master of the castle of Dunoon in Cowal. His tenants of the isle of Bute attacked and slew Alan Lile the governor, and presented his head to their master. John the son of Gilbert, governor of the castle of Bute, was made prisoner in the action. He ordered the garrison to surrender, and attached himself to the Scottish interest. Encouraged by these successes, the Steward entered his ancient inheritance of Renfrew, and compelled the inhabitants to acknowledge the sovereignty of David. Godfrey Ross, the governor of Ayrshire, submitted to the Steward. The earl of Moray returned from France, whither he had fled after the battle of Halydon, and was acknowledged regent along with the Steward. The earl, having raised a body of troops, marched against the earl of Athol, compelled him to retire into Lochaber, and at last to surrender; after which he embraced the party of the conquerors. Baliol was now obliged to retire again into England, to solicit assistance from Edward; and this was readily granted. Edward himself took the field at a very unfavorable season for military enterprises. His army was divided into two parts. With the one he wasted Lothian, while Baliol did the like in Annandale with the other; and, in the mean time, Patrick earl of March renounced his allegiance to England; sensible that, though the kings of England main-

tained him in an independency dangerous to Scotland, they would never permit him to become formidable in a country which they themselves possessed. The year 1335 is remarkable for the siege of Lochleven castle by the English, under John de Strivelin. This fort was built on a small island, very difficult of access. The English commander erected a fort in the cemetery of Kinross; and at the lower end of the lake, whence runs the river Leven, he raised a strong and lofty bulwark, by which he hoped to lay the island under water, and oblige the garrison to surrender. But four Scottish soldiers, having approached the bulwark undiscovered, pierced it so dexterously that the waters, rushing out with a prodigious force, overflowed part of the English camp; and the garrison, sallying out during the confusion, stormed and plundered the fort at Kinross. At this time, the English commander, with many of his soldiers, happened to be absent at Dunfermline, celebrating the festival of St. Margaret. On his return, he swore that he would never desist till he had taken the place, and put the garrison to the sword; however, his utmost efforts were at last baffled, and he was obliged, notwithstanding his oath, to desist. In the mean time, the regents assembled a parliament at Dairsy, near Cupar in Fife; but no plan of defence could be determined upon, from the animosities and factions among the barons. Through the mediation of the French, terms of peace were proposed; but, being rejected by the English, Edward again invaded Scotland, cruelly ravaging the country with one army, while Baliol and the earl of Warren did the same with another. Soon after this invasion, count Guy of Namur landed at Berwick with a considerable number of men at arms in the service of the English. He advanced to the neighbourhood of Edinburgh; but was defeated and taken prisoner by the earls of March and Moray, and Sir Alexander Ramsay. In this engagement one Richard Shaw, a Scottish esquire, was singled out by a combatant in the army of count Guy, and both pierced each other with their spears; the stranger, being stripped, was discovered to be a woman. The earl of Moray treated Guy with the greatest respect, not only allowing him and the remainder of his troops to depart from Scotland without molestation, but even attending him to the borders, accompanied by William Douglas and his brother James. On his return, William de Pressen, warden of the castle and forest of Jedburgh, attacked and defeated his party; James Douglas was killed, the earl himself taken prisoner, and carried into England. Thus was the Scottish nation once more reduced to the brink of ruin. Alexander and Geoffrey Mowbray, and some others, pretending powers from 'the earl of Athol, and Robert the Steward of Scotland,' concluded a treaty with Edward at Perth; the substance of which was, that all the Scots should receive pardon, and have their fees, lands, and offices restored, excepting those who by common assent in parliament should be excluded. The liberties of the church, and the ancient laws and usages of Scotland, were to remain in full force. All offices were to be filled with Scotsmen, ex-

cepting that the king should appoint whom he pleased within his regalities.

The earl of Athol now began to persecute with the utmost fury those who wished well to the freedom of Scotland. With 3000 men he besieged the castle of Kildrummy, which had hitherto been the great refuge of king David's party. Sir Andrew Murray of Bothwell resolved to attempt the rescue of his wife and family, who were shut up in it. With 1100 men he surprised Athol in the forest of Kilblain. The earl's men, seized with a panic, fled; on which their commander, refusing to accept of quarter, was killed. Sir Andrew Murray then assembled a parliament at Dunfermline, where he was immediately appointed regent. In 1336 the king of England, perceiving that the Scots were taken under the patronage of France, resolved to invade their country, and crush them at once before they could have assistance from their allies. In this expedition he penetrated as far as Inverness; but the Scots, under Sir Andrew Murray, avoided a general action; so that Edward could effect nothing of consequence. The inhabitants of Aberdeen attacked one Thomas Rosheme, who landed at Dunottar. They were defeated; but Rosheme fell in the action. Edward chastised the vanquished severely, and burned the town. He then began to repair the castles whose fortifications had been demolished by king Robert. He put in a state of defence the castles of Dunottar, Kinclevin, Lawrieston, Stirling, Bothwell, Edinburgh, and Roxburgh; greatly augmented the fortifications of Perth, and left a considerable body of troops in the place. The Scots reduced these castles as soon as Edward was departed; and in 1337, under Sir Andrew Murray, invaded Cumberland. No great exploits, however, were now performed on either side. Edward, making preparations for invading France, had little leisure to attend to the affairs of Scotland; and the Scots, divided among themselves, and destitute of those leaders under whom they had acquired so much glory, could not now annoy their enemies. The most remarkable transaction was the siege of the castle of Dunbar, belonging to the earl of March. The English commander was the earl of Salisbury. The earl of March was absent; but his wife, the daughter of Randolph, commonly called Black Agnes, undertook to defend it in her husband's absence. The English again employed their huge machine called a sow, mentioned in our account of the siege of Berwick: it met with the same fate as formerly; a huge stone, let fall upon it from the top of the walls, crushed it to pieces. The English, baffled in every attack, turned the siege into a blockade; but, Sir Alexander Ramsay having entered it with forty resolute men, the garrison made a sally, and cut in pieces the advanced guard of the enemy. The English, disheartened by so many misfortunes, abandoned the enterprise. In 1338 Sir Andrew Murray the regent died, and was succeeded in his office by Robert the Steward of Scotland. In 1339 he reduced the town of Perth and the castle of Stirling; and gained over to the Scottish interest William Bullock, governor of the castle of Coupar: after which,

having expelled the enemy from every post north of the Forth, he employed himself in settling the affairs of the nation. In 1341 the castle of Edinburgh was surprised by Sir William Bullock. According to his appointment, one Walter Currie of Dundee privately received into his ship the knight of Liddesdale, with William Fraser, Joachim of Kimbueh, and 200 resolute men. Currie cast anchor in Leith road, pretending to be an English shipmaster, who had a cargo of wine and provisions, with which he proposed to furnish the commander of the castle. His barrels and hampers were brought to the castle-gate, and suddenly thrown down in such a manner as to obstruct the shutting of it. Currie and his men then slew the sentinels; and the knight of Liddesdale, with a party who lurked in the neighbourhood, rushed in, overpowered the garrison, and made themselves masters of the place. On the 4th of March, this year, the king and queen arrived from France, and landed at Bervie in Kincardineshire. In 1342 Sir Alexander Ramsay took the strong fortress of Roxburgh; for which important service the king bestowed on him the charge of sheriff of Teviotdale, then held by William Douglas of Liddesdale. The king's liberality proved fatal to Ramsay, for from that time Douglas became his implacable enemy; and having, after a pretended reconciliation, unexpectedly surprised him with three of his friends, he put these instantly to death, carrying off Ramsay himself to his castle of the Hermitage, where he caused him to be starved in a most barbarous manner. The unhappy man was confined in a room, over which was a heap of wheat; a few grains of which were let fall every day through a hole, not as many as would support life, but as would protract it for a time, and make him longer sensible of the agonies of hunger; in this miserable situation he survived seventeen days. About the same time, Sir William Bullock was put to death by Douglas in a similar manner; nor was king David in a capacity to punish such atrocious cruelties. In the mean time David, having raised a powerful army, prepared to take a severe revenge of the English, from whom he had suffered so much. Edward was then in France, but commanded Baliol to raise all the militia beyond the Trent: which order, however, produced but little effect; so much was the mean-spirited prince despised by the English. David invaded and ravaged Northumberland; but was obliged to raise the siege of Newcastle, which was commanded by Sir John Nevil, an excellent officer. Exasperated at this repulse, David entered the bishopric of Durham, which he ravaged in the most cruel manner. However, on the approach of Edward with a powerful army, the Scots retired; and a two years truce was agreed upon. This pacification was but short-lived. In 1345 the Scots again prepared to invade England, while Edward took all necessary measures for opposing them; but they ravaged Westmoreland, and burnt several towns. The year ended with a new truce, and hostilities were not renewed till 1346, when David entered England with an army of 50,000 men. His first exploit was the taking of the fortress of Liddel, and massacring all whom he found in it. The

commander, Sir Walter Selby, capitulated with a Scottish knight for his life; but, the bargain being disapproved of by David, he barbarously ordered two of Selby's sons to be strangled in his presence, and then the father's head to be cut off. Thence the Scots marched to Lanercroft, which they plundered; then, passing into Northumberland, they pillaged the priory of Hexham, but spared the town, to serve as a magazine. Three other towns, Corbridge, Durham, and Darlington, were spared for the same reason. In his march to Durham, he would have made the county a desert, had not some of the monks paid him a contribution of £1000 to spare their estates: however, according to Knyghton, every Englishman who fell into David's hands was put to death, unless he could redeem his life by paying threepence. To put a stop to the cruelties of this invader, the queen of England, in her husband's absence, assembled a powerful army, which was divided into four bodies; the first commanded by lord Henry Percy; the second by the archbishop of York; the third by the bishop of Lincoln, the lord Mowbray, and Sir Thomas Rokeby; and the fourth and principal division by Edward Baliol. The king of Scotland headed a chosen battalion, of the flower of his nobility, and the French auxiliaries. The high steward of Scotland headed the second line; and the third was commanded by the earls of Moray and Douglas. While the English were approaching, lord Douglas and Sir David Graham skirmished with them, but were defeated with the loss of 500 men. The general engagement began between the archers on each side, but, the English being superior in the use of the bow, the steward of Scotland advanced to the relief of his countrymen. The English archers, unable to bear his attack, fell back upon lord Henry Percy's division, which was thus put in confusion, and would have been totally defeated, had not Baliol advanced to their relief with a body of 4000 horse. The steward was then obliged to retire; by which means the flank of that division commanded by David, and which was then engaged with another line of the English, was left exposed to an attack. Baliol perceived the advantage; and, without pursuing the steward, attacked the king's division, which was immediately cut in pieces. David was left with about eighty noblemen and gentlemen, but still maintained the fight with obstinacy; nor would he yield, even when wounded in the head with an arrow, expecting to be delivered by the steward, and that line of his army which was still entire under the lords Moray and Douglas. At last, finding himself totally overpowered, he attempted to retreat, but was overtaken by a party under one John Copeland. This captain, endeavouring to seize the king, had two of his teeth struck out by a blow of his gauntlet; but at last the king was obliged to give up his sword, and surrender himself. After he was taken, Baliol attacked and totally routed that division of the Scottish army which had hitherto remained entire under the lords Moray and Douglas. In this battle the Scots lost a great number of their nobility, and 15,000 soldiers. Many persons of distinction were also taken along with the king; and had it not been that

the escape of the Scots was favoured by the avarice of the English soldiers, who neglected the pursuit to plunder, scarcely a single Scotsman would have returned.

David was carried to the castle of Bamboorough, where he was kept with so much privacy that for some time it was not known where he was, or that he had been taken prisoner. As soon as the truth was known, the queen of England demanded the royal prisoner from Copeland; but the latter positively refused to part with him even to the queen, unless she could produce an order to that purpose under Edward's hand and seal. This resolute behaviour was resented by the queen, and a complaint made to the king; in consequence of which Copeland was summoned to appear before Edward, when he resigned David to the custody of lord Nevil. The English monarch, then in France, approved of all that he had done, rewarded him with £500 a-year, and sent him back to England honored with knighthood. David was then escorted by Copeland, attended by 20,000 men, from the castle of Ogle in Northumberland, till lord Nevil, by indenture, delivered him to Sir Thomas Rokeby sheriff of Yorkshire. In the same pompous manner he was conducted all the way to London, which he entered on a black courser. He was received in the capital with the greatest solemnity by the lord mayor and aldermen, the city companies under arms lining all the streets through which he passed, and the houses being loaded with spectators who expressed a generous concern for his captivity. Being arrived at the tower, he was delivered, by indenture likewise, to the custody of the constable, lord John Darcy, on the 2d of January, 1347. Baliol, now encouraged by the misfortune of his rival, made an effort once more to establish himself on the throne of Scotland; and, before the end of the year, reduced the castles of Hermitage and Roxburgh, the forest of Etteric, the Merse, with the counties of Annandale, Teviotdale, and Tweeddale. The Scots continued faithful to their king, notwithstanding his misfortune, and chose the steward for the guardian of the kingdom. He behaved with a prudence equal to the high station he filled; but the progress of Baliol was so rapid that it is scarcely probable he could have maintained his ground, had not Edward again consented to a truce; which, however, seems to have been ill observed on the part of the Scots. In fact, though both the Scottish and English historians are silent as to particulars, we find that, about the end of 1348, all Scotland was recovered out of the hands of the English, excepting Berwick, Roxburgh, Hermitage, and Lanark, which was part of Baliol's hereditary estate, and defended by him with an army. The Scottish historians inform us that the English, in revenge for the damages done to their country by the breach of the peace, proclaimed a tournament and other military exercises at Berwick, to which they invited the Scots; but, in their way thither, the latter fell into an ambuscade and were all cut in pieces. The years 1349 and 1350 were remarkable only for a dreadful plague which invaded Scotland, after having ravaged the continent of Europe.

According to Fordun, one-third of the people of Scotland perished at this time. The patients' flesh swelled exceedingly, and they died in two days' illness; but the mortality chiefly affected the middling and lower ranks. The same dreadful calamity continued throughout the years 1351 and 1352; occasioning a cessation of arms not only in Scotland, but throughout all Europe. All this time king David remained a prisoner in England; for, though several treaties had been proposed, they had come to nothing, as Edward insisted upon being indemnified for the ravages the Scots had committed in his territories. At last it was proposed that the king of Scotland should be set at liberty, on paying 90,000 merks for his ransom, by equal proportions, within nine years; with other conditions seemingly not unreasonable, but which we need not specify, as the whole were rejected by the Scottish nobility; and, in 1355, war was recommenced with England, at the instigation of France, who sent 40,000 crowns to Scotland to defray the expenses. With this sum the guardian, having raised an army, once more took the field; but not before the English had destroyed the Lothians and Douglasdale. A battle was fought on Nisbet Moor; in which the English, being drawn into an ambuscade, were totally defeated. The next attempt of the Scots was against Berwick, which they designed to surprise by an escalade. They met, however, with such a vigorous resistance, that many persons of distinction were killed. However, the attack proved successful; but the acquisition was of no importance as the castle held out. Edward, in the mean time, hearing of the loss of the town, hurried back from France to London. Here he staid but three days, and marched northward to raise the siege. He reached Durham on the 23rd of December, 1355, where he appointed all his military tenants to meet him on the 1st of January, 1356. On the 14th he arrived before Berwick, which was instantly retaken; but the Scots were allowed to return home. Baliol now perceiving that Edward meant not to establish him on the throne of Scotland, but to retain in his own possession as many places of that country as he could, came to the resolution of giving up quietly to the king of England all his claims to Scotland. This indeed was only a form, as he was not then possessed of any part of it. However, the ceremony was performed at Roxburgh; and Baliol presented his crown and some earth and stones by way of investiture. Baliol, in return, was to have a revenue of £2000 a-year; and, as Edward was at the head of an excellent army, he had little doubt of forcing the Scots to submit. The affairs of Scotland were now in a very critical situation, and it was necessary to gain time. Edward was therefore amused with a negotiation; and to this he the more willingly listened, as he was waiting for his fleet, from which he had great expectations. A little time, however, discovered the deceit. The Scots plainly told Edward that they would die rather than submit to his demands; and he, in return, threatened a dreadful revenge. His fleet in the mean time arrived in the Frith of Forth; the mariners destroyed and pillaged all that was

within their reach, without sparing even the sacred edifices, carrying off the statues of the blessed virgin, loading the monks with chains, and committing every kind of sacrilege. Edward had by this time marched as far as Haddington, but was obliged to receive provisions all the way from his fleet; for the Scots had desolated the country. During his march his army was harassed, and his foragers cut off, so that he was reduced to extreme distress; and at last, his fleet being totally destroyed by a storm, he was obliged to return to England. In the mean time the prince of Wales, who had been left by his father to carry on the war in France, defeated and took prisoner John king of France at the battle of Poitiers. In this battle were 3000 Scots, who had gone over as auxiliaries to the French monarch, and who suffered extremely. However the success of Edward, instead of rendering him haughty, seemed to have a contrary effect; and, by the mediation of pope Innocent V., a truce for two years was concluded with France, in which the Scots were comprehended. During this interval the ransom of the king of Scots was settled at 100,000 merks, to be paid in ten years; for which twenty hostages were to be given. In consequence of this treaty, David obtained his liberty in 1358, and Edward laid aside all hopes of ever subduing Scotland. As for Baliol, he was now sunk in oblivion; and it is not known what became of him, or when he died. David, though restored to liberty, found himself greatly embarrassed with the payment of such a large sum for his ransom; the kingdom of Scotland being then in a most miserable and exhausted condition. After sending his queen, and going into England himself, he could obtain no greater favor than a respite of a few months for the payment of the second moiety; so that he was at last constrained to ask assistance from France. This could scarcely be expected in the distressed situation of that kingdom; however, it was at last agreed that 50,000 merks should be paid to Scotland, in case the Scots would consent to renew the war the following year. Neither party, however, kept their word; and David, being still greatly distressed about the remainder of his ransom, at last entered into a very extraordinary negotiation with Edward, by which he consented that the king of England should be his successor to the throne of Scotland. But this negotiation was defeated through the invincible hatred which the Scots bore to an English governor. David then, being entirely unable to discharge the remainder of his ransom, was obliged to enter into a new treaty; by which the kingdom of Scotland became indebted to Edward in the sum of £100,000 sterling, to be paid by equal proportions within twenty-five years, during which there should be a truce within the two nations. From this time we meet with little more of any moment in the reign of David. After the death of his queen Johanna, the sister of Edward, he married a Scottish woman of mean birth, named Margaret Logie; but by neither of his wives had he any children. Queen Margaret he divorced on what pretence is not known; but she left the kingdom, and complained personally to the pope,

who treated her as David's lawful wife, and enjoined him to receive her as such under the most severe penalties; but Margaret never returned to Scotland, and, on the 22d of February, 1371, David himself died, leaving the kingdom to his nephew Robert Stewart, the first of that family who sat on the throne of Scotland.

On the accession of Robert II. an assembly of the states was held, in which it was resolved that he should be crowned at Scone; and, to prevent all future disputes concerning the succession, a particular act was framed, by which the kingdom was secured to Robert and his heirs. Being thus established on the throne, he endeavoured to renew the war with the English, to recover from them the town of Berwick, and some other places on the borders. In this, however, he failed; and, as £56,000 of David's ransom still remained unpaid, Robert bound himself to discharge it at the rate of 4000 marks every midsummer. He then proposed an alliance with France; but, the terms demanded by that kingdom being that Scotland should be obliged to make war with England whenever France should require it, Robert would not consent to such a condition. A new treaty, therefore, was entered into, by which it was provided that neither Scotland nor France should be obliged to make war with England; and, by another clause, that the dispensation or authority even of the pope himself should never free the kings or kingdoms of France and Scotland from the obligations they lay under to assist one another as often as required, in opposition to the kingdom of England. In case of a competition for the crown of Scotland, the king of France and his heirs were to take care that no English influence was used; but should with all his power defend and assist the king established by the Scotch laws. Lastly, it was agreed that no Frenchman should ever serve for wages or otherwise against Scotland, nor any Scotsman against France. This last article occasioned a real of all the Scots from the English armies, which Edward looked upon to be a prelude to invasion. He accordingly issued writs for assembling all the militia in the north of England. At this time an invincible hatred subsisted between the neighbouring people of both nations, which extended not only through the lower ranks, but the higher classes also. The inhabitants of the borders, indeed, paid very little regard to the orders of their respective sovereigns; so that hostilities were committed by them daily upon each other, even when there was peace between the nations. They had established with one another certain conventions, which have been since collected, by the name of Border laws: the families of Douglas and Percy, and their adherents in particular, whose estates lay contiguous to one another, were at perpetual variance. It had been common for the borderers of both kingdoms, during a truce, to frequent each other's fairs: and a servant of the earl of March had been killed in a fray about this time at Roxburgh, which was still in the hands of the English. Justice for this murder was demanded from lord Percy, but he slighted the complaint. On this the earl of March, with his

brother the earl of Moray, assembling their followers, entered the next fair that was held in Roxburgh, plundered and burnt the town, and killed all the English who fell into their hands. The English borderers were ordered to lay waste the lands of the earl of March; but in their way thither destroyed the castle of Sir John Gordon, a man of great property in the south of Scotland. Sir John in his turn invaded England, whence he drove off a large booty in cattle, and a number of prisoners. In his retreat he was attacked by a body of fresh troops under Sir John Lishburn, at a place called Caram. An obstinate encounter followed. The Scots were five times repulsed; but at last they renewed the charge with such fury that they made Lishburn, his brother, and several other persons of distinction, prisoners, with all their surviving soldiers. On this lord Percy with 7000 men encamped at Dunse, in the south of Scotland, but was obliged to retire. In the mean time Musgrave, the governor of Berwick, who had been ordered to join Percy with a detachment from the garrison, was on his march intercepted, defeated, and taken prisoner by Sir John Gordon; after which the border war became general. The issue of these disturbances is but little known; however, in 1377, we find them raging with more violence than ever. The fair of Roxburgh was once more the scene of action, and the town was again burnt down by the Scots. Lord Percy, who was now earl of Northumberland, resolved to take signal vengeance. He ravaged the Scottish borders, particularly the earl of March's estate, for three days, at the head of 10,000 men. Some time after this the Scottish insurgents became powerful enough to surprise Berwick; which, however, was quickly retaken by the English, who soon after invaded Scotland. In this expedition, however, they succeeded so ill that Percy desisted from his expedition. The Scots then began hostilities by sea, under one Mercer, an experienced sailor; but he was taken prisoner by the English with all his fleet. In 1379 England was afflicted with a dreadful plague, of which the Scots took advantage to invade the country, killing and plundering the defenceless inhabitants without mercy. This predatory war continued, generally to the disadvantage of the English, till the beginning of November 1380, when a truce was concluded for a year. This truce, like the others, was but indifferently observed; so that, in 1383, new negotiations were set on foot; but, in 1384, the war was renewed with greater fury than ever. In spring the earls of March and Douglas took the castle of Lochmaben, and intercepted a rich convoy which the English were sending to Roxburgh; burnt to the ground the castle of Wark, and committed such devastations in the north of England that several gentlemen offered to resign their estates to Richard II. because they were not able to defend them against the Scots. The duke of Lancaster entered Scotland at the head of an army; but the inhabitants had removed every thing valuable, so that he marched on to Edinburgh without accomplishing any thing of consequence. On his return he was harassed by flying parties of Scots, who destroyed a considerable number

of his men. This year, also, the French sent a body of auxiliaries into Scotland. The earls of Northumberland and Nottingham entered Scotland with an army of 10,000 horse and 6000 archers; but retired, after having committed devastations in the southern counties. The Scots revenged themselves by laying waste all the northern part of England to the gates of Newcastle. Berwick was taken by the Scots, and soon after surrendered for 2000 merks. A truce was then, as usual, concluded; but in the mean time king Robert was meditating a severe blow against the English. The duke of Burgundy, having come to the possession of the estate of his father-in-law the earl of Flanders, claimed the sovereignty of the town of Ghent; but the people refused to submit to him, and in this refusal were protected by king Richard II. of England. On this the duke of Burgundy proposed to the French court to invade England in concert with the Scots. A fleet was accordingly fitted out at Sluys; on board of which John de Vienne, the French admiral, embarked, carrying along with him £50,000 in gold, which the duke of Burgundy advanced to be distributed in Scotland, where the admiral arrived safe with 2000 auxiliaries, of whom 500 were men at arms. 400 suits of complete armour were brought along with them, to be distributed among the bravest of the Scots, who were for a short time elated with the great attention which had been paid them by the French king; but in the mean time, the Flemings having revolted, the French abandoned the Scots to sustain the whole weight of the English resentment, that they themselves might employ their arms in Flanders. King Richard took the field with a more numerous army than had ever been mustered in England before. Hostilities were begun by the Scots, who, according to custom, invaded the northern parts of England, and carried off a considerable booty; however, in their retreat, they were in danger of being cut off by the duke of Lancaster, who had been sent with an army to intercept them. The English army proceeded northwards, but could not accomplish any thing, the country being desolated, till they came to Edinburgh, which they laid in ashes. Being, however, incessantly harassed by parties of the enemy, they were obliged to retreat. In 1378, after a short truce, the war was renewed with fresh fury. Northumberland and Westmoreland were ravaged by the earls of Fife and Douglas, and lord Nithisdale defeated a body of 3000 English; after which he formed a plan of invading Ireland, the inhabitants of which had of late been very active against the Scots. In 1388 Douglas obtained permission to raise a body of forces for his invasion; and, having landed in safety, defeated the Irish, plundered the town of Carlingford, and loaded fifteen ships with the booty. Thence the Scots sailed to the Isle of Man, which, in like manner, was plundered and laid waste; after which they returned with their booty to Lock Rian in Scotland. Encouraged by their success Robert determined to proceed on a more enlarged plan. Having assembled a parliament at Aberdeen, a double invasion of England was resolved upon. Two armies were raised consisting of 25,000 men each, the one

under the earls of Monteith and Fife, Douglas, lord of Galloway, and Alexander Lindesay; the other under the earls of Douglas, March, Crawford, Moray, the lord high constable of Scotland, and other persons of rank. The former entered Cumberland, and the latter Northumberland, both which countries they laid waste, and both armies were to meet within ten miles of Newcastle. The English were thrown into the greatest consternation. Newcastle was defended by the earl of Northumberland, whose age and infirmities rendered him incapable of taking the field; but his place was abundantly supplied by his two sons Henry and Ralph, the former of whom is known in English history by the name of Hotspur. The town was garrisoned by the flower of the English nobility and gentry, as well as the inhabitants of the adjacent counties, who had fled thither for refuge. Douglas selected 2000 foot and 400 horsemen out of the two armies, and encamped on the north side of the town, with a view of storming it next day. In the meantime he was challenged by Hotspur to fight him hand to hand, with sharp ground spears, in sight of both armies. Douglas accepted the challenge, and Percy was unhorsed the first encounter, and obliged to take refuge within the portcullis of the town; whence Douglas brought off his antagonist's lance, with a pennon affixed to it, and swore in his hearing that he would carry it into Scotland. Next day Douglas attempted to storm the town; but, being repulsed in the attack, he decamped in the night. Percy, breathing furious revenge, pursued and overtook the Scots at Otterburn. His arrival was quite unexpected, so that the principal commanders of the Scottish army were sitting down to supper unarmed. The soldiers, however, were instantly prepared for battle; but, in the hurry necessarily attending a surprise of this kind, Douglas forgot to put on his cuirass. Both leaders encouraged their men by the most animating speeches; and both parties waited for the rise of the moon, which happened that night to be unusually bright. The battle being joined on the moon's first appearance, the Scots began to give ground, but, being rallied by Douglas, who fought with a battle-axe, the English, though greatly superior in numbers, were totally routed; 1200 were killed on the spot, and 100 persons of distinction, among whom were the two Percies, were made prisoners by Keith, marischal of Scotland. On the side of the Scots the greatest loss was that of the brave earl Douglas, who was killed in consequence of going to battle without his armour. This single combat between Douglas and Percy, and the subsequent battle, gave rise to the celebrated ballad of Chevy Chase. See OTTERBURN. In the mean time the bishop of Durham marched towards Newcastle with an army of 10,000 men; but was informed by the runaways of Percy's defeat, on the 21st of July 1388. In a council of war it was resolved to pursue the Scots, whom they hoped easily to vanquish, as being wearied by the battle of the preceding day, and laden with plunder. The earl of Moray, who commanded in chief, having called a consultation of his officers, resolved to venture a battle. The prisoners were almost as

numerous as the whole Scottish army; however the generals required no more of them than their words of honor that they should continue inactive during the battle, and remain prisoners still. This condition being complied with, the Scots drew out their army for battle. Their rear was secured by marshes, and their flanks by large trees which they had felled. In short their appearance was so formidable that the English, dreading to encounter a resolute enemy so strongly secured, retired to Newcastle, leaving the Scots at liberty to continue their march to their own country. Robert being now oppressed with age, so that he could no longer endure the fatigues of government, the administration of affairs devolved upon his second son the earl of Fife; for his eldest son was by nature indolent, and besides lame by an unlucky blow he had received from a horse. Early in the spring of 1389 he invaded England with success; but the same year a truce was concluded, to last from the 19th of June 1389 to the 16th of August 1392; in which the allies of both crowns were included. This truce was violently opposed by the nobility, who suspected their king of being too much under French influence. Upon this the court of France sent over ambassadors to persuade the nobility to comply; informing them that, in case of a refusal, they could expect no assistance either of men or money from the continent. With difficulty they prevailed, and peace between England and Scotland was once more restored. Scarcely, however, was this truce finished, when the peace of the nation was most scandalously violated by Robert's third son, Alexander, earl of Buchan. This prince, having a quarrel with the bishop of Murray, burnt down the fine cathedral of Elgin, which has been called by historians the ornament of the north of Scotland. The king for this crime caused his son to be imprisoned; and a civil war would have been the consequence had it not been for the veneration which the Scots retained for their old king. However they did not long enjoy their beloved monarch; for he died on the 19th of April 1390, in the seventy-fifth year of his age, and the nineteenth of his reign.

On the death of Robert II. the crown devolved upon his eldest son John; but the name being thought unpropitious, from the unfortunate reigns of the three Johns of Scotland, England, and France, he changed it for that of Robert, though he was still called by the commonalty Robert John Fernier. He had been married to Annabella, the daughter of Sir John Drummond, ancestor to the noble family of Perth; and was crowned along with his consort at Scone, on the 13th of August, 1390. He confirmed the truce with England, and renewed the league with France; but the beginning of his reign was disturbed by the wars of the petty chieftains with each other. Duncan Stewart, son to Alexander, earl of Buchan, who had died in prison, assembling his followers under pretence of revenging his father's death, laid waste the county of Angus. Walter Ogilvy, the sheriff of Angus, attempting to repel the invaders, was killed, with his brother and sixty of their followers. The king then gave a commission to the earl of Crawford to suppress them, which he soon did, and most

of them were either killed or executed. The followers of the earl of Buchan were composed of the wildest Highlanders, distinguished by the title of Catterenes, which answers to that of banditti or robbers. They seem to have lived, like the Arabs, entirely by plunder; and they or their ancestors had emigrated from the Western Isles and from Ireland. The lands they inhabited were never cultivated till the middle of the seventeenth century. The earl of Crawford's success against the followers of Buchan encouraged Robert to intrust him with a commission for subduing other insurgents. The most remarkable of these were the Clan Chattan and Clan Kay. As both these tribes were numerous and brave, Crawford was afraid that they might unite against him as a common enemy. He proposed, therefore, that the two rival clans should each choose thirty men, to determine their differences by the sword without any other weapon. The king and his nobility were to be spectators of the combat; the conquered clan were to be pardoned for all their former offences, and the conquerors honored with the royal favor. This proposal was readily accepted, and the North Inch of Perth was to be the scene of action. But, upon mustering the combatants, it was found that one of the clan Chattan had absented himself. It was proposed to balance this difference by withdrawing one of the combatants from the clan Kay; but not one of them could be prevailed on to resign his place. At last one Henry Wynd, a saddler, though no way connected with either party, offered to supply the place of him that was absent, on condition of his receiving a French crown of gold (about 7*s.* 6*d.* of our money); which was immediately paid him. The combat then began with incredible fury; but at last, through the superior valor and skill of Henry Wynd, victory declared in favor of the clan Chattan. Only ten of the conquerors besides Wynd were left alive, and all of them desperately wounded. Of the clan Kay only one remained; and he having received no hurt escaped by swimming across the Tay. While these internal broils were going on, the truce which had lately been concluded with England was so ill observed that it became necessary to enter into fresh negotiations. These had little effect. The borderers on both sides had been so accustomed to ravage and plunder that they could not live in quiet. Robert also was thought to be too much attached to the king of England. He had introduced the new title of *duke*, which he bestowed first on the prince royal; but, making an offer of that honor to one of the heads of the Douglas family, it was rejected with disdain. That powerful family had never lost sight of an ancient claim they had upon the castle of Roxburgh, which was still in the possession of the English; and this year the son of the earl of Douglas, Sir William Stewart, and others, broke down the bridge of Roxburgh, plundered the town, and destroyed the forage and corn there and in the adjacent country. The English applied for satisfaction; but obtained none, as the confusion which involved the kingdom by the deposition and murder of Richard II., and the accession of Henry IV., prevented them from having recourse to arms, the only argument to

which the Scottish patriots in those days would listen. No sooner was the catastrophe of Richard known in Scotland than the Scots resolved to avail themselves of it; and invading the north parts of England, demolished the castle of Wark, and laid the neighbouring country under contribution. The situation of Henry's affairs did not admit of his resenting this insult. He contented himself with nominating his brother, the earl of Westmoreland, to treat with the Scots about a truce of peace; or, if that could not be obtained, to make a mutual agreement that the towns of Dumfries in Scotland, and Penrith in England, should be free from hostilities during the war. To this proposal the Scots paid no regard; and being now encouraged by the court of France, who resented the deposition of Richard, they renewed their ravages in England. In 1400 Henry called a parliament to consult on the best means of repelling the Scottish invasions; and in this he was greatly assisted by the divisions of the Scots among themselves. Prince David, duke of Rothesay, the heir-apparent of the crown, was now grown up to man's estate, and it was thought proper to provide a suitable consort for him. The king scandalously offered him to the lady whose father could give him the highest price. The earl of March was the highest bidder; and advanced a considerable sum in ready money, on condition that his daughter should become the royal bride. This sordid match was opposed by Douglas, who proposed his own daughter, the lady Margery. So degenerated was the court of Scotland, at this time, that neither the king nor the duke of Rothesay opposed this proposal of a new match, because it was to be purchased with a fresh sum; and they even refused to indemnify the earl of March for the money he had already advanced. As the duke of Albany sided with Douglas, a council of the nobility was privately assembled, which annulled the contract of the lady Elizabeth Dunbar, the earl of March's daughter, in favor of the lady Margery, daughter to the earl of Douglas; but without taking any measures for repaying the money to the earl of March. The continuator of Fordun informs us that the earl of Douglas paid a larger sum for his daughter's fortune than that which had been advanced by the earl of March, and that the earl of Douglas's daughter was married to the duke of Rothesay: that, before the marriage was celebrated, March demanded that the money he had advanced should be reimbursed; but, receiving an unsatisfactory answer, he declared that, as the king had not fulfilled his bargain, he would bring unexpected calamities upon the country. Accordingly he fled into England, leaving his castle of Dunbar to the custody of his nephew Robert Maitland, who soon after put it into the hands of the earl of Douglas, called in history Archibald the Grim, from the sternness of his visage. As soon as Robert heard of the revolt of the earl of March, he sent ambassadors demanding back his subject; but the request was disregarded. On the other hand, the earl of March demanded repossession of the castle of Dunbar, pleading that he had committed no act of treason, but had come to England under a safe conduct from king Henry, on purpose to nego-

ciate his private affairs; but this request was disregarded; upon which he sent for all his family and followers to England, where they joined him in great numbers. This produced a war between the two kingdoms. The earl of March, with Henry Percy, surnamed Hotspur, invaded Scotland, penetrating as far as Haddington, and carrying off great numbers of the inhabitants into captivity. Thence they went to Peebles, and then to Linton, ravaging the country all the way as they passed along. They next besieged the castle of Hales, and took several of the neighbouring forts; but Archibald the Grim, or his son, having raised an army against them, they were struck with terror, and fled to Berwick, to the gates of which they were pursued by the Scots. At this time the Scottish admiral, Sir Robert Logan, was at sea with a squadron; but miscarried in an attempt he made upon some English ships of war that protected their fleet when fishing upon the coast of Scotland. After this the English plundered the Orkney Islands; which, though belonging to the crown of Norway, were at that time governed, or rather farmed, by Sinclair the Scottish earl of Orkney and Caithness. All this time the earl of March continued under the protection of the king of England. He had received repeated invitations to return to his allegiance: but, all of them being rejected, he was proclaimed a traitor; and the Scottish governor made a formal demand of him from king Henry. With this the latter not only refused to comply, but renewed his league with the lord of the isles. On the 25th of July, 1400, the earl of March renounced his homage, fealty, and service, to the king of Scotland, and transferred them to Henry by a formal indenture. For this he was rewarded with a pension of 500 merks sterling, and the manor of Clipestone in Sherwood forest. Henry now began to revive the claim of homage from the kings of Scotland, and even to meditate the conquest of the kingdom. He had indeed many reasons to hope for success; from the weakness of the Scottish government, the divided state of the royal family, and the dissensions among the chief nobility. Before he set out on his journey he received a letter from the duke of Rothesay, full of reproaches on account of the presumptuous letters which Henry had addressed to Robert and his nobility. The letter was addressed by the duke, 'To his adversary of England,' as the Scots had not yet recognised the title of Henry IV. to the crown of England. Towards the end of it the duke desired Henry, to avoid the effusion of Christian blood, to fight him in person with two, three, or 100 noblemen on a side. But this challenge produced no other answer from Henry than that 'he was surprised that the duke of Rothesay should consider noble blood as not being Christian, since he desired the effusion of the one, and not of the other.' Henry arrived at Leith on the very day on which he had appointed the Scottish nobility to meet him and pay their homage, and conclude a peace between the two crowns. He flattered the English with a promise of raising the power and glory of their country to a higher pitch than it had ever reached. Under this pretext he seized upon the sum of £350,000

in ready money, beside: as much in plate and jewels, which had been left by Richard II. in the royal treasury. He raised also vast contributions on the clergy and nobility, and likewise on the principal towns and cities. At last, finding that neither his vast preparations, nor the interest of the earl of March, had brought any of the Scots to his standard, he formed the siege of Edinburgh castle, which was defended by the duke of Rothesay. The duke of Albany, brother to king Robert, was then in the field with an army, and sent a letter to king Henry, promising that, if he would remain where he was for six days, he would give him battle, and force him to raise the siege, or lose his life. When this was written the duke was at Calder-muir; and Henry was so much pleased with the letter that he presented the herald who delivered it with his upper garment, and a chain of gold; promising, on his royal word, that he would remain where he was until the day appointed. On this occasion, however, the duke forfeited his honor (if indeed the villain had any to forfeit); for he suffered six days to elapse without making any attempt on the English army. Henry in the mean time, pushed on the siege of Edinburgh castle; but met with a most vigorous resistance from the duke of Rothesay. At the same time he was informed that the Welsh were on the point of rebellion under their famous chieftain Owen Glendower. He knew also that many of the English were highly dissatisfied with his title to the crown; and that he owed his peaceable possession of it to the moderation of the earl of March, who was the real heir to the unfortunate Richard, but a nobleman of no ambition. For these reasons he raised the siege of Edinburgh castle, and returned to England. He then agreed to a truce for six weeks, but which was afterwards prolonged for a year, by commissioners of the two crowns, who met at Kelso. In 1401 Scotland suffered a great loss by the death of Trail, archbishop of St. Andrew's, a most exemplary patriot, and a person of great influence. Archibald Douglas the Grim had died some time before, and his loss also was now severely felt; for the king himself, naturally feeble, and quite disabled by his age and infirmities, lived sequestered from the world. This year also queen Annaoella died, so that none remained who might be able to heal those divisions which prevailed among the royal family. Robert duke of Albany, a man of great ambition, was an enemy to the duke of Rothesay, the heir-apparent; and endeavoured to impress his father with a bad opinion of him. This prince, however, appears to have been chargeable with no misdeemeanor of consequence. One Ramorgny, a man of the vilest principles, but an attendant on the duke of Rothesay, had won his confidence; and, perceiving how much he resented the conduct of his uncle the duke of Albany, had the villainy to suggest to the prince the despatching him by assassination. This infamous proposal the prince rejected with such horror and displeasure, that the villain, being afraid he would disclose it to the duke of Albany, informed the latter, under the seal of the most inviolable secrecy, that the prince intended to murder him; upon which the

duke, and William Lindsay of Rossay, his associate, resolved upon the prince's death. By practising upon the doating king, Lindsay and Ramorigny obtained a writ directed to the duke of Albany, empowering him to arrest his son, and to keep him under restraint. The same traitors had previously possessed the prince with an apprehension that his life was in danger, and had persuaded him to seize the castle of St. Andrew's. He was riding thither with a small attendance, when he was arrested between the towns of Nidi and Stratirum (according to the continuator of Fordun), and hurried to the very castle of which he was preparing to take possession. The duke of Albany, and the earl of Douglas, who was likewise the prince's enemy, were then at Culross, waiting the event; of which they were no sooner informed, than they ordered a strong body of ruffians to carry the royal captive from the castle; which they did, after clothing him in a russet cloak, and committing him to the custody of two execrable wretches, John Selkirk and John Wright, who were ordered by the duke of Albany to starve him to death. According to Buchanan his fate was for some time prolonged by the compassion of one of his keeper's daughters, who thrust him oat cakes through the chinks of his prison walls, and a woman who, being a wet nurse, found means to convey part of her milk to him through a small tube. Both these charitable females were detected, and put to death. The prince himself died on Easter-eve, his hunger, it is said, having impelled him to devour part of his own flesh. In the mean time Robert, being yet ignorant of the shocking murder, had consented to renew hostilities with England. On the expiration of the truce, Henry sent a commission to the earls of Northumberland and Westmoreland, to offer the Scots any terms they could reasonably desire; but every offer of this kind was rejected. The earl of March had received another pension from Henry, on condition of his keeping on foot a certain number of light troops to act against the Scots; and so effectually did these now annoy their enemies that the earl of Douglas was obliged to take the field. By dividing his men into small parties, he repressed the depredations of the invaders; and Thomas Haliburton, the commander of one of the Scottish parties, made incursions into England as far as Bamboorough, whence he returned with a considerable booty. This encouraged another chieftain, Patrick Hepburn, to make a similar attempt; but, being elated with success, he remained too long in the enemy's country; so that the earl of March sent a detachment to intercept him. This produced a desperate encounter, in which Hepburn was killed; the flower of the youth of Lothian, who had attended him, were cut off, and scarcely a single Scotchman remained unwounded. On the news of this disaster, the earl of Douglas applied for assistance to the duke of Albany. He was immediately furnished with a considerable army, consisting of 10,000, or 13,000; but, according to the English historians, of 20,000 men. Murdoch, the son of the duke, attended the earl on this expedition, as did also the earls of Moray, Angus, Orkney, and many others of the chief

nobility, with eighty knights. The Scots on this occasion conducted themselves with the same imprudence they had done before. Having penetrated too far into the country, they were intercepted by the English on their return, and obliged to engage at a place called Homeldon, under great disadvantages. The consequence was that they were utterly defeated, and almost the whole army either killed or taken. Henry Hotspur, to whom this victory was chiefly owing, resolving to pursue the advantage he had gained, entered the southern parts of the kingdom, and laid siege to a castle called Cocklawys, on the borders of Teviotdale. The castle was for some time bravely defended; but at last the governor entered into a treaty, by which it was agreed to deliver up the castle, if it was not relieved by the king or governor in six weeks; during which time no additional fortifications were to be made. But, while the English were retiring, one of Percy's soldiers pretended that the Scots had broke the capitulation by introducing a mattock into the place. The governor, hearing of this charge, offered to fight any Englishman who should engage to make it good. A champion was accordingly singled out, but was defeated by the Scotchman; and the English army retired according to agreement. The matter then being debated in the Scottish council, it was resolved to send relief to the castle. Accordingly the duke of Albany, with a powerful army, set out for the place; but, before he came there, certain news were received of the defeat and death of Hotspur, at Shrewsbury. In 1404 king Henry, anxious for a peace with Scotland, renewed negotiations for that purpose. These, however, not being attended with success, hostilities were continued, but without any remarkable transaction. In the mean time king Robert was informed of the miserable fate of his eldest son the duke of Rothesay; but was unable to resent it by executing justice on the monster Albany. After giving himself up to grief, therefore, for some time, he resolved to provide for the safety of his second son James, by sending him into France; and the young prince took shipping with all imaginable secrecy at the Bass, under the care of the earl of Orkney. On his voyage he was taken by an English privateer off Flam-borough Head, and brought before Henry. The English monarch having examined the attendants of the prince, they told him they were carrying the prince to France for his education. 'I understand the French tongue,' replied Henry, 'and your countrymen ought to have been kind enough to have trusted me with their prince's education.' He then committed the prince and his attendants close prisoners to the tower of London. The news of this disaster arrived at the castle of Rothesay in the Isle of Bute (the place of Robert's residence) while the king was at supper; and the news threw him into such an agony of grief that he died in three days, the 29th of March 1405, after having reigned about fifteen years.

By the death of Robert, and the captivity of the prince, all the power devolved upon the duke of Albany, who was appointed regent by a convention of the states assembled at Scone.

The allegiance of the people, however, to their captive prince could not be shaken; so that the regent was obliged to raise an army for the purpose of rescuing him. Henry summoned all his military tenants, and made great preparations; but, having agreed to treat of a final peace with Ireland and the lord of the Isles, the regent laid hold of this as a pretence for entering into a new negociation with the English monarch; and a truce was concluded for a year. In consequence of this, Rothesay, king at arms, was appointed commissary general for the king and kingdom of Scotland; and in that quality repaired to the court of England. When prince James was taken, there had been a truce, however ill observed, subsisting between the two nations. Rothesay produced the record of this truce, which provided that the Scots should have a free navigation; and, in consequence of this, he demanded justice of the captain and crew of the privateer who had taken the prince. Henry ordered the matter to be enquired into; but the English brought their complaints as well as the Scots; and the claims of both were so intricate that the examination fell to the ground, but at the same time the truce was prolonged. In the end of 1409, or the beginning of 1410, the war was renewed with England, and Henry prepared to strike the fatal blow which he had long meditated against Scotland. He had entered into a league with the lord of the Isles, where a considerable revolution then happened. Walter Lesley had succeeded to the estate and honors of the earl of Ross, in the right of his wife, who was the heir. By that marriage, he had a son named Alexander, who succeeded him; and a daughter Margaret, who was married to the lord of the Isles. This Alexander had married one of the regent's daughters; and, dying young, he left behind him an only daughter, Euphan, who was deformed, and became a nun at North Berwick. Her grandfather, the regent, procured from her a resignation of the earldom of Ross, to which she was undoubted heir, in favor of John earl of Buchan, but in prejudice of Donald lord of the Isles, who was the son of Margaret, sister to the earl Alexander, and consequently the nearest heir to the estate after the nun. Donald applied for redress; but, his suit being rejected, he, with his brother John, fled into England, where he was graciously received by king Henry. According to the instructions given him by the English monarch, Donald returned to his own dominions in the Isles, where he raised an army, and, passing over into Ross-shire, violently seized on the estate in dispute. He was soon at the head of 10,000 Highlanders, with whom he marched into the province of Moray, and thence to Strathbogie and Garioch, which he laid under contribution. Advancing towards Aberdeen, with a view to pay his troops with the plunder of that city, which was then a place of considerable trade, he was met by the earl of Marr, whom the regent had employed to command against him, at a village called Harlaw, near Aberdeen. A fierce engagement ensued, in which great numbers were killed on both sides, and the victory remained uncertain; but Donald finding himself in the midst of an enemy's country, where he could

raise no recruits, began to retreat next day; and, the shattered state of the royal army preventing him from being pursued, he escaped to his own dominions; where in a short time he submitted, and swore allegiance to the crown of Scotland. In the mean time Henry continued the war, and refused to renew the truce, though frequently solicited. He had now, however, sustained a great loss by the defection of the earl of March, who had gone over to the Scots. This nobleman, on his return to Scotland, had been fully reconciled to the Douglas family, and now strove to distinguish himself in the cause of his country; a circumstance which, together with the countenance shown the Scots by the court of France, and a bull published by the pope in their favor, contributed to reduce Henry to reason: we hear of no more hostilities between the two nations till after the death of the English monarch, which happened in 1413.

In 1415, the truce being expired, the Scots made great preparations for besieging Berwick; but nothing was done during the campaign, but the burning of Penrith by the Scots, and Dumfries by the English. Next year a truce was agreed upon, and a treaty entered into for the ransom of king James; which was so far advanced that the English king agreed to his visiting Scotland, provided he engaged to forfeit £100,000 sterling in case of his failure to return by a certain day. For reasons now unknown, this treaty was broken off, and vast preparations were made for a new invasion of Scotland; which, however, was executed with so little success, that it became known among the common people of Scotland by the name of the fule raid. In 1420 died Robert duke of Albany, regent of Scotland, at the age of eighty; and such was the veneration which the Scots had for his memory, notwithstanding his villany, that his post of regent was conferred upon his eldest son Murdoch. The war with England was now discontinued; but in France Henry V. met with the greatest opposition from the Scots auxiliaries, inasmuch that he proclaimed all the Scots in the service of the Dauphin rebels against their lawful sovereign. Soon after this the town and castle of Melun being obliged to capitulate, one of the articles was, that all the English and Scots in the place should be resigned to the absolute disposal of the king of England; when he caused twenty Scottish soldiers who were found in the place to be hanged. In 1421 Henry returned to England, and with him James the Scottish king. On his arrival there, he was informed that the Scots, under the earl of Douglas, had made an irruption into England, where they had burnt Newark, but had been forced to return to their own country by a pestilence, though a new invasion was daily expected. Instead of resenting this insult, Henry invited the earl of Douglas to a conference at York; in which the latter agreed to serve him during life, by sea and land, against all living, except his own liege lord the king of Scotland, with 200 foot and as many horse; the king of England, in the mean time, allowing an annual revenue of £200 for paying his expenses. A new negociation was also now set on foot for the ransom of king James; but

he did not obtain his liberty till 1424. Henry V. was then dead; and, none of his generals being able to supply his place, the English power in France began to decline. They then became sensible how necessary it was to be at peace with Scotland. James was therefore highly caressed, and at his own liberty within certain bounds. The English even consulted him about the manner of conducting the treaty for his ransom; and one Dougal Drummond, a priest, was sent with a safe conduct for the bishop of Glasgow, chancellor of Scotland, Dunbar earl of March, John Montgomery of Androssan, Sir Patrick Dunbar of Bele, Sir Robert Lauder of Edrington, &c., to have an interview at Pomfret, with their master the captive king, and there to treat of their common interests. Most of these noblemen and gentlemen had before been nominated to treat with the English about their king's return; and Dougal Drummond seems to have been a domestic favorite with James. Hitherto the Scottish king had been allowed an annual revenue of £700; but, while he was making ready for his journey, his equipage and attendants were increased to those befitting a sovereign; and he received a present from the English treasury of £100. That he might appear in a way suitable to his dignity, at every stage were provided relays of horses, fish, flesh, and fowl, with cooks and other servants for furnishing the most sumptuous entertainments. In this meeting at Pomfret, James acted as a kind of a mediator between England and his own subjects, to whom he fully laid himself open; but, in the mean time, the English regency issued a commission for settling the terms upon which he was to be restored, if he and his commissioners should lay a proper foundation for such a treaty. The instructions the commissioners received were dated at Westminster, July 6th, 1423; but we need not quote them, as nothing definitive was concluded at this time, but that another meeting should be held at York. This accordingly took place, and the chief articles proposed were agreed to. The English commissioners were, Thomas bishop of Durham, chancellor of England, Philip bishop of Winchester, Henry Percy earl of Northumberland, and Mr. John Wodeham. On the 10th of September they came to the following agreement with the Scottish commissioners:—1. That the king of Scotland and his heirs, as an equivalent for his entertainment in England, should pay to the king of England and his heirs, at London, in the church of St. Paul, by equal proportions, the sum of £40,000 sterling. 2. That the first payment of 10,000 merks, should be made six months after the king of Scotland's entering his own kingdom; that the like sum should be paid next year, and so on for six years, when the whole would be cleared; unless, after payment of 40,000 merks, the last payment of 10,000 should be remitted. 3. That the king of Scotland, before entering his own kingdom, should give sufficient hostages for his performance. 4. That the king of Scotland should be at Branspath, or Durham, by the 1st of March, where he should be attended by the nobles of his blood, and other subjects, to fix the number and quality of the

hostages. 5. That, to cement and perpetuate the amity of the two kingdoms, the governors of Scotland should send ambassadors to London, with power to conclude a contract of marriage between the king of Scotland and some lady of the first quality in England. (James, it is probable, had already fixed his choice upon the lady Joan, daughter to the earl of Somerset, who was son to John of Gaunt duke of Lancaster, by his second marriage; but he paid his people the compliment, not only of consulting their opinion, but of concluding the match.) The commissioners, after their agreement at York, proceeded towards London, and Thomas Somerville of Carnwath, with Walter Ogilvy, were added to their number. Being arrived at that capital, they ratified the former articles, and undertook for their king, that he should deliver his hostages to the king of England's officers, in the city of Durham, before the last day of March; that he should also deliver to the said officers four obligatory letters, for the whole sum of £40,000 from the four burghs of Edinburgh, Perth, Dundee, and Aberdeen; that he should give his obligatory letter to the same purpose, before removing from Durham, and should renew the same four days after his arrival in his own kingdom; that the hostages might be changed from time to time for others of the same fortune and quality, and that, if any of them should die in England, others should be sent thither in their room. The marriage of James with the lady Joan Beaufort was celebrated in the beginning of February, 1424. The young king of England presented him with a suit of cloth of gold for the ceremony; and the next day he received a legal discharge of £10,000 to be deducted from the £40,000 at which his ransom was fixed. The ceremony being performed, the king and queen set out for Durham, where the hostages were waiting; and arrived at his own dominions, along with the earl of Northumberland and the chief of the northern nobility, who attended him with great pomp. On the 20th of April, the same year, he was crowned at Scone. During the dependence of the treaty for James's release, the Scots had emigrated to France in such numbers that no fewer than 15,000 of them appeared in arms under the duke of Touraine.

On his return, James found himself in a disagreeable situation. The great maxim of the duke of Albany, when regent, had been to maintain himself in power by exempting the lower class of people from taxes. This plan had been continued by his son Murdoch; but, as the latter was destitute of his father's abilities, the people abused their happiness, and Scotland became such a scene of rapine that no commoner could say he had a property of his own. The Stewart family, on their accession, were possessed of a very considerable patrimonial estate, independent of the standing revenues of the crown, which consisted chiefly of customs, wards, and reliefs. The revenues of the paternal estate belonging to James, had they been regularly transmitted to him, would have more than maintained him in a splendor equal to his dignity, while he was in England; nor would he in that case have had any occasion for an allowance from

the king of England. But, as the duke of Albany never intended that his nephew should return, he parcelled out among his favorites the estate of the family in such a manner that James found all his patrimonial revenues gone, and many of them in the hands of his best friends. This circumstance, of itself sufficiently disagreeable, was attended with two others, which tended to make it more so. The one was that the hostages which had been left for the king's ransom in England, being all of them persons of the first rank, were attended by their wives, families, children, and equipages, which rivalled those of the same rank in England, and drew much ready money out of the nation. The other circumstance was, the expense of the Scottish army in France; where Charles, who had never been in a condition to support it, was now reduced to the utmost necessity; while the revenues of James himself were both scanty and precarious. To remedy these inconveniences, therefore, the king obtained from his parliament an act, obliging the sheriffs of the respective counties to enquire what lands and estates had belonged to his ancestors David II., Robert II., and Robert III.; and he formed a resolution of resuming these lands wherever they could be discovered. At this time many of the most illustrious personages in the kingdom were arrested, and the duke of Albany, his two sons, and the earl of Lennox the duke's father-in-law, were put to death. James proceeded with great spirit to reform the abuses which had pervaded every department of the state, and warmly protected and encouraged learning and learned men. He himself wrote some poetry; and in music was so excellent a composer, that he has been with good reason regarded as the father of Scottish music. He introduced organs into his chapels, and a much better style of architecture into all the public buildings. He was also a warm patron of the useful arts: in short, he did more towards the civilisation of his people than had been done by any of his predecessors. In the mean time the truce continued with England. James, however, seemed not to have any inclination to enter into a perpetual alliance with that kingdom. On the contrary, in 1428, he entered into a treaty with France; by which it was agreed that a marriage should be concluded between the dauphin of France, afterwards Louis XI., and the young princess of Scotland; and so great was the necessity of Charles VII. for troops at that time, that he demanded only 6000 forces as a portion for the princess. The rest of the reign of James was spent in reforming abuses, curbing the authority of the great barons, and recovering the royal estates. In this, however, he used so much severity that he was at last murdered in 1437. The perpetrators of this regicide were the earl of Athol; Robert Graham who was connected with the earl, and discontented on account of his losing the estate of Strathern; and Robert, grandchild and heir to Athol, and one of the king's domestics. The king had dismissed his army, without even reserving to himself a body guard, and was at supper in the Dominican convent of the Black friars near Perth: Graham had for some time

been at the head of a band of outlaws, and brought a party of them to Perth in the dead of the night, posting them near the convent. Walter Stratton, one of the king's cupbearers, on bringing some wine to the king while at supper, perceived armed men in the passage, and gave the alarm, when he was immediately killed. Catharine Douglas, one of the queen's maids of honor, ran to bolt the outer door; but the bar was taken off by Robert Stuart; and, the lady thrusting her arm into the staple, it was instantly broken. Patrick Dunbar, brother to the earl of March, was killed in attempting to defend his sovereign, and the queen received two wounds in attempting to interpose herself betwixt her husband and the assassins. James defended himself as long as he could; but was overpowered at last after receiving twenty-eight wounds.

The crown now devolved upon his son James II., at that time only seven years of age. A parliament was immediately called by the queen-mother, at which the most cruel punishments were decreed to the murderers of the late king. The crime, no doubt, deserved an exemplary punishment; but the barbarities inflicted on some of those wretches are shocking to relate. Within less than six weeks after the death of the king, all of them were brought to Edinburgh, arraigned, condemned, and executed; the earl of Athol and Robert Graham undergoing the most cruel torments, such as pinching with hot irons, dislocation of the joints, &c. The earl of Athol had, besides, a crown of red hot iron put on his head, and was afterwards cut up alive, his heart taken out, and thrown into a fire. Æneas Sylvius, the pope's nuncio, who beheld them, said on this occasion that he was at a loss to determine whether the crime committed by the regicides or the punishment inflicted upon them was the greatest. As the late king had prescribed no form of a regency, in case of his death, the settlement of the government became a matter of great difficulty. Archibald earl of Douglas, who had been created duke of Touraine in France, was by far the greatest subject in the realm; but as he had not been a favorite, and the people were now disgusted with regencies, he was not formally appointed to the administration, though he in fact enjoyed the supreme power as long as he lived; which, however, was but a short time. He died the same year (1438); and Sir Alexander Livingstone of Callendar was appointed to succeed him as governor of the kingdom, that is, to have the executive power, while William Crichton, as chancellor, had the direction of the civil courts. This was a most unfortunate partition of power for the public. The governor and chancellor quarrelled; the latter took possession of the king's person and the castle of Edinburgh, to neither of which he had any right; while the former had on his side the queen mother, a woman of intrigue and spirit. Her son was shut up in the castle of Edinburgh; and in a short time there was no appearance either of law or government. The governor's edicts were counteracted by those of the chancellor in the king's name, and those who obeyed the chancellor were punished by the

governor; while the young earl of Douglas, with his numerous followers and dependents, was a declared enemy of both parties. The queen-mother demanded access to her son, which Crichton could not deny her; and she was accordingly admitted, with a small train, into the castle. She played her part so well, and dissembled with so much art, that the chancellor, imagining that she had become a convert to his cause, treated her with unbounded confidence. Pretending that she had vowed a pilgrimage to the white church at Buchan, she recommended the care of her son's person, till her return, to the chancellor, in the most affectionate terms; but, in the mean time, she secretly sent him to Leith, packed up in a clothes chest; and both she and James were received at Stirling by the governor before the escape was known. As every thing had been managed in concert with Livingstone, he called together his friends, and laying before them the tyrannical behaviour of the chancellor, it was resolved to besiege him in the castle of Edinburgh, the queen promising to open her own granaries for the use of the army. In the mean time, the chancellor anticipating the storm, and applying to the earl of Douglas, that haughty nobleman answered him that he was preparing to exterminate both parties. The siege of Edinburgh castle being formed, the chancellor demanded a parley, and to have a personal interview with the governor; which the latter, who knew the sentiments of Douglas, readily agreed to. Common danger united them, and the chancellor resigning to the other the custody of the castle and the king's person, with the highest professions of duty and loyalty, the two competitors swore an inviolable friendship. Next day the king cemented their union, by confirming both in their respective charges. The lawless example of the earl of Douglas encouraged the other great landholders to gratify their private animosities, sometimes at the expense of their honor, as well as their humanity: and a family difference having occurred between Sir Allan Stuart of Darnley, and Thomas Boyd of Kilmarnock; it was settled that both parties should come to a peaceable agreement at Polmaisthor, between Linlithgow and Falkirk, where Stuart was treacherously murdered by his enemy. His death was revenged by his brother, Sir Alexander Stuart of Beilmonth, who challenged Boyd to a pitched battle, the principals being each attended by a small army. The conflict was fierce and bloody, each party retiring in its turn, and charging with fresh fury; but at last victory declared for Stuart, the bravest of Boyd's attendants being cut off in the field. About this time the islanders, under two of their chieftains, Lauchlan Maclean and Murdoch Gibson, notorious freebooters, invaded Scotland, and ravaged the province of Lenox. They were opposed by John Colcluhoun of Lass, whom they slew, some say treacherously, and others in an engagement at Lochlomond, near Inchmartin. After this the robbers became more outrageous than ever: all the laboring hands in the kingdom being engaged in domestic broils, and a dreadful famine ensued, attended, as usual, by a pestilence. James II. was now about ten years of age; and the

wisest part of the kingdom agreed that the public distresses were owing to a total disrespect of the royal authority. The young earl of Douglas never had fewer than 1000, and sometimes 2000 horse in his train. He pretended to be independent of the king and the law; that he had a right of judicature upon his own large estates; and that he was entitled to the exercise of royal power. He gave protection to thieves and murderers, affecting to brave the king, made knights, and, according to some writers, endowed certain noblemen, of his own dependents, with a power of sitting in parliament. The queen-mother was not wholly guiltless of those abuses. She had fallen in love with, and married Sir James Stuart, commonly called the Black Knight of Lorn, brother to the lord of that title, and a descendant of the house of Darnley. Affection for her husband caused her to renew her political intrigues; her interest inclined towards the party of the Douglasses. The governor sought to strengthen his authority by restoring the exercise of the civil power. The conduct of lord Callendar was not so defensible, either as to prudence or policy. When the queen expressed her desire that her husband might be admitted to some part of the administration, the governor threw both him and his brother lord Lorn into prison, on a charge of disloyal practices. The queen, being offended at this, was herself confined to a mean apartment in the castle of Stirling; and a convention of the states was called to judge in what manner she was to be proceeded against. The case was difficult; nor is it probable that the governor would have carried matters to such extremity, had he not had strong evidences of her illegal behaviour. She was obliged to dissemble her resentment, by professing before the states that she had always been entirely innocent of her husband's practices. Upon making this purgation (as Lindsay calls it) she was released, with her husband and his brother, being bailed by the chancellor and the lord Gordon, who became sureties for their good behaviour in the penalty of 4000 merks. The governor was afterwards accused of many arbitrary and partial acts: but if we consider his situation, and the violence of the parties, it was almost impossible, consistently with his own safety, to have exerted the virtues either of patriotism or moderation. The chancellor was piqued at the small regard which the governor paid to his person and dignity, and secretly connected himself with the queen-mother. The king and his mother continued at Stirling; where the governor, on pretence of consulting the public safety, and that of the king's person, maintained a strong guard. The queen-mother represented this to her son as a restraint upon his liberty; and, obtaining his consent to put himself into the chancellor's hands, the latter, a man of activity and courage, crossing the Forth in the dark with a strong body of horse, surrounded the king as he was hunting: and, when some of the guards offered to dispute the possession of his person, Sir William Livingstone, the governor's eldest son, restrained them, and suffered the king to depart. This happened when the governor was absent from Stirling; and the chan-

celler entered Edinburgh at the head of 4000 horse, where the king and he were joyfully received. The governor showed no emotion at what had happened; on the contrary, he invited the chancellor to an interview, to settle all differences. Lord Douglas, however, continued to brave both parties. He demanded by his ambassadors, Malcolm Fleming of Cumbernauld, and Allan Lawder, the investiture of the sovereignty of Touraine from Charles VII. of France; which, being readily granted, served to increase his insolence. The first-fruits of the accommodation between the two great officers of state was the holding of a parliament at Edinburgh, for redressing the public disorders; and encouragement was given to all persons who had been injured by Douglas to make their complaints. The numbers which on that occasion resorted to Edinburgh were incredible; parents, children, and women, demanding vengeance for the murder of their relations, or the plunder of their estates; till, by the multiplicity of their complaints, they became without remedy, none being found bold enough to encounter the earl, or to endeavour to bring him to a fair trial. The parties, therefore, were dismissed without relief, and it was resolved to proceed with that haughty noble in a different manner. Letters were written to him by the governor and chancellor in the name of the states, requesting him to appear with his friends in parliament, and to take that lead in public affairs to which they were entitled by their high rank and possessions: and the manner in which these letters were penned operated effectually on his vanity, and made the earl consider them as proceeding from the inability of the government to continue the administration of affairs without him. Without suspecting that any man in Scotland would be so bold as to attack him, he wrote to the chancellor and governor that he intended to set out for Edinburgh: when the chancellor, on pretence of doing him honor, met him on his journey; and, inviting him to the castle of Crichton, entertained him there for some days. The chancellor had not only removed the earl's suspicion, but had made him a kind of convert to patriotism, by painting to him the miseries of his country, and the glory that must redound to him and his friends in removing them. He therefore attended the chancellor to Edinburgh; and, being admitted into the castle, dined at table with the king. Towards the end of the entertainment, a bull's head, the certain prelude of immediate death, was served up. The earl and his brother started to their feet, and endeavoured to escape; but the armed men, rushing in, overpowered them, and, tying their hands and those of Sir Malcolm Fleming with cords, they were carried to the hill and beheaded. The young king endeavoured, with tears, to procure their pardon; for which he was severely checked by his unrelenting chancellor.

In 1443 the king, being arrived at the age of fourteen, declared himself out of the years of minority, and took upon himself the administration of affairs. He appears to have been a prince of great spirit and resolution; and he had occasion for it. Having appointed one Robert Sempil of Fulwood governor of the castle of

Dumbarton, he was killed by one Galbreath (a noted partizan of the earl of Douglas), who seized upon the government of the castle. The young earl of Douglas, finding himself not supported by the chief branches of his family, began to think his safest course would be to return to his duty. He accordingly repaired to the king at Stirling; and, throwing himself at his feet, implored his pardon. The king, finding that he insisted on no terms but that of pardon, and that he had unconditionally put himself into his power, not only granted his request, but made him the partner of his councils. James had always disliked the murder of the earl of Douglas and his brother; and the chancellor, perceiving the ascendancy which this earl was daily gaining at court, thought it high time to provide for his own safety. He therefore resigned the great seal, and retired to the castle of Edinburgh, the custody of which he pretended had been granted to him by the late king during his life, or till the present king should arrive at the age of twenty-one. Lord Callendar, who knew himself equally obnoxious as Crichton, to bring he could not maintain his footing by himself, resigned likewise all his posts, but kept possession of the castle of Stirling. As both this and that of Edinburgh were royal forts, the two lords were summoned to surrender them; but, instead of complying, they justified their conduct by the great power of their enemies, who had been so lately at the head of robbers and outlaws; but promised to surrender themselves to the king as soon as he was of lawful age. This answer being deemed contumacious, the chancellor and the late governor, with his two sons Sir Alexander and Sir James Livingston, were proclaimed traitors in a parliament summoned to meet at Stirling. In another parliament held at Perth the same year, an act was passed that all the lands and goods which had belonged to the late king should be possessed by the present to the time of his lawful age. This act was levelled against the late governor and chancellor, who were accused of having alienated to their own uses, or to those of their friends, a great part of the royal effects and jewels; and, their estates being confiscated, the execution of the sentence was committed to John Forrester of Corstorphin, and other adherents of the earl of Douglas. The sentence threw the whole nation into a flame. The castle of Crichton was besieged; and, being surrendered upon the display of the royal banner, it was levelled with the ground. It soon appeared that the governor and chancellor, the latter especially, had many friends; and in particular Kennedy bishop of St. Andrew's, nephew to James I., who sided with them from the dread and hatred they bore to Douglas. Crichton thus soon found himself at the head of a body of men; and, while Forrester was carrying fire and sword into his estates and those of the late governor, his own lands and those of the Douglasses were overrun. Corstorphin, Abercorn, Blackness, and other places were plundered; and Crichton carried off from them more booty than he and his adherents had lost. Douglas was so much exasperated by the great losses he had sustained,

that he engaged his friends, the earl of Crawford and Alexander Ogilvy of Innerquharly, to lay waste the lands of the bishop of St. Andrew's, whom he considered as the chief support of the two ministers. This prelate was not more considerable by his high birth than he was venerable for his virtue; and had, from a principle of conscience, opposed the earl of Douglas and his party. Being conscious he had done nothing that was illegal, he first admonished the earl of Crawford and his coadjutor to desist from destroying his lands; but, finding his admonitions ineffectual, he laid the earl under excommunication. That nobleman was almost as formidable in the north, as Douglas had been in the southern parts of Scotland. The Benedictine monks of Aberbrothick had chosen Alexander Lindsay, his eldest son, to be judge of their temporalities, until Lindsay proved so chargeable, by the number of his attendants and his high manner of living, to the monks, that their chapter removed him from his post, and substituted in his place Alexander Ogilvy of Innerquharly, guardian to John Ogilvy of Airley, who had an hereditary claim upon the bailiwick. This, notwithstanding their former intimacy, created an irreconcilable difference between the two families. Each competitor strengthened himself by calling in the assistance of his friends; and the lord Gordon taking part with the Ogilvies, to whom he was paying a visit, both parties immediately mustered in the neighbourhood of Aberbrothick. The earl of Crawford, who was at Dundee, immediately posted to Aberbrothick, and, placing himself between the two armies, demanded an interview with Ogilvy; but, before his request could be granted, he was killed by a common soldier. His death exasperated his friends; and a bloody conflict ensued, which ended to the advantage of the Lindsays, that is, the earl of Crawford's party. On that of the Ogilvies were killed Sir John Oliphant of Aberdalgy, John Forbes of Pitsligo, Alexander Barclay of Gartley, Robert Maxwell of Telling, Duncan Campbell of Campbellfether, William Gordon of Burrowfield, and others. With these gentlemen, about 500 of their followers are said to have fallen. Innerquharly was taken prisoner, and carried to the earl of Crawford's house at Finhaven, where he died of his wounds; but lord Gordon escaped by the swiftness of his horse. This battle seems to have kindled the flames of civil discord all over the kingdom. No regard was paid to the magistracy, nor to any but the clergy. The most numerous, fiercest, and best allied family wreaked its vengeance on its foes, either by force or treachery; and the enmity that actuated the parties stifled every sentiment of honor and humanity. The Lindsays, secretly abetted by the earl of Douglas, carried fire and sword through the estates of their enemies; and all the north of Scotland presented scenes of murder and devastation. In the west, Robert Boyd of Dunchal, governor of Dumbarton, treacherously surprised Sir James Stuart of Achmynto, and treated his wife with such inhumanity that she expired in three days in Dumbarton castle. The castle of Dunbar was taken by Patrick Hepburn of Hales. Alex-

ander Dunbar dispossessed the latter of his castle of Hales; but it was retaken by the partisans of the earl of Douglas, whose tenants in Annandale behaved with peculiar fierceness and cruelty. At last the gentlemen of the country, unconnected with these robbers and murderers, shut themselves up in their several houses; each of which in those days was a petty fortress, victualled, and provided in the best manner they could. This seems to have been the first measure that composed the public commotions. The earl of Douglas was sensible that the clergy and the disinterested part of the kingdom considered him as the source of the calamities which the nation suffered; and that James himself would soon be of the same opinion. He therefore sought to avail himself of the juncture, by forming secret but strong connexions with the earls of Crawford, Ross, and other great noblemen, who wanted to see their feudal power restored. The queen dowager and her husband, during this public confusion, had retired to the castle of Dunbar, while it was in Hepburn's possession, where she died soon after. She left by her second husband three sons; John, who in 1455 was made earl of Athole; James, who in 1469, was created earl of Buchan; and Andrew who became bishop of Murray. As the earl of Douglas was an enemy to the queen-dowager's husband, the latter retired to England, where he obtained a pass to go abroad; but, being taken at sea by Flemish pirates, died in confinement. The great point between the king and Sir William Crichton, whether the latter should give up the castle to his majesty, remained still undecided; and by the advice of the earl of Douglas, who had been created lord-lieutenant of the kingdom, it had now suffered a nine months' siege. Crichton and his followers were offered a full indemnity for past offences, and restoration to the king's favor: when he accepted of the conditions, but refused to act in any public capacity till they were confirmed by a parliament. This was soon held at Perth, and he was restored to his estate and honors. By this reconciliation between Douglas and Crichton, the former was left at full liberty to prosecute his revenge against lord Callendar, the late governor, and this he did with rigor. The governor himself, Sir James Dundass of Dundass, and Sir Robert Bruce of Clackmannan, were forced to save their lives by the loss of their estates; but they were sent prisoners to the castle of Dumbarton. Alexander, the governor's eldest son, and two other gentlemen of his name and family, were condemned to lose their heads. Lindsay gives an extract of the speech which Alexander Livingston, one of the most accomplished gentlemen of his time, made upon the scaffold, in which he complained with great bitterness of the cruel treatment his father, himself, and friends had undergone; and that he suffered by a packed jury of his enemies.

The king being about eighteen years of age, it was now thought proper that a suitable consort should be provided for him; and, after various consultations, Mary, the daughter of Arnold duke of Gueldres, was chosen, at the recommendation of Charles VII. of France. This produced

an immediate rupture with England. The earls of Salisbury and Northumberland entered Scotland at the head of two armies. The former burnt the town of Dumfries, as the latter did that of Dunbar; while Sir John Douglas of Balveny made reprisals by plundering the county of Cumberland, and burning Alnwick. Upon the return of the English to their own country, additional levies were made, and a fresh invasion of Scotland was resolved upon under the earl of Northumberland, who had a lieutenant, whom the Scots, from the bashiness and color of his beard, called Magnus with the red mane. He was an excellent officer, having been trained in the French wars; and is said to have demanded no other recompense for his services, from the English court, than that he should enjoy all he could conquer in Scotland. The Scots, in the mean time, had raised an army commanded by George Douglas earl of Ormond, and under him by Wallace of Craigie, with the lords Maxwell and Johnston. The English, having passed Solway Frith, ravaged all that part of the country which belonged to the Scots; but, hearing that the earl of Ormond was approaching, called in their parties, and fixed their camp on the banks of the Sark. Their advanced guard was commanded by Magnus; their centre by the earl of Northumberland; and their rear, which was composed of Welsh, by Sir John Pennington, an officer of courage and experience. The right wing of the Scots was commanded by Wallace, the centre by the earl of Ormond, and their left wing by the lords Maxwell and Johnston. Before the battle, the earl of Ormond endeavoured to inspire his men with high resentment against the English, who, he said, had treacherously broken the truce. The signal being given, the Scots under Wallace rushed forward upon their enemies; but, as usual, were received by so terrible a discharge from the English archers that their impetuosity must have been stopped, had not their brave leader put them in mind that their forefathers had always been defeated in distant fights by the English, and that they ought to trust only to their swords and spears. They obeyed, and broke in upon the English, commanded by Magnus, with such fury as soon fixed the fortune of the day on the side of the Scots. The slaughter (for both parties fought with the utmost animosity) fell chiefly upon the division commanded by Magnus, who was killed, together with the whole of his body guard of picked soldiers. Sir John Pennington's division, with that under the earl of Northumberland, was likewise routed; and the whole English army, struck by the loss of their champion, fled towards the Solway; where, the river being swelled by the tide, numbers of them were drowned. The loss of the English in slain amounted to at least 3000 men. Among the prisoners were Sir John Pennington, Sir Robert Harrington, and the earl of Northumberland's eldest son, the lord Percy, who lost his own liberty in forwarding his father's escape. Of the Scots about 600 were killed; but none of note excepting the brave Wallace, who died three months after of his wounds. The booty on this occasion is said to have been greater

than any that had fallen to the Scots since the battle of Bannockburn. The rest of the history of this reign is almost entirely a relation of the cabals and conspiracies of the nobles and other chiefs. The earl of Douglas had entered into a confederacy with the earls of Crawford, Moray, and Ross, and appeared on all occasions with such a train of followers as bade defiance to the royal power. This insolence was detested by the wiser part of the nation; and Maclellan, who was nephew to Sir Patrick Gray, captain of the king's guard, refused to give any attendance upon the earl. This inoffensive behaviour was by the latter considered as a kind of treason, and seizing upon Maclellan's house and person, he sent him prisoner to the castle of Douglas. As Maclellan was a gentleman of great worth and reputation, his uncle Sir Patrick applied to James in his favor; who wrote and signed a letter for his release: and, upon Gray's delivering this letter to Douglas at his castle, the latter seemed to receive it with the highest respect, and to treat Gray with hospitality; but in the mean time he gave private orders that Maclellan's head should be struck off, and his body exposed upon the green before the castle. After dinner the earl told Gray that he was ready to obey the king's commands; and, conducting him to the green, showed him the lifeless trunk. Upon this Gray mounted his horse, and, trusting to his swiftness for safety, was pursued by the earl's attendants to the gates of Edinburgh. The conspiracy against James's government was now no longer a secret. The lords Balveny and Hamilton, with such a number of other barons and gentlemen, had acceded to it, that it was thought to be more powerful than all the force the king could bring into the field. Even Crichton advised James to dissemble. The confederates entered into a solemn bond and oath never to desert one another: all who did not enter into this association were treated as enemies to the public; their lands were destroyed, their effects plundered, and they themselves imprisoned or murdered. Drummond says that Douglas was now able to bring 40,000 men into the field; and that his intention was to have usurped the crown. When James invited him to a conference in the castle of Stirling, he offered to comply, provided he had a safe conduct; which was expedited in the form and manner required. The earl began his march with his usual great retinue, and arrived at Stirling on Shrove Tuesday. He was received by the king as if he had been the best of his friends, and admitted to sup with his majesty, while his attendants were dispersed in the town. The entertainment being over, the king told the earl, 'That, as he was now of age, he was resolved to be the father of all his people, and to take the government into his own hands; that he, therefore, had no reason to be under any apprehensions from his old enemies Callendar and Crichton; that there was no occasion to form any confederacies, as the law was ready to protect him; and that he was welcome to the principal direction of affairs under the crown, and to the first place in the royal confidence; nay, that all former offences done by himself and his friends should be pardoned.'

This speech was the very reverse of what the earl of Douglas expected. It rendered him, indeed, the first subject of the kingdom; but still he was controllable by the civil law. In short, upon the king's peremptorily putting the question to him, he not only refused to dissolve the confederacy, but upbraided the king for his government. This produced a passionate rejoinder on the part of James; but the earl represented that he was under a safe conduct, and that the nature of the confederacy was such that it could not be broken but by the common consent of all concerned. The king insisted upon his setting the example; and, the earl continuing more and more obstinate, James stabbed him with his dagger, and armed men, rushing into the room, finished the slaughter. After the death of the earl of Douglas the confederacy came to nothing. The insurgents excused themselves as being too weak for such an enterprise; and were contented with trailing the safe conduct at a horse's tail, and proclaiming by trumpets and horns the king a perjured traitor. They proceeded no farther, and each departed to his own habitation, after agreeing to assemble with fresh forces about the beginning of April. James lost no time in improving this short respite; and found the nation in general much better disposed in his favor than he had reason to expect. The intolerable oppressions of the great barons made his subjects esteem the civil far preferable to the feudal subjection, and even the Douglasses were divided among themselves; for the earl of Angus and Sir John Douglas of Dalkeith were among the most forward of the royalists. James at the same time wrote letters to the earl of Huntly, to all the noblemen who were not parties in the confederacy, and to the ecclesiastics. Before the effect of those letters could be known, the insurgents had returned to Stirling (where James still kept himself upon the defensive); repeated their insolence, and the opprobrious treatment of his safe conduct; and at last plundered the town, and laid it in ashes. Being still unable to take the castle, partly through their own divisions, and partly through the diversity of their operations, they left Stirling, and destroyed the estate of Sir John Douglas of Dalkeith, whom they considered as a double traitor. They then besieged his castle; but it was so bravely defended by Parick Cockburn, a gentleman of the family of Langton, that they raised the siege. All this time the unhappy country was suffering the most cruel devastations; for matters were now come to such extremity that it was necessary for every man to be a royalist or a rebel. The king was obliged to keep on the defensive; and, though he had ventured to leave the castle of Stirling, he was in no condition to face the rebels. They were in possession of all the strong passes by which his friends were to march to his assistance; and he even consulted with his attendants on the means of escaping to France, where he was sure of an hospitable reception. He was diverted from that resolution by bishop Kennedy and the earl of Angus, who was himself a Douglas, and prevailed upon to wait for the event of the earl of Huntly's attempts. This nobleman, who was

descended from the Seatons, but by marriage inherited the great estates of the Gordons in the north, had raised an army for James, to whose family he and his ancestors, by the Gordons as well as the Seatons, had been always devoted. James was not mistaken in the high opinion he had of Huntly; and in the mean time he issued circular letters to the chief ecclesiastics and bodies politic of his kingdom, setting forth the necessity he was under to proceed as he had done, and his readiness to protect all his loyal subjects against the power of the Douglasses and their rebellious adherents. Before those letters could have any effect, the rebels had plundered the defenceless houses and estates of all who were not in their confederacy. The indignation which the public had conceived against the king, for the violation of his safe conduct, began now to subside; and the behaviour of his enemies seemed to justify what had happened. The forces he had assembled being unable, as yet, to act offensively, he resolved to wait for the earl of Huntly, who by this time was at the head of a considerable army, and had begun his march southwards. He had been joined by the Forbeses, Ogilvies, Leslie, Grants, Irvings, and other relations and dependents of his family; but, having advanced as far as Brechin, he was opposed by the earl of Crauford, the chief ally of the earl of Douglas, who commanded the people of Angus, and all the adherents of the rebels in the neighbouring counties, headed by foreign officers. The two armies joining battle, on the 18th of May, victory was for some time in suspense; till one Coloss of Bonnymoon, or Balnamuin, on whom Crauford had great dependence, but whom he had imprudently disobliged, came over to the royalists with the division he commanded, which was the best armed part of Crauford's army. His defection gave the fortune of the day to the earl of Huntly, as it left the centre flank of Crauford's army entirely exposed. He himself lost one of his brothers; and fled with another, Sir John Lindsay, to his house at Finhaven, where he declared, 'That he would be content to remain seven years in hell, to have in so timely a season done the king his master that service the earl of Huntly had performed, and carry that applause and thanks he was to receive from him.' No author informs us of the loss of men on either side, though all agree that it was very considerable upon the whole. The earl of Huntly lost two brothers, William and Henry; and to indemnify him for his services, and for the presents he had made to his followers, the king gave him the lands of Badenoch and Lochaber. The battle of Brechin was not immediately decisive in favor of the king, but proved so in its consequences. The earl of Moray, a Douglas likewise, took advantage of Huntly's absence to harass and ravage the estates of all the royalists in the north; but Huntly, returning from Brechin with his victorious army, drove the enemy into his own county of Moray, and afterwards expelled him even thence. James was now encouraged, by the advice of his kinsman bishop Kennedy, to proceed against the rebels in a legal manner, by holding a parliament at Edinburgh, to which the confederated lords were

summoned; and, upon their non-appearance, declared traitors. This proceeding seemed to make the rebellion rage more fiercely; and at last the confederates disowned their allegiance to James. The earls of Douglas, Crauford, Ormond, Moray, the lord Balveny, Sir James Hamilton, and others, signed public manifestoes, which were pasted on the doors of the principal churches, importing 'that they were resolved never to obey any command or charge, nor answer any citation for the time coming; because the king, so far from being a just master, was a bloodsucker, a murderer, a transgressor of hospitality, and a surpriser of the innocent.' These atrocious proceedings did no service, however, to their cause. The earl of Huntly continued victorious in the north, where he and his followers, in revenge for the earl of Moray's having burnt his castle of Huntly, ravaged all Moray's estate north of the Spey. When he came to Forres, he burnt one side of the town because it belonged to the earl, and spared the other, the property of his own friends. James thought himself, from the behaviour of Douglas and his adherents, now warranted to come to extremities; and, marching into Annandale, he carried fire and sword through all the estates of the Douglasses. The earl of Crauford destroyed the lands of the people of Angus, and of all others who had abandoned him at the battle of Brechin. James, returning from Annandale to Edinburgh, marched northwards to Angus, to reduce the earl of Crauford, who had hitherto deferred throwing himself at the king's feet, only in hopes that better terms might be obtained from James for himself and his party. Perceiving that the earl of Douglas's obstinacy had put an end to all hopes of a treaty, he resolved to make a merit of breaking the confederacy, by being the first to submit. James, having arrived in Angus, was continuing his march through the country, when the earl and some of his chief followers fell on their knees before him on the road, bare-headed and bare-footed; the earl acknowledging his crimes, and imploring forgiveness. James was then attended by his chief counsellors, particularly bishop Kennedy. He asked their advice; which proving merciful, James promised to the earl and his followers restitution of all their estates and honors. The earl, in gratitude, before the king left Angus, joined him with a troop of his friends and followers; and, attending him to the north, was extremely active in suppressing all the remains of the rebellion there. The submission of the earl of Crauford was followed by that of the earl of Douglas; but he soon resumed his rebellious practices, and in 1451 raised an army to fight against the king. The king erected his standard at St. Andrew's, marched thence to Falkland, and ordered all the forces of Fife, Angus, Strathern, &c., to rendezvous at Stirling; which they did to the number of 30,000. Douglas assembled his forces, which amounted to 40,000, some say 60,000 men, on the south bank of the Carron, between Stirling and Abercorn. Bishop Kennedy had advised the king to divide his enemies by offering them pardon separately; and thus in a few days the earl was

deserted by all his numerous army, excepting about 100 of his nearest friends and domestics, with whom he retired towards England. However, in his journey southward, he raised a considerable body of forces, consisting of his own tenants, of outlaws, robbers, and borderers, with whom he renewed his depredations on the loyal subjects of the king. He was opposed by the earl of Angus, who continued firm in the royal cause. An engagement ensued at Ancrum muir; where Douglas was entirely defeated, and he himself with great difficulty escaped to an adjacent wood. His estates were afterwards forfeited to the king. The rest of the reign of James II. was spent in internal regulations for the good of his people. He was killed in 1460 at the siege of Roxburgh castle, by the bursting of a cannon. This siege he had undertaken in favor of the queen of England, wife of Henry VI., who, after losing several battles, and being reduced to distress, was obliged to apply to him for relief. The nobility who were present concealed his death for fear of discouraging the soldiers; and in a few hours after the queen appeared in the camp, and presented her young son James III. as their king.

James III. was not quite seven years of age at his accession to the crown. The administration devolved on his mother, who pushed the siege of Roxburgh castle with so much vigor that the garrison capitulated in a few days; after which the army ravaged the country, and dismantled the castle of Wark. In 1466 negotiations were begun for a marriage between the young king and Margaret princess of Denmark; and in 1468 the following conditions were stipulated;—1. That the annual rent hitherto paid for the northern isles of Orkney and Shetland should be for ever remitted and extinguished. 2. That king Christian I. should give 60,000 florins of gold for his daughter's portion, whereof 10,000 should be paid before her departure from Denmark; and that the islands of Orkney should be made over to the crown of Scotland by way of pledge for the remainder; with this proviso that they should return to that of Norway after complete payment. 3. That king James should, in case of his dying before the said Margaret, leave her in possession of the palace of Linlithgow, and castle of Down, in Monteith, with all their appurtenances, and the third part of the ordinary revenues of the crown, to be enjoyed by her during life. 4. But, if she chose to return to Denmark, that in lieu of the said liferent, palace, and castle, she should accept of 120,000 florins of the Rhine; from which sum the 50,000 due for the remainder of her portion being deduced and allowed, the islands of Orkney should be reannexed to the crown of Norway. When these articles were agreed upon, Christian found himself unable to fulfil his part of them. Being then engaged in an unsuccessful war with Sweden, he could not advance the 10,000 florins which he had promised to pay down as part of his daughter's fortune. He was therefore obliged to apply to the plenipotentiaries to accept of 2000, and to take a farther mortgage of the isles of Shetland for the other 8000. The Scottish plenipotentiaries, of

whom Boyd, earl of Arran, was one, gratified him in this request; and this concession is thought to have proved fatal to the earl. Certain it is that his father was beheaded for treasonable practices alleged to have been committed long before, and for which he produced a parliamentary indemnity to no purpose; the earl himself was divorced from his wife, the king's sister, and obliged to live in perpetual exile, while the countess was married to another. In 1476 those misfortunes began to come on James which afterwards terminated in his ruin. He had made his brother, the duke of Albany, governor of Berwick; and had entrusted him with very extensive powers upon the borders, where a violent propensity for the feudal law still continued. The Humes and the Hepburns, then the most powerful subjects in those parts, could not brook the duke of Albany's greatness, especially after he had forced them, by virtue of a late act, to part with some of the estates which had been granted them in this and the preceding reign. The pretended science of judicial astrology, by which James was incredibly infatuated, was the most effectual engine that could work their purposes. One Andrew, an infamous impostor in that art, had been brought over from Flanders by James; and he and Schevez, then archbishop of St. Andrew's, concurred in persuading James that the Scottish lion was to be devoured by his own whelps; a prediction that, to a prince of James's turn, seemed of certain accomplishment. The condition to which James reduced himself by his belief in astrology was truly deplorable. The princes upon the continent were smitten with the same infatuation; and the wretches who besieged his person had no safety but by continuing the delusion in his mind. According to Lindesay, Cochran, who had some knowledge of architecture, and had been introduced to James as a master mason, privately procured an old woman, who pretended to be a witch, and who heightened his terrors by declaring that his brothers intended to murder him. James believed her; and the unguarded manner in which the earl of Mar treated his weakness, exasperated him so much, that the earl was arrested, and committed to the castle of Craig-miller; whence he was brought to the Canongate, a suburb of Edinburgh, where he suffered death. The duke of Albany was at the castle of Dunbar when his brother the earl of Mar's tragedy was acted; and James could not be easy without having him likewise in his power. In hopes of surprising him he marched to Dunbar; but the duke, being apprised of his coming, fled to Berwick, and ordered his castle of Dunbar to be surrendered to the lord Evendale, though not before the garrison had provided themselves with boats and small vessels, in which they escaped to England. He ventured to come to Edinburgh; where James was so well served with spies that he was seized, and committed close prisoner to the castle, with orders that he should speak with none but in the presence of his keeper. The duke had probably suspected and provided against this disagreeable event; for we are told that he had agents, who every day repaired to the castle, as if they had come from

court, and reported the state of matters between him and the king, while his keepers were present, in so favorable a light that they made no doubt of his soon regaining his liberty, and being readmitted to his brother's favor. The seeming negotiation at last went on so prosperously, that the duke gave his keepers a kind of a farewell entertainment, previous to his obtaining a formal deliverance; and they drank so immoderately that, being intoxicated, they gave him an opportunity of escaping over the castle wall, by converting the sheets of his bed into a rope. Whoever knows the situation of that fortress will be amazed at the boldness of this attempt; we are told that the duke's valet, the only domestic he was allowed to have, making the experiment before his master, broke his neck; upon which the duke, lengthening the rope, slid down unhurt, and went on board a ship which his friends had provided, and escaped to France. In 1482 the king began to feel the bad consequences of taking into his favor men of worthless characters. His great favorite at this time was Cochran, whom he had raised from a low station to the dignity of earl of Mar. All historians agree that this man made a most infamous use of his power. He obtained at last a liberty of coinage, which he abused so much as to endanger an insurrection; for he issued a base coin called black money by the common people, which they refused to take in payments. His skill in architecture had first introduced him to James; but he maintained his power by other arts; for, knowing that the king's predominant passion was the love of money, he procured it by the meanest and most oppressive methods. James had other favorites still less worthy of the royal countenance; Hommil, a tailor; Leonard, a blacksmith; Torrifan, a dancing-master; and some others. The favor shown to these men gave so much offence to the nobility that, after some deliberation, they resolved to remove the king, with some of his least exceptionable domestics (but without offering any violence to his person), to the castle of Edinburgh; and to hang all his worthless favorites over Lauder bridge, the common place of execution. Their deliberation was not kept so secret as not to come to the ears of his favorites, who, suspecting the worst, wakened James before day-break, and informed him of the meeting. He ordered Cochran to repair to it, and to bring him an account of the proceedings. According to Lindesay, who seems to have had very minute information as to this event, Cochran rudely knocked at the door of the church, just after the assembly had finished their consultation; and, upon Sir Robert Douglas of Lochleven informing them that the earl of Mar demanded admittance, the earl of Angus ordered the door to be thrown open; and, rushing upon Cochran, pulled a massy gold chain from his neck, saying, that a rope would become him better; while Sir Robert Douglas stripped him of a costly hunting horn he wore by his side, telling him he had been too long the hunter of mischief. Cochran, astonished, asked them whether they were in jest or earnest, but they soon convinced him they were in earnest, by pinioning down his arms with a halter. The

earl of Angus, with some of the chief lords, attended by a detachment of troops, then repaired to the king's tent, where they seized his other favorites, Thomas Preston, Sir William Rogers, James Hommil, William Torfifan, and Leonard, and upbraided him in rude terms with his misconduct in government, and even in private life. James only interceded for the safety of a young gentleman, Ramsay of Balmain. Cochran, with his other favorites, were hanged over Lauder bridge as proposed, and he himself was conducted, under easy restraint, to the castle of Edinburgh. Though confined, he here behaved with great spirit; and refused to pardon those who had confined him, or had any hand in the execution at Lauder. At last, however, he was relieved by the duke of Albany, at the queen's desire. He accomplished his deliverance, as some say, by surprising the castle of Edinburgh; others say the gates were opened, upon a formal requisition made by two heralds; the king then repaired to the abbey of Holyrood-house with his brother, who acted now as his first minister. All the lords who were near the capital came to pay him their compliments; but James was so much exasperated at what had happened that he committed sixteen of them prisoners to the castle. After his release James granted a patent to the citizens of Edinburgh, and enlarged their privileges. In 1487 he finished the secret negotiations in which he had engaged with Henry VII. king of England. The principal articles agreed upon between the two monarchs were, That king James's eldest son should marry Catherine, the third daughter of Edward IV., and sister to the princess Elizabeth, then queen of England; and that James, who was now a widower, should marry queen Elizabeth. A third marriage was also to be concluded between the duke of Rothesay and another daughter of Edward IV. To complete these treaties, and end all controversies concerning the town of Berwick, which the king of Scotland much desired to possess, a congress was to be held the ensuing year. In the mean time a most powerful confederacy was formed against the king; the origin of which was his passion for architecture. Being pleased with the situation of Stirling castle, he resolved to give it all the embellishments which art could bestow; and about this time made it the chief place of his residence. He raised within it a hall, which at that time was deemed a noble structure; and a college, which he called the chapel royal, endowed with an archdeacon who was a bishop, a subdean, treasurer, chanter, &c., and a double set of the other officers usually belonging to such institutions. The expenses necessary for maintaining these establishments were considerable, and the king had resolved to assign the revenues of the rich priory of Coldingham for that purpose. This priory had been generally held by the Hume family, who, through length of time, considered it as their property; they therefore strongly opposed the king's intention. The dispute seems to have lasted some years; for the former parliament passed a vote annexing the priory to the king's chapel royal; and the parliament of this year had passed a statute strictly prohibiting all persons, spiritual and temporal,

to attempt any thing directly or indirectly, contrary or prejudicial to the said union and annexation. The Humes resented their being stripped of so gainful a revenue, the loss of which affected most of the gentlemen of that name; and they united themselves with the Hepburns, another powerful clan in that neighbourhood, in an association, by which both families engaged to stand by each other, and not to suffer any prior to be received for Coldingham, if he was not of one of their surnames. The lords Gray and Drummond soon joined the association; as did many other noblemen and gentlemen, who had their own causes of discontent. Their agents gave out, that the king was grasping at arbitrary power; that he had acquired his popularity by deep hypoerisy; and that he was resolved to be signally revenged upon all who had any hand in the execution at Lauder. The earl of Angus, who was the soul of the confederacy, advised the conspirators to apply to old earl of Douglas to head them; but that nobleman was now dead to all ambition, and, instead of encouraging the conspirators, pathetically exhorted them to break off all their rebellious connexions, and return to their duty. Finding he could not prevail with them, he wrote to all the numerous friends and descendants of his family, and particularly to Douglas of Cavers, sheriff of Teviotdale, dissuading them from entering into the conspiracy, some of his letters to this effect are still extant. This great man survived the application but a short time; for he died without issue at Lindores, on the 15th of April, 1488; and in him ended the first branch of that noble house. He was remarkable for being the most learned of all the Scotch nobility of his time, and for the comeliness of his person.

James appears to have been no stranger to the proceedings of the conspirators; but, though he dreaded them, he depended upon the protection of the law, as they did upon his pusillanimity. His degeneracy in this respect is remarkable. Descended from a race of heroes, he was the first of his family who had been branded with cowardice. But his conduct at this time fully justifies the charge. Instead of vigorously supporting the execution of the laws in his own person, he shut himself up in his castle of Stirling, and raised a body guard; the command of which he gave to Bothwel, master of his household. He likewise issued a proclamation, forbidding any person in arms to approach the court; and Bothwel had a warrant to see the same put into execution. Though the king's proceedings in all this were perfectly agreeable to law, yet they were given out by his enemies as so many indications of his aversion to the nobility, and served only to induce them to parade the country in more numerous bodies. The connexions entered into by James with Henry alarmed the conspirators, however, and made them resolved to strike the great blow, before he could avail himself of an alliance that seemed to place him above all opposition. The acquisition of Berwick to the crown of Scotland, which was looked upon to be as good as concluded; the marriage of the duke of Rothesay with the daughter of the dowager and sister to the consort

queen of England; and, above all, the strict harmony which reigned between James and the states of his kingdom, rendered them in a manner desperate. Besides the earl of Angus, the earls of Argyle and Lennox favored the conspirators; yet their success may be said to have been entirely owing to his English connexions; which they made use of to affirm that Scotland was soon to become a province of England, and that James intended to govern his subjects by an English force. These allegations inclined many, even of the moderate party, to their cause; and they soon took the field, and appointed their rendezvous; until all the south of Scotland was in arms. James continued to rely upon the authority of his parliament; and summoned, in the terms of law, the insurgents to answer at the proper tribunals for their breaches of the peace. The conspirators, far from paying any regard to his citations, tore them in pieces, buffeted and otherwise maltreated the messengers, and set the laws at open defiance. Even north of the Forth, the heads of the houses of Gray and Drummond spread the spirit of disaffection through the populous counties of Fife and Angus; but the counties north of the Grampians continued firm in their duty. The duke of Rothesay was then a promising youth about fifteen years of age; and the subjecting the kingdom of Scotland to that of England being the chief, if not the only cause urged by the rebels for their appearing in arms, they naturally cast their eyes upon that prince, as his appearance at their head would give strength and vigor to their cause; and in this they were not deceived. James, in the mean time, finding that the inhabitants of the southern provinces were either engaged in the rebellion, or at best observed a cold neutrality, embarked on board of a vessel which was then lying in the frith of Forth, and passed to the north of that river, not finding it safe to go by land to Stirling. Arriving at the castle, he gave orders that the duke of Rothesay should be put under the care of Schaw, of Sauche, whom he had made its governor, charging him not to suffer that prince on any account to depart from the fort. The rebels, giving out that James had fled to Flanders, plundered his equipage and baggage before they passed the Forth; and thus supplied themselves with a large sum of money, which proved of the utmost consequence to their affairs. They then surprised the castle of Dunbar, and plundered the houses of every man to the south of the Forth whom they suspected of being a royalist. James was all this time making a progress, and holding courts of justice in the north, where the great families were entirely devoted to his service, particularly the earls of Huntley, Errol, and Marshal. But every day brought him fresh alarms from the south. The conspirators, notwithstanding the promising appearance of their affairs, found, that in a short time their cause must languish, and their numbers dwindle, unless they were furnished with fresh pretexes, and headed by a person of the greatest authority. While they were deliberating who that person should be, the earl of Angus boldly proposed the duke of Rothesay; and an immediate application was made to Schaw, the young prince's

governor, who secretly favored their cause, and was prevailed upon by a considerable sum of money to put the prince into their hands, and declare for the rebels. James, having ordered all the forces of the north to assemble, hurried to Perth, where he appointed the rendezvous of his army, which amounted to 30,000 men. Among the other noblemen who attended him was the famous lord David Lindsay of the Byres (an officer of great courage and experience, having long served in foreign countries), who headed 3000 foot and 1000 horse, mostly raised in Fifeshire. Upon his approaching the king's person, he presented him with a horse of remarkable spirit and beauty, and informed his majesty that he might trust his life to his agility and sure-footedness. The lord Ruthven, who was sheriff of Strathern, and ancestor to the unfortunate earls of Gowry, joined James at the head of 3000 well armed men. The whole army being assembled, James proceeded to Stirling; but was astonished, when he was not only denied entrance into the castle, but saw the guns pointed against his person, and understood, for the first time, that his son was at the head of the rebels. Schaw pretended that the duke of Rothesay had been carried off against his will; but the king's answer was, 'Traitor, thou hast deceived me; and if I live I shall be revenged on thee, and thou shalt be rewarded as thou hast deserved.' James lay that night in the town of Stirling, where he was joined by all his army; and, understanding the rebels were advancing, he formed his line of battle. The earl of Athol, his uncle, who was trusted by both parties, proposed an accommodation; which was effected, according to Abercromby and other historians; but the terms are not recorded. The earl of Athol surrendered himself as a hostage into the hands of the rebels. James was sensible of the advantage which public clamor gave to his enemies; and he applied to the kings of France and England, and the pope, for their interposition. His holiness named Adrian de Castello for his nuncio on this occasion, and the two kings threatened to raise troops for the service of James. But he, by a strange fatality, left the strong castle of Edinburgh, where he might have been in safety till his friends reassembled; and, crossing the Forth, made another attempt to be admitted into the castle of Stirling. Again he was disappointed, and informed that the rebels were at Torwood in the neighbourhood, and ready to give him battle. He was at this time in possession of the castle of Blackness; his admiral, Wood, commanded the Forth; and his loyal subjects in the north were upon their march to join him. Hlawthornden says that, while he remained at Blackness, he was attended by the earls of Montrose, Glencarn, and lords Maxwell and Ruthven. To give his northern friends time to join him, he proposed a negotiation; but that was soon at end, upon the rebels peremptorily requiring him to resign his crown to his son, that is, to themselves. The latter had been injured to war, and consisted chiefly of borderers, well armed and disciplined; in which they had the advantage of the king's Lowland subjects, who were unaccustomed to arms. The forces of James were at Falkirk; but they soon passed the Car-

ron, encamp'd above the bridge near Torwood, and made such dispositions as rendered a battle unavoidable. He was encamp'd at a small brook named Sauchie-burn, near the same spot of ground where the great Bruce had defeated the English under Edward II. The earl of Monteith, the lords Erskine, Graham, Ruthven, and Maxwell, commanded the first line of the king's army. The second was commanded by the earl of Glencairn, who was at the head of the Westland and Highland men. The earl of Crawford, with the lord Boyd and Lindsay of Byres, headed the rear, wherein the king's main strength consisted, and where he himself appeared in person, completely armed, and mounted upon the horse which had been presented to him by Lindsay. The first line of the royalists obliged that of the rebels to give way; but, the latter being supported by the Annandale men and borderers, the first and second line of the king's army were beat back. The little courage James possessed had forsaken him on the first onset; and he put spurs to his horse, intending to gain the banks of the Forth, and to go on board one of Wood's ships. In passing through the village of Bannockburn, however, a woman who was filling her picher at a brook, frightened at the sight of a man in armor galloping full speed, left it behind her; and, the horse taking fright, the king was thrown to the ground, and carried, bruised and maimed, by a miller into his hovel. He immediately called for a priest to make his confession; and, the rustics demanding his name and rank, 'I was,' said he, 'your king this morning.' The woman, running to the door, called in a priest to confess the king: being introduced into the hovel, he saw the king covered with a coarse cloth; and, kneeling by him, he asked James whether he thought he could recover if medically attended? James answering in the affirmative, the villain pulled out a dagger, and stabbed him to the heart. Such is the dark account given of this prince's unhappy end. The name of the person who murdered him is said to have been Andrew Borthwick, a priest, one of the pope's knights. Some pretend that the lord Gray, and others that Robert Stirling of Keir, was the regicide; and even Buchanan is uncertain as to the name of the person who gave him the fatal blow.

It is probable that the royalists lost the battle through the cowardice of James. Even after his flight his troops fought bravely; but they were discouraged on receiving certain accounts of his death. The prince, young as he was, had an idea of the unnatural part he was acting, and before the battle had given a strict charge for the safety of his father's person. Upon hearing that he had retired from the field, he sent orders that none should pursue him; but they were ineffectual, the rebels being sensible that they could have no safety but in the king's death. When that was certified, hostilities seemed to cease; nor were the royalists pursued. The number of slain must have been considerable, as the earl of Glencairn, the lords Sempil, Erskine, and Ruthven, and other gentlemen of great eminence, are mentioned. As to the duke of Rothesay, who was now king, he appeared inconsolable when

he heard of his father's death; but the rebels endeavoured to efface his grief, by the profusion of honors they paid him as king. Seeing his remorse and anguish, in reflecting on the unnatural part he had acted, they became apprehensive indeed for their own safety. The catastrophe of James III., however, was not yet become public; and it was thought that he had gone aboard some of the ships belonging to Sir Andrew Wood. Willing to indulge the hope as long as possible, the prince desired an interview with the admiral; but the latter refused to come on shore, unless he had hostages for his safety. These being delivered, Sir Andrew waited upon the young king at Leith. He had by messages assured him that he knew nothing of his father; and had even offered to allow his ships to be searched: yet such was the anxiety of the new king that he could not be satisfied till he had examined him in person. Young James had been long a stranger to his father. When Wood, therefore, entered the room, he asked him, 'Are you my father?' 'I am not,' replied Wood, bursting into tears, 'but I was your father's true servant, and while I live I shall be the determined enemy of his murderers.' This did not satisfy the lords, who demanded whether he knew where the king was. The admiral replied in the negative; and upon their questioning him concerning his manœuvres on the day of battle, when his boats were seen plying backwards and forwards, he told them that he and his brother had determined to assist the king in person; but all they could do was to save some of the royalists. 'I would to God,' says he, 'my king was there safely; for I would defend and keep him skaitless from all the traitors who have cruelly murdered him; and I think yet to see the day that shall behold them hanged and drawn for their demerits.' This spirited declaration, and the freedom with which it was delivered, struck the guilty part of the council with dismay; but the fear of sacrificing the hostages procured Wood his freedom, and he was suffered to depart. When he came on board his fleet, he found his brother preparing to hang the two lords who had been left as hostages; and this would certainly have been their fate, had the admiral been longer detained.

The council now removed to Edinburgh, where James IV. was crowned on the 24th of June, 1487. In October this year the nobility, and others interested, converted themselves into a parliament, and passed an act by which they were indemnified for their rebellion against their late sovereign; after which the act was exemplified under the great seal of Scotland, that it might be produced in their justification, if called for by any foreign prince. They next proceeded to the arduous task of vindicating their rebellion in the eyes of the public; and so far did they gain upon the new king by flattery, that he consented to summon the lords who had taken part with his father, before the parliament, to answer for their conduct. In consequence of this, no fewer than twenty-eight lords were cited to appear at Edinburgh in the space of forty days. The first upon the list was lord David Lindsay of the Byres, who was called upon to answer for

the cruel coming against the king at Bannockburn with his father, giving him council to have devoured the king's grace here present; and to that effect giving him a sword and a good horse to fortify him against his son.' Lord Lindsay was remarkable for the bluntness of his conversation and the freedom of his sentiments: being irritated by this charge, he delivered himself in such a manner, concerning the treason of the rebellious lords, as abashed the boldest of them; and, as they were unable to answer him, all they could do was to press him to throw himself upon the king's clemency; which he refused to do. His brother, Patrick Lindsay, undertook to be his advocate, and apologised upon his knees for the roughness of his behaviour; upon which Lindsay was released, on entering into recognizance to appear again at an appointed day: however, he was afterwards sent prisoner by the king's order, for a twelve-month, to the castle of Rothesay. The regicides now endeavoured to gain the public favor by affecting a strict administration of justice. The king was advised to make a progress through the kingdom, attended by his council and judges; while, in the mean time, certain noblemen and gentlemen were appointed to suppress all kinds of disorders in their own lands and those adjoining, till the king came to the age of twenty-one. The memory of the late king was branded in the most opprobrious manner. All justices, sheriffs, and stewards, who were possessed of heritable offices, but who had taken up arms for him, were either deprived of them for three years, or rendered incapable of possessing them for ever. All the young nobility, who had been disinherited by their fathers for taking arms against the late king, were, by act of parliament, restored to their successions. At last, to give a kind of proof to the world that they intended only to resettle the state of the nation, without prejudice to the lower ranks of subjects, who did no more than follow the examples of their superiors, it was enacted, 'That all goods and effects taken from the burghesses, merchants, and those who had only personal estates, or, as they are called unlanded men, since the battle of Stirling, were not only to be restored, but the owners were to be indemnified for their losses; and their persons, if in custody, to be set at liberty. Churchmen, who were taken in arms, were to be delivered over to their ordinaries, to be dealt with by them according to the law.' The castle of Dunbar was ordered to be demolished; and some statutes were enacted in favor of commerce, and for the exclusion of foreigners. These last acts were passed with a view to recompense the boroughs, who had been very active in their opposition to the late king. However the lords, before they dissolved their parliament, thought it necessary to give some public testimony of their disapproving the late connexion with England. It was therefore enacted, 'That as the king was now of age to marry a noble princess, born and descended of a noble and worshipful house, an honorable embassy should be sent to the realms of France, Britanny, Spain, and other places, to conclude the matter.' This embassy was to be splendid: and to consist of a bishop, an earl, or

lord of parliament, a secretary, clergyman, and knight. They were to be attended by fifty horsemen; and £5000 was allowed them for expenses: they were empowered to renew the ancient league between France and Scotland; and, in the mean time, a herald, or, as he was called, a trusty squire, was sent abroad to visit the several courts, to find out a proper match for the king. One considerable obstacle, however, lay in the way of this embassy. The pope had laid under an interdict all those who had appeared in arms against James III.; and the party who now governed Scotland were looked upon by all the powers of Europe as rebels. The embassy was therefore suspended for a considerable time, and it was not till 1491 that the pope could be prevailed upon to take off the interdict. In the mean time the many good qualities which discovered themselves in the young king began to conciliate the affections of his people. Being considered, however, as little better than a prisoner in the hands of his father's murderers, several of the nobility made use of that as a pretext for taking arms. The most forward of these was the earl of Lennox, who with 2000 men attempted to surprise the town of Stirling; but, being betrayed by one of his own men, he was defeated, and the castle of Dumbarton, of which he was the keeper, taken by the opposite party. In the north, the earls of Huntley and Marshal, with the lord Forbes, complained that they had been deceived, and declared their resolution to revenge the late king's death. Forbes, having procured the bloody shirt of the murdered prince, displayed it on the point of a lance, as a banner under which all loyal subjects should enlist themselves. However, after the defeat of Lennox, the northern chieftains found themselves incapable of marching southward. The cause of the murdered king was next undertaken by Henry VII. of England, who made an offer to Sir Andrew Wood of five ships to revenge it. The admiral accepted the proposal; but the English behaving as pirates, and plundering indiscriminately all who came in their way, he thought proper to separate himself from them. Upon this James was advised to send for the admiral, offer him a pardon, and a commission to act against the English freebooters. Wood accepted of the king's offer; and, being well provided with ammunition and artillery, he, with two ships only, attacked the five English vessels, all of which he took, and brought their crews prisoners to Leith. This conduct of Wood was highly resented by the king of England. The Scottish admiral's ships had been fitted out for commerce as well as war, and Henry commanded his best sea-officer, Sir Stephen Bull, to intercept him on his return from a commercial voyage to Flanders. Wood had no more than two ships with him: the English admiral had three; and those much larger, and carrying a greater weight of metal. The English took their station at the island of May, in the mouth of the Frith of Forth, and, having come unawares upon the enemy, fired two guns as a signal for their surrender. The Scottish commander encouraged his men as well as he could; and, finding them determined to stand by him,

began the engagement in sight of numberless spectators on both sides of the Frith. The fight continued all that day and was renewed with redoubled fury in the morning; but, in the mean time, the ebb-tide and a south wind had carried both squadrons to the mouth of the Tay. Here the English fought under great disadvantages, by reason of the sand-banks; and, before they could get clear of them, all the three were obliged to submit to the Scots, who carried them to Dundee. Wood treated his prisoners with humanity; and, having afterwards presented them to king James, the latter dismissed them not only without ransom, but with presents, and a letter to king Henry. To this the English monarch returned a polite answer; a truce was concluded, and all differences were accommodated. James all this time had continued to display such moderation in his government, and appeared to have the advantage of his subjects so much at heart, that they became gradually well affected to his government, and in 1490 all parties were fully reconciled; the next year the happiness of his kingdom was completed by the pope taking off his interdict, and giving the king absolution for his father's death. Tranquillity being thus restored, the negotiations concerning the king's marriage began to take place, but met with several interruptions. In 1493 Henry VII. proposed a match between James and his cousin, the princess Catharine; but this was treated with contempt. Henry made in 1495 another offer of alliance with James; proposing a marriage betwixt him and his eldest daughter Margaret. This proposal was accepted: but, at the time in which he was negotiating the marriage, he not only protected Perkin Warbeck, the avowed pretender to the crown of Henry, but invaded England on his account. This conduct was highly resented by the English parliament; but Henry himself forgave even this insult, and the marriage negotiations were resumed. The bride was not more than ten years and six months old; and, being only the fourth degree of blood from James, it was necessary to procure a dispensation from the pope. This being obtained, a treaty of perpetual peace was concluded between the two nations, on the 1st of July, 1503, being the first that had taken place for 170 years, or since the peace of Northampton, between Robert I. and Edward III. One of the great ends that Henry had in view in promoting this marriage was to detach James from the French interest; no sooner, therefore, was the treaty signed, than he wrote to his son-in-law to this purpose; who, however, politely declined to break with his ancient ally. On the 16th of June, the royal bride set out from Richmond in company with her father, who convoyed her as far as Collyweston, the residence of his mother, the countess of Richmond. After passing some days there the king resigned his daughter to the care of the earls of Surrey and Northumberland. On the borders of Scotland a number of her retinue were permitted to take leave; but those who remained still made a royal appearance. At Lamberton church they were met by James, attended by a numerous train of his nobility and officers of state; and at Edinburgh the nuptials

were celebrated with the greatest splendor. On this occasion the Scots vied, we are told, with the most extravagant of their guests in luxury and display. After the celebration of the nuptials James appears to have enjoyed a tranquillity almost unknown to any of his predecessors; and began to make a considerable figure among the European potentates. But the magnificence of his court and embassies, his liberality to strangers and to learned men, his costly edifices, and, above all, the large sums he laid out in ship-building, brought him into some difficulties; and he so far attended to the advice and example of his father-in-law that he supplied his necessities by reviving dormant penal laws, particularly with regard to wardships and old titles of estates. Though he did this without assembling his parliament, yet he found agents who justified his proceedings, in the manner of the English ministers of the day, Empson and Dudley. At last, however, touched with the sufferings of his subjects, he ordered all prosecutions to be stopped. He even went farther: and, sensible of the detestation into which his father-in-law's avarice had brought himself and his administration, he ordered the ministers who had advised him to these shameful courses to be imprisoned; and several of them died in confinement. About this time James applied himself with incredible assiduity to naval affairs; one ship which he built, the *St. Michael*, is supposed to have been the largest then in the world. She was 240 feet long, thirty-six wide within the sides, and ten feet thick. She carried 300 small artillery, twelve cannons, and 1000 men. The expense was £30,000. He worked with his own hands in building it, and Scotland at this time produced excellent seamen. The first essay of his arms by sea was in favor of his kinsman John of Denmark. This prince was brother to Margaret queen of Scotland; and had partly been called to the throne of Sweden, and partly possessed it by force. He was opposed by the administrator Sture, whom he pardoned after he was crowned. Sture, however, renewing his rebellion, and the Norwegians revolting, John was forced to return to Denmark; but left his queen in possession of the castle of Stockholm, which she bravely defended. This heroic princess became a great favorite with James; and several letters that passed between them are extant. The king of Denmark, next to the French monarch, was the favorite ally of James. It appears, from the histories of the north, that both James and his father had given assistance to him in reducing the Norwegians; and he resolved to become a party in the war against the Swedes, if they continued in their revolt. Previous to this he sent an ambassador to offer his mediation between John and his subjects. The mediation was accepted and the negotiations opened at Calmar. The deputies of Sweden not attending, John prevailed with those of Denmark and Norway to pronounce sentence of forfeiture against Sture and all his adherents. In the mean time the siege of the castle of Stockholm was pressed so warmly that the garrison was diminished to a handful, destitute of all kind of provisions; so that the brave queen was forced to capitulate on

condition that she should be suffered to depart for Denmark; a stipulation perfidiously violated by Sture, she being confined in a monastery. On this occasion James resolved to employ his maritime power. He wrote a letter, conceived in the strongest terms, to the archbishop of Upsal, the primate of Sweden, exhorting him to employ all his authority in favor of the king; and another to the Lubeckers, threatening to declare war against them, as well as the Swedes, if they continued to assist the rebels. According to Hollingshed, James, in consequence of king John's application, gave the command of an army of 10,000 men to the earl of Arran, who replaced John upon his throne. It is certain that, had it not been for James, John must have sunk under his enemies. Sture, hearing that a considerable armament was fitting out in Scotland, agreed to release the queen, and to conduct her to the frontiers of Denmark; where he died. By this time James's armament, which was commanded by the earl of Arran, had set sail; but, perceiving that all matters were adjusted between John and the Swedes, the ships returned sooner than James expected, 'which,' says he, in a letter he wrote afterwards to the queen, 'they durst not have done, had they not brought me an account that her Danish majesty was in perfect safety.' The severity of John having occasioned a fresh revolt James again sent a squadron to his assistance, which appeared before Stockholm, and obliged the Lubeckers to conclude a new treaty. James, having thus discharged his engagements with his uncle, turned his attention towards the Flemings and Hollanders, who had insulted his flag, on account of the assistance he had afforded the duke of Gueldres. He gave the command of a squadron to Barton; who put to sea and treated all the Dutch and Flemish traders who fell into his hands as pirates, sending their heads in hogsheads to James. Soon after Barton returned to Scotland, and brought with him a number of rich prizes. James was then so much respected upon the continent that no resentment was shown either by the court of Spain, whose subjects those Netherlands were, or any other power in Europe, for this vigorous proceeding. The peace with England continued all the reign of Henry VII.; nor did our Henry VIII., though he had not the same reason as his father to conciliate the Scots, for some time show any disposition to break with them. A breach, however, did soon take place. About thirty years before John Barton, a relation of the above commander, was taken in a trading vessel by two Portuguese captains; and Barton, with several Scotchmen, were killed in defending their property. The action was esteemed cowardly as well as piratical, because it was done under the protection of a large Portuguese squadron. The ship and the remaining part of the crew, with the cargo, were carried to Portugal, whence no redress could be obtained; and James III. granted letters of marque to John and Robert Bartons, heirs to the Barton who had been murdered. Upon the accession of James IV. the letters of marque were recalled, and a friendly correspondence was entered into between James and the king

of Portugal. No redress, however, was to be had from the latter; and Robert Barton being made a prisoner, and his ship a prize, was detained in Zealand, till James procured his deliverance by applying in his favor to the emperor Maximilian. Sir Andrew Barton took part in the quarrel; and, having obtained a like letter of marque, he made dreadful depredations on the Portuguese trade. According to English authors, he also plundered many English ships, on pretence of their carrying Portuguese property, and made the navigation of the narrow seas dangerous to Englishmen. The court of London received daily complaints of his depredations; but, Henry being averse to quarrel with James, these complaints were heard with coldness. The earl of Surrey had then two sons; and he declared to Henry's face that, while he had an estate that could furnish out a ship, or a son who was capable of commanding one, the narrow seas should not be thus infested. Henry could not discourage his generous offers; and letters of marque were accordingly granted to the two young noblemen, Sir Thomas and Sir Edward Howard. The prizes that Barton had taken had rendered his ships immensely rich, consequently they were heavy laden, and unfit for fighting; while the ships of the Howards were clean, and of a superior force. After encountering a great deal of foul weather, Sir Thomas Howard came up with the Lyon, commanded by Sir Andrew Barton; and Sir Edward fell in with the Unicorn, Barton's other ship. The event was such as might be expected from the inequality of the match. Barton was killed, while he was animating, with his whistle, his men to hold out to the last; and both the Scottish ships, being taken, were carried in triumph to London. James could never forgive the loss of this brave officer. He sent to demand satisfaction; but was answered that Barton and his crew were lawless pirates, and that what had been done against them ought never to be re-sented amongst sovereign princes. James asserted that Barton was no pirate, because he bore his commission; and that he ought to have been convicted of piratical acts before he was treated as guilty. Henry intimated to James that he was willing to accommodate the affair by way of negotiation; but James rejected the proposal with disdain. Various negotiations took place concerning this and other affairs till 1513; when James, fully resolved upon a war with England, thought it highly necessary that it should have the sanction of his parliament, which he accordingly assembled. The young nobility were not only inspired with the sentiments of James, but had been won over by the French; and the majority of them, as well as of the clergy, were ripe for a war with England. The older statesmen, on the other hand, who saw the flourishing state of Scotland, arising from a long peace, dreaded the ruinous consequences of a war. The queen naturally headed this party; and she was joined by the earl of Angus and the sober part of the nobility. But their arguments made no impression on James, who had received a present from Louis XI. of four ships laden with wine and flour, and two

ships of war completely equipped. He promised to the French queen, upon his honor, that he would take the field against the English; and she had sent him a fresh letter, gently reproaching him for want of gallantry. In short, the reasonings of the wisest and best part of the nobility were over-ruled, and an expedition against England was resolved on. The earl of Hume, who was chamberlain of Scotland, was, at this juncture, at the head of 7000 or 8000 men, with whom he committed great devastation on the English borders. Henry's queen, Catharine of Spain, whom he had left regent of his dominions, issued a commission of array, directed to Sir Thomas Lovel, K. G., for assembling the militia of the counties of Nottingham, Derby, Warwick, Leicester, Stafford, Rutland, Northampton, and Lincoln. The management of this war, however, was chiefly committed to the earl of Surrey, who assembled the militia of Chester, Lancaster, Northumberland, Westmoreland, Cumberland, and the bishopric of Durham. Hume had by this time laid great part of Northumberland waste; and his men were returning home laden with booty. The earl of Surrey, resolving to intercept them, ordered Sir William Bulmer to form an ambush with 1000 archers, at a place called Broomhouse. Bulmer executed his orders with great success. The archers assaulted the Scots all at once, and made such good use of their arrows that their main body was put to flight, 500 killed, and 400 taken, with lord Hume's standard; the greatest part of the plunder being recovered at the same time. The Scots styled this expedition the Ill raid. James was more exasperated than ever by this defeat, and continued his preparations for invading England with additional vigor. His queen did all that became a prudent wife to divert him from his purpose. She endeavoured to work upon his superstition, by recounting to him her ominous dreams. James treating these as mere fictions of the brain, she had recourse to other arts. While he was waiting at Linlithgow for the arrival of his army from the north and the Highlands, he assisted one afternoon at the vespers in the church of St. Michael. Being placed in one of the canons' seats, a venerable man entered, dressed in a long garment of an azure color, and girded round with a towel or roll of linen, his forehead bald, and his yellow locks hanging down his shoulders; in short, he was dressed and formed like St. Andrew, the apostle of Scotland. The church being crowded, this personage made his way to the king's seat; and, leaning over it, said, 'Sire, I am sent hither to intreat you for this time to delay your expedition, and to proceed no farther in your intended journey; for, if you do, you shall not prosper in your enterprise. I am further charged to warn you, if you be so refractory as to go forward, not to use the acquaintance, company, or counsel of women, as ye tender your honor, life, and estate.' After delivering these words he retired through the crowd, and was seen no more, though diligent enquiry was made after him. That this scene was enacted, seems to be past dispute; for Sir David Lindsay, who was then a young man, and present in the church, reported it both to Buchanan and Lind-

say the historians. It is the opinion of historians that the whole was a contrivance of the queen, to whose other afflictions the stings of jealousy were now added. In one of the Scottish inroads into England, one Heron, the proprietor of the castle of Ford, had been taken prisoner and sent to Scotland; where he was detained on a charge of murder, of which he seems to have been innocent. The English historians mention this as having passed after James entered England; but, from the latter part of the supposed phantom's speech, it is probable that it happened before; and that Heron's wife and beautiful daughter had been for some time soliciting James for his deliverance. Be that as it may, James was smitten with the charms of the daughter; and her mother, who was a most artful woman, knew how to avail herself of the conquest. Pretending that she had interest enough to procure the release of lord Johnston and Alexander Home, who were prisoners in England, she was permitted by James to keep a constant correspondence with the earl of Surrey, to whom she is said to have betrayed all James's secrets and measures.

The rendezvous of James's army was at the Barrow-muir, to which James repaired; and, having given orders for the march of his artillery, he lodged at the abbey of Holyrood House. While he was there, another attempt was made to divert him from his purpose of invading England: but James, deaf to all solicitations, mustered his army; and on the 22d August passed the Tweed, encamping that night near the banks of the Twissel. On his arrival at Twisselhaugh, on the 14th, he called an assembly of his lords, and declared that the heirs of all such as should die in the army, or be killed by the enemy during his stay in England, should have their wards, relief, and marriages, of the king; who, upon that account, dispensed with their age. This was the crisis of that prince's fate. Abandoned to his passion for his English mistress, she prevailed with him, at her mother's instigation, to trifle away his time for some days; during which interval the junction of the English army was formed. The earl of Surrey, the English general, was then at Pomfret; but ordered the landholders of the neighbouring counties to certify to him in writing what number of men each could furnish, charging them to be ready at an hour's warning; and laid his plan so as not to bring his army into the field till James had advanced so far into England as to render it difficult for him to retire without a battle. This precaution assisted the lady Ford in persuading James that there was no danger in the delay. In the mean time the earl of Surrey ordered the governors of Berwick and Norham, the two strongest places on the frontiers of England, to prepare for a vigorous resistance; and directed them to certify how long they could hold out; in hopes that, if they made a resolute defence, James would march on, and leave them in his rear. The governor of Norham's answer was, that his castle was so well provided as to leave him no doubt, in case of a siege, to be able to defend it till king Henry should return from abroad and relieve it in per-

son. James, however, besieged it on the 25th of August, and battered it so furiously that he took it by capitulation on the sixth day. James then proceeded to the castle of Etal, belonging to the family of Manners, which he took and demolished likewise, as he also did Wark, and arrived before the castle of Ford. The Scottish army is generally allowed to have consisted of at least 50,000 men when it passed the Tweed. At this time it was encamped on the heights of Cheviot, in the heart of a country naturally barren, and now desolate through the precautions taken by the English general. Being obliged to extend their quarters, for the benefit of subsistence, the mercenary part of them had acquired a considerable plunder, with which, as usual, they retired to their own country, as many more did for want of subsistence. The earl of Surrey knew their situation, and ordered the rendezvous of his army, first at Newcastle, and then near Northam, having certain intelligence of the vast desertions daily happening in the Scottish army. The wetness of the season rendered his march, especially that of the artillery, extremely difficult; but, being joined by several persons of distinction, he arrived on the 3d of September at Alnwick, where he was reinforced by 5000 hardy veteran troops, sent from the English army on the continent; so that his army now consisted of 26,000 men, all completely provided for the field. James having, in the manifesto which he dispersed on his entering England, given the death of Barton as one of the causes of his invasion, the lord-admiral had prevailed with Henry to send him upon this service; and he informed James by a letter that he intended to justify the death of that pirate in the front of the English army. By this time the army of James was, by desertion and other causes, reduced to less than half its numbers; but the chief misfortune attending it was his own conduct. His indolence, inactivity, and scandalous amours, at such a season, had disgusted several of his greatest and best friends; some of whom suspected a correspondence between the English lady and the earl of Surrey. James was deaf to all their remonstrances; until the earl of Angus declared that he was resolved to return home, as he foresaw the ruin of the army was inevitable. He accordingly withdrew to Scotland, but left behind him his two sons. Lord Hume and the earl of Huntley were likewise discontented. The former had brought his men into the field; but, according to some historians, with a design rather to betray than to serve James; but Huntley, though he disliked his conduct, remained firmly attached to his person. The defection or backwardness of those great men seemed to make no impression upon James. He had chosen a strong camp in the neighbourhood of Ford, on the side of a mountain called Flodden Hill; and separated from the English army by the river Till. This advantageous situation put the earl of Surrey under great difficulties; for it rendered the Scottish army inaccessible, as it was fortified by artillery, and was well supplied with provisions. The earl drew up a manifesto, with which he charged Rouge Croix herald, who was attended by a trumpet. It contained some pro-

posals for an exchange of prisoners, which seems to have been calculated to give the lady Ford the more credit with James; but concluded with reproaches for his perfidious invasion of England, and a defiance to a general battle. The herald was farther charged with a verbal commission to James, that the earl of Surrey had issued orders that no quarter should be given to any of the Scottish army but the king. A council of war was called on this occasion; in which the earl of Huntly and others made strong remonstrances against a general engagement. They showed how fatal it must be to Scotland, should it prove unsuccessful; and that the wisest course James could follow was to return home, where, if he was pursued by the enemy, he could fight to great advantage. Huntly, however, added that he was equally ready to share in his majesty's danger as his glory. Other noblemen, and the French ambassador, represented a retreat as disgraceful to the nobility of Scotland and the arms of James, and used many romantic arguments, which but too well suited with the king's disposition. According to Drummond, the council were of opinion that the king should immediately besiege Berwick; but the majority were of opinion that it was beneath the dignity of James to fight the earl of Surrey at that nobleman's requisition. Patrick lord Lindsay of Byres, who was president of the council, expressed himself so strongly on that head, that James, in a passion, is said by the historian Lindsay to have sworn that if he lived to return to Scotland he would hang that nobleman at his own gate. He ordered Rouge Croix to be called in; and, after treating him with great politeness, sent a message to the earl of Surrey by one of his own heralds (Islay), importing that he would give the English battle on the Friday following; and that had he received such a message from the earl even in his own castle of Edinburgh, he would have left that, and all other business, to have fought him. With this message, a manifesto, in vindication of James's conduct, was sent by the same herald. The earl of Surrey, who was then so infirm that he was carried about in a sedan or chariot, had foreseen that James would return an answer by one of his own heralds; but, unwilling that he should obtain any knowledge of the situation of the English camp, he ordered proper persons to receive him at two miles' distance, where soon after he attended in person. Islay executed his commission, and the English general dismissed him, after bestowing great compliments upon the honor and courage of James. The earl then ordered his army to march in the line of battle towards Wollerhaugh. There he was joined by Rouge Croix, who gave him an account of the strong situation of the Scottish camp; but the advanced posts of the English army were then within three miles of the enemy, and the earl of Surrey found his difficulties daily increasing. The roads were broken up, the swelling of the rivers cut him off from the necessary communications for supplying his army, and nothing but a battle could save him either from being disbanded or destroyed. James seems to have so far regarded the advice of his wisest counsellors,

as not to abandon his strong situation. They endeavoured to persuade him that it was sufficient for his honor, if he did not decline the battle on the day appointed; and that his engagement did not bind him to fight upon disadvantageous ground. The Scots, at the same time, knew of their enemy's distresses; and warmly represented to their king that he wanted nothing but patience to be victorious. The earl of Surry, however, again sent Rouge Croix to inform James that he was ready to give him battle, and James was nettled at this tacit imputation upon his courage. It is certain that he neglected the necessary precautions for guarding the passages of the Till, which the English crossed, partly at a place where it was fordable, and partly at a bridge. While the English were passing the bridge, Borthwick, master of the Scottish artillery, fell upon his knees, and begged permission from James to point his cannon against them; but James answered in a passion that it must be at the peril of his (Borthwick's) head, and that he was resolved to see all his enemies that day on the plain before him in a body. The earl of Surry, after passing the Till, took possession of Braxton, which lay to the right of the Scottish camp; and by that manœuvre cut off the communication of his enemies with the Tweed, and commanded the river below Eton castle. The Scottish generals saw themselves now in danger of being reduced to the same straits in which their enemies had been involved two days before. James had intelligence that this was far from being the intention of the English general; and imagining that the latter's intention was to take possession of a strong camp upon a hill between him and the Tweed, which would give the English a farther command of the country, he resolved to be before-hand with the earl, and gave orders for making large fires of green wood, that the smoke might cover his march along the height, to take advantage of that eminence. But, while this stratagem concealed his march, the movements of the enemy were also concealed from him: for, when he came to the brow of the height, he found them drawn up in order of battle on the plain, so close to where he was that his artillery must overshoot them. A battle was now not only unavoidable, but the only means of saving the Scottish army. James's person was so dear to his troops that many of them dressed themselves as nearly as they could in the same coats of armour and with the same distinctions that James wore that day. His generals had earnestly desired him to retire to a place of safety, where he would be secure in all events; but he obstinately refused to follow their advice; and on the 9th of September, 1513, early in the morning, dispositions were ordered for the line of battle. The command of the van was allotted to the earl of Huntly; the earls of Lennox and Argyle commanded the Highlanders under James; and the earls of Crawford and Montrose led the body of reserve. The earl of Surry gave the command of his van to his son, the lord admiral; his right wing was commanded by his other son, Sir Edward Howard; and his left by Sir Marjnaduke Constable. The rear was commanded

by the earl himself, lord Dacres, and Sir Edward Stanley. Under those leaders served the flower of all the nobility and gentry then in England. Lord Hume served under the earls of Crawford and Montrose, and Hepburn earl of Bothwell was in the rear. The first movement of the English army was made by the lord admiral, who suddenly wheeled to the right, and seized a pass at Milford, where he planted his artillery so as to command the most sloping part of the ascent where the Scots were drawn up; and it put them into such disorder that the earl of Huntly found it necessary to attack the lord admiral: he drove him from his post; and the consequence must have been fatal to the English, had not his precipitate retreat been covered by some squadrons of horse under the lord Dacres, which gave the admiral an opportunity of rallying. The earl of Surry now advanced to the front, so that the English army formed one continued line, which galled the Scots with perpetual discharges of their artillery and bows. The Highlanders, as usual, impatient to come to a close fight, rushed down the declivity with their broad swords, without order or discipline, and before the rest of the army, particularly the division under lord Hume, advanced to support them. Their impetuosity, however, made a considerable impression upon the main battle; and, the king bringing up the earl of Bothwell's reserve, the conflict became general. By this time the lord admiral, having again formed his men, came to the assistance of his father, and charged the division under the earls of Crawford and Montrose, who were marching to support the Highlanders, among whom the king and his attendants were fighting on foot: while Stanley, making a circuit round the hill, attacked the Highlanders in the rear. Crawford and Montrose, not being seconded by the Humes, were routed; and thus all that part of the Scottish army which was engaged under the king was completely surrounded by the division of the English under Surry, Stanley, and the admiral. In this situation James acted with a coolness not common to his temper. He drew up his men in a circular form, and their valor more than once opened the ranks of the English, or obliged them to stand aloof, and again have recourse to their bows and artillery. The chief of the Scottish nobility made fresh attempts to prevail with James to make his escape while it was practicable; but he obstinately continued the fight. He saw the earls of Montrose, Crawford, Argyle, and Lennox, fall by his side, with the bravest of his men; and, darkness now coming on, he himself was killed by an unknown hand; while the English, ignorant of the victory they had gained, had actually retreated from the field of battle, with a design of renewing it next morning. This disaster was evidently owing to the romantic disposition of the king, and to the want of discipline among his soldiers; though some writers have ascribed it to the treachery of lord Hume. Many of James's domestics knew and mourned over his body; and it appeared that he had received two mortal wounds, one through the trunk with an arrow, and the other on the head with a ball. His coat of armour was presented to queen Ca-

therine, who informed her husband, then in France, of the victory over the Scots. The loss on both sides, in this engagement, is far from being ascertained; though Polydore Virgil, who lived at the time, mentions the loss of the English at 5000, and that of the Scots at 10,000.

After the death of James IV. the administration devolved on the queen dowager; but she being pregnant, and unable to bear the weight of government, accepted of Beaton archbishop of Glasgow and chancellor of Scotland, with the earls of Huntly, Angus, and Arran, to assist her in the public affairs. Soon after her husband's death she had written an affecting letter to her brother the king of England, setting forth the deplorable state of the kingdom, with her own condition, and imploring his friendship and protection for herself and her child. The letter seems never to have been communicated by Henry to his council; but he answered it, and informed his sister that if the Scots would have peace they should have peace, and war if they chose it. 'He added,' says Drummond, 'that her husband had fallen by his own indiscreet rashness, and foolish kindness to France; that he regretted his death as his ally, and should be willing to prohibit all hostility against Scotland during the minority of her son.' For a remedy of present evils, one year and a day's truce was agreed to. But, though Henry might grant this truce to his sister's intreaty, it certainly did not become a national measure; for it appears by a letter dated two years after, from the Scottish council to the king of France, published by Rymer, that the Scots never had desired a truce. So far from that, the French influence, joined to a desire of revenge, remained so strong in the kingdom that, after the meeting of the parliament, some members proposed a renewal of the war. The motion was indeed over-ruled, but they could not be brought to make any advances towards Henry for a peace; and every day was now big with public calamity. The archbishopric of St. Andrew's being vacant, three competitors appeared: viz. 1. Gawin Douglas, abbot of Aberbrothick; 2. John Hepburn, prior of St. Andrew's, a bold, avaricious, restless, but shrewd and sensible priest; and, 3. Forman, bishop of Moray in Scotland, and archbishop of Bourges in France, who had in his interest not only the duke of Albany (son to the traitor duke) first prince of the blood, but also the court of Rome; and, having received the pope's bull and nomination to the dignity, he was considered as the legal archbishop. This preference discouraged Douglas from pursuing his pretensions; but Hepburn being supported by the clan of his own name, and by the Humes, made so formidable a head against his rivals that none could be found daring enough to publish the papal bull. The earl of Hume, however, put himself at the head of his followers, and, notwithstanding all the opposition given by the Hepburns, proclaimed the bull at the cross of Edinburgh; an undertaking which proved that the earl of Hume had more power than the queen; but Hepburn's resolution, and the greatness of his friends, obliged Forman to agree to a compromise. Hepburn was advanced to the see of Moray, without

accounting for the revenues of the archbishopric which he had received during its vacancy; and he gave Forman a present of 3000 crowns, to be divided among his friends and followers.

In April 1514 the posthumous son, of whom the queen had been delivered in Stirling castle, was by the bishop of Caithness baptized Alexander. On the 6th of August she was married to the earl of Angus; than which nothing could be more impolitic. She had neither consulted her brother nor the States of Scotland in the match; and by this marriage she in fact resigned all claim to the regency. But the Douglasses affirmed that the states might lawfully reinstate her in it; and that the peace of the kingdom required it. The earl of Hume put himself at the head of the opposition to this proposal. He dreaded that the farther aggrandisement of Angus must weaken his interest on the borders: and he was joined by a number of the young nobility, who, though otherwise divided, united against Angus. In short, the general opinion was, that the Douglasses were already too great; and that, should the queen be reinstated in the regency, they must be absolute. It was added by the earl of Hume, that, now the queen had made a voluntary abdication of it by her marriage, it ought not to be renewed. At last the duke of Albany was chosen regent. He was possessed of all the qualities requisite; nor did he disappoint the expectations of the public. On his arrival at Glasgow, he took upon him the titles of earl of March, Marr, Garioch, lord of Annandale, and of the Isle of Man, regent and protector of the kingdom of Scotland. At Edinburgh he was received in form by the three estates, and the queen met him at some distance from the town. The parliament then resumed its session, and the three estates took an oath of obedience, till the king, then an infant of four years old, should arrive at maturity. The first thing at which the regent aimed was the conciliating the differences amongst the various contending families in the kingdom; at the same time that he suppressed various daring robbers, one of whom is said to have had no fewer than 800 attendants in his career. He took into favor Hepburn the prior of St. Andrew's, whom he consulted for information concerning the state of Scotland, and who acquainted him with all the feuds and animosities which raged among the great families. He represented the civil power as too weak to curb these potent chieftains: and gave it as his opinion that the regent's administration ought to be supported by foreign arms, meaning those of France. Hepburn also gained an ascendancy over the regent, by money laid out among his domestics, by a fawning and plausible address, and well-directed flatteries; and took care to employ this ascendancy to destroy those who were obnoxious to himself. The earl of Hume thus became obnoxious to the regent, through the insinuations of Hepburn; and soon perceived that neither he nor his friends were welcome guests at court. Alarmed for his safety, he resolved to form a party with the queen-mother and her new husband against the regent: a scheme in which both readily concurred. In the mean time the regent was making a progress

through Scotland, and bloody feuds were raging among the nobles: but, before any remedy could be applied to these disorders, he was informed of the schemes of the queen-mother and her party; and that she had resolved to fly into England with her infants. On this he returned to Edinburgh; set out at midnight, and surprised the castle of Stirling, where he found the queen-mother and her children. The regent, after this bold step, took care to show that the care of the royal infants was his chief study. As he himself was nearly allied to the crown, to remove all suspicions, he committed the care of the king and his brother to three noblemen of the most unexceptionable character, of whom one was the earl of Lennox. They were appointed to attend the princes by turns; to whom also a guard of French and Scots was assigned; and the queen-mother was left at liberty to reside where she pleased. On this the earl of Hume retired to his own estate; whence he was soon after drawn, and obliged to fly into England, by the earls of Arran and Lennox. The queen-mother retired to a monastery at Coldstream; and messengers were despatched to the court of England to know how Henry would have his sister disposed of. He ordered the lord Dacres, his warden of the marches, to attend her to Harbottle castle Northumberland; where she was delivered of her daughter the lady Mary Douglas, mother of Henry lord Darnley, father of James VI. The regent sent ambassadors to Henry, to vindicate his own conduct. He likewise invited the queen to return to Scotland; where she should at all times be admitted to see her children. This offer, however, she declined; and set out for London, where she was affectionately received by her brother. But in the mean time many disorders were committed throughout the kingdom by her party; though, by the interposition of archbishop Forman, they were terminated without bloodshed; and the earl of Angus and others returned to their duty. Lord Hume however refused to surrender, or to accept of the regent's terms; and was of consequence declared a traitor, and his estate confiscated. All this time he had been infesting the borders at the head of a lawless banditti; and now he began to commit such devastations that the regent marched against him at the head of 1000 troops. Hume, being obliged to lay down his arms, was sent prisoner to Edinburgh castle; where the regent very unaccountably committed him to the charge of his brother-in-law the earl of Arran. Hume easily gained over this near relation to his party; and both of them in October 1515 escaped to the borders, where they soon renewed hostilities. Both the earls were now proclaimed traitors, but Hume was allowed fifteen days to surrender himself. This short interval the regent employed in quashing the rebellion, for which purpose the parliament had allowed him 15,000 men. He besieged the castle of Hamilton, the earl of Arran's chief seat, which was in no condition of defence: but he was prevailed upon by Arran's mother, daughter to James II., and his own aunt, to forbear further hostilities, and to pardon her son. Arran accordingly submitted; but the public tranquillity was not restored.

An association at the head of which was the earl of Moray, the king's natural brother, had been formed against the earl of Huntly. That nobleman was too well attended to fear any danger by day; but his enemies introduced some armed troops in the night into Edinburgh. On this a fierce skirmish ensued, in which some were killed on both sides; but farther bloodshed was prevented by the regent, who confined all the lords in prison till he had brought about a general reconciliation. One Hay, who had been very active in stirring up the quarrels, was banished to France; and only the earl of Hume now continued in arms. In 1516 died Alexander duke of Rothesay; an event which brought the regent one degree nearer the crown. Negotiations were then entered into about prolonging the truce with England; but, Henry insisting upon a removal of the regent from his place, they were dropped. Finding, however, that he could neither prevail on the parliament as a body to dismiss the regent, nor form any party of any consequence against him, he at last consented to a prolongation of the truce for a year. In 1517, the affairs of the regent requiring his presence in France, he resolved before his departure to remove the earl of Hume, who alone continued to disturb the public tranquillity. Under pretence of settling some differences which still remained with England, he called a convention of the nobility, and sent special letters to the earl of Hume and his brother to attend, on account of their great knowledge in English affairs. Both of them obeyed the summons, and were seized and executed as soon as they arrived at Edinburgh. By this severity the regent lost the affections of the people to such a degree that he could scarcely get their places supplied. That of lord-warden of the marches he at last gave to his French favorite Sir Anthony D'Arcy; and that of lord chamberlain to lord Fleming. Soon after this the regent levied an army, on pretence of repressing some disturbances on the borders. These being speedily quelled, he seized on his return upon the earl of Lennox, and forced him to deliver up his castle of Dumbarton; not choosing to leave it, during his absence, in the custody of a nobleman of suspected fidelity; and, from similar motives, he afterwards took him along with him to the continent. He then procured himself to be nominated ambassador to France, in which character he left the kingdom, having committed the government to the archbishops of St. Andrew's and Glasgow, the earls of Arran, Angus, Huntly, and Argyle, with the warden D'Arcy, on whom was his chief dependence. On the departure of the regent, the queen-mother left the English court; and arrived with a noble retinue at Berwick, to visit her son. Here she was received by her husband; for whom she had contracted an invincible aversion, on account of his infidelities to her bed. However she suppressed her resentment, and accompanied him to Edinburgh. Here she demanded access to her son; but was refused by D'Arcy. Lord Erskine, however, who was one of those to whom the care of the young king was committed, conveyed him to the castle of Craigmillar (where D'Arcy had no ju-

risdiction), on pretence that the plague was in Edinburgh; and there the queen was admitted; but this gave such offence to D'Arcy that lord Erskine was obliged to carry back the king to the castle of Edinburgh, where all further access was denied to his mother. In short, the behaviour of this favorite was on all occasions so haughty and violent that he rendered himself universally odious; and was at last murdered with all his attendants in his way to Dunse, where he proposed to hold a court of justice. His death was very little regretted; yet his murderers were prosecuted with the utmost severity, and several persons of distinction declared rebels on that account. Meanwhile, the regent was treated with high marks of distinction in France. The king showed him the greatest respect, promised to assist in establishing his authority in Scotland, and confirmed the ancient league between the two kingdoms. Soon after the earl of Lennox arrived from France, with assurances of assistance from the king, who was highly pleased at the zeal of the governors in punishing D'Arcy's murderers; and 500 soldiers arrived with him, to reinforce the garrisons, especially that of Dunbar. All this time the queen-mother continued at Edinburgh, employing herself in attempts to procure a divorce from her husband, under pretence of his having been previously contracted to another. The affairs of the kingdom again began to fall into confusion, and many murders and commotions happened continually. The earl of Arran had the chief direction in the state; but Angus had still great interest, and took every opportunity to oppose him. This produced an encounter at Edinburgh; in which victory declared for Angus, and seventy-two of the routed party were killed, on the 30th of April, 1519. On the 19th of November, 1521, the regent returned from France. He found the kingdom in great disorder. The earl of Angus domineered in the field, but his antagonists outvoted his party in parliament. The queen-mother, who had fixed her affections on a third husband, hated all parties almost equally; but joined the regent, in hopes of his depriving the other two of power. This happened accordingly, and she was with the regent when he made a kind of triumphal entry into Edinburgh, attended by many persons of the first rank. The earl of Angus was now summoned to appear as a criminal; but his wife interceded for him, because he gave her no opposition in the process of divorce. In the mean time Henry VIII., perceiving that the Scots were entirely devoted to the French interest, sent a letter full of accusations against the regent, and threats against the nation, if they did not renounce that alliance. No regard being paid to these requisitions, lord Dacres was ordered to proclaim upon the borders, that the Scots must stand to their peril, if they did not fall in with his measures by the 1st of March, 1522. This producing no effect, Henry seized the effects of all the Scots residing in England, and banished them his dominions, after marking them, according to bishop Lesley, with a cross. A war was the consequence; and, on the 30th April, the earl of Shrewsbury,

Henry's steward of the household, and K. G., was appointed commander-in-chief against the Scots; and lord Dacres made an inroad as far as Kelso, plundering and burning wherever he came. The regent ordered his army to rendezvous at Roslin; but the Scots, remembering the disaster at Flodden, showed an extreme aversion to the war, and told the regent that, though they would defend themselves if they were attacked, they would not engage in a French quarrel. The regent remonstrated, but without effect; and, as the malecontents continued obstinate, he was in danger of being left by himself, when the queen mother interposed, and prevailed upon lord Dacres to agree to a conference, the event of which was a renewal of the negotiations for peace. The regent, perceiving that he had lost his former popularity, determined to revenge himself; and told those whom he could trust, that he was about to return to France, whence he should bring such a force by sea and land as should render it unnecessary for him to ask leave of the Scots any more to invade England. Accordingly he embarked for France on the 25th of October, publicly giving out that he should return the ensuing August. On the regent's arrival in that country, he made a demand of 10,000 foot and 5000 horse for carrying on the war against England; but the situation of Francis I. did not then allow him to spare so many, though he was daily sending over ships with men, ammunition, and money, for the French garrisons in Scotland. At last it was publicly known in England that the regent was about to return with a strong fleet, and 4000 of the best troops of France; upon which Henry determined, if possible, to intercept him. Sir William Fitz-Williams, with thirty-six large ships, was ordered to block up the French squadron in the harbour of Finhead. Sir Anthony Poyntz cruised with another in the Western seas, as Sir Christopher Dow and Sir Henry Shireburn did in the northern with a third squadron. The duke of Albany, being unable to cope with Fitz-Williams, was obliged to set out from another port with twelve ships, having some troops on board. They fell in with Fitz-Williams's squadron; two of their ships were sunk, and the rest driven back to Dieppe. Fitz-Williams then made a descent at Treport, where he burnt eighteen French ships, and returned to his station off Finhead. As soon, therefore, as Fitz-Williams appeared, the duke disembarked his soldiers, as if he had intended to delay his expedition for that year; but a storm soon arising, which obliged the English fleet to return to the Downs, the regent reembarked his men, and, sailing by the western coasts, arrived safe in Scotland. All this time the earl of Surry had been carrying on the most cruel and destructive war in that country; insomuch that, according to cardinal Wolsey, 'there was left neither house, fortress, village, tree, cattle, corn, nor other succour for man,' in Tweedale and March. The regent's return did not immediately put a stop to these devastations; for the intestine divisions in Scotland prevented him from taking the field; his party was weakened by his long absence, and the queen mother had been very active in strengthening the English interest. A parlia-

ment was called in 1523, where it was debated, whether peace or war with England should take place; and the latter was determined on. Henry was at this time so well disposed to cultivate a friendship with Scotland that he offered to James his eldest sister Mary in marriage; but the Scots, animated by the appearance of their French auxiliaries, and corrupted by their gold, rejected all terms, and resolved upon war. However, when the army was assembled, and had advanced to the borders, the regent found the same difficulty he had formerly experienced; for they flatly refused to enter England. With great difficulty he prevailed upon part of them to pass the Tweed; but, not meeting with success, he was obliged to return to Scotland, which at this time was divided into four factions. One of these was headed by the regent, another by the queen, a third by the earl of Arran, and a fourth by Angus, who had lived as an exile under Henry's protection. At last the duke of Albany, finding all parties united against him, resigned his office of regent; and on the 14th of March in that year went on board one of his own ships for France, whence he never returned to Scotland. He did not make a formal abdication of his government; indeed he requested the nobility, whom he convened for that purpose, to enter into no alliance with England during his absence, which he said would continue no longer than the 1st of September following; to make no alteration in the government; and to keep the king at Stirling.

The nobility, impatient for the absence of the regent, readily promised whatever he required but without any intention of performing it; nor, indeed, was it in their power; for it had been previously determined that James himself should now take the administration into his own hands. According to Buchanan, the regent had no sooner returned to France than Scotland relapsed into all the miseries of anarchy. The queen dowager had the management of public affairs, but her power was limited. The earl of Arran, apprehending danger from the English, entered into the views of the French party. The queen-mother's dislike to her husband prevented a union among those who were in the English interest; and Wolsey restored the earl of Angus to all his importance in Scotland. The queen, therefore, had no other way left to keep herself in power but to bring her son into action. On the 29th of July, therefore, James V. removed from Stirling to Holyrood House, where he took upon himself the exercise of government, convoking the nobility, and obliging them to swear allegiance a second time. The truce with England was now prolonged, and the queen's party carried all before them. On the very day in which the last truce was signed with England, the earl of Angus entered Scotland. He had been invited from his exile in France into England where he was caressed by Henry, who disregarded all his sister's intreaties to send him back to France, and now resolved to support him in Scotland. Yet, though his declared intention in sending the earl to Scotland, was, that the latter might balance the French party there, the king enjoined him to sue for a reconciliation with his wife, and to co-operate with the earl of Arran, who now

acted as prime minister. On his return, however, he found himself excluded from all share in the government, but soon found means to form a strong party in opposition to Arran. In the mean time ambassadors were sent to the court of England, to treat of a perpetual peace. At the same time a match was proposed between the young king of Scotland and Henry's daughter. This had originally been a scheme of Henry himself. The ambassadors arrived in London on the 19th December, and found Henry very much disposed both to the peace and to the match. Commissioners were appointed to treat of both; but they were instructed to demand, by way of preliminary, that the Scots should renounce their league with France, and that James should be sent for education to England. The Scottish commissioners declared that they had no instructions on these points; but the earl of Cassils offered to return to Scotland, and bring a definitive answer from the three states; in the mean time the truce was prolonged to the 15th of May, 1525. On his arrival at Edinburgh he found the earl of Angus the leading man in parliament; by whose influence it was determined that the Scots should renounce their league with France, and substitute in place of it a similar league with England; and that the king should be brought up at the English court, till he was of an age proper for marriage; but at the same time they required of Henry to break off all engagements with Charles V., who was the bitter enemy of Francis, and at that time detained him prisoner. To this Henry returned a cold answer, being then engaged in treaties with the emperor, among which one was concerning the marriage of the princess Mary. However, before Cassils returned, a truce of two years and a half was concluded. But now the queen mother, though she had always been a warm advocate for an alliance between the two nations, yet disliked the means of bringing it about. She saw her husband's party increasing every day in power; so that she had no other resource than keeping possession of the king's person, whom she removed to the castle of Edinburgh. Being under the necessity of convening a parliament, it was resolved to hold it within the castle; which, being an unconstitutional measure, the earl of Arran and his party complained. They began with remonstrances, but, finding them ineffectual, they formed a blockade of the castle with 2000 men, and cut off all communication with the town by means of trenches. As no provisions could thus be got into the castle, the queen ordered some of the cannon to be turned against the town, to force the citizens to put an end to the blockade. Several shots were fired; but, when all things appeared ready for a civil war, matters were compromised. It was agreed that the king should remove out to the palace of Holyrood House; whence he should repair with all possible magnificence to his parliament, in the house where it was commonly held; and there a finishing hand was to be put to all differences. This agreement was signed on the 25th of February, 1526. The parliament accordingly met, and the king's marriage with the princess of England was confirmed; but no mention was made of his being sent for

his education into that country ; on the contrary, he was committed to the care of eight lords of parliament. These were to have the custody of the king's person, every one his month successively, and the whole to stand for the government of the state ; yet with this limitation, ' that the king, by their counsel, should not ordain or determine any thing in great affairs to which the queen, as princess and dowager, did not give her assent.' This partition of power, by giving the queen a negative in all public matters, soon threw every thing into confusion. The earl of Angus, by leading the king into various scenes of dissipation, gained such an ascendancy over him that he became totally guided by him ; while the queen mother, finding that she could not have access to her son without her husband, whom she hated, retired with her domestics to Stirling. Thus the young monarch was left under the sole tuition of the earl of Angus, who made a very bad use of his power, engrossing all the places of honor and profit. The archbishop of St. Andrew's, having now joined the queen's party, advised her to make a formal demand upon her husband, that the order of government which had been settled last parliament should take place, and that under a penalty he should set the king at liberty. To this the earl answered that ' having been so highly favored by his good uncle the king of England, and that James himself being under great obligations to him, neither the queen nor the other lords need be in any pain about him, as he chose to spend his time with the earl of Angus rather than with any lord in the kingdom.' James, however, perceived that he was in fact no better than the king's prisoner, and resolved to recover his liberty. The earls of Argyll and Arran had retired from court, and were living on their own estates ; but the earl of Lennox dissembled his sentiments so well, that he was neither suspected by the earl of Angus nor any of the Douglas family. The king, being gained upon by his insinuating behaviour, opened his mind to him, and requested his assistance against his keepers. At the same time he sent letters to his mother and her party, by some domestics, whom Lennox had pointed out, intreating them to remove him from the earl, adding that if this could not be done by any other means they should use force. On receiving this letter the queen and her party assembled their forces at Stirling, and began their march for Edinburgh. Angus, on the other hand, prepared to give them a warm reception, but to carry along with him the king. This resolution being made known to the queen-mother, she was so much concerned for the safety of her son that the whole army was disbanded ; and thus the authority of the earl of Angus seemed to be more established than ever. Nothing, indeed, was now wanting to render him despotic but the possession of the great seal, which the archbishop of St. Andrew's had carried to Dunfermline. As no deed of any consequence could be executed without this, he prevailed upon the king to demand it by special message ; in consequence of which the archbishop was obliged to give it up. About this time the divorce between the queen-mother and the earl took place ; which increased

the dislike of James, while the imprudence of Angus gave every day fresh disgust. As Angus knew that he had no firm support but in the attachment of his followers, he suffered them to rob and plunder the estates of his opponents without mercy. These, again, did not fail to make reprisals ; so that, towards the end of 1526, there was scarcely an appearance of civil government in Scotland. Thus the court became almost totally deserted ; every nobleman being obliged to go home to defend his own estate. Even Angus himself shared in the common calamity, and hence was frequently obliged to leave the king to the custody of Lennox. To this nobleman the king now made the most grievous complaints, and charged him to contrive some plan for his escape. Lennox accordingly recommended to him the baron of Buccleugh, who was very powerful in the southern parts, and a violent enemy to Angus and the whole family of Douglas. To him he gave orders to foment the disorders in the southern parts to such a degree as to require the king's personal presence to compose them. Buccleugh was then to attack the party, and take the king by force from the Douglasses. This scheme was put in execution, but Buccleugh was defeated, and the attempt proved abortive. After this the earl of Angus behaved towards Lennox with such indifference that Lennox openly declared against him, and advised the king to form a friendship with the archbishop of St. Andrews. This was accordingly done ; but the interest of the archbishop and Lennox was overbalanced by that of Arran and the Hamilton family, whom the earl of Angus now drew over to his party. However, the earl of Lennox, having received powers from the king, suddenly retired from court, and published a manifesto, inviting all loyal subjects to assist him in delivering the king from confinement. In consequence of this he was soon joined by a numerous army, with whom he advanced towards Edinburgh. Angus assembled his adherents ; and sent orders to the inhabitants of Edinburgh to take the field with the king at their head. The citizens immediately put themselves under arms ; but, James pretending to be indisposed, Sir George Douglas, brother to the earl of Angus, said, ' Sir, rather than our enemies should take you from us, we will lay hold of your person ; and, should you be torn in pieces in the struggle, we will carry off part of your body. Upon this speech, which James never forgot, he mounted his horse, and set forward to Linlithgow at a slow pace ; insomuch that Sir George Douglas, afraid of not coming in time to succor his brother, made use of many insinuations to push James on to the field of battle. Three expresses arrived from the earl of Angus ; the first informing his brother that he was about to engage with a superior army ; the second that Angus was engaged with a division of Lennox's army, commanded by the earl of Glencairn ; and that Lennox himself was engaged with the Hamiltons. The third informed him that Lennox, if not defeated, was on the point of being so. Upon receiving this last news James hastened to the field of battle, that he might save Lennox, and put an end to the bloodshed ; but he came

too late; for the royal party was already defeated with great slaughter; and Lennox himself, after being wounded and taken prisoner, was murdered by Sir James Hamilton. On the night of the battle the king was removed to Linlithgow; and, though he was under the greatest grief for the fate of Lennox, the behaviour of the Douglasses struck him with such terror that he dissembled his sentiments. The earl of Angus led his victorious troops into Fife, in hopes of surprising the queen and the archbishop of St. Andrews. The queen, on the news of his approach, fled, with her new husband Henry Stuart, brother to lord Evandale, to Edinburgh, and both were admitted into the castle. The archbishop fled to the mountains, where he was obliged to keep cattle as a shepherd. Angus, after having plundered the castle of St. Andrew's and the abbey of Dunfermline, returned in triumph in Edinburgh, where he prepared to besiege the castle; but the queen, hearing that her son was among the number of the besiegers, ordered the gates of the castle to be thrown open, and surrendered herself and her husband prisoners to James, who was advised to confine them to the castle. After these successes, the earl of Angus established a court of justice, in which he prosecuted those who had opposed him, among whom was the earl of Cassils. He was offered by Sir James Hamilton, natural son to the earl of Arran, the same who had murdered Lennox, an indemnity, if he would own himself a vassal of that house; but this condition was rejected. Being called to his trial, and accused of having taken arms against the king, a gentleman of his name and family, who was his advocate, denied the charge, and offered to produce a letter under James's own hand desiring him to assist in delivering him from his gaolers. This striking evidence confounded the prosecutor so much that the earl was acquitted; but, on his return home, he was way-laid and murdered by one Hugh Campbell, at the instigation of Sir James Hamilton. During these transactions in the south, many of the Highland clans were perpetrating the most horrid scenes of rapine and murder. The state of the borders was little better than that of the Highlands; but it engaged the attention of Angus more, as he had great interest in these parts. Marching, therefore, against the banditti which infested these parts, he soon reduced them to reason. His power seemed now to be firmly established, inasmuch that the archbishop of St. Andrews began to treat with Sir George Douglas, to whom he offered lucrative leases and other emoluments, if he would intercede with Angus in his favor. This was readily agreed to; and the archbishop was allowed to return in safety to his palace about the same time that Angus returned from his expedition against the borderers. Nothing was then to be seen at court but festivities of every kind, in which the queen-mother, who was now liberated, took part; and she was afterwards suffered to depart to the castle of Stirling, which Angus had neglected to secure. In the mean time the archbishop invited the Douglasses to spend some days with him at his castle; which they accordingly did, and carried the king along with them. Here James dissembled so

well that Angus thought there could be no danger in leaving him in the hands of his friends, till he should return to Lothian to settle some public and private affairs. He left the king in the custody of his uncle Archibald, his brother Sir George, and one James Douglas of Parkhead, captain of the guards, who watched the king on pretence of doing him honor. The earl was no sooner gone than the archbishop sent an invitation to Sir George Douglas, desiring him to come to St. Andrews, and there put the last hand to the leases. This was so plausible that he immediately set out for St. Andrews; while his uncle the treasurer went to Dundee, where he had an amour. James, thinking this the best opportunity for an escape, resolved to attempt it, and, by a private message, apprised his mother of his design. It was then the season for hunting, which James often followed in the park of Falkland; and, calling for his forester, he told him that, as the weather was fine, he intended to kill a stag next morning, ordering him at the same time to summon all the gentlemen in the neighbourhood to attend him with their best dogs. He then called for his chief domestics, and commanded them to get his supper early, because he intended to be in the field by day-break; and talked with the captain of his guard of nothing but the excellent sport he expected. Meantime he had engaged two young men, the one a page of his own, the other, John Hart, a helper in his stables, to attend him in his flight, and to provide him with the dress of a groom for a disguise. Having taken leave of his attendants, charging them to be ready early in the morning, and, being left alone, he stole softly out of his bed-chamber, went to the stable, dressed himself in his disguise; and he and his companions, mounting the three best horses, galloped to Stirling castle; into which he was admitted soon after day-break. He commanded all the gates to be secured; and, the queen having previously prepared every thing for a vigorous defence, orders were given that none should be admitted into the castle without the king's permission. About an hour after the king escaped from Falkland, Sir George Douglas returned; and, being assured that the king was asleep, went to bed. But James had been seen and known in his flight; for, in the morning, the bailiff of Abernethy informed Sir George that the king had passed Stirling bridge. An express was despatched, informing Angus of all that had happened. The earl quickly repaired to Falkland, where he and his friends resolved to go to Stirling, and demand access to the king. James by this time had issued letters to the earls of Huntly, Argyre, Athol, Glencairn, Monteith, Rothes, and Eglinton; lords Graham, Livingston, Lindsay, Sinclair, Ruthven, Drummond, Evandale, Maxwell, and Semple. Before all of them could arrive at Stirling, the earl of Angus and his friends were upon their journey to the same place; but were stopped by a herald, commanding them not to approach within six miles of the king's residence. On this the earl deliberated with his party how to proceed. Some were for marching, and taking the castle by surprise; but that was found to be impracticable. The earl and his brother therefore resolved to

make a show of submission to the king's order ; and they accordingly went to Linlithgow. By this time all the nobility already mentioned, and many others, had assembled at Stirling; and James, calling them to council, inveighed against the tyranny of the Douglasses with acrimony, and in conclusion, said, 'Therefore I desire, my lords, that I may be satisfied of the said earl, his kin, and friends. For I vow that Scotland shall not hold us both, while I be revenged on him and his.' The result was that proclamation should be made, renewing the order for the Douglasses not to approach the court, and divesting the earl of Angus and his brother of all their public employments. Such was the moderation of the assembly that by their advice James ordered the earl to retire to the north of the Spey till his pleasure should be known ; but his brother was commanded to surrender himself a prisoner in the castle of Edinburgh, to take his trial in a very full parliament, to be held in that city next September. The earl and his brother considered all this as a prelude to their destruction ; and resolved to surprise the city of Edinburgh, and hold it against the king and parliament, before the latter could assemble. The royal party acted with great spirit. The management of the king's escape, his reception into Stirling, the fortifying that castle, and the ready obedience of his great nobility, some of whom attended him with their followers before they received any summonses, are proofs of wise and spirited deliberations. It was to be expected that the Douglasses, who remained assembled in a numerous body, would make the attempt they made ; but the royalists despatched lord Maxwell and the baron of Lochinvar with troops to take possession of the city, till James could arrive with 2000 forces to their relief. Maxwell and Lochinvar made such despatch that they were in possession of the city when the Douglasses appeared before it, and repulsed them ; while a terrible storm had scattered the troops under James, before he could come to their assistance, so effectually, that, being left almost without attendants, he might have been taken by the smallest party of the enemy. Upon the retreat of the Douglasses from Edinburgh, the parliament met ; and the earl of Angus, his brother, Sir George Douglas, his uncle Archibald Douglas, and Alexander Drummond of Carnock, with some of their chief dependents, were indicted and forfeited in absence (none of them appearing), for 'assembling of the king's lieges, with intention to have assailed his person ; detaining of the king against his will and pleasure, and contrary to the articles agreed upon, for two years and more ; all which time the king was in fear and danger of his life.' One Banantyne had the courage to plead their cause against these heinous charges ; but so exasperated were both the king and parliament against them that the former swore he never would forgive them, and the latter that they never would intercede for them. Nor was it deemed sufficient simply to declare their resolution ; but the solemnity of oaths was added, to discourage the king of England from continuing the applications he was daily making for the pardon of Angus ; and, to

extinguish all hopes of that kind, James created his mother's third husband lord Methven, and gave him the direction of his artillery. The disgrace and forfeiture of the Douglasses having created many vacancies in the state, Gavin Dunbar, archbishop of Glasgow, and tutor to the king, was nominated lord chancellor, and Robert Carnecross, a person, says Buchanan, more eminent for wealth than virtue, was made treasurer ; but he was soon after displaced for favoring the Douglasses, and Robert Barton appointed to succeed him. The Douglasses still kept their arms ; and, being joined by many outlaws and robbers in the south, they ravaged all the lands of their enemies, carrying their devastations to the very gates of Edinburgh. A commission of lieutenancy was then given to the earl of Argyll and lord Hume, who did great service in protecting the country from the outlaws. Several villages, however, near Edinburgh, were burnt ; and all the provisions the Douglasses could find were carried off to their castle of Tamtalan, which served as their head quarters. The castle of Dunbar remained still in the hands of the duke of Albany's garrison, who recognised no master but him. The place was well stored with artillery of all kinds ; and, lying in the neighbourhood of Tamtalan, it was easy to transport them to the siege ; but James thought he had no right to make use of them without the consent of one Maurice, governor of the castle. Having summoned, by proclamation, the inhabitants of Fife, Angus, Strathern, Stirlingshire, Lothian, Merse, and Teviotdale, to appear at Edinburgh on the 10th of December, with forty days victuals, to assist in the siege, he sent three noblemen to borrow artillery from Maurice, and to remain as pledges for the safe redelivery of the same ; and they were accordingly sent him. This delicacy is the more remarkable as the duke of Albany had given orders that every thing in his castle should be at the king's service. However unanimous the parliament might appear against the Douglasses, yet James was but ill seconded in this attempt. The enemies of the Douglasses had impolitically rendered it treasonable for any person to shelter or protect the earl of Angus, his kinsmen, or followers. This proceeding, in a country where the Douglasses had so many connexions, carried with it an appearance of cruelty and a thirst of revenge, especially as James had chosen such a season for carrying on the siege. In short, after battering the place for some days, and losing one Falconer, his chief engineer, the king abandoned his enterprise. Before this time, a negotiation was going forward between James and the king of England ; which proves that the former was now rendered placable towards the Douglasses, and was the reason why the siege was suspended. The truce between Scotland and England was now near expiring ; and Henry, under that pretence, gave a commission to the prior of Durham, Thomas Magnus, Sir Anthony Ughtred, captain of the town and castle of Berwick, William Frankelyn, chancellor of Durham, and Sir Thomas Tempest. England was then the principal ally of Francis against the emperor ; and this gave a handle for Francis to interpose so far in favor of

the Douglasses, that he brought James to consent to a preliminary negotiation for their obtaining a secure retreat in England.

James being now delivered from all dread of the Douglasses, and under no control from any party, showed excellent dispositions for government. Finding that the borderers were renewing their depredations, he resolved to strike at the root of an evil which had so long disgraced his ancestors, by giving no quarter to the chiefs of these robbers, whose residence was in Liddesdale. This was the more necessary, as their daring attempts had exasperated the English so much, that they had actually burnt a town in Teviotdale; and had killed one Robert Kerr, a man of some consequence. Two of the chiefs of the Scottish borderers were Cockburn of Kenderlaw, and Adam Scot, commonly called the king of the thieves. Both of them were barons; and had been so inured to the practice that they thought there was no crime in robbing; they therefore appeared publicly in Edinburgh; where James ordered them to be apprehended, tried, and hanged. He next proceeded with great firmness against many noblemen and gentlemen, who were suspected of being disaffected to the late peace. All of them had behaved with great loyalty, and some of them had done him the most important services. Of this number were the earl of Hume, lord Maxwell, with the barons of Buccleugh, Farnherst, Polwart, Johnston, and Mark Kerr; yet so zealous was James for the impartial administration of justice that he ordered them all, with many other chiefs of the borderers, to be sent to prison; where they lay till they entered into recognizances, and found bail for their good behaviour. Of all the party of the Douglasses, none of any note, excepting Alexander Drummond of Carnock, was suffered to return home, at the earnest request of the ambassadors and the treasurer Barton. This lenity was of very little consequence; for James having appointed the earl of Murray to be sole warden of the Scottish marches, with power to treat with the earl of Northumberland, their conferences had broken off on account of fresh violences. He now resolved to attempt in person what his predecessors and he had so often failed in by their deputies. As he was known to be fond of hunting, he summoned his nobility to attend him with their horses and dogs; which they did in such numbers, that his hunting retinue consisted of above 8000 persons, two-thirds of whom were well armed. This preparation gave no suspicion to the borderers, as hunting matches in those days commonly consisted of some thousands; and James, having set out upon his diversion, is said to have killed 540 deer. Among the other gentlemen who had been summoned to attend him was John Armstrong of Gilnockhall. He was the head of a numerous clan, who lived with great splendor upon the contributions under which they laid the English borderers. He was himself always attended by twenty-six gentlemen on horseback, well mounted and armed, as his body guards. Having received the king's invitation, he was fond of displaying his magnificence to his sovereign; and, attiring himself and his guard more pompously

than usual, they presented themselves before James, from whom they expected some particular mark of distinction for their services against the English, and for the protection they had always given to their countrymen the Scots. On their first appearance James, not knowing who he was, returned Armstrong's salute, imagining him to be some nobleman; but, upon hearing his name, he ordered him and his followers to be immediately apprehended, and hanged upon the spot. Armstrong begged hard for his life; and offered to serve the king in the field with forty horsemen, besides making him large presents of jewels and money, with many other tempting offers; but the king was inexorable. These and some similar executions restored peace to the borders.

Hitherto we have considered only the civil transactions of Scotland; but religion will now claim a considerable share of our attention. The opinions of Luther had been propagated in Britain soon after his preaching in 1517. They had for some years gained ground, and, when the contentions began between James and his nobility, were become formidable to the established religion. James, having escaped from the hands of his nobles by means of the archbishop of St. Andrew's, was naturally favorable to the clergy, and, as they opposed the reformation, became a zealous persecutor. On the other hand the nobility, having opposed the king and clergy in civil affairs, did so likewise in religion. The clergy finding themselves unequal in argument, had recourse to more violent methods. Rigorous inquisitions were made after heretics, and fires were every where prepared for them. 'The first person,' says Dr. Stuart, 'who was called upon to suffer for the reformed religion was Patrick Hamilton, abbot of Ferne. At an early period of life he had been appointed to this abbacy; and, having imbibed a favorable idea of the doctrines of Luther, he had travelled into Germany, where, becoming acquainted with the most eminent reformers, he was fully confirmed in their opinions. Upon his return to Scotland he exposed the corruptions of the church, and insisted on the advantages of the tenets which he had embraced. A conduct so bold, and the avidity with which his discourses were received by the people, gave an alarm to the clergy. Under the pretence of a religious and friendly conference he was seduced to St. Andrew's by Alexander Campbell, a Dominican friar, who was instructed to remonstrate with him on the subject of the reformation. The conversation they held only served to establish the abbot more firmly in his sentiments, and to inflame his zeal to propagate them. The archbishops of St. Andrews and Glasgow, and other dignitaries of the church, constituting a court, called him to appear before them. The abbot neither lost his courage, nor renounced his opinions. He was convicted accordingly of heretical pravity, delivered over to the secular arm, and executed in 1527. His tenets are thus enumerated in the sentence:—'Man hath no free will. Man is in sin so long as he liveth. Children, incontinent after their baptism, are sinners. All Christians, that be worthy to be called Christians, do know that they are in grace. No man is justified by works,

but by faith only. Good works make not a good man, but a good man doth make good works; and faith, hope, and charity, are so knit, that he that hath the one hath the rest; and he that wanteth the one of them wanteth the rest.' (Keith's Hist. p. 3). This reformer had not attained the twenty-fourth year of his age. His youth, his virtue, his magnanimity, and his sufferings, all operated in his favor with the people. To Alexander Campbell, who insulted him at the stake, he objected his treachery, and cited him to answer for his behaviour before the judgment seat of Christ. And this persecutor, a few days after, being seized with a frenzy, and dying in that condition, it was believed and affirmed with confidence that Mr. Hamilton was an innocent man and a martyr. A deed so affecting, from its novelty and circumstances, excited throughout the kingdom a universal indignation and curiosity. Particular enquiries were made into the tenets of Hamilton. Converts to the new opinions multiplied in every quarter, and a partiality to them began to prevail even among the Romish clergy. Alexander Seton, the king's confessor, inveighed against the errors and abuses of Popery; neglected in his discourses all mention of purgatory, and pilgrimages, and saints; and recommended the doctrines of the reformed. What he taught was impugned; and, his boldness rising with contradiction, he defended warmly his opinions, and even affirmed that in Scotland there were no true and faithful bishops. A sarcasm so just, and so daring, provoked the whole body of the prelacy. They studied to compass his destruction; and, as Mr. Seton had exhorted the king to a greater purity of life, they hoped to conduct him to the stake; but he fled into England. In 1533 Henry Forest, a Benedictine friar, who adopted the reformed doctrines, was not so fortunate. After having been imprisoned for some time in the tower of St. Andrews, he was brought to trial, condemned, and burnt. He had said that Mr. Hamilton was a pious man and a martyr; and that the tenets for which he suffered might be vindicated. This guilt was aggravated by the discovery that friar Forest was in possession of a New Testament in the English language. A cruelty so repugnant to the feelings of mankind, while it pleased the pride of the ecclesiastics, was destroying their importance, and exciting a general disposition in the people to adopt the principles and sentiments of the reformed. In 1534 archbishop James Beaton of St. Andrews, though remarkable for prudence and moderation, was overawed by his nephew and coadjutor David Beaton and by the clergy. By commission, granted by him, persecutions were carried on with violence. Many were driven into banishment, and many were forced to acknowledge what they did not believe. The more strenuous and resolute were delivered over to punishment. Among these were two private gentlemen, Norman Gourlay and David Stratton. They were tried at Holyrood House before the bishop of Ross; and, refusing to recant, were condemned. King James, who was present, appeared exceedingly solicitous that they should recant their opinions; and Stratton, upon being adjudged to the fire, having

begged for mercy, was about to receive it, when the priests proudly pronounced that the grace of the sovereign could not be extended to a criminal whom their law had doomed to suffer. A few years after, the bishops having assembled at Edinburgh, two Dominican friars, Killor and Beverage, with Sir Duncan Sympson a priest, Robert Forrester a gentleman of Stirling, and Thomas Forest vicar of Dolour in Perthshire, were condemned to be burnt together. At Glasgow a similar scene was acted in 1539; Hieronymus Russel, a gray friar, and a young gentleman named Kennedy, were accused of heresy before the bishop. Russel, when brought to the stake, displaying a deliberate demeanor, reasoned gravely with his accusers, and was only answered with reproaches. Mr. Kennedy, who was not yet eighteen years of age, seemed disposed to disavow his opinions, and to sink under the weight of cruel affliction; but, the exhortation and example of Russel awakening his courage, his mind assumed a firmness and constancy, his countenance became cheerful, and he exclaimed with a joyful voice, 'Now I defy thee, death; I praise my God, I am ready.' James Beaton, archbishop of St. Andrews, having died about this time, the ambition of David Beaton, his coadjutor, was gratified in the fullest manner. He had before been created a cardinal, and was now advanced to the primacy of Scotland. No Scottish ecclesiastic had been ever invested with greater authority; and the reformers had every thing to fear from so formidable an enemy. The natural violence of his temper had swelled into an overbearing insolence. His youth had been passed in scenes of policy and intrigue, which gave him address and knowledge of men. He was dark and designing. No principles of justice were any bar to his schemes; nor did his heart open to any impressions of pity. His ruling passion was an inordinate love of power; and, his consequence depending upon the church of Rome, he maintained its superstitions with the warmest zeal. He seemed to take a delight in perfidiousness and dissimulation; had certainly no religion; and indulged in the most open profligacy of manners. In connexion with these defects he possessed a persevering obstinacy in pursuing his measures, and practised all the arts necessary to advance them. He was scarcely invested in the primacy when he exhibited his taste for magnificence, and his aversion to the reformed. He proceeded to St. Andrews with an uncommon pomp and parade. The earls of Huntly, Arran, Marischal, and Montrose, with the lords Fleming, Lindsay, Erskine, and Seton, honored him with their attendance; and there appeared in his train Gavin archbishop of Glasgow and lord high chancellor, four bishops, six abbots, many private gentlemen, and a vast multitude of the inferior clergy. In the cathedral, from a throne erected by his command, he harangued on the state of religion and the church to this company and a crowd of other auditors. He lamented the increase of heretics; insisted upon their audacity; and urged the necessity of acting against them with rigor. He told this assembly that he had cited Sir John Borthwick to appear before it for maintaining tenets of faith hostile

to the church, and for dispersing heretical books, and he desired their assistance in bringing him to justice. Thirteen articles of accusation were accordingly read against him; but he neither appeared personally nor by any agent or deputy. He was however found guilty; and the cardinal, with a solemnity calculated to strike with awe and terror, pronounced sentence against him. His goods and estate were confiscated; and a painted representation of him was burnt publicly. It was declared that every office of humanity, comfort, and solacement extended to him should be considered as criminal, and be punished with confiscations and forfeitures. Sir John Borthwick, having been apprised of his danger, fled into England, where he was kindly received by Henry VIII., who employed him in negotiations with the Protestant princes of Germany. Cardinal Beaton perceived with concern that this act of severity did not terrify the people. New defections from the church were announced. Andrew Cunningham, son to the master of Glencairn, James Hamilton brother to Patrick Hamilton the martyr, and the celebrated George Buchanan the historian, were imprisoned upon suspicion of heresy; and, if they had not escaped, must have died at the stake. In this declining condition of popery the cardinal held many mournful consultations with the bishops. All their wisdom was employed to devise methods to support their power. The project of an inquisitorial court was conceived. To erect this tribunal they allured James V. with the hopes of the confiscation and spoils which might enrich him, from the persecution and punishment of the reformed. He yielded to their solicitations, and gave them the sanction of his authority. A formal commission was granted, constituting a court of enquiry after heretics, and nominating for its president Sir James Hamilton of Fennard, natural brother to the earl of Arran. The officious zeal of this man, his ambition, and thirst of blood, were acceptable in a high degree to the clergy; and to this bad eminence their recommendation had promoted him. Upon the slightest suspicion he was allowed to call any person before him, to scrutinise into his creed, and to absolve or to condemn him. A tribunal so dreadful could not have found a director more suited to it. He was in haste to fill the prisons with culprits, and was marking down the names of all those to whom heresy was imputed by popular report. But, while he was brooding over mischief, and multiplying in fancy the triumphs of his wickedness, an unexpected turn of affairs presented him in the light of a criminal, and brought him to the scaffold. The brother of Mr. Hamilton the martyr, to avoid persecution, had been obliged to go into banishment; but, by the intercession of his friends, he was permitted to return for a short time to his own country, that he might regulate the affairs of his family. He was connected with Sir James Hamilton, and, trusting to the ties of blood, ventured to prolong his stay beyond the period allotted to him. Sir James, willing to give a signal example of severity, and thus to ingratiate himself with the priesthood, resolved to make his own relation the first victim of his power. Mr. Hamilton, however, being

acquainted with the most private machinations of this inquisitor, despatched his son to the king, who was about to pass the Forth in a barge, and entreated him to provide for his safety as Sir James Hamilton had conspired with the house of Douglas to assassinate him. James V. being at variance with the house of Douglas was disposed to believe every thing flagitious of Sir James Hamilton. He ordered the young gentleman to go with expedition to Edinburgh, and to open the matter to the privy-council; and he furnished him with the ring which he sent to them upon these important occasions, which required their address and activity. Sir James Hamilton was apprehended and imprisoned. An accusation of having devised the king's death was preferred against him. His defence appeared unsatisfactory. A jury of men of rank and character pronounced him guilty; and, being condemned to suffer the death of a traitor, he lost his head, and the quarters of his body were exposed on the gates of the city of Edinburgh. The clergy, who could not prevent his trial and execution, regretted his death, but did not appoint a successor to him in their court of inquisition.—Dr. Gilbert Stuart's History of the Reformation.

In other respects, however, James showed great concern for the welfare of his people. Being dissatisfied with the ordinary administration of justice, he had recourse to the parliament of Paris for a model of the like institution in Scotland. Great objections lay to ambulatory courts of justice. The authority of the heritable jurisdiction was almost exclusive of all law; for, though the king might preside in them, yet he seldom did; and appeals to the council were disagreeable and expensive. The institution of the lords of articles threw too much weight into their scale, as no business could be transacted in parliament but what they prepared; and it was in the power of the king to direct them as he pleased. The true source of the public grievances in matters of property lay in the disregard shown to the excellent acts which had passed during the reigns of James I., II., and III., and which had not been supported in the late reigns. The evil had gathered strength during the minority of James V.; and he resolved to establish a standing jury for all matters of law and equity, with a president, who was to be the mouth of the assembly. On the 13th of May, this year, as we find by a curious MS. in the British museum, the lords of the articles laid before the parliament the proposition for instituting the court of session in the following words:—‘Item, anent the second artikel concerning the order of justice; because our sovereign lord is maist desirous to have an permanent order of justice for the universal of all his lieges; and therefore tendis to institute an college of cunning and wise men for doing and administration of justice in all civil actions; and therefore thinkes to be chosen certain persons maist convenient and qualified yair (there), to the number of fifteen persons, half spiritual, half temporal, with an president.’ In 1553 hostilities were recommenced with England; but, after some slight incursions on both sides, a truce again took place. The

chief transactions of these years, however, were the negotiations for the king's marriage. Indeed there is scarcely any monarch mentioned in history who seems to have had a greater variety of choice, or who was more difficult to be pleased. The situation of affairs on the continent of Europe had rendered Scotland a kingdom of great consequence, as holding the balance of power between France and England, and the emperor of Germany; and each of the rival powers endeavoured to gain the favor of James by giving him a wife. In 1534 king Francis offered him his daughter; and the match was strongly recommended by the duke of Albany, who was still living in France. The same year the imperial ambassador arrived in Scotland, and presented, in the name of his master, the order of the golden fleece to James, who had already been invested with that of St. Michael by Francis. At the same time he offered him his choice of three princesses; Mary of Austria, the emperor's sister, and widow of Lewis king of Hungary; Mary of Portugal, the daughter of his sister Eleanora of Austria; or Mary of England, the daughter of Catharine and Henry. Another condition, however, was annexed to this proposal; viz. that, to suppress the heresies of the time, a council should be held for obviating the calamities which threatened the Christian religion. These proposals would have met with a more ready acceptance from James, had not his clergy at this time been disgusted with Charles for allowing too great a latitude to the Protestants of Germany. James, in his answer, returned the emperor his polite acknowledgments for the splendid alliances he had offered him: touched on the proposal of the council as being a measure rather to be wished for than hoped, because it ought to be free and holy, and upon the model of the first councils; and observed that, if such a council could be obtained, he would send ecclesiastics to it; but, if not, every prince ought to reform the errors of the clergy within his own dominions. He bewailed the obstinate conduct of his uncle in his divorce and marriage; and offered his best offices for effecting a reconciliation between him and the emperor, wishing that all the princes of Christendom would unite their arms against their common enemy the Turks. He hinted, very justly, that his imperial majesty had offered more than he could perform, because his cousin, Mary of England, was not at his disposal. That it would be impolitic to give a preference to any of the three princesses, all of them being so illustrious and deserving; but, to show how much he valued an alliance with his imperial majesty, he would become a suppliant to that prince for his niece, daughter to Christian king of Denmark, to become his bride. The ambassador's answer to this unexpected request was that she was already betrothed to the count palatine. But, whether the emperor had any right to offer the English princess or not, it is agreed by most historians that he was offered either Mary or Elizabeth by their father Henry himself. To Mary of Bourbon, the daughter of the duke of Vendosme, he is said to have been contracted; but for some reason or other all these matches were broken off; and the king at last

went to France, where he married Magdalen the eldest daughter of Francis. The nuptials were celebrated at Paris in 1537, with great magnificence; and among other things served up by way of dessert at the marriage feast, were a number of covered cups filled, it is said, with pieces of gold and gold dust, the product of Scotland, which James distributed among the guests. This gold was found in the mines of Crawford Moor, then worked by the Germans. In the beginning of May the royal pair embarked for Leith, under convoy of four large ships of war, and landed on the 28th of the same month. The joy of the Scots was universal, but it was of short continuance; for the young queen died of a fever on the 22d of July the same year. King James did not long remain a widower; for the same year he sent Beaton, abbot of Arbroath, to treat of his second marriage with a French lady, Mary of Guise, duchess-dowager of Longueville. In this he was rivalled by his uncle Henry VIII., but not before James had been contracted to her. Henry, however, not only insisted upon having this lady for his wife, but threw out some menaces against Francis, because he would not comply with his request. In January, 1538, she was married to James, and escorted to Scotland by the admiral of France with a considerable squadron, both James and Francis being suspicious that Henry would make some attempt to intercept the royal bride. But nothing of this kind happened: and she landed safely at Fife Ness; whence she was conducted to the king at St. Andrew's. But, while James was thus completing his domestic arrangements, he was in other matters showing himself a bloody tyrant. Some differences subsisted between the families of Gordon and Forbes in the north. The heir of the house last mentioned had been educated in a loose dissipated manner, and kept company with a worthless fellow named Strahan. Having refused this favorite something he had asked, the latter attached himself to Gordon earl of Huntly, who, it is said, assisted him in forging a charge of treason against Forbes. He was accused of intending to restore the Douglasses to their forfeited estates and honors; which improbable story being supported by some venal evidence, the unhappy young man was condemned and executed as a traitor. The king could not but see the injustice of this execution; and, to make some amends for it, banished Strahan the kingdom. Another execution, which happened a few days after, was even more inhuman. The earl of Angus, finding that he could not regain the favor of the king, had recourse to a method usual in those days for attracting his notice, viz. the committing of depredations on the borders. This crime was sufficient with James to occasion the death of his innocent sister, the dowager lady of Glamis. She had been courted by one Lyon, whom she had rejected in favor of a gentleman of the name of Campbell. Lyon, exasperated at his repulse, found means of admittance to James, whom he filled with the greatest terrors on account of the practices of the family of Angus; and at last charged the lady, her husband, and an old priest, with a design of poisoning the king. The parties were all remarkable for the

quiet and innocent lives they led; and this circumstance was by their diabolical accuser turned to their prejudice, by representing it as the effect of cunning. However, the evidence against the lady appeared so absurd and contradictory that some of the judges were for dropping the prosecution, and others for recommending her ease to the king; but the majority prevailed to have it determined by a jury, who brought her in guilty; and she was condemned to be burnt alive on the Castle-hill of Edinburgh. The defence she made would have done honor to the ablest orator, and undeniably proved her innocence; but, though it was reported to James, it was so far from mitigating her sentence that it was aggravated by her husband being obliged to behold her execution. The unhappy man endeavoured to make his way over the castle wall of Edinburgh; but, the rope proving too short, he was dashed in pieces: and lord Glamis her son, though but a child, was imprisoned during the remainder of this reign. The old priest, though put to the torture, confessed nothing, and was freed. Lyon, like Straban, was banished the kingdom. Whether these and other cruelties had affected the king's conscience, or whether his brain had been touched by the distractions of the different parties is unknown; but it is certain that, in 1540, he began to live retired: his palace appeared like the cloistered retreat of monks; his sleep was haunted by the most frightful dreams, which he construed into apparitions; and the body of Sir James Hamilton seemed continually present to his eyes. Perhaps the loss of his two sons, who died on the same day that Sir James was executed, might have contributed to bring this man more remarkably to his remembrance. No doubt it added to the gloom of his mind; and he now saw his court abandoned by almost all his nobility. At last James was in some degree roused from his inaction, by the preparations made against him by his uncle Henry VIII. of England. Some differences had already taken place: to accommodate which Henry had desired a conference with James at York. But this the latter, by the advice of his parliament, had declined. The consequence was a rupture between the two courts, and the English had taken twenty of the Scots' trading vessels. Henry threatened to revive the antiquated claim of the English superiority over Scotland, and had given orders for a formidable invasion of the Scottish borders. He complained that James had usurped the title of Defender of the Faith, to which he had added the word Christian, implying that Henry was an infidel: but the kings of Scotland had, some time before, been complimented by the papal see with that title. James, on the other hand, threw his eyes towards Ireland, the north part of which was actually peopled with inhabitants, who owned no sovereign but the king of Scotland, and who offered to serve James against the English: some of their chiefs having repaired to Scotland, and done homage to James. Henry had about this time declared himself king of Ireland, of which he was before only styled the lord; and James roundly asserted that he had a preferable claim to at least one-half of that island, which had been peopled by the subjects of Scot-

land. Though the Scottish historians of this reign take very little notice of this incident, James appears to have been very tenacious of his title; and a vast intercourse was certainly carried on between the subjects of Scotland and the northern Irish, who unanimously acknowledged James for their natural sovereign. Indeed, this was the only ground of quarrel that the king, with the least shadow of justice, could allege against Henry. His parliament being met, many public-spirited acts were passed; and, before the assembly was dissolved, the members renewed the acts against leasing making; by which is meant the misrepresenting of the king to his nobles, or the nobles to their king: and James, to dismiss them in good humor, passed an act of free grace for all crimes committed in his minority; the earl of Angus, and Sir George and Sir Archibald Douglas being excepted. Henry, after cutting off the head of his wife Catharine Howard, married and divorced the princess Anne of Cleves, and found himself either deserted or distrusted by all the princes on the continent, Protestant as well as Roman catholic. James and his clergy relied greatly on this public odium incurred by Henry: but the emperor, having again quarrelled with Francis, left Henry, whose dominions they had threatened jointly to invade, at liberty to continue his preparations against the Scots. He first ordered his fleet, then the most formidable of any in the world, to make fresh descents upon Scotland. At the same time he appointed a very considerable army to rendezvous upon the borders, under Sir Robert Bowes, the earl of Angus, and his brothers Sir George and Sir Archibald Douglas. James was every day expecting supplies of money, arms, and other necessities from Francis; but, these not arriving, he reassembled his parliament on the 14th of March, who gratified him in all his demands. Many excellent regulations were made for the internal government, peace, and security of the kingdom, and against the exportation of money instead of merchandise. Acts were passed for fortifying and embellishing the town of Edinburgh, and for better supplying Scotland with wine. The royal revenue was increased by many additional estates; and the last hand was put to one of the best plans for a national militia that perhaps ever appeared. As yet, excepting in the disappointment which Henry met with from his nephew in not meeting him at York, he had no grounds for commencing hostilities. But the queen-mother was now dead; and consequently the connexion between James and Henry was weakened. Whatever her private character might have been, she was a happy instrument of preventing bloodshed between the two kingdoms. She was buried with royal honors at Perth. James, to all appearance, was at this time in a most desirable situation. His domain, by forfeitures and otherwise, far exceeded that of any of his predecessors. He could command the purses of his clergy; had large sums of ready money in his exchequer; his forts were well stored and fortified; and he was now daily receiving remittances of money, arms, and ammunition from France. All this show of happiness was only in appearance; for the affections of his nobility, and the wiser part of his subjects, were

now alienated from him more than ever, by his excessive bigotry and superstition. He had nominated the earl of Huntly to the command of his army on the borders, consisting of 10,000 men; and his lieutenant-general was Sir Walter Lindsay of Torphichen, who had seen a great deal of foreign service, and was esteemed an excellent officer. Huntly acquitted himself admirably in his commission; and was so well served by his spies as to have certain intelligence that the English intended to surprise and burn Jedburgh and Kelso. The English army under Sir Robert Bowes and the Douglasses, with other northern Englishmen, continued still upon the borders; and one of the resolutions the Scottish nobility and gentry had come to was, not to attack them on their own ground, nor to act offensively, unless their enemies invaded Scotland. Huntly being informed that the English had advanced on the 24th of August to a place called Haldanrig, and that they had destroyed great part of the Scottish and debateable lands, resolved to engage them: and the English were astonished when at day break they saw the Scots drawn up in order of battle. Neither party could now retreat without fighting; and Torphichen, who led the van, consisting of 2000 of the best troops of Scotland, charged the English so furiously that Huntly gained a complete and an easy victory. Above 200 of the English were killed, and 600 taken prisoners; among whom were their general Sir Robert Bowes, Sir William Mowbray, and about sixty of the most distinguished northern barons; the earl of Angus escaping by the swiftness of his horse. The loss of the Scots was inconsiderable. Meanwhile the duke of Norfolk, having raised a great army, had orders to march northwards, and to disperse a manifesto, complaining of James for having disappointed him of his interview at York, and reviving the ridiculous claim of superiority over the kingdom of Scotland. It was plain, from the words of this manifesto, that Henry was still placable towards James; and that he would easily have dropped that claim, if his nephew would have made any advances towards a reconciliation. The condition of James was now deplorable. The few faithful counsellors he had about him, such as Kirkaldy of Grauge, then lord treasurer, plainly intimated that he could have no dependence on his nobles, as he was devoted to the clergy; and James sometimes, in a fit of distraction, would draw his dagger upon the cardinal and other ecclesiastics, when they came to him with fresh propositions of murder and proscriptions, and drive them out of his presence. But he had no constancy of mind; and he certainly put into his pocket a bloody scroll that had been brought him by his priests, beginning with the earl of Arran, the first subject of the kingdom. In one of his cooler moments he appointed lord Erskine, and some others of his nobility, to make a fresh attempt to gain time; and Henry even condescended to order the duke of Norfolk (who was then advanced as far as York), the lord privy seal, the bishop of Durham, and others, to treat with him. The conferences were short and unsuccessful. The duke bitterly complained that

the Scots sought only to amuse him till the season for action was over. In short, he considered both them and Learmonth, who was ordered to attend him, as so many spies, and treated them accordingly. It was the 21st of October before he entered the east borders of Scotland. According to the Scottish historians, his army consisted of 40,000 men; but the English have fixed it at 20,000. James affected to complain of this invasion as unprovoked; but he lost no time in preparing to repel the danger. The situation of his nobility, who were pressed by a foreign invasion on the one hand and domestic tyrants on the other, induced them to hold frequent consultations; the king, who was encamped with his army at Falla Moor, hearing of this, removed hastily to Edinburgh; from which he sent orders for his army to advance, and give battle to the duke of Norfolk. The answer of the nobility was, that they were determined not to attack the duke upon English ground; but that, if he invaded Scotland, they knew their duty. The earl of Huntly, who commanded the van of the Scottish army, consisting of 10,000 men, was of the same opinion; but no sooner did Norfolk pass the Tweed than he harassed the English army, cut off their foraging parties, and distressed them in such a manner that the duke agreed once more to a conference for peace; which was managed on the part of the Scots by the bishop of Orkney and Sir James Learmonth; but nothing was concluded. The English general, finding it now impossible to prosecute his invasion, re-passed the Tweed; and was harassed in his march by the earl of Huntly, who desisted from the pursuit when his enemies gained English ground. James, whose army at this time amounted to above 30,000 men, continued still at Edinburgh, from which he sent frequent messages to order his nobility and generals to follow the duke of Norfolk into England; but these were disregarded. James was flattered that now he had it in his power to be revenged for all the indignities that had been offered by England to Scotland. In this he was encouraged by the French ambassador, and the high opinion he had of his own troops. About the beginning of November he came to a resolution of reassembling his army, which was disbanded upon the duke of Norfolk's retreat. This project appeared so feasible and so promising that several of the nobility fell in with it, particularly lord Maxwell, the earls of Arran, Cassils, and Glencairn, with lords Fleming, Somerville, and Erskine: others represented, but in vain, that the arms of Scotland had already gained sufficient honor, by obliging the powerful army of the English, with their most experienced general at their head, to make a shameful retreat before a handful; that the force of Scotland was inferior to that of England; and that an honorable peace was still practicable. It was said, in reply to these considerations, that the state of the quarrel was now greatly altered; that Henry had in his manifesto declared his intention to enslave their country; that he treated the nobility as his vassals; that the duke of Norfolk had been guilty of burning the dwellings of the defenceless inhabitants, by laying above twenty villages and towns in ashes; and that no

Scotchman, who was not corrupted by Henry's gold, would oppose the king's will. The last, perhaps, was the chief argument that prevailed on lord Maxwell, a nobleman of great honor and courage, to agree to carry the war into England by Solway, provided he was at the head of 10,000 men. It was at last agreed that the earl of Arran and the cardinal should openly raise men, as if they intended to enter the east marches, where they were to make only a feint, while lord Maxwell was to make the real attempt upon the west. Private letters were every where circulated to raise the men who were to serve under the lord Maxwell; among whom were the earls of Cassils and Glencairn, the lords Fleming, Somerville, Erskine, and many other persons of great consideration. James, who was never suspected of want of courage, probably would have put himself at the head of this expedition, had he not been dissuaded from it by his priests and minions, who reminded him of the consultations at Falla Moor, and the other treasonable practices of the nobility. They added that, most of them being corrupted by the English gold, he could not be too much on his guard. He was at last persuaded to repair to the castle of Lochmaben near Carlaverock, and there to wait the issue of the inroad. It was probably at this place that James was prevailed on to come to the fatal resolution of appointing one Oliver Sinclair, a son of the house of Roslin, and a favorite minion at court, to command the army in chief; and his commission was made out accordingly. On the 23d of November the Scots began their march at midnight; and, having passed the Esk, all the adjacent villages were seen in flames by the break of day. Sir Thomas Wharton, the English warden of those marches, Dacres and Mulgrave, hastily raised about 500 men, and drew them up upon an advantageous ground; when Sinclair, ordering the royal banner to be displayed, and being mounted on the shoulders of two tall men, produced and read his commission. It is impossible to conceive the consternation into which the Scots were thrown upon this occasion; their leaders setting the example, the whole army declared that they would rather surrender themselves prisoners to the English than submit to be commanded by such a general. In an instant all order in the Scottish army was broken down; horse and foot, soldiers and noblemen and peasants, were intermingled. The English general perceived this confusion: 100 of his light-horse advanced; they met with no resistance: the nobles were the first who surrendered themselves prisoners; and, the rest of the English advancing, they obtained a bloodless victory; for even the women and the boys made prisoners of Scotch soldiers, and none were killed. Lord Herbert relates the circumstances of this shameful affair, and agrees with the Scottish authorities on the whole; but mentions that only 800 common soldiers were made prisoners. The chief prisoners were the earls of Cassils and Glencairn, the lords Maxwell, Fleming, Somerville, Oliphant, and Gray, and above 200 gentlemen. James was then at Carlaverock, about twelve miles distant from the place of action, depressed in his spirits, and anxious about the event of the expedition, still called the Raid of Solway Moss.

When the news came, and that the earl of Arran and the cardinal were returned to Edinburgh, he was seized with an additional dejection of mind, which brought him to his grave. In such a situation every cruel action of his life wounded his conscience; and he at last sunk into a sullen melancholy, which admitted of no consolation. From Carlaverock he removed to Falkland; and sometimes expressed himself as if he thought the whole body of his nobility were in a conspiracy against him. The presence of the few attendants who were admitted into his chamber, and who were the wicked instruments of his misconduct, seemed to aggravate his sufferings, and he either could not or would not take any sustenance. His death being now inevitable, Beaton approached his bed side with a paper, to which he is said to have directed the king's hand, pretending that it was his last will. On the 18th of December, while James was in this deplorable state, a messenger came from Linlithgow, with an account that the queen was brought to bed of a daughter; and the last words he was distinctly heard to say were, 'It will end as it began: the crown came by a woman, and it will go with one; many miseries approach this poor kingdom: Henry will either master it by arms, or win it by marriage.' He then turned his face to the wall, and in broken ejaculations pronounced the word Solway Moss, and some faint expressions alluding to the disgrace which the Scots had just suffered there. In this state he languished for some days; and died on the 13th.

V. HISTORY OF SCOTLAND UNTIL THE UNION OF THE SCOTTISH AND ENGLISH CROWNS.—James V. was succeeded by his infant daughter Mary. He had taken no steps for the security of his kingdom, so that ambitious men had now another opportunity of throwing the public affairs into confusion. The situation of Scotland indeed at this time was very critical. Many of the nobility were prisoners in England, and those who remained at home were factious and turbulent. The nation was dispirited. Commotions were daily excited on account of religion, and Henry VIII. had formed a design of adding Scotland to his other dominions. By a testamentary deed which cardinal Beaton had forged in the name of his sovereign, he was appointed tutor to the queen and governor of the realm, and three of the principal nobility were named to act as his counsellors in the administration. The nobility and the people, however, calling in question the authenticity of this deed, which he could not establish, the cardinal was degraded; and the states advanced to the regency James Hamilton, earl of Arran, whom they judged to be entitled to this distinction, as the second person in the kingdom, and the nearest heir, after Mary, to the crown. 'The disgrace of cardinal Beaton,' Dr. Stuart observes, 'might have proved the destruction of his party, if the earl of Arran had been endowed with vigor of mind and ability. But he was too indolent to gain partizans, and too irresolute to fix them. Slight difficulties filled him with embarrassment, and great ones overpowered him. His enemies, applying themselves to the timidity of his disposition, betrayed him into weakness; and the esteem which his

gentleness had procured him in private life was lost in the contempt attending his public conduct, which was feeble, fluctuating, and inconsistent. The attachment which he professed for the reformed religion drew to him the love of the people; his high birth, and the mildness of his virtues, conciliated their respect; and, from his name being at the head of the roll of heretics which the clergy had presented to the late king, a sentiment of tenderness was mingled with his popularity. His conduct corresponded, at first, with the impressions entertained in his favor. Thomas Guillaume and John Rough, two celebrated preachers, were invited to live in his house; and he permitted them to declaim openly against the errors of the church of Rome. They attacked and exposed the supremacy of the pope, the worship of images, and the invocation of saints. Cardinal Beaton and the prelates were exceedingly provoked, and indefatigably active to defend the established doctrines. This public sanction afforded to the reformation was of little consequence, however, when compared with a measure which was soon after adopted by Robert lord Maxwell. He proposed that the liberty of reading the scriptures in the vulgar tongue should be permitted to the people; and that, for the future, no heretical guilt should be inferred against any person for having them in his possession or for making use of them. The regent and the three estates acknowledged the propriety of this proposal. Gavin Dunbar archbishop of Glasgow, and chancellor of Scotland, protested, indeed, for himself and for the church, that no act on this subject should pass and be effectual, till a provincial council of all the clergy of the kingdom should consider and determine, whether there was a necessity that the people should consult and study the scriptures in the vulgar tongue; but, his protestation being disregarded, the bill of the lord Maxwell was carried into a law, and the regent made it generally known by a proclamation. From this period copies of the bible were imposed in great numbers from England; and, men allured by an appeal so flattering to their reason, were proud to recover from the supine ignorance in which they had been kept by an artful priesthood. To read became a common accomplishment; and books were multiplied in every quarter, which disclosed the pride, the tyranny, and the absurdities of the Romish church and superstitions. The death of James V. proved very favorable to the ambitious designs of Henry. He now proposed a union of the two kingdoms by the marriage of his son Edward VI. with Mary the young queen of Scotland. To promote this, he released the noblemen who had been taken prisoners at Solway, after having engaged them on oath, not only to concur in promoting the alliance, but to endeavour to procure him the charge and custody of the young queen, with the government of her kingdom, and the possession of her castles. The earl of Angus, and his brother, who had been fifteen years in exile, accompanied them to Scotland, and brought letters from Henry recommending them to the restitution of their honors and estates. The regent was inclined to favor the demands of persons of such

eminent station; but, though the states were inclined to the marriage, they refused to permit the removal of the queen into England, and treated with contempt the idea of giving the government of Scotland and the care of the castles to the king of England. Sir Ralph Sadler, the English ambassador, exerted all his endeavours to induce the regent to comply with the requisitions of his master; but all his intrigues were unsuccessful; and Henry at last authorised the commissioners to consent to treaties of amity and marriage, on the most favorable terms that could be procured. In consequence of these powers, it was agreed that a firm peace and alliance should take place between the two nations, and that they should mutually defend and protect one another in case of an invasion. The queen was to remain within her own dominions till she was ten years of age; and Henry was not to claim any share in the government. Six nobles, or their apparent heirs, were to be surrendered to him in security for the conveyance of the young queen into England, and for her marriage with prince Edward, as soon as she was ten years of age. It was also stipulated that, though the queen should have issue by Edward, Scotland should retain not only its name, but its laws and liberties. These conditions, however advantageous to Scotland, yet did not give entire satisfaction. Beaton, who had been imprisoned on suspicion of treasonable schemes, and was now released from his confinement by the influence of the queen-dowager, took all opportunities of exclaiming against the alliance, as tending to destroy the independency of the kingdom. He pointed out to the churchmen the dangers which arose from the prevalence of heresy, and urged them to unanimity and zeal. Awakened all their fears and selfishness, they granted him a large sum of money, with which he might gain partizans; the friars were instructed to preach against the treaties with England; and fanatical men were instructed to display their rage in offering indignities to Sir Ralph Sadler. Cardinal Beaton was not the only antagonist the regent had to deal with. The earls of Argyle, Huntly, Bothwell, and Murray, concurred in the opposition; and having collected some troops, and possessed themselves of the queen's person, they assumed all the authority of the government. They were joined by Matthew earl of Lennox, who was made to hope that he might espouse the queen-dowager and obtain the regency. He was also inclined to oppose the earl of Arran, from an ancient quarrel between their families, and from a claim he had to supersede him, both in the enjoyment of his personal estates and in the succession to the crown. The regent, alarmed at such a powerful combination, inclined to attend to some advances made him by the queen-dowager and cardinal. To refuse to confirm the treaties, after he had brought them to a conclusion, was, however, a step so repugnant to probity, that he could not be prevailed upon to adopt it. He therefore, in a solemn manner, ratified them in the abbey-church of Holyrood House, and commanded the great seal of Scotland to be appended to them. The same day he went to St. Andrews and issued a mandate to the cardi-

nal, requiring him to return to his allegiance. To this the prelate refused to pay any attention, or to move from his castle; upon which the regent denounced him a rebel, and threatened to compel him to submission by military force. But, in a few days after, the pusillanimous regent, meeting with Beaton, forsook the interest of Henry VIII. and embraced that of the queen-dowager and of France. Being in haste also to reconcile himself to the church of Rome, he renounced publicly, at Stirling, the opinions of the reformed, and received absolution from the hands of the cardinal. By this mean-spirited conduct the regent exposed himself to universal contempt, while cardinal Beaton usurped the whole authority. The earl of Lennox, finding that he had no hopes of success in his suit to the queen-dowager, engaged in negotiations with Henry, to place himself at the head of the Scottish lords who were in the English interest, and to assert the cause of the reformation.

The consequence of all this was a rupture with England. Henry not only delayed to ratify the treaties on his part, but ordered all the Scottish ships in the harbour of England to be taken and confiscated. This violent proceeding inflamed the national disgusts against the English alliance; and the party of the cardinal and queen-dowager thus obtained an increase of popularity. Henry himself, however, was so much accustomed to acts of outrage and violence, that he seemed to think the step he had taken a matter of no moment; and therefore demanded that the hostages, in terms of the treaty of marriage, should still be delivered up to him. But the cardinal and regent informed his ambassador, Sir Ralph Sadler, that from their own authority they could not command any of the nobles to be committed to him as hostages; and that the offensive strain of behaviour assumed by the English monarch might have altered the sentiments of the Scottish parliament with regard to a measure of such importance. After much altercation the conferences were broken off; and, as the lords who were released from captivity had promised to return prisoners to England, it now remained with them to fulfil their promise. None of them, however, had the courage to do so, excepting the earl of Cassils; and Henry, being struck with his punctilious sense of honor, dismissed him loaded with presents. Cardinal Beaton, being thus in possession of power, took measures to secure it. The coronation of the queen was celebrated at Stirling; a council was chosen to direct and assist the regent in the greater affairs of state, at the head of which was the queen-dowager: John Hamilton, abbot of Paisley, who had acquired an ascendancy over the regent, was promoted to the privy seal, and made treasurer of the kingdom; and cardinal Beaton, upon the request of the regent and the three estates, accepted the office of lord high chancellor. After the flatteries and the hopes with which the earl of Lennox had been amused, the cardinal had reason to dread the utmost warmth of his resentment. He had therefore written to Francis I. giving a detail of the critical situation of affairs in Scotland, and entreating him to recall to France the earl of Lennox, who was now

interested to oppose the influence and operations of the queen-dowager. But the indignation with which the treachery of the cardinal had inflamed the earl of Lennox precipitated him into immediate action, and defeated the intention of this artifice. In the hostile situation of his mind towards Scotland, an opportunity of commencing hostilities had presented itself. Five ships had arrived in the Clyde from France, loaded with warlike stores, and having on board the patriarch of Venice, Peter Contarini, legate from Paul III., with La Brosse, and James Mesnaye, ambassadors from France; and 30,000 crowns, which were to be employed in strengthening the French faction, and to be distributed by the queen-dowager and the cardinal. Prevailing with the commanders of these vessels, who conceived him to be the fast friend of their monarch, he secured this money for his own use, and deposited the military stores in his castle of Dumbarton, under the care of George Stirling, the deputy governor, who at this time was entirely in his interests. By the successful application of this wealth the earl of Lennox called forth the full exertions of his party in levying a formidable army, with which he threatened the destruction of the regent and the cardinal, offering them battle in the fields between Leith and Edinburgh. The regent, not being in a condition to accept the challenge of his rival, had recourse to negotiation. Cardinal Beaton and the earl of Huntly proposed terms of amity, and exerted themselves with so much address that the earl of Lennox, losing the opportunity of chastising his enemies, consented to an accommodation, and indulged anew the hope of obtaining the queen-dowager in marriage. His army was dismissed, and he threw himself at the feet of his mistress, by whom he was, in appearance, favorably received; but many of his friends were seduced from him under different pretences; and at last, apprehending his total ruin from some secret enterprise, he fled to Glasgow, and fortified himself in that city. The regent collecting an army marched against him; and having defeated his friend the earl of Glencairn, in a bloody encounter, was able to reduce the place of strength in which he confided. In this ebb of his fortune, the earl of Lennox had no hope but from England. The revolution produced in the political state of Scotland by the arts of cardinal Beaton, while it defeated the intrigues of Henry VIII., pointed all its strength against the progress of the reformation. After abandoning his old friends, the regent, in connexion with the cardinal, was ambitious to undo all the services he had rendered to them. The three estates annulled the treaties of amity and marriage, and empowered commissioners to conclude an alliance with France. The regent discharged the two preachers Guillaume and Rough, whom he had invited to impugn the doctrines of the church; and he drove back into England many pious persons, whose zeal had brought them to Scotland, to explain and advance the new opinions. He caressed with particular respect the legate whom the pope had sent to discourage the marriage of the young queen with the prince of Wales, and to promise his assistance against the enterprises of Henry VIII. He procured an act of parliament to be

passed for the persecution of heretics; and, upon the foundation of this authority, the most rigorous proceedings were concerted against the reformed; when the arms of England, rousing the apprehensions of the nation, gave the fullest employment to the regent and his counsellors. In the rage and anguish of disappointed ambition, the earl of Lennox made an offer to assist the views of the king of England; who, treating him as an ally, engaged, in the event of success, to give him in marriage his niece lady Margaret Douglas, and to invest him in the regency of Scotland. To establish the reformation in Scotland, to acquire the superiority over it to Henry VIII., and to effectuate the marriage of the prince of Wales with the queen of Scots, were the great objects of their confederacy. Henry, though engaged in a war with France, which required all his military force, could not resist the opportunity to execute his vengeance against Scotland. Edward Seymour earl of Hartford was appointed to command 10,000 men, who were embarked at Tinnmouth, about a fleet of 200 ships, under the direction of Sir John Dudley, lord Lisle. This army landed without opposition near Leith, and the earl of Hertford made it known to Sir Adam Otterburn, the provost of Edinburgh, that his commission empowered him to lay the country waste and desolate, unless the regent should deliver up the young queen to the king of England. It was answered that every extremity of distress would be endured, before the Scottish nation would submit to so ignominious a demand: 600 horse from Berwick, under lord Evers, now joined the earl of Hertford. Leith and Edinburgh, after a feeble resistance, yielded to the English commander, who abandoned them to pillage, and then set fire to them. A cruel devastation ensued in the surrounding villages and country, and an immense booty was conveyed on board the English fleet. But, while extreme terror was every where excited, the earl of Hertford reembarked a part of his troops, and ordered the remainder to march with expedition to the frontiers of England. The regent, assisted by cardinal Beaton and the earls of Huntly, Argyle, Bothwell, and Murray, was active, in the mean time, to collect an army, and to provide for the security of the kingdom. He felt, therefore, the greatest surprise on being relieved so unexpectedly from the most imminent danger; and an expedition conducted with so little discernment did not advance the measures of Henry VIII. To accomplish the marriage of the young queen with the prince of Wales, to possess himself of her person, or to achieve a conquest over Scotland, were all circumstances apparently within the reach of the English commander; and yet, in the moment of victory, he neglected to prosecute his advantages, and having inflamed the animosities of the Scottish nation, by a display of the passions and cruelty of his master, left them to recover from their disaster, and to improve their resources. The earl of Lennox, taking the opportunity of the English fleet, went to consult with Henry VIII. upon the desperate state of his affairs. He renewed his engagements with this monarch; and received in marriage the lady Margaret Douglas,

with possessions in England. Soon after he arrived in the Frith of Clyde, with eighteen ships and 600 soldiers, that he might secure the castle of Dumbarton, and employ himself in plundering and devastation. But George Stirling, to whom the castle was intrusted, refused to surrender it; and even obliged him to re-embark his troops. After engaging in a few petty incursions and skirmishes, he returned to England. In 1544 Henry consented to a truce; and Scotland, says Dr. Stuart, after having suffered the miseries of war, was subjected to the horrors of persecution. The regent had procured an act of parliament for the persecution of the reformed; and the cardinal, to draw to himself an additional splendor and power, had obtained from the pope the dignity of legate à latere. A visitation of his own diocese appeared to him the most proper method of commencing the proposed extirpation of heresy; and he carried with him in his train the regent, and many persons of distinction, to assist in his judicatories, and to share in his disgrace. In the town of Perth many persons were accused and condemned. The most trifling offences were regarded as atrocious crimes, and made the subjects of prosecution and punishment. Robert Lamb was hanged for affirming that the invocation of saints had no merit to save. William Anderson, James Reynold, and James Finlayson, for having abused an image of St. Francis, by putting horns upon his head. James Hunter, having kept them company, was found to be equally guilty, and hanged likewise. Helen Stirke, having refused, when in labor, to invoke the assistance of the Virgin, was drowned. Many of the burghesses of Perth, being suspected of heresy, were sent into banishment; and the lord Ruthven, the provost, was upon the same account dismissed from his office. The cardinal was equally strenuous in persecuting heresy elsewhere. But the clamor attending the executions of men of inferior station was now lost in the fame of the martyrdom of Mr. Wishart; a person who, while he was respectable by his birth, was highly eminent from the opinion entertained of his capacity and endowments. The historians of the protestant persuasion have spoken of this reformer in terms of the highest admiration. They extol his learning as extensive, insist on the extreme candor of his disposition, and ascribe to him the utmost purity of morals. They even imputed to him the spirit of prophecy. It may be sufficient to affirm that George Wishart was the most eminent preacher who had hitherto appeared in Scotland. His mind was cultivated by reflection and study, and he was amply possessed of those abilities and qualifications which excite the passions of the people. His ministry had been attended with the most flattering success; and his courage to encounter danger grew with his reputation. The day before he was apprehended, he said to John Knox, 'I am weary of the world, since I perceive that men are weary of God.' He had already reconciled himself to that terrible death which awaited him. He was found in the house of Cockburn of Ormiston, in East Lothian; who, refusing to deliver him to the servants of the regent, the earl of

Bothwell, the sheriff of the county, required that he should be entrusted to his care, and promised that no injury should be done to him. But the authority of the regent and his counsellors obliged the earl to surrender his charge. He was conveyed to the cardinal's castle at St. Andrews, and his trial was hurried on. The cardinal and the clergy, proceeding in it without the concurrence of the secular power, adjudged him to be burnt alive. In the circumstances of his execution there appears a deliberate and most barbarous cruelty. When led out to the stake, he was met by priests, who, mocking his condition, called upon him to pray to the virgin, that she might intercede with her Son for mercy to him. 'Forbear to tempt me, my brethren,' was his mild reply. A black coat of linen was put upon him by one executioner, and bags of powder were fastened to his body by another. Some pieces of ordnance were pointed to the place of execution. He spoke to the spectators, intreating them to remember that he was to die for the true gospel of Christ. Fire was communicated to the fagots. From a balcony in a tower of his castle, which was hung with tapestry, the cardinal and the prelates, reclining upon rich cushions, beheld the inhuman scene. This insolent triumph, more than all his afflictions, affected the magnanimity of the sufferer. He exclaimed that the enemy, who so proudly solaced himself, would perish in a few days, and be exposed ignominiously in the place which he now occupied. Cardinal Beaton took a pleasure in receiving the congratulations of the clergy upon a deed which it was thought would fill the enemies of the church with terror. But the indignation of the people was more excited than their fears. All ranks of men were disgusted with an exercise of power which despised every boundary of moderation and justice. The prediction of Mr. Wishart, suggested by the general odium which attended the cardinal, was considered by the disciples of this martyr as the effusion of a prophet; and perhaps gave occasion to the assassination that followed. Their complaints were attended to by Norman Lesley, the eldest son of the earl of Rothes, whom the cardinal had treated with indignity, though he had profited by his services. He consented to be their leader. The cardinal was in his castle of St. Andrews, which he was fortifying after the strongest fashion of that age. The conspirators, at different times, early in the morning entered into it. The gates were secured; and appointing a guard, that no intimation of their proceedings might go to the cardinal, they dismissed from the castle all his workmen separately, to the number of 100, and all his domestics, who amounted to no fewer than fifty persons. The eldest son of the earl of Arran, whom he kept as a hostage for his father's behaviour, was alone detained by them. The prelate, alarmed with their noise, looked from his window, and was informed that his castle was taken by Norman Lesley. It was in vain that he endeavoured to secure the door of his chamber by bolts and chests. The conspirators brought fire, and were ready to apply it, when, admitting them, he implored their mercy. Two of them struck him hastily with their swords. But James Melvil, rebuking their passion, told them that this work

and judgment of God, though secret, ought to be done with gravity. He reminded the cardinal, in general terms, of the enormity of his sins, and reproached him in a more particular manner with the death of Mr. Wishart. He swore that no hopes of his riches, no dread of his power, and no hatred to his person, were any motives which actuated him; but that he was moved to accomplish his destruction by the obstinacy and zeal manifested by him against Christ Jesus and his holy gospel. Waiting for no answer, he thrust the cardinal three times through the body with his dagger, on the 29th of May, 1546. The rumor that the castle was taken giving an alarm to the inhabitants of St. Andrew's, they came in crowds to gratify their curiosity, and to offer their assistance, according to the sentiments they entertained. The adherents and dependents of the cardinal were clamorous to see him; and the conspirators, carrying his dead body to the very window from which he had beheld the sufferings of Mr. Wishart, exposed it to their view.

The truce, in the mean time, which had been concluded with England was frequently interrupted; but no memorable battles were fought. Mutual depredations kept alive the hostile spirit of the two kingdoms; and while the regent was making military preparations, which gave the promise of important events, a treaty of peace was finished between England and France, in which Francis I. took care to comprehend the Scottish nation. In this treaty it was stipulated by Henry that he was not to wage war against Scotland, unless he should be provoked by new and just causes of hostility. But the murderers of cardinal Beaton, apprehensive of their safety, had despatched messengers into England with applications to Henry for assistance; and, being joined by more than 120 of their friends, they took the resolution of keeping the castle, and of defending themselves. Henry, notwithstanding his treaty with France, resolved to embrace this opportunity of augmenting the disturbances of Scotland. He hastened to collect troops; and the regent and his counsellors pressed France for supplies in men and money, and military stores and artillery. The high places which the cardinal occupied were filled up immediately upon his death. John Hamilton, abbot of Paisley, was elected archbishop of St. Andrews, and George earl of Huntly was promoted to be chancellor. By these officers the regent was urged to proceed with vigor against the conspirators; and it was a matter of the greatest anxiety to him to recover his eldest son, whom they detained in custody. The clergy had, in the most solemn manner, pronounced them to be accursed; and agreed to furnish, for four months, a monthly subsidy of £3000 to defray the expense of reducing them to obedience. The queen dowager and the French faction were eager at the same time, to concur in avenging the assassination of a man to whose counsels and services they were so greatly indebted. And, that no dangerous use might be made of the eldest son of the earl of Arran, who, after his father, was the heir of the monarchy, an act of parliament was passed, excluding him from his birth-right while he remained in the possession of the

enemies of his country, and substituting his brothers in his place, according to their seniority. The dark politics of Henry suggested the necessity of this expedient; and in its meaning and tendency there may be remarked the spirit and greatness of a free people. A powerful army laid siege to the castle of St. Andrews, and continued their operations during four months; but no success attended the assailants. The fortifications were strong; and a communication with the besieged was open by sea to the king of England, who supplied them with arms and provisions. The garrison received his pay, and the principal conspirators had pensions from him. In return for his generosity, they were engaged to promote the marriage of his son with the young queen; to advance the reformation; and to keep in custody the eldest son of the regent. Negotiation succeeded to hostility; and as the regent expected assistance from France, and the conspirators had the prospect of support from an English army, both parties were disposed to gain time. A treaty was entered into, in which the regent engaged to procure from Rome an absolution to the conspirators, and to obtain to them from the three estates an exemption from prosecutions of every kind. Upon the part of the besieged, it was stipulated, that, when these conditions were fulfilled, the castle should be surrendered, and the regent's son be delivered up to him. In the mean time Henry VIII. died; and in a few weeks after Francis I. also paid his debt to nature. But the former, before his death, had recommended the prosecution of the Scottish war; and Henry II., the successor of Francis, was eager to show his attention to the ancient ally of his nation. When the absolution arrived from Rome, the conspirators refused to consider it as valid; and an expression used by the pope, implying an absurdity, furnished an apology for their conduct. They knew that the counsellors of Edward VI. were making vigorous preparations to invade Scotland; they were confident of their present ability to defend themselves; and the advocates for the reformation encouraged them. The latter indeed, in the mean time, adopted but too many of the intolerant maxims of the Roman Catholics, and many of them congratulated the conspirators upon what they called their godly deed and enterprise. Rough, who had formerly been chaplain to the regent, entered the castle and joined them. At this time also John Knox began to distinguish himself in an eminent manner, both by his success in argument, and the unbounded freedom of his discourse; while the Roman clergy, every where defeated and ashamed, implored the assistance of the regent and his council, who assured them that the laws against heretics should be put in execution.—Stuart's History. In the mean time the castle of St. Andrews, being invested by a fleet of sixteen sail under admiral Strozzi from France, was obliged to capitulate. Honorable terms were granted to the conspirators; but, after being conveyed to France, they were cruelly used, from the hatred entertained by the Catholics against the Protestants. Many were confined in prisons; and others, among whom, says Dr. Stuart, was John Knox, were sent to the galleys.

The castle itself was razed to the ground. The same year, 1547, Scotland was invaded by an English army under the duke of Somerset, who had been chosen protector of England during the minority of Edward VI. The design of this invasion was to oblige the Scots to comply with the scheme of Henry VIII., and conclude a marriage between Edward and the young queen of Scotland. The English army consisted of 13,000 men; besides which the protector had a fleet of sixty sail, one-half of which were ships of war, and the others were vessels laden with provisions and military stores. On the other hand, the regent opposed him with an army of 40,000. Before the commencement of hostilities, however, the duke of Somerset addressed a letter to the government, in which he pressed the marriage with such powerful arguments, and so clearly showed the benefits which would result from it to both nations, that the regent and his party, who were averse to peace, thought proper to suppress it, and to circulate a report that the English had come to force away the queen, and to reduce the kingdom to a state of dependence. All hopes of an accommodation being thus removed, the English army advanced to give battle to the Scots. They found the latter posted in the most advantageous situation, around the villages of Musselburgh, Inveresk, and Monkton; so that he could not force them to an action, at the same time that he found himself in danger of having his communication with his ships cut off, which would have totally deprived his army of the means of subsistence. In this dangerous situation he had again recourse to negotiation, and offered terms still more favorable than before. He now declared himself ready to retire into England, and to make ample compensation for the injuries committed by his army, if the Scottish government would promise that the queen should not be contracted to a foreign prince, but should be kept at home till she was of age to choose a husband for herself, with the consent of the nobility. These concessions increased the confidence of the regent so much, that, without taking advantage of the strength of his situation, he resolved to come to a general engagement. The protector moved towards Pinkey, a gentleman's seat, east of Musselburgh; and the regent, conceiving that he meant to take refuge in his fleet, changed the strong ground in which he was encamped. He commanded his army to pass the Esk, and to approach the English forces, which were posted on the middle of Faside Hill. The earl of Angus led on the van; the main body marched under the regent; and the earl of Huntly commanded in the rear. It was the regent's intention to seize the top of the hill. The lord Gray, to defeat this purpose, charged the earl of Angus, at the head of the English cavalry. They were received upon the points of the Scottish spears, which were longer than the lances of the English horsemen, and put to flight. The earl of Warwick, more successful with his command of infantry, advanced to the attack. The ordnance from the fleet assisted his operations; and a brisk fire from the English artillery, which was planted on a rising ground, served still more to intimidate

the Scottish soldiery. The remaining troops under the protector were moving slowly and in the best order, to take a share in the engagement. The earl of Angus was not well supported by the regent and the earl of Huntly. A panic spread through the Scottish army. It fled in different ways, presenting a scene of the greatest havoc and confusion. Few perished in the fight; but the chase continuing in one direction to Edinburgh, and in another to Dalkeith, with the utmost fury, a prodigious slaughter was made. The loss of the English did not amount to 500 men; but 10,000 soldiers perished on the side of the Scots. A multitude of prisoners were taken; and among these the earl of Huntly, the lord high chancellor.

Amidst the consternation of this decisive victory, the duke of Somerset had a full opportunity of effectuating the marriage and union projected by Henry VIII., and on the subject of which such fond anxiety was entertained by the English nation. But, the cabals of his enemies threatening his destruction at home, he yielded to the necessities of his ambition, and marched back into England. He took precautions, however, to secure an entry into Scotland, both by sea and land. A garrison of 200 men was placed in the isle of St. Kolumba in the Forth, and two ships of war were left as a guard to it. A garrison was also stationed in the castle of Broughty, in the mouth of the Tay. When he passed through the Merse and Teviotdale, the leading men of these counties repaired to him; and, taking an oath of allegiance to king Edward, surrendered their places of strength. Some of these he demolished, and to others he added new fortifications. Hume castle was garrisoned with 200 men, and entrusted to Sir Edward Dudley; and he posted 300 soldiers, with 200 pioneers, in the castle of Roxburgh, under Sir Ralph Bulmer. The only resource of the regent now was the hope of assistance from France. The young queen was lodged in the castle of Dumbarton, under the care of the lords Erskine and Livingstone; and ambassadors were sent to Henry II. of France, acquainting him with the disaster at Pinkey, and imploring his assistance. The regent had asked permission from the protector to treat of peace, and the earl of Warwick was appointed to wait for them at Berwick; but none were ever sent on the part of Scotland. Hostilities were soon recommenced by the English. Lord Gray led an army into Scotland, fortified the town of Haddington, took the castles of Yester and Dalkeith, laid waste the Merse and the counties of East and Mid-Lothian. On the other hand, in June, 1548, M. De Desse, a French officer of great reputation, landed at Leith with 6000 soldiers, and a formidable train of artillery. In the mean time the regent was in disgrace on account of the disaster at Pinkey; and the queen-dowager, to supersede his authority, improved this circumstance to her own advantage. As her power and interest could best be supported by France, she resolved to enter into the strictest alliance with that kingdom. It had been proposed that the dauphin of France should marry the queen of Scotland; and this proposal now met with many partisans, the hos-

tilities of the English having lost a great number of friends to the cause of that country. It was resolved to send the queen immediately to France, which would remove the cause of the present contentions, and her subsequent marriage with the dauphin would in the fullest manner confirm the friendship betwixt the two nations. The French government also entered deeply into the scheme: and, to promote it, made presents of great value to many of the Scottish nobility. The regent himself was gained over by a pension of 12,000 livres, and the title of duke of Chatelherault. M. de Villegagnon, who commanded four galleys in the harbour of Leith, making a feint as if he intended to proceed instantly to France, tacked about to the north, and, sailing round the isles, received the queen at Dumbarton; whence he conveyed her to France, and delivered her to her uncles, the princes of Lorraine, in July, 1548. The siege of Haddington had been undertaken as soon as the French auxiliaries arrived, and was now conducted with vigor. To reinforce the garrison 1500 horse advanced from Berwick; but, an ambuscade being laid for them, they were almost totally destroyed. Another body of English troops, however, which amounted only to 300 persons, was more successful. Eluding the vigilance of the Scots and the French, they entered Haddington, and supplied the besieged with ammunition and provisions. Lord Seymour, high admiral of England, made a descent upon Fife with 1200 men and some pieces of artillery; but was driven back to his ships with great slaughter by James Stuart, natural brother to the young queen, who opposed him at the head of the county militia. A second descent was made by him at Montrose; but, being equally unsuccessful there, he left Scotland without performing any important achievement. Having collected an army of 17,000 men, and adding to it 3000 German Protestants, the protector put it under the direction of the earl of Shrewsbury. Upon the approach of the English, Desse, though he had been reinforced with 15,000 Scots, thought it more prudent to retreat than to hazard a decisive battle. He raised the siege of Haddington, and marched to Edinburgh. The earl of Shrewsbury did not follow him to force an engagement: jealousies had arisen between the Scots and the French. The insolence and vanity of the latter, encouraged by their superior skill in military arts, had offended the quick and impatient spirit of the former. The fretfulness of the Scots was augmented by the calamities inseparable from war; and, after the conveyance of the young queen to France, the peculiar advantage conferred upon that kingdom by this transaction was fully understood, and appeared highly disgraceful and impolitic. In this state of their humor Desse found not at Edinburgh the reception he expected. The quartering of his soldiers produced disputes, which ended in an insurrection of the inhabitants. The French fired among the citizens. Several persons of distinction fell, and among these were the provost of Edinburgh and his son. The national discontents and inquietudes were driven, by this event, to the most dangerous extremity; and

Desse, who was a man of ability, thought of giving employment to his troops, and of flattering the people by the splendor of some martial exploit. The earl of Shrewsbury, after supplying Haddington with troops, provisions, and military stores, retired with his army into England. Its garrison was in the enjoyment of security, and unsuspecting of danger. Marching in the night, Desse reached this important post; and, destroying a fort of observation, prepared to storm the main gates of the city, when the garrison took the alarm. A French deserter pointing a double cannon to the thickest ranks of the assailants, the shot was incredibly destructive, and threw them into confusion. In the height of their consternation, a vigorous sally was made by the besieged. Desse renewed the assault in the morning, and was again discomfited. He now turned his arms against Broughty castle; and, though unable to reduce it, yet recovered the neighbouring town of Dundee, which had fallen into the possession of the enemy. Hume castle was retaken by stratagem. Desse entered Jedburgh, and put its garrison to the sword; ravaged the English borders in different incursions, and obtained several petty victories. Leith, which from a small village had grown into a town, was fortified by him; and the island of Inchkeith, nearly opposite to the harbour, being occupied by English troops, he made them prisoners, after a brisk encounter. His activity and valor could not, however, compose the discontents of the Scots; and, the queen-dowager having written to Henry II. to recall him, he was succeeded in his command by M. de Thermes, who was accompanied into Scotland by Monluc bishop of Valence, a person highly esteemed for his address and ability. This ecclesiastic was designed to supply the loss of cardinal Beaton, and to discharge the office of lord high chancellor of Scotland. But the jealousies of the nation increasing, and the queen-dowager herself suspecting his ambition and turbulence, he soon returned home. De Thermes brought with him from France a reinforcement of 1000 foot, 2000 horse, and 100 men at arms. He erected a fort at Aberlady, to distress the garrison of Haddington, and to intercept its supplies. At Coldingham he destroyed a troop of Spaniards in the English pay. Fast castle was regained by surprise. Distractions in the English court did not permit the protector to act vigorously in the war. The earl of Warwick was diverted from marching an army into Scotland. An infectious distemper had broke out in the garrison at Haddington; and it could not hold out for any time against the Scots. The earl of Rutland, therefore, with a body of troops, entered the town; and, after setting fire to it, conducted the garrison and artillery to Berwick. The regent was solicitous to recover the other places still in the power of the English. De Thermes laid siege to Broughty castle, and took it. He then besieged Lauder; and the garrison was about to surrender at discretion, when the news arrived that a peace was concluded between France, England, and Scotland. By this treaty Henry II. obtained the restitution of Boulogne and its dependencies, which had been taken from him by

the king of England, and for which he paid 400,000 crowns. No opposition was to be given to the marriage of the queen of Scotland with the dauphin: the fortresses of Lauder and Douglas were to be restored to the Scots, and the English were to destroy the castles of Roxburgh and Eymouth. After the ratifications of the articles, the queen-dowager embarked with Leon Stozzi for France, attended by many of the nobility. Having arrived there, she communicated to the king her design of assuming the government of Scotland, and he promised to assist her. But the jealousy which prevailed between the Scots and French rendered the accomplishment of this design very difficult. To remove the regent by an act of power might endanger the scheme altogether; but it might be possible to persuade him to resign his office. For this purpose intrigues were immediately commenced; indeed the regent himself contributed to promote their schemes by his violent persecution of the reformed. The peace was hardly proclaimed, when he provoked the public resentment by an action of sanguinary insolence. Adam Wallace, a man of simple manners, but of great zeal for the reformation, was accused of heresy, and brought to trial in the church of the Black Friars at Edinburgh. In the presence of the regent, the earl of Angus, Huntly, Glencairn, and other persons of distinction and rank, he was charged with preaching without any authority of law, with baptizing one of his own children, and with denying the doctrine of purgatory; and it was strenuously objected to him that he accounted prayers to the saints and the dead to be a useless superstition; that he had pronounced the mass to be an idolatrous service; and that he had affirmed that the bread and wine in the sacrament of the altar, after the words of the consecration, do not change their nature, but continue to be bread and wine. These offences were esteemed too terrible to admit of any pardon.—The earl of Glencairn alone protested against his punishment. The pious sufferer bore with resignation the contumelious insults of the clergy; and by his courage and patience at the stake recommended the opinions he had embraced. Other acts of atrocity and violence stained the administration of the regent. In his own palace, William Crichton, a man of family and reputation, was assassinated by lord Semple. No attempt was made to punish the murderer. His daughter was the concubine of the archbishop of St. Andrews, and her tears and entreaties were more powerful than justice. John Melvil, a person respectable by his birth and his fortune, had written to an English gentleman, recommending to his care a friend who was then a captive in England. This letter contained no improper information in matters of state; and no suspicion of any crime against Melvil could be inferred from it. Yet the regent brought him to trial upon a charge of high treason; and, for an act of humanity and friendship, he was condemned to lose his head. The estate of Melvil, forfeited to his family, was given to David, the youngest son of the regent.

Amidst the amusements of the French court, the queen-dowager was not inattentive to the

scheme of ambition which she had projected. The earls of Huntly and Sutherland, Marischal and Cassils, with lord Maxwell, and other persons of eminence who had accompanied her to France, were gained over to her interests. Robert Carnegie of Kinnaird, David Panter, bishop of Ross, and Gavin Hamilton, commendator of Kilwinning, being also at this time in that kingdom, and having the greatest weight with the regent, were treated with a most punctilious respect. Henry declared to them his earnest wish that the queen-dowager might attain the government of Scotland. In case the regent should consent to this measure, he expressed a firm intention that no detriment should happen to his consequence and affairs; and he desired them to inform him that he had already confirmed his title of duke of Chatellerault, had advanced his son to be captain of the Scots gendarmes in France, and was ready to tender other marks of favor to his family. With this message, Mr. Carnegie was sent to Scotland; and a few days after he was followed by the bishop of Ross. The bishop, being a man of eloquence and authority, obtained a promise from the regent to resign; and for this service he received, as a recompense, an abbey in Poitou. The queen-dowager, full of hopes, now prepared to return to Scotland, and in her way thither made use of a safe-conduct obtained from Edward VI. by the king of France. The English monarch, however, had not yet forgot the beautiful queen of Scotland; and did not fail to urge his superiority of claim to her over the dauphin. The queen-dowager did not seriously enter upon the business; only in general terms complained of the hostilities committed by the English; and two days after this conversation she proceeded towards Scotland, where she was conducted by the earl of Bothwell, lord Hume, and some other noblemen, to Edinburgh, amidst the acclamations of the people. She had not long been returned to the capital, when the bad conduct of the regent afforded her an opportunity of exerting her influence. The regent, having proposed a judicial circuit through the kingdom, under pretence of repressing crimes and disorders, molested the people by plunder and rapine. Great fines were levied for offences pretended as well as real; and the protestants in particular were the objects of his severity. In his progress he was accompanied by the queen dowager; and, as she affected to behave in a manner directly opposite, the most disagreeable comparisons were made between her and the regent. The bishop of Ross did not fail to put him in mind of his promise, but he wished still to continue in power. His resolution, however, failed him, on the intimation of a parliamentary enquiry into his administration. An agreement with the queen dowager then took place; and it was stipulated that he should succeed to the throne upon the death of the queen without issue; that his son should enjoy the command of the gendarmes; that no enquiry should be made into the expenditure of the royal treasures; that no scrutiny into his government should take place; and that he should enjoy in the most ample manner his duchy and his pension. These articles were re-

tified at an assembly of parliament, and the queen-dowager was formally invested with the regency.

Mary of Lorraine, the new regent, though she had with great difficulty attained the summit of her wishes, seemed to be much less conversant in the arts of government than in those of intrigue. She was scarcely settled in her new office when she rendered herself unpopular by her too great attachment to France, and by her persecution of the Protestants. She was entirely guided by the counsels of her brothers, the duke of Guise and the cardinal of Lorraine; and paid a devoted attention to those of M. d'Oysel the French ambassador. Several high offices were filled with Frenchmen, which excited the highest resentment of the Scottish nobility; and the commonalty were instantly prejudiced against her by the partiality she showed to the Papists. At first, however, she enacted many salutary laws; and, while she made a progress herself through the southern provinces of the kingdom to hold justiciary courts, she endeavoured to introduce order and law into the western counties and isles: first by the earl of Huntly, and afterwards by the earls of Argyre and Athol, to whom she granted commissions for this purpose. In another improvement, which the queen-regent attempted by the advice of her French council, she found herself opposed by her own people. It was proposed that the possessions of every proprietor of land in the kingdom should be valued and entered into registers; and that a proportional payment should be made by each. The application of this fund was to maintain a regular and standing body of soldiers. This guard or army, it was urged, being at all times in readiness to march against an enemy, would protect effectually the frontiers; and there would no longer be any necessity for the nobles to be continually in motion on every rumor of hostility or incursion from English invaders. No art, however, or argument could recommend these measures. A perpetual tax and a standing army were conceived to be the genuine characteristics of despotism. All ranks of men considered themselves insulted and abused; and 300 tenants of the crown assembling at Edinburgh, and giving way to their indignation, sent their remonstrances to the queen-regent in such strong and impressive language as induced her to abandon the scheme. Yet still the attempt which she had made left an impression in the minds of the people. They suspected her to be a secret enemy to their government and liberties; and they were convinced that Henry II. was engaging her in artifices that he might reduce Scotland to be a province of France. While an alarm about their civil rights was spreading among the people, the Protestants were rising daily in their spirit and in their hopes. John Knox, whose courage had been confirmed by misfortunes, and whose talents had improved by exercise, was at this time making a progress through Scotland. The characteristic peculiarities of Popery were the favorite topics of his declamation and censure. He treated the mass, in particular, with the most sovereign contempt, representing it as a remnant of idolatry. Many

of the nobility and gentry afforded him countenance and protection. They invited him to preach at their houses, and partook with him in the ordinances of religion after the reformed method. Religious societies and assemblies were held publicly in defiance of the Papists; and celebrated preachers were courted with assiduity to officiate in particular districts and towns. The clergy cited him to appear before them at Edinburgh, in the church of the Blackfriars. On the appointed day he presented himself, with a numerous attendance of gentlemen, who were determined to exert themselves in his behalf. The priesthood did not choose to proceed in his prosecution; and Knox, encouraged by this symptom of their fear, took the resolution to explain and inculcate his doctrines repeatedly and openly in the capital. In 1556 the earl of Glencairn took the earl Marischal to hear the exhortations of this celebrated preacher; and they were so much affected with his reasonings and rhetoric that they requested him to address the queen-regent upon the subject of the reformation of religion. In compliance with this request, he wrote a letter in terms more forcible than pleasing, and the earl of Glencairn delivered it with his own hand, in the expectation that some advantage might be obtained for the reformed. But the queen-regent was no less offended with the freedom of the nobleman than of the preacher; and, after perusing the paper, she gave it to James Beaton, archbishop of Glasgow, with an expression of disdain: 'Here, my lord, is a pasquill.' Amidst these occupations Knox received an invitation to take the charge of the English congregation at Geneva; which he accepted. The clergy called upon him, in his absence, to appear before them, condemned him to death as a heretic, and ordered him to be burned in effigy. This injurious treatment did not in the least obstruct the progress of the reformation. Desertions were made from popery in every town and village; and even many members of the church, both secular and regular, were forward to embrace the new principles, and to atone for their past mistakes by the bitterest raileries against the corruptions and folly of the Romish faith. The priests were treated in all places with ridicule and contempt. The images, crucifixes, and relics, which served to rouse the decaying fervors of superstition, were stolen from the churches, and trampled under foot. The bishops implored the assistance of the queen regent. Citations were given to the preachers to appear in their defence. They obeyed; but with such a formidable retinue that it was with difficulty she was permitted to apologise for her conduct. James Chalmers of Gaitgirth, pressing forward from the crowd, addressed himself to her: 'We row to God that the devices of the prelates shall not be carried into execution. We are oppressed to maintain them in their idleness. They seek to undo and murder our preachers and us; and we are determined to submit no longer to this wickedness.' The multitude, applauding this speech, put their hands to their daggers. A trusty messenger was despatched to Geneva, inviting John Knox to return to his own country; but, upon further consideration, by opposite de-

spatches, Knox was requested to delay his journey for some time. To this zealous reformer their unsteadiness was a matter of serious affliction; and, in the answer, he rebuked them with severity, but entreated them not to faint under their purposes, from apprehensions of danger. To particular persons he wrote other addresses; and to all of them the greatest attention was paid. In 1557 a formal bond of agreement, which obtained the appellation of the first covenant, was entered into, and all the more eminent persons who favored the reformation were invited to subscribe it. The earls of Argyle, Glencairn, and Morton, with the lord Lorn, and John Erskine of Dun, led the way by subscribing it. All the subscribers to this deed, renouncing the superstitions and idolatry of the Church of Rome, promised to apply continually their whole power and wealth, and even to give up their lives, to forward and establish the word of God. They distinguished the reformed by calling them the Congregation of Christ; and, by the opprobrious title of the Congregation of Satan, they peculiarised the favorers of Popery. After the leaders of the reformation had subscribed the first covenant they addressed letters to Knox, urging in the strongest terms his return to Scotland; and, that their hopes of his assistance might not be disappointed, they sent another address to Calvin, the celebrated reformer, begging him to join his commands to their entreaties. The archbishop of St. Andrews, who perceived the rising storm, was in a difficult situation. A powerful combination threatened ruin to the church; and he had separated himself from the politics of the queen-regent. The zeal of the Roman Catholics pointed out strong measures to him; and his dispositions were pacific. The clergy were offended with his remissness. The reformers detested his loose principles, and were shocked with the depravity of his life. He tried the force of address and did not succeed. He then resolved to be severe, and was still more unsuccessful. The earl of Argyle was the most powerful of the reformers. To allure him from his party the archbishop of St. Andrews employed Sir David Hamilton. But the kindness he affected, and the advices he bestowed, were no compliment to this nobleman; and his threats were despised. The reformers, instead of losing their courage, felt a sentiment of exultation and triumph; and the earl of Argyle dying about this time he not only maintained the new doctrines in his last moments, but entreated his son to promote the public preaching of the gospel, and the utter ruin of superstition and idolatry. At length the archbishop and the prelates resolved on a furious persecution of the reformed. Walter Mill, a priest, having been long under the suspicion of heresy, was carried to St. Andrews, committed to prison, and accused before the archbishop and his suffragans. He was in an extreme old age; and had struggled all his life with poverty. He sunk not, however, under the hardness of his fate. To the articles of his accusation he replied with signal recollection and fortitude. The firmness of his mind, in the emaciated state of his body, excited admiration; and the insults of his enemies, and their contempt

served to discover his superiority over them. When the clergy declared him a heretic no temporal judge could be found to condemn him to the fire. He was respite to another day; and such great sympathy prevailed for his misfortunes that it was necessary to allure one of the archbishop's domestics to supply the place of the civil power, and to pronounce the sentence of condemnation. When brought to the stake he praised God that he had been called to seal the truth with his life; and he conjured the people, as they would escape eternal death, not to be overcome by the errors and the artifices of monks and priests, abbots and bishops. The barbarity of this execution affected the reformers with inexpressible horror. Subscriptions for mutual defence were taken. The leaders of the reformation, dispersing their emissaries to every quarter, encouraged the vehemence of the multitude. The covenant to establish a new form of religion extended far and wide. When the leaders of the reformation were apprised of the ardent zeal of the people, and considered the great number of subscriptions which had been collected in the different counties of the kingdom, they assembled to deliberate concerning the steps to be pursued. It was resolved that a public supplication of the whole body of the Protestants should be presented to the queen-regent; which, after complaining of the injuries they had suffered, should require her to bestow upon them her support and assistance, and urge her to proceed in the work of a reformation. To explain their full meaning, a schedule, containing particular demands, was to be presented to her scrutiny. To Sir James Sandilands of Calder they committed the important charge of their manifesto and articles of reformation. His character was in the highest estimation; his services to his country were numerous; his integrity and honor were superior to all suspicion; and his age and experience gave him authority and reverence. The petition of the Protestants was expressed in strong but respectful terms. They told the queen regent that, 'though they had been provoked by great injuries, they had yet, during a long period, abstained from assembling themselves, and from making known to her their complaints. Banishment, confiscation of goods, and death in its most cruel shape, were evils with which the reformed had been afflicted; and they were still exposed to these dreadful calamities. Compelled by their sufferings they presumed to ask a remedy against the tyranny of the prelates and the estate ecclesiastical. They had usurped an unlimited dominion over the minds of men. Whatever they commanded, though without any sanction from the word of God, must be obeyed. Whatever they prohibited, though from their own authority only, it was necessary to avoid. All arguments and remonstrances were equally fruitless and vain. The fire, the faggot, and the sword, were the weapons with which the church enforced and vindicated her mandates. By these, of late years, many of their brethren had fallen; and, upon this account, they were troubled and wounded in their consciences. For, conceiving themselves to be a part of that power which God had established in this kingdom, it was their

duty to have defended them, or to have concurred with them in an open avowal of their common religion. They now take the opportunity to make this avowal. They break a silence which may be misinterpreted into a justification of the cruelties of their enemies; and, disdaining all farther dissimulation in matters which concern the glory of God, their present happiness, and their future salvation, they demand that the original purity of the Christian religion shall be restored, and that the government shall be so improved as to afford to them a security in their persons, their opinions, and their property.' With this petition of the Protestants Sir James Sandilands presented their schedule of demands, or the preliminary articles of the reformation. They were in the spirit of their supplication, and of the following tenor:—*I.* It shall be lawful to the reformed to peruse the Scriptures in the vulgar tongue; and to employ also their native language in prayer publicly and in private. *II.* It shall be permitted to any person qualified by knowledge to interpret and explain the difficult passages in the Scriptures. *III.* The election of ministers shall take place according to the rules of the primitive church; and those who elect shall enquire diligently into the lives and doctrines of the persons whom they admit to the clerical office. *IV.* The holy sacrament of baptism shall be celebrated in the vulgar tongue, that its institution and nature may be the more generally understood. *V.* The holy sacrament of the Lord's Supper shall likewise be administered in the vulgar tongue; and in this communion, as well as in the ceremonial of baptism, a becoming respect shall be paid to the plain institution of Christ Jesus. *VI.* The wicked and licentious lives of the bishops and estate ecclesiastical shall be reformed; and, if they discharge not the duties of true and faithful pastors, they shall be compelled to desist from their ministry and functions.'

The queen-regent now found it necessary to flatter the Protestants. She assured them by Sir James Sandilands, their orator or commissioner, that every thing they could legally desire should be granted to them; and that, in the mean time, they might, without molestation, employ the vulgar tongue in their prayers and religious exercises. But, upon the pretence that no encouragement might be given to tumults and riot, she requested that they would hold no public assemblies in Edinburgh or Leith. The Congregation, for this name was now assumed by the Protestants, were transported with these proofs of her regard; and, while they sought to advance still higher in her esteem by the inoffensive quietness of their carriage, they were encouraged in the undertaking they had begun. Nor to the clergy, who at this time were holding a provincial council at Edinburgh, did the Congregation scruple to communicate the articles of the intended reformation. The latter received their demands with a storm of rage, which died away, however, in innocent debility. Upon recovering from their passions, they offered to submit the controversy between them and the reformed to a public disputation. The Congregation did not refuse this mode of trial; and desired, as their

cally conditions, that the Scriptures might be considered as the standards of orthodoxy and truth, and that those of their brethren who were in exile and under persecution might be permitted to assist them. These reasonable requests were not, however, complied with; and the church would allow no rule of right but the canon law and its own councils. Terms of reconciliation were then offered on the part of the estate ecclesiastical. It held out to the Protestants the liberty of praying and administering the sacraments in the vulgar tongue, if they would pay reverence to the mass, acknowledge purgatory, invoke the saints, and admit of petitions for the dead. To conditions so ineffectual and absurd the Congregation did not deign to return any answer. The meeting of the parliament approached. The parties in contention were agitated with anxieties, apprehensions, and hopes. An expectation of firm and open assistance from the queen-regent gave courage to the reformed; and, from the parliamentary influence of their friends in the greater and the lesser baronage, they expected the most important services. They drew up with eagerness the articles which they wished to be passed into a law; and, as the spirit and sense of their transactions are to be gathered in the completest manner from the papers which were framed by themselves, it is proper to attend to them. Their petitions were few and explicit. I. They could not, in consequence of principles which they had embraced from a conviction of their truth, participate in the Romish religion. It was therefore their desire that all the acts of parliament giving authority to the church to proceed against them as heretics should be abrogated; or at least that their power should be suspended till the disputes which had arisen were determined and brought to a conclusion. II. They did not mean that all men should be at liberty to profess what religion they pleased, without the control of authority. They consented that all transgressors in matters of faith should be carried before the temporal judge. But it was their wish that the clergy should have only the power to accuse; and they thought it conformable to justice that a copy of the criminal charge should be lodged with the party upon trial, and that a competent time should be allowed him to defend himself. III. They insisted that every defence consistent with law should be permitted to the party accused; and that objections to witnesses, founded in truth and reason, should operate to his favor. IV. They desired that the party accused should have permission to interpret and explain his own opinions; and that his declaration should carry a greater evidence than the deposition of any witness; and no person ought to be punished for religion, who is not obstinate in a wicked or damnable tenet. V. In fine they urged that no Protestant should be condemned for heresy, without being convicted by the word of God, of the want of that faith which is necessary to salvation. The congregation presented these articles to the queen-regent, expecting that she would not only propose them to the three estates assembled in parliament, but employ all her influence to recommend them. But, finding them-

selves disappointed, they began to suspect her sincerity; and they were sensible that their petitions, though they should be carried in parliament, could not pass into a law without her consent. They therefore abstained from presenting them: but, as their complaints and desires were fully known in parliament, they ordered a solemn declaration to be read there in their behalf, and demanded that it should be inserted in the public records. In this declaration, after expressing their regret for having been disappointed in their scheme of reformation, they protested that no blame should be imputed to them for continuing in their religion, which they believed to be founded in the word of God; that no danger of life, and no political pains, should be incurred by them, for disregarding statutes which support idolatry, and for violating rites which are of human invention; and that, if insurrections and tumults should disturb the realm, from the diversity of religious opinions, and if abuses should be corrected by violence, all the guilt, disorder, and inconvenience thence arising, instead of being applied to them, should be ascribed solely to those who had refused a timely redress of wrongs, and who had despised petitions presented with the humility of faithful subjects, and for the purposes of establishing the commandments of God, and a most just and salutary reformation. The three estates received this protest with attention and respect; but the intention of inserting it in the national records was abandoned by the congregation upon a formal promise from the queen-regent that all the matters in controversy should speedily be brought by her to a fortunate issue. While the protestants were thus making the most vigorous exertions in behalf of their spiritual liberties, the queen-regent, to establish herself the more effectually, used every effort to promote the marriage of her daughter with the dauphin of France. In 1557 commissioners were appointed to negotiate this marriage; but, while these negotiations were going on, the court of France acted in the most perfidious manner. At the age of fifteen, after solemnly ratifying the independency of Scotland, and the succession of the crown in the house of Hamilton, queen Mary was influenced by the king and her uncles, the princes of Lorrain, to sign privately three extraordinary deeds or instruments. By the first she conveyed the kingdom of Scotland to the king of France and his heirs, in the default of children of her own body. By the second she assigned him, if he should die without children, the possession of Scotland, till he should receive a million of pieces of gold, or be amply recompensed for the sums expended by him in the education of the queen of Scotland in France. By the third she confirmed both these grants in an express declaration that they contained the pure and genuine sentiments of her mind; and that any papers which might be obtained, either before or after her marriage, by means of the Scottish parliament, should be invalid, and of no force nor efficacy. On the 24th of April the nuptials were celebrated with uncommon pomp; and the dauphin Francis was allowed to assume the title of king of Scotland.

The French court demanded for the dauphin the crown and other ensigns of royalty belonging to Scotland; but the commissioners had no power to comply with the request. It was then desired that, when they returned home, they should use all their influence to procure the crown matrimonial of Scotland for the dauphin. This also was refused; the court of France was disgusted; and four of the commissioners died, it was supposed of poison, given them by the princes of Lorraine. This subject, however, was pressed, on the return of the surviving commissioners, by the king of France himself, the queen of Scotland, and the queen-regent. The Protestants also joined their interest, hoping thereby to gain over the queen and queen-regent to their party; so that an act of parliament was at length passed, by which the crown matrimonial was given to the dauphin during the time of his marriage with queen Mary; but without any prejudice to the liberties of the kingdom, to the heirs of her body, or to the order of succession. With so many restraints it is difficult to see the advantages which could accrue from this gift so earnestly sought after; and it is very probable that the usurpations of France in consequence of it would have been productive of many disturbances; but these were prevented by the death of Francis II., in December 1560. But before this event took place, Scotland was, by the intrigues of France, involved in confusion on another account. After the death of Mary I. queen of England, and daughter to Henry VIII., the princes of Guise insisted on the claim of Mary queen of Scots to the crown of England, in preference to that of Elizabeth, whom they looked upon as illegitimate. This claim was supported by the king of France, who prevailed with the queen of Scots herself to assume the title of queen of England, and to stamp money under that character. The arms of England were quartered with those of France and Scotland; and employed as ornaments for the plate and furniture of Mary and the dauphin. Thus was laid the foundation of an irreconcilable quarrel between Elizabeth and Mary; and to this we may ascribe the inveteracy with which the former persecuted the unhappy queen of Scotland every time she had it in her power. But, while they imprudently excited a quarrel with England, they yet more imprudently quarrelled also with the majority of the people of Scotland. As Elizabeth professed the Protestant religion, it was easily foreseen that the congregation, or body of the reformed in Scotland, would never consent to act against her in favor of a popish power; and, as they could not be gained, it was resolved to destroy them at once by putting to death all their leaders. The queen regent gave intimation of her design to re-establish popery by proclaiming a solemn observance of Easter, receiving the sacrament according to the Romish communion herself, and commanding all her household to receive it in the same manner. She next expressed herself in a contemptuous manner against the reformed, affirmed that they had insulted the royal dignity, and declared her intention of restoring it to its ancient lustre. The preachers of the congregation were next cited to appear at Stirling to

answer the charges which might be brought against them. Alexander earl of Glencairn, and Sir Hugh Campbell of Loudon, were deputed to admonish her not to persecute the preachers unless they had been obnoxious, by circulating erroneous doctrines, or disturbing the peace of government. The queen-regent, in a passion, told them that the preachers should be all banished Scotland though their doctrines were as sound as those of St. Paul. The deputies urged her former kind behaviour and promises; but the queen-regent answered that 'the promises of princes ought not to be exacted with rigor, and that they were binding only when subservient to their convenience and pleasure.' To this they replied that in such a case they could not look upon her as their sovereign, and must renounce their allegiance as subjects. Soon after this transaction the queen-regent received the news that the reformation was established in Perth. Lord Ruthven, the provost of the city, was summoned to answer for this innovation; but his reply was that he had no dominion over the minds and consciences of men. The provost of Dundee, being ordered to apprehend an eminent preacher, named Paul Methven, sent him intelligence of the order that he might provide for his safety. The proclamation for observing Easter was every where despised and neglected, and people exclaimed against the mass as an idol. New citations, in the mean time, had been given to the preachers to appear at Stirling. They obeyed the summons; but attended by such multitudes that the queen-regent, dreading their power, though they were without arms, intreated Mr. Erskine of Dun, whom they had sent before as a deputy, to stop their march; assuring him that all proceedings against the preachers should be stopped. In consequence of this the multitude dismissed; yet, when the day came on which the preachers should have appeared, the queen-regent, with unparalleled folly as well as treachery, caused them to be declared traitors, and proclaimed it criminal to afford them any subsistence. Mr. Erskine, exasperated by this shameful conduct, hastened to the congregation, apologised for his conduct, and urged them to proceed to the last extremities. At this critical period also John Knox, returning from Geneva, joined the Congregation at Perth, and pointed all the thunder of his eloquence against idolatry. A priest, in contempt of this reformer's rhetoric, prepared immediately after his sermon to say mass; and, opening a case which stood upon the altar, displayed the images of the saints. The great provocations which the Protestants had received, joined to the impious passions of the multitude thus excited, were now productive of the greatest disorders. Images were destroyed, monasteries pulled down, and their wealth either seized by the mob or given to the poor. The celebrated monasteries of the Gray and Black Friars, with that of the Carthusians, were attacked and demolished. The example of Perth was followed by Cupar in Fife; and, similar insurrections being apprehended in other places, the queen-regent determined to punish the inhabitants of Perth in the most exemplary manner. But the gentlemen of Fife, Angus, and Mearns,

assembling their friends and dependents, formed a camp near Perth. The earl of Glencairn, with admirable celerity, advanced from Ayrshire with 2500 men. The queen-dowager also collected an army, but, being opposed by such a formidable power by the Protestants, she thought proper to conclude an agreement. The Protestants, however, dreaded her insincerity; and therefore entered into a second covenant to stand by and defend one another. Their fears were not vain. The queen-regent violated the treaty almost as soon as made, and began to treat the Protestants with severity. The earl of Argyle, and the prior of St. Andrew's, who about this time began to take the title of lord James Stuart, now openly headed the Protestant party, and prepared to collect their whole strength. The queen-regent opposed them with what forces she had, and which indeed chiefly consisted of her French auxiliaries; but, being again afraid of coming to an engagement, she consented to a truce until commissioners should be sent to treat with the lords of an effectual peace. No commissioners, however, were sent on her part; and the nobles, provoked by such complicated and unceasing treachery, resolved to push matters to the utmost extremity. The first exploit of the reformed was the taking of the town of Perth, where the queen-regent had placed a French garrison. The multitude, elated with this achievement, destroyed the palace and abbey of Scone, in spite of all the endeavours of their leaders, and even of Knox himself to save them. The queen-regent, apprehensive that the congregation would commit farther ravages to the southward, resolved to throw a garrison into Stirling; but the earl of Argyle and lord James Stuart anticipated her design, and arrived there the very day after the demolition of the abbey and palace of Scone. The people, incapable of restraint, and provoked beyond measure by the perfidious behaviour of the Catholic party, demolished all the monasteries in the neighbourhood, together with the fine abbey of Cambuskenneth, situated on the bank of the Forth. From Stirling they went to Linlithgow, where they committed their usual ravages upon every thing that they reckoned relics of idolatry; after which they advanced to Edinburgh: the queen-regent, alarmed at their approach, fled to Dunbar; and the Protestants took up their residence in Edinburgh.

The congregation, having thus got possession of the capital, assumed to themselves the ruling power of the kingdom, appointing preachers in all the churches, and seized the mint, with all the instruments of coinage. The queen-regent, unable to dispute the matter in the field, published a manifesto, in which she set forth their seditious behaviour, commanding them to leave Edinburgh within six hours, and enjoining her subjects to avoid their society under the pain of treason. The congregation having already lost somewhat of their popularity, by their violent proceedings, were now incapable of coping with government. As they had not established themselves in any regular body, or provided a fund for their support, they felt their strength decay, and multitudes of them returned to their habitations. Those who remained found themselves

obliged to vindicate their conduct; and, in an address to the regent, to disclaim all treasonable intentions. Negotiations again took place, which ended abortively, and the queen-regent, who had taken this opportunity of collecting her forces, marched against the congregation on the 23d of July, 1559. At length the Protestants, finding themselves incapable of making head against their enemies, entered into a negotiation, by which all differences were for the present accommodated. The terms of this treaty were, that the town of Edinburgh should be open to the queen-dowager and her attendants; that the palace of Holyrood House and the mint should be delivered up to her; that the Protestants should be subject to the laws, and abstain from molesting the Roman Catholics in the exercise of their religion. On the queen's part, it was agreed, that the Protestants should have the free exercise of their religion, and that no foreign troops should enter the city of Edinburgh. Notwithstanding this treaty, the reformed had no confidence in the queen's sincerity. Having heard of the death of Henry II. of France, and the accession of Francis II. and Mary to that kingdom, they seem to have dreaded more danger than ever. They now entered into a third covenant; in which they engaged to refuse attendance to the queen-dowager, in case of any message or letter; and that, immediately on the receipt of any notice from her to any of their number, it should be communicated without reserve, and be made a common subject of scrutiny and deliberation. It was not long before they had occasion for all their constancy and strength. The queen-regent repented of the favorable terms she had granted the reformed; and, being denied the favor which she requested of saying mass in the High church of Edinburgh, she ordered them to be every where disturbed in the exercise of their religion. In this imprudent measure, the queen-regent was confirmed by letters which now came from Francis and Mary, promising a powerful army to support her. The envoy who brought these despatches also carried letters to lord James Stuart, now the principal leader of the Protestants, and natural brother to the queen. These letters were filled with reproaches and menaces, mixed with entreaties; and along with them the envoy delivered a verbal message, that the king his master was resolved rather to expend all the treasures of France than not to be revenged on the rebellious nobles who had disturbed the peace of Scotland. Lord James Stuart was not to be frightened by these menaces. He returned a cool and deliberate answer, apologising for the Protestants, and vindicating them from the charge of rebellion; but at the same time intimating his full resolution of continuing to head the reformed, as he had already done. The letters of Francis and Mary were soon followed by 1000 French soldiers, with money and military stores; and the commander was immediately despatched again to France, to solicit the assistance of as many more soldiers, with four ships of war, and 100 men at arms. But, before he could set out, La Bosse, another French commander, arrived with 2000 infantry; and, that the congregation might be defeated not only

by arms but in disputation, the same ship brought three doctors of the Sorbonne, to show the pernicious tendency of the new doctrines. Thus matters were pushed beyond all hopes of reconciliation. The nation was universally alarmed on account of the introduction of French troops, to which they saw no end: the queen-regent attempted to quiet the minds of the public by a proclamation; but their fears increased the more. The congregation assembled at Stirling, where they were joined by the earl of Arran, and soon after by his father the duke of Chatelherault. They now deliberated on the measures to be followed with the queen-regent; and the result of their consultations was, that an expostulatory letter should be addressed to her. This was accordingly done; but, as the queen behaved with her usual duplicity, the nobles called the people to arms: mutual manifestoes were published; and both parties prepared to decide the contest by the sword. The congregation having seized Broughty castle, marched thence to Edinburgh. The queen-regent retired to Leith, which she had fortified and filled with French troops. Thither the nobles sent their last message to her, charging her with a design to overthrow the liberties of the kingdom. They requested her to command her Frenchmen and mercenaries to depart from Leith, and to make that place open and patent, not only to the inhabitants who had been dispossessed of their houses, but to all the inhabitants of Scotland. They declared that her denial of this request should be considered by them as a proof of her intention to reduce the kingdom to slavery; in which case they were determined to employ their utmost power to preserve its independence. Two days after this message the queen-regent sent to them the lord Lyon, whom she enjoined to tell them that she considered their demand not only as presumptuous, but as an encroachment on the royal authority; that it was an indignity to her to be dictated to by subjects; that Frenchmen were not to be treated as foreigners, being entitled to the same privileges with Scotchmen; and that she would neither disband her troops, nor command the town of Leith to be made open and patent. The lord Lyon then, in the name of the queen-regent, commanded the lords of the congregation to depart from Edinburgh and disperse themselves under the pain of high treason. The Protestants irritated by this answer, after some deliberation, degraded the queen-regent; and to this purpose the nobility, barons, and burghesses, all agreed in subscribing an edict, which was sent to the principal cities in Scotland and published in them.

The next step taken by the congregation was to summon Leith to surrender; but, meeting with defiance instead of submission, it was resolved to take the town by scalade. For this service ladders were framed in the church of St. Giles; a business which, interrupting the preachers in the exercise of public worship, made them prognosticate misfortune and miscarriage to the congregation. In the displeasure of the preachers the common people found a source of complaint; and the emissaries of the queen-dowager acting with indefatigable industry to divide her adver-

saries, and spread chagrin and dissatisfaction among them, discontent, animosity, and terror, prevailed to a great degree. The duke of Chatelherault discouraged many by his example. Defection from the Protestants added strength to the queen-dowager. The most secret deliberations of the confederated lords were revealed to her. The soldiery were clamorous for pay; and it was very difficult to procure money to satisfy their claims. Attempts to soothe and appease them, discovering their consequence, engendered mutinies. They put to death a domestic of the earl of Argyle, who endeavoured to compose them to order; they insulted several persons of rank who discovered a solicitude to pacify them; and they even ventured to declare that, for a proper reward, they were ready to suppress the reformation, and to re-establish the mass. It was absolutely necessary to give satisfaction to the Protestant soldiers. The lords and gentlemen of the congregation collected a considerable sum among them; but it was not equal to the exigency. The avarice of many withheld what they could afford, and the poverty of others did not permit them to indulge their generosity. It was resolved that each nobleman should surrender his silver plate to be struck into money. By the address, however, of the queen-dowager, the officers of the mint were bribed to conceal, or to convey to a distance, the stamps and instruments of coinage. A gloomy despair gave disquiet to the congregation, and threatened their ruin. Queen Elizabeth, with whose ministers the confederated lords maintained a correspondence at this time, had frequently promised them her assistance; but they could not now wait the event of a deputation to the court of England. In an extremity so pressing they therefore applied for a sum of money to Sir Ralph Sadler and Sir James Croft, the governors of Berwick; and Cockburn of Ormiston, who was entrusted with this commission, obtained from them an aid of 4000 crowns. Traitors, however, in the councils of the congregation, having informed the queen-dowager of his errand and expedition, the earl of Bothwell, by her order, intercepted him upon his return, discomfited his retinue, and made a prize of the English subsidy. To rouse the spirit of the party, an attack was projected upon Leith, and some pieces of artillery were planted against it; but, before any charge could be made, the French soldiers sallied out to give battle to the troops of the congregation, possessed themselves of their cannon, and drove them back to Edinburgh. A report that the victors had entered the city with the fugitives filled it with disorder and dismay. The earl of Argyle and his Highlanders hastened to recover the honor of the day, and harassed the French in their retreat. This petty conflict, while it elated the queen-dowager, served to augment the despondence of the Protestants. Vain of their prowess, the French made a new sally from Leith, to intercept a supply of provisions and stores for the congregation. The earl of Arran and lord James Stuart attacked them, and obliged them to retire; but, pursuing them with too much heat, a fresh body of French troops made its appearance. It was prudent to retreat, but

difficult. An obstinate resistance was made. It was the object of the French to cut off the soldiery of the congregation from Edinburgh, and by these means to divide the strength of that station. The earl of Arran and lord James Stuart had occasion for all their address and courage. Though they were able, however, to effect their escape, their loss was considerable, and the victory was manifestly on the side of their adversaries. About this time William Maitland of Lethington, secretary to the queen-dowager, withdrew secretly from Leith, and joined himself to the confederated nobles. He had been disgusted with the jealousies of the French counsellors, and was exposed to danger from having embraced the doctrines of the reformed. His reception was cordial, and corresponded to the opinion entertained of his wisdom and experience. He was skilled in business, adorned with literature, and accustomed to reflection; but it was not known that he wanted integrity. The accession of this statesman to their party could not console the lords of the congregation for the unpromising aspect of their affairs. Those who affected prudence retired privately from a cause which they accounted desperate, and the timorous fled with precipitation. The distrust of the brethren was infectious; and excited the ridicule and scorn of the partisans of the queen-dowager. In this distress the associated nobles resolved to abandon the capital. A little after midnight they retired from Edinburgh; and so great was the panic that they marched to Stirling without any stop. John Knox, who had accompanied the congregation to Stirling, anxious to restore their unanimity and courage, addressed them from the pulpit. He represented their misfortunes as the consequences of their sins; and, entreating them to remember the goodness of their cause, assured them in the end of joy, honor, and victory. His popular eloquence, corresponding to all their warmest wishes, diffused satisfaction and cheerfulness. They passed from despair to hope. A council was held, in which the confederated nobles determined to solicit, by a formal embassy, the aid of queen Elizabeth. Maitland of Lethington and Robert Melvil were chosen to negotiate this important transaction; and they received the fullest instructions concerning the state and difficulties of the congregation, the tyrannical designs of the queen-dowager, and the danger which threatened England from the union of Scotland with France. The queen of England determined to assist the reformers; whose leaders now dispersed themselves, and went to different parts of the kingdom to exert their activity for the common cause. The queen-dowager, imagining that the lords were fled, conceived great hopes of being able to crush the reformed at once. Her sanguine hopes, however, were soon checked on hearing that queen Elizabeth was resolved to assist them. She now determined to crush her enemies before they could receive any assistance from England. Her French troops took the road to Stirling, and wasted in their march all the grounds which belonged to the favorites of the reformation. After renewing their depredations at Stirling they passed the bridge; and, proceeding along the side of the

river, exercised their cruelties in a district which had distinguished itself by an ardent zeal against popery. While the terror of their arms was thus diffusing itself, they resolved to seize the town and castle of St. Andrews, which they considered as an important military station, and as a convenient place of reception for the auxiliaries they expected from France. But lord James Stuart employed himself to interrupt their progress and retard their attempts; and, to keep the force of the Congregation entire, he hazarded no action of importance. A small advantage was obtained by the French at Petticure; and they took Kinghorn. Lord James Stuart, with 500 horse and 100 foot, entered Dysart. With this inconsiderable strength he proposed to act against an army of 4000 men. His admirable skill in military affairs and his heroic courage were eminently displayed. During twenty days he prevented the march of the French to St. Andrews, intercepting their provisions, harassing them with skirmishes, and intimidating them by the address and boldness of his stratagems. M. d'Oysel, enraged and ashamed to be disconcerted by a body of men so disproportioned to his army, exerted himself with vigor. Lord James Stuart was obliged to retire. Dysart and Wemys were given to the French troops to be pillaged; and, when d'Oysel was in full march to St. Andrews, he discovered a powerful fleet bearing up the Frith. It was concluded that the supplies expected from France were arrived. Guns were fired by his soldiers, and their joy was indulged in all its extravagance. But this fleet having taken the vessels which contained their provisions, and the ordnance with which they intended to improve the fortifications of the castle at St. Andrews, a period was put to their rejoicings. Certain news was brought that the fleet they observed was the navy of England, which had come to support the congregation. A consternation, heightened by the giddiness of their preceding transports, invaded them. M. d'Oysel perceived now the value and merit of the service which had been performed by lord James Stuart; and, thinking no more of St. Andrews and conquest, fled to Stirling, in his way to Leith, from which he dreaded to be intercepted:—he reached that important station after a march of three days. A formal treaty was now concluded between the lords of the Congregation and queen Elizabeth.

In the mean time the queen dowager was disappointed in her expectations from France. The violent administration of the house of Guise had involved that nation in troubles and distresses. Its credit was greatly sunk, and its treasury was near exhausted. Persecutions, and the spirit of reaction, produced commotions and conspiracies; and, amidst domestic and dangerous intrigues and struggles, Scotland failed to engage that particular distinction which had been promised to its affairs. It was not, however, neglected altogether. The count de Martigues had arrived at Leith with 1000 foot and a few horse. The marquis D'Elbeuf had embarked for it with another body of soldiers; but, after losing several ships in a furious tempest, was obliged to return to the haven from which he had sailed. In this sad reverse of fortune many forsook the queen-

dowager. It was now understood that the English army was upon its march to Scotland. The Scottish lords who had preserved a neutrality, meditated a union with the Protestants. The earl of Huntly gave a solemn assurance that he would join them. Proclamations were issued throughout the kingdom, calling upon the subjects of Scotland to assemble in arms at Linlithgow, to re-establish their ancient freedom, and to assist in the utter expulsion of the French soldiery. The English fleet, meanwhile, under Winter the vice-admiral, had taken and destroyed several ships, had landed some troops upon Inchkeith, and discomfited a body of French mercenaries. Upon these acts of hostility, the princes of Lorrain despatched the chevalier de Seure to queen Elizabeth, to make representations against this breach of the peace, and to urge the recall of her ships. This ambassador affected likewise to negotiate concerning the evacuation of Scotland by the French troops, and to propose methods by which the king of France might quarter the arms of England without prejudice to queen Elizabeth. But to prevent the execution of vigorous resolutions against the queen-dowager, and to gain time, were the only objects he had in view. With similar intentions Mouluc, bishop of Valence, a man of greater address and ability, and equally devoted to the house of Guise, was also sent at this time to the court of England. Queen Elizabeth, however, and her ministers, were too wise to be amused by artifice and dexterity. Lord Grey entered Scotland with an army of 1200 horse and 6000 foot; and lord Scroop, Sir James Croft, Sir Henry Percy, and Sir Francis Lake commanded under him. By an inhuman policy, the queen-dowager had already wasted all the country around the capital. But the desolation she had made, while it was ruinous to the Scottish peasants, affected not the army of England. The leaders of the congregation had provided against this difficulty. The duke of Chatelherault, the earls of Argyre, Glencarn, and Monteith, the lord James Stuart, and the lords Ruthven, Boyd, and Ochiltree, with a numerous and formidable force, joined the English commander at Preston. Struck with the sad condition of her affairs, despairing of a timely and proper succor from France, and reminded by sickness of her mortality, the queen-dowager retired from Leith to the castle of Edinburgh, and put herself under the protection of lord Erskine. At the period when she was appointed to the regency lord Erskine had received from the three estates the charge of this important fortress, with the injunction to hold it till he should know their farther orders; and, giving way to the solicitations of neither faction, he had kept it with fidelity. By admitting the queen-dowager, he yielded to sentiments of honor and humanity, and yet did not depart from his duty. A few only of her domestics accompanied her, with the archbishop of St. Andrews, the bishop of Dunkeld, and the earl Marischal. The confederated nobles now assembled at Dalkeith to hold a council; and, conforming to those maxims of prudence and equity which, upon the eve of hostilities, had been formerly

exercised by them, they invited the queen-dowager to an amicable conclusion of the present troubles. In a letter which they wrote to her they called to her remembrance the frequent manifestoes and messages in which they had pressed her to dismiss the French soldiery, who had so long oppressed the lower ranks of the people, and who threatened to reduce the kingdom itself to servitude. The aversion, however, with which she had constantly received their suit and prayers was so great that they had given way to a strong necessity, and had intreated the assistance of the queen of England to expel these strangers by force of arms. But, though they had obtained the powerful protection of this princess, they were yet animated with a becoming respect for the mother of their sovereign; and, abhorring to stain the ground with Christian blood, were disposed once more to solicit the dismission of these mercenaries, with their officers and captains: and, that no just objection might remain against the grant of this their last request, they assured her that a safe passage by land, to the ports of England, should be allowed to the French; or that, if they judged it more agreeable, the navy of queen Elizabeth should transport them to their own country. If these proposals should be rejected, they appealed and protested to God and to mankind, that no motive of malice, or hatred, or wickedness of any kind, had induced them to employ the fatal expedient of arms; but that they had been compelled to this distressful remedy, for the preservation of their commonwealth, religion, persons, estates, and posterity. They begged her to weigh the equity of their petitions, to consider the inconveniences of war, and to think on the rest and quiet which were necessary to relieve the afflictions of her daughter's kingdom; and they besought her to embalm her own memory, by an immortal deed of wisdom, humanity, and justice. To give authority and weight to the letter of the associated lords, lord Grey directed Sir George Howard and Sir James Croft to wait upon the queen-dowager, and to stipulate the peaceable departure of the English troops, upon the condition that the French mercenaries were immediately dismissed from her service, and prohibited from residing in Scotland. Returning no direct answer to the applications made to her, she desired time to deliberate upon the resolution which it became her to adopt. This equivocal behaviour corresponded with the spirit of intrigue which had uniformly distinguished the queen-dowager; and it is probable that her engagements with France did not permit her to be explicit. The combined armies marched towards Leith. A body of the French, posted upon a rising ground, called Hawk Hill, disputed their progress. During five hours the conflict was maintained with obstinate valor. At length the Scottish horsemen charged the French with a fury which they were unable to resist. They fled to Leith with precipitation; and might have been cut off from it altogether, if the English cavalry had exerted themselves: 300 French soldiers perished in this action, and a few only on the side of the congregation. Leith

was invested. The pavilions and tents of the English and Scottish nobility were planted at Restalrig, and around it. Trenches were cast; and, the ordnance from the town annoying the combined armies, a mount was raised, upon which eight cannons were erected. A continued fire from these, against St. Anthony's tower in South Leith, being kept up and managed with skill, the walls of this fabric were shaken, and the French found it necessary to dismount their artillery. Negligent from security, and apprehensive of no attack, the English and Scottish officers occupied themselves in amusements, and permitted a relaxation of military discipline. The French, informed of this levity, made a sally from Leith. While some of the captains were diverting themselves at Edinburgh, and the soldiery were engaged at dice and cards, they entered the trenches unobserved, and, pushing their advantage, put 600 men to the sword. After this slaughter, the Protestants were more attentive to their affairs. Mounts were built at proper distances, which, being fortified with ordnance, served as places of retreat and defence in the event of sudden incursions; and thus they continued the blockade in a more effectual manner. The army under the marquis D'Elbeuf, promised so often to the queen-regent, was in vain expected by her; but she received, at this time, supplies in money and military stores; and Monluc, bishop of Valence, though defeated in dexterity by Elizabeth and her ministers, had arrived in Scotland to try anew the arts of negotiation. Conferences were held by him with the queen-dowager, with the English commanders, and with the confederated nobles; but no agreement could be concluded. His credentials neither extended to the demolition of Leith, nor to the recall of the French mercenaries: and, though he obtained powers from his court to consent to the former of these measures, they were yet burdened with conditions which were disgraceful to the congregation; who, in the present prosperous state of their fortunes, were not disposed to give up any of the objects for which they had struggled so long, and to the attainment of which they now looked forward with a settled hope. Though the orations of Monluc could not overpower the stubborn sense of the congregation, yet as he affected to give them admonitions and warnings, and even ventured to insult them with menaces, they appear to have conceived a high indignation against him. Under this impulse, and that, in so advanced a stage of their affairs, they might exhibit the determined firmness of their resolutions, and bind to them by an indissoluble tie the earl of Huntly and the other persons who had joined them in consequence of the English alliance, they entered into a new league and covenant, more solemn, expressive, and resolute, than any which they had yet subscribed. The nobles, barons, and inferior persons, who were parties to this bond, bound themselves in the presence of Almighty God, as a society, and as individuals, to advance and set forward the reformation of religion, and to procure, by every possible means, the true preaching of the Gospel, with the proper administration of the sacraments and other ordinances. Deeply

affected, at the same time, with the misconduct of the French statesmen, who had been promoted to high offices; with the oppressions of the French mercenaries, whom the queen-dowager kept up and maintained under the color of authority; with the tyranny of their captains; and with the manifest danger of conquest to which the country was exposed, by different fortifications upon the sea-coast, and by other dangerous innovations; they promised and engaged, generally and individually, to join with the English army, and to concur in an honest, plain, and unreserved resolution to expel all foreigners from the realm, as oppressors of public liberty; that, by recovering the ancient rights, privileges, and freedom of their nation, they might live for the future under the due obedience of their king and queen, be ruled by the laws and customs of the country, and by officers and statesmen born and educated among them. It was likewise contracted and agreed by the subscribers to this bond and covenant that no private intelligence by writing or message, or communication of any kind, should be kept up with their adversaries. When the strong and fervid sentiments of this new association were communicated to the queen-dowager, she resigned herself to sorrow. Her mind, inclined to despondence by the increase of her malady, felt the more intensely the cruel distractions into which the kingdom had been driven by the ambition of France, her own doating affection for the princes of Lorraine, and the vain prognostications of flatterers. In the agony of passion she is said to have invoked the curse of God to alight upon all those who had counselled her to persecute the preachers, and to refuse the petitions of the most honorable portion of her subjects. In the mean time the siege of Leith was prosecuted. But, the strength of the garrison amounting to more than 4000 soldiers, the operations of the besiegers were languid. An accidental fire in the town, which destroyed many houses and a great part of the public granary, afforded them an opportunity of plying their artillery with some advantage; and a few days after they made a general assault. But the scaling-ladders which were applied to the walls being too short, and Sir James Croft, who had been gained to the queen-dowager, having acted a treacherous part, the attempt failed of success, and 1000 men were destroyed. The combined armies, however, did not lose their hopes. The English and Scots animated the constancy of one another; and in the ratification of the treaty of Berwick, which was now made, a new source of cordiality opened itself. Letters also had come from the duke of Norfolk, promising a powerful reinforcement, giving the expectation of his taking upon him the command of the troops in person, and ordering his pavilion to be erected in the camp. Leith began to feel the misery of famine, and the French to give themselves to despair. The besiegers abounded in resources; and the arrival of 2000 men, the expected reinforcement from England, gave them the most decisive superiority over their adversaries. Frequent sallies were made by the garrison, and they were always unsuccessful. Discouraged by defeats, depressed with the want of provisions, and languishing

under the negligence of France, they were ready to submit to the mercy of the congregation. Amidst these distresses the queen-dowager, wasted with a lingering distemper and with grief, expired in the castle of Edinburgh. A few days before her death she invited to her the duke of Chatehault, lord James Stuart, and the earls of Argyle, Glencairn, and Marischal, to bid them a last adieu. She expressed to them her sorrow for the troubles of Scotland, and made it her earnest suit that they would consult their constitutional liberties, by dismissing the French and English from their country; and that they would preserve a dutiful obedience to the queen their sovereign. She professed an unlimited forgiveness of all the injuries which had been done to her; and she entreated their pardon for the offences committed against them. In token of her kindness and charity she then embraced them by turns, while the tears started to her eyes. After this interview, the short remaining portion of her life was dedicated to religion; and she flattered the congregation by calling John Willocks, one of the most popular of their preachers, to assist and comfort her by his exhortations. He made long discourses to her about the abominations of the mass; but she appears to have died in the communion of the Roman church; and her body, being transported to France, was deposited in the monastery of St. Peter, at Rheims, in Champagne, where her sister Renée was abbess.

The death of the queen-dowager, at a period so critical, broke altogether the spirit of the French troops. They were blocked up so completely that it was almost impossible for any supplies to reach them either by sea or land; and France had delayed so long to fulfil its magnificent promises that it was no longer in a capacity to take any steps towards their accomplishment. Its internal distress and disquiets were multiplying. The nobility, impoverished by wars, were courting the rewards of service, and struggling in hostility: the clergy were avaricious, ignorant, and vindictive. The populace, knowing no trade but arms, offered their swords to the insurgents. Francis II. the husband of Mary, was without dignity or understanding. Catherine de Medicis his mother was full of artifice and falsehood: insurrections were dreaded in every province. The house of Guise was encompassed with difficulties and trembling with apprehensions, so that they could not think of persisting in their views of distant conquests. It was chiefly in the exemption from foreign wars that they could hope to support their own greatness, and apply a remedy to the domestic disturbances of France. It appeared to Francis and Mary that they could not treat in a direct method with the congregation, whom they affected to consider as rebellious subjects, without derogating from their dignity; in negotiating for a peace, therefore, they addressed themselves to queen Elizabeth. They granted a commission to John Monluc, bishop of Valence, Nicholas Pellevé bishop of Amiens, James de la Brosse, Henry Clentin lord of Oysel, and Charles de la Rochefaucault lord of Randan; authorising them to enter into agreements with the queen of England. The

English commissioners were Sir William Cecil principal secretary of state, Nicholas Wotton dean of Canterbury and York, Sir Ralph Sadler, Sir Henry Percy, and Sir Peter Crew; and the powers of treaty were to be exercised by them all in conjunction, or by four, three, or two of them. The plenipotentiaries of France, though empowered only to treat with England, were yet, by a separate commission, entrusted also to assure the congregation that, notwithstanding the heinous guilt incurred by them, Francis and Mary were inclined to receive them into favor upon their repentance and return to obedience; and to abstain for ever from all enquiry into their conduct. They had full authority, at the same time, by this new deed, to hear, in conjunction with the commissioners of Elizabeth, their complaints, and to grant, with their consent, the relief which appeared most proper and salutary. The nobility and people of Scotland, choosing for their representatives lord James Stuart, lord Ruthven, and Maitland of Lethington, expressed their willingness to concur in reasonable measures for the re-establishment of the public union and tranquillity, while, by a formal petition, they enumerated their grievances, claimed a redress of them, and asked a uniform protection to their constitution and laws. To this petition the intercession of queen Elizabeth effected the friendly attention of Francis and Mary; and upon the foundation thus concerted Monluc and Randan, Cecil and Wotton, the acting plenipotentiaries of England and France, drew up and authenticated the celebrated Deed of Relief and Concession, which does so much honor to the spirit, perseverance, and magnanimity of the Scottish nation. By this agreement Francis and Mary consented that no French soldiers or foreign troops should ever be introduced into Scotland without the council and the advice of the three estates. They concurred in the opinion that the French mercenaries should be sent back into France, and that the fortifications of Leith should be demolished; they agreed that commissioners should be appointed to visit Dunbar, and to point out the works there which ought to be destroyed; and they bound themselves to build no new fortress or place of strength within the kingdom, and to repair no old one without parliamentary authority. They consented to extinguish all debts which had been contracted for the maintenance of the French and Scottish soldiery; appointed the estates of the realm to hold a parliament for the discussion of affairs of state; and obliged themselves to consider the acts of this assembly as valid and effectual. They confirmed the ancient law of the country, which prohibited the princes of Scotland from making peace or war without the advice of the three estates. It was agreed by them that the three estates, in concurrence with the queen, should elect a council for the administration of affairs during her majesty's absence. They became bound to employ the natives of Scotland in the management of justice both civil and criminal, in the offices of chancellor, keeper of the seals, treasurer, comptroller, and in other similar stations; and to abstain from the promotion of all foreigners to places of trust and honor, and from investing

any clergyman in the charge of affairs of the revenue. They further determined to publish an act of oblivion, and to bury for ever the memory of all the late transactions. They concluded that a general peace and reconciliation should take place among all parties. And they referred the reparation which might be proper to compensate the injuries that had been sustained by bishops and ecclesiastics to the judgment of the three estates. Upon the subject of reformation, the plenipotentiaries of England and France did not choose to deliberate and decide, although articles with regard to it had been presented to them by the nobles and people. They referred this delicate topic to the ensuing meeting of the parliament; and the leaders of the congregation engaged that deputies from the three estates should repair to the king and queen, to know their intention concerning matters of such high importance. After having granted these concessions to the nobility and people of Scotland upon the part of their respective courts, Monluc and Randan, Cecil and Wotton, concluded another deed of treaty and agreement. By this it was determined that the English and French troops should depart out of Scotland; that all warlike preparations should cease; that the fort of Eymouth should be razed, in terms of the treaty of Cambray; that Francis and Mary should abstain from bearing the title and arms of England or Ireland; that it should be considered whether a further compensation should be made to Elizabeth for the injuries committed against her; and that the king and queen of Scots should be fully and sincerely reconciled to the nobility and the people of their kingdom. The interests of England and France were the particular objects of this agreement. But, though the concessions to the Protestants were not inserted in it at full length, an express reference was made to them; and they received a confirmation in terms which could not be misunderstood. This deed recorded the clemency of Francis and Mary to their subjects of Scotland, the extreme willingness of the nobility and people to return to their duty and allegiance, the representation they had offered of their grievance and the request of queen Elizabeth that redress should be afforded to them; and it appealed to the consequent concessions which had been stipulated to their advantage. By these important negociations the Protestants, while they humbled France, flattered queen Elizabeth; and, while they acquired a power to act in the establishment of the reformation, restored its civil constitution to Scotland. The exclusion of foreigners from offices of state, the limitation of the Scottish princes with regard to peace and war, the advancement of the three estates to their ancient consequence, and the act of oblivion of all offences, were acquisitions most extensively great and useful; and, while they gave the fullest security to the reformed, gratified their most sanguine expectations.

The peace, so fortunately concluded, was immediately proclaimed. The French mercenaries embarked for their own country, and the English army took the road to Berwick. Amidst events so joyful, the preachers exhorted the confederated nobles to command the solemnity of a thanks-

giving. It was ordered accordingly; and, after its celebration, the commissioners of the boroughs, with several of the nobility, and the tenants in capite, were appointed to choose ministers to preach the gospel in the principal towns throughout the kingdom. John Knox was called to discharge the pastoral functions at Edinburgh, Christopher Goodman at St. Andrews, Adam Heriot at Aberdeen, John Row at Perth, Paul Methven at Jedburgh, William Christison at Dundee, David Ferguson at Dunfermline, and David Lindsay at Leith. That the business of the church might be managed with propriety, superintendants were elected to preside over the ecclesiastical affairs of provinces and districts. John Spottiswood was named the superintendant for Lothian, Willocks for Glasgow, John Winram for Fife, John Erskine of Dun for Angus and Mearns, and John Carswell for Argyll and the Isles. This gave a beginning to the reformed church of Scotland. Amidst the triumph and exultation of the Protestants, the meeting of the parliament approached. All persons who had a title from law, or from ancient custom, to attend the great council of the nation, were called to assemble there: while there was a full convention of the greater barons and the prelates, the inferior tenants in capite, or the lesser barons, upon an occasion so great, instead of appearing by representation, came in crowds to give personally their assistance and votes; and all the commissioners for the boroughs, without exception, presented themselves. It was objected to this parliament, when it was assembled, that it could not be valid, since Francis and Mary were not present, and had not empowered any person to represent them. But, by the terms of the late concessions to the nobility and the people, they had in effect dispensed with this formality; and the objection, after having been agitated with heat for some days, was rejected. The lords of the articles were then chosen; and, as the Protestant party were superior to the popish faction, they were careful in electing the members of this committee to favor all those who were disposed to forward the reformation. The first object which the lords of the articles held out to the parliament was the supplication of the nobility, gentry, and all the other persons who professed the new doctrines. It required that the Romish church should be condemned and abolished. It reprobated transubstantiation, the merit of works, papistical indulgences, purgatory, pilgrimages, and prayers to departed saints; considering them as pestilent errors, and as fatal to salvation. It demanded that all those who should teach and maintain them should be exposed to correction and punishment. Also that a remedy should be applied against the profanation of the holy sacraments by the Roman Catholics; that the ancient discipline of the church should be restored; that the supremacy and authority of the pope should be abolished; and that the patrimony of the church should be employed in supporting the reformed ministry, in the provision of schools, and in the maintenance of the poor. This supplication of the Protestants was received in parliament with marks of the greatest respect. The popish doctrines it censured, and the strong

language it employed, excited no dispute. The nobility, however, and the lay members, did not think it expedient that the patrimony of the church, in all its extent, should be allotted to the reformed ministry, and the support of schools and the poor. Avoiding therefore any explicit scrutiny into this point, the parliament gave it in charge to the ministers and the leading men of the reformation, to draw up under distinct heads, the substance and sense of those doctrines which ought to be established over the kingdom. Within four days this important business was accomplished. The writing or instrument to which the reformed committed their opinions was termed 'The Confession of Faith, professed and believed by the Protestants within the realm of Scotland.' (See Knox's Collection of Confessions of Faith, vol. II., and Stat. Book Parl., 1567). It was read first to the lords of the articles. It was then read to the parliament; and the prelates of the Romish church were commanded, in the name of God, to make publicly their objections to the doctrines it proposed. They preserved a profound silence. A new diet was appointed for concluding the transaction. The articles of the Confession were again read over, and the votes of the parliament were called. Of the temporal nobility, three only refused to bestow upon it their authority. The earl of Athol, and the lords Somerville and Bothwell, protested that 'they would believe as their fathers had done before them.' The bishops and the estate ecclesiastical, from a consciousness of the weakness of popery, seemed to have lost all power of speech. No dissent, no vote, was given by them. 'It is long,' said the earl Marischal, 'since I entertained a jealousy of the Romish faith, and an affection to the reformed doctrines. But this day has afforded me the completest conviction of the falsehood of the one, and the truth of the other. The bishops, who do not conceive themselves to be deficient in learning, and whose zeal for the maintenance of the hierarchy cannot be doubted, have abandoned their religion, and their interest in it, as objects which admit of no defence or justification.' All the other constituent members of this great council were zealous for the establishment of the reformation, and affirmed the propriety of its doctrines. Thus the high court of parliament, with great deliberation and solemnity, examined, voted, and ratified the confession of the reformed faith.

A few days after the establishment of the Confession of Faith, the parliament passed an act against the mass and the exercise of the Romish worship. It ordained that all persons saying or hearing mass should, for the first offence, be exposed to the confiscation of their estates, and to a corporal chastisement, at the discretion of the magistrates; that for the second offence they should be banished out of the kingdom; and, for the third, they should incur and suffer the pains of death. This fierceness, it must be acknowledged, did not suit the generosity of victory; and, while an excuse is sought for it in the perfidiousness of the Romish priesthood, it escapes not the observation of the most superficial historians that these severities were exactly those of which the Protestants had complained so loudly, and with so much justice. By another

ordination the parliament, after having declared that the pope had inflicted a deep wound upon the sovereignty and government of Scotland, by his frequent interferences and claims of power, decreed that, for the future, his jurisdiction and authority should be dead and extinct; and that all persons maintaining the smallest connexion with him, or with his sect, should be liable to the loss of honor and offices, proscription, and banishment. These memorable and decisive statutes produced the overthrow of the Romish religion. To obtain to these proceedings the approbation of Francis and Mary was an object of the greatest anxiety, and of infinite moment to the three estates. Sir James Sandilands, lord St. John, was therefore appointed to go to France, and to express to the king and queen the affection and allegiance of their subjects, to explain what had been done in consequence of the late concessions and treaty, and to solicit their royal ratification of the transactions of the parliament. The spirited behaviour of the congregation had, however, exceeded all the expectations of the princes of Lorraine; and the business of the embassy, and the ambassador himself, though a man of character and probity, were treated not only with ridicule, but with insult. He returned accordingly without any answer to his commission. Instead of submitting the heads of a reformation to Francis and Mary, by a petition, the parliament had voted them into laws; and from this informality the validity of its proceedings has been suspected: but it is observable that the Protestants had not concealed their views with regard to religion and the abolition of Popery; that in the grant of redress and concession, and in the deed of treaty, no prohibition was made to bar the establishment of the reformation; that a general authority was given to the parliament to decide in affairs of state; and that Francis and Mary were solemnly bound to authenticate its transactions. Though a formality was wanting, the spirit of the treaties was yet respected and maintained. The nation, of consequence, imputed the conduct of Francis and Mary to political reasons suggested by the princes of Lorraine, and to the artifices of the Popish clergy; and as Elizabeth did not refuse, upon her part, the ratification of the agreements, but solicited and pressed the French court to adopt the same measure, a strength and force were thence communicated to this conclusion. When the three estates despatched Sir James Sandilands to France, they instructed the earls of Morton and Glencairn, with Maitland of Lethington, to repair to the court of England. By these ambassadors they presented to Elizabeth their respectful thanks for her late most important services; and, while they solicited the continuance of her favor and protection, entreated that, for the establishment of a perpetual peace and amity, she would be pleased to take in marriage the earl of Arran, the next heir after his father to the Scottish monarchy. The queen made new and fervent protestations of her regard, and promised her warmest aid when it should be necessary, in their just defence, upon any future occasion. She spoke in obliging terms of the earl of Arran; but, as she found in herself no present dis-

position to marriage, she desired that he might consult his happiness in another alliance. She expressed a favorable opinion of the Scottish nobility; and, as a demonstration of her esteem, she begged them to consider the unanimity of their order as a necessary guard against the ambition and the artifices of the enemies of their nation. The success of the congregation, though great and illustrious, was not yet completely decisive. The refusal of Francis and Mary to ratify their proceedings was a source of inquietude. The Popish party, though humbled, was not annihilated: under the royal protection it might soon be formidable. Political considerations might arise, not only to cool the amity of England, but even to provoke its resentment; and France, though it could now transport no army against Scotland, might soon be able to adopt that expedient. Severe calamities were still therefore to be dreaded. In the narrowness of their own resources they could find no permanent security against the rage of domestic faction, and the strenuous exertions of an extensive kingdom. While the anguish of melancholy apprehensions repressed the triumph of the congregation, the event which could operate most to their interests was announced to them. This event was the death of Francis II., without issue. The tie which knit Scotland to France was thus broken. A new scene of politics arose. Catherine de Medicis, the queen-mother, ruled Charles IX., and was the personal enemy of the queen of Scots. The power and the credit which Mary had lent to her uncles, and the frequent and humiliating disappointments which the queen-mother had suffered from her influence over Francis, were now repaid with a studied neglect. In the full perfection of her charms, with two crowns on her head, and looking towards a third, she felt herself to be without grandeur and without consequence. Leaving a court where she had experienced all the enjoyments of which humanity is susceptible, she retired to Rheims to indulge her sorrow.

In the humiliation of their queen, and in the change produced in the councils of France, the Protestants of Scotland found every possible encouragement to proceed with vigor in the full establishment of the reformed doctrines. After the dissolving of the parliament they turned their attention to the plan of policy which might suit best the religion for which they had contended. The three estates, amidst their other transactions, had granted a commission to Messrs. John Winram, John Spottiswood, John Willocks, John Douglas, John Row, and John Knox, to frame and model a scheme of ecclesiastical government. They were not long in composing the First Book of Discipline; in which they explained the uniformity and method which ought to be preserved concerning doctrine, the administration of the sacraments, the election and provision of ministers, and the policy of the church. A convention of the estates gave its sanction to the Presbyterian scheme; but, while the Book of Discipline sketched out a policy admired for its simplicity, yet it required that the patrimony and the rich possessions of the ancient church should be allotted to the new establishment.

The reformers, however, so successful in the doctrines and the policy they had proposed, were here very unfortunate. This convention of the estates did not pay a more respectful regard to this proposal than the celebrated parliament had done, which demolished the mass and the jurisdiction of the see of Rome. It was not till after long and painful struggles that the new establishment was able to procure to itself a becoming, or even necessary provision and support. The Romish clergy were strenuous to continue in their possessions, and to profit by them; and the nobles and the laity, having seized upon great part of the property of the church, were no less anxious to retain their acquisitions. The aversion entertained from bestowing riches upon the Presbyterian establishment, encouraged the ardor which prevailed for advancing all the other views and interests of the reformed. This end was also promoted by the insidious policy of Catherine de Medicis. She was willing to increase all the difficulties in the situation of the queen of Scots and her subjects. Upon this account she had engaged Charles IX. to despatch M. Noailles to the Scottish parliament, to urge it in strong terms to renew the ancient league between the two kingdoms, to dissolve the alliance with England, and to re-establish over Scotland the popish doctrines and the popish clergy. A new meeting of the estates was assembled, which treated these strange requisitions with the indignation they merited. M. Noailles was instructed to inform his sovereign that France having acted with cruelty and perfidiousness towards the Scots, by attacking their independency and liberties under the pretence of amity and marriage, did not deserve to know them any longer as an ally; that principles of justice, a love of probity, and a high sense of gratitude, did not permit the Scottish parliament to break the confederacy with England, which had generously protected their country against the tyrannical views of the French court, and the treacherous machinations of the house of Guise; and that they were never to acknowledge the popish clergy to be a distinct order of men, or the legal possessors of the patrimony of the church; since, having abolished the power of the pope, and renounced his doctrines, they could bestow no favor or countenance upon his vassals and servants. To this council of the estates a new supplication was presented by the Protestants. They departed from the high claim which they had made for the riches and patrimony of the popish church; and it was only requested by them that a reasonable or decent provision should be allotted to the true preachers of the gospel. This application, however, was treated with neglect; but, amidst the anxiety manifested by the nobles and the tenants of the crown to hold the Presbyterian clergy in subjection and in poverty, they discovered the warmest zeal for the extension and continuance of the reformed opinions. For, in this supplication of the Protestants, an ardent desire being urged that all the monuments of idolatry which remained should be utterly destroyed, the fullest and most unbounded approbation was given to it. An act accordingly was passed which com-

manded that every abbey-church, every cloister, and every memorial whatsoever of popery, should be finally overthrown and demolished; and the care of this popular employment was committed to those persons who were most remarkable for their keenness and ardor in the work of the reformation. Its execution in the western counties was given in charge to the earls of Arran, Argyle, and Glencairn; lord James Stuart attended to it in the more northern districts; and, in the inland divisions of the country, it was intrusted to the barons in whom the congregation had the greatest confidence. A dreadful devastation ensued. The populace, armed with authority, spread their ravages over the kingdom. The churches and religious houses were every where defaced or pulled to the ground; and their furniture, utensils, and decorations, became the property of the invaders. The libraries of the ecclesiastics, and the registers of their transactions and of civil affairs, were gathered into heaps and burnt. Religious antipathy, the sanction of law, the exhortation of the clergy, the hope of spoil, and the ardor to put the last hand to the reformation, concurred to drive the rage of the people to its wildest fury. The death of Francis II. having left his queen Mary in a very disagreeable situation in France, she now began to think of returning to her own country. To this she was solicited both by the Protestants and Papists; the former that they might gain her over to their party; and the latter, hoping that, as Mary was of their own persuasion, popery might be re-established in Scotland. For this deputation the Protestants chose lord James Stuart, and the Papists John Lesly, official and vicar-general of the diocese of Aberdeen. The latter got the start of the Protestant ambassador, and thus had the opportunity of first delivering his message. He advised her strongly to beware of lord James Stuart, whom he represented as a man of unbounded ambition, who had espoused the Protestant cause for no other reason than that he might advance himself to the highest employments in the state; nay, that he had already fixed his mind on the crown. For these reasons he advised that lord James should be confined in France till the government of Scotland could be completely established; but if the queen was averse to this measure, he compelled her to land in some of the northern districts of Scotland, where her friends were most numerous; in which case an army of 20,000 men would accompany her to Edinburgh, to restore the Popish religion, and to overawe her enemies. The next day lord James Stuart waited upon her, and gave an advice very different from that of Lesly. The surest method of preventing insurrections, he said, was the establishment of the Protestant religion; that a standing army and foreign troops would certainly lose the affections of her subjects; for which reason he advised her to visit Scotland without guards and without soldiers, and he became solemnly bound to secure their obedience to her. To this advice Mary, though she distrusted its author, listened with attention; and lord James took care to improve the favorable opportunity; by which means he obtained a promise of the

earldom of Marre. Before Mary set out from France she received an embassy from queen Elizabeth, pressing her to ratify the treaty of Edinburgh, in which she had taken care to get a clause inserted that Francis and Mary should for ever abstain from assuming the title and arms of England and Ireland. But this was declined by the queen of Scotland, who, in her conference with the English ambassadors, gave proof of her political abilities. Her refusal greatly augmented the jealousies which already prevailed between her and Elizabeth, insomuch that the latter refused her a safe passage through her dominions. This was considered by Mary as a high indignity; she returned a very spirited answer, informing her rival that she could return to her dominions without any assistance from her, or indeed whether she would or not. In August 1561 Mary set sail from Calais for Scotland. She left France with much regret; and at night ordered her couch to be brought upon deck, desiring the pilot to awaken her in the morning if the coast of France should be in view. The night proved calm, so that the queen had an opportunity once more of indulging herself with a sight of that beloved country; a favorable wind now sprung up, and, a thick fog coming on, she escaped a squadron of men of war which Elizabeth had sent out to intercept her; on the 20th of August she landed safely at Leith.

Though the Scots received their queen with the greatest demonstrations of joy, it was not long before an irreconcilable quarrel arose. The Protestant religion was now established all over the kingdom; and its possessors had so far deviated from their own principles, or what ought to have been their principles, that they would grant no toleration to the opposite party, nor even to the sovereign herself. In consequence of this, when the queen attempted to celebrate mass in her own chapel of Holyrood House, a violent mob assembled, and it was with the utmost difficulty that lord James Stuart and other persons of distinction could appease the tumult. Mary attempted to allay these ferments by a proclamation, in which she promised to take the advice of the states in religious matters; and, in the mean time, declared it to be death for any person to attempt an innovation or alteration of the religion now established in Scotland. Against this proclamation the earl of Arran protested, and told the herald that the queen's proclamation should not protect her attendants and servants if they presumed to commit idolatry and to say mass. John Knox declared from the pulpit that one mass was more terrible to him than if 10,000 armed enemies had landed in any part of the kingdom to re-establish popery. The preachers every where declaimed against idolatry and the mass; keeping up, by their mistaken zeal, a spirit of discontent and sedition throughout the whole kingdom. Knox was called before the queen to answer for the freedom of his speeches; but his unbounded boldness gave Mary much disquiet. The freedoms, however, which were taken with the queen, could not induce her to depart from the plan of government which she had laid down. To the Protestants she resolved to pay the greatest attention; from

among them she chose her privy council, and heaped favors upon lord James Stuart, who, for his activity in promoting the reformation, was the most popular man in the kingdom; while, to her courtiers of the Roman Catholic persuasion, she behaved with a distant formality. In the mean time the difference between the two rival queens became every day greater. The queen of Scotland pressed Elizabeth to declare her the nearest heir to the crown of England, and Elizabeth pressed Mary to confirm the treaty of Edinburgh. With this the latter could not comply, as it would in fact have been renouncing for ever the title to that crown for which she was so earnestly contending. Endless negotiations were the consequence, and the hatred of Elizabeth to Mary continually increased. This year the queen of Scotland amused herself by making a circuit through part of her dominions. From Edinburgh she proceeded to Stirling; thence to Perth, Dundee, and St. Andrews. Though received every where with the greatest acclamations and marks of affection, she could not but remark the rooted aversion which had universally taken place against popery; and, upon her return to Edinburgh, her attention was called to an exertion of this zeal, which may be considered as highly characteristic of the times. The magistrates of this city, after their election, enacted rules, according to custom, for the government of their borough. By one of these acts, which they published by proclamation, they commanded all monks, friars, and priests, together with all adulterers and fornicators, to depart from the town and its limits within twenty-four hours, under the pains of correction and punishment. Mary, interpreting this exertion of power to be a usurpation of the royal authority and a violation of order, displaced the magistrates, commanded the citizens to elect others in their room, and granted by proclamation a plenary indulgence to all her subjects not convicted of any crime, to repair to, and remain in, her capital at their pleasure. Besides these disturbances on account of religion, the kingdom was now in confusion on another account. The long continuance of civil wars had left a proneness to tumults and insurrections every where; and thefts, rapine, and licentiousness of every kind, threatened to subvert the foundations of civil society. Mary made considerable preparations for the suppression of these disorders, and appointed lord James Stuart her chief justiciary and lieutenant. He was to hold criminal courts at Jedburgh, and at Dumfries. To assist his operations against the banditti, who were armed, and often associated into bodies, a military force was necessary; but, as there were then neither standing army nor regular troops in the kingdom, the county of Edinburgh and ten others were commanded to have their strength in readiness to assist him. The feudal tenants, and the allodial or free proprietors of these districts, in complete armor, and with provisions for twenty days, were appointed to be subservient to the purposes of his commission, and to obey his orders in establishing the public tranquillity. In this expedition he was attended with his usual success. He destroyed many of the strong

holds of the banditti, hanged twenty of the most notorious offenders, and ordered fifty more to be carried to Edinburgh, to suffer the penalties of the law for their rebellious behaviour. He entered into terms with lord Grey and Sir John Foster, the wardens of the English borders, for the mutual benefit of the two nations; and he commanded the chiefs of the disorderly clans to submit to the queen. In the mean time the queen was in a very disagreeable situation, being suspected and disturbed by both parties. From the concessions she had made to the Protestants, the Papists supposed that she had a design of renouncing their religion altogether; while, on the other hand, the Protestants could scarcely allow themselves to believe that they owed any allegiance to an idolater. Disquiets of another kind also now took place. The duke of Chatelherault, having left the Catholics to join the opposite party, was neglected by his sovereign. Being afraid of danger he fortified the castle of Dumbarton, which he resolved to defend; and, in case of necessity, to put himself under the protection of the queen of England. The earl of Arran was a man of weak abilities, but of boundless ambition. The queen's beauty had made an impression on his heart, and his ambition made him fancy himself the fittest person in the kingdom for her husband. But his fanaticism, and the violence with which he had opposed the mass, disgusted her. He bore her dislike with an uneasiness that preyed upon his intellects and disordered them. The earl of Bothwell was distinguished chiefly by his prodigalities and the licentiousness of his manners. The earl of Marischal had every thing that was honorable in his intentions, but was over wary. The earl of Morton possessed penetration and ability, but was attached to no party from any principles of rectitude; his own interests were the motives which governed him. The earl of Huntly, the lord chancellor, was unquiet, variable, and vindictive. The earls of Glencairn and Monteith were exceedingly zealous for the new opinions; and this, as well as their poverty, recommended them to queen Elizabeth. Among courtiers of this description it was difficult for Mary to make a selection of ministers in whom to confide. The popularity of lord James Stuart, and of Maitland of Lethington, had early pointed them out to this distinction; and hitherto they had acted to her satisfaction. They were each of eminent capacity; but the former was suspected of aiming at the sovereignty; the latter was prone to duplicity; and both were more connected with Elizabeth than became them as the ministers and subjects of another sovereign. Beside the policy of employing and trusting statesmen who were Protestants, and the precaution of maintaining a firm peace with England, Mary had it also at heart to enrich the crown with the revenues of the ancient church. A convention of estates was assembled to deliberate upon this measure. The bishops were alarmed with their perilous situation. They were told that the charge of the queen's household required an augmentation; and that, as the rents of the church had flowed chiefly from the crown, it was expedient that a proportion of

them should now be resumed to uphold its splendor. After long consultations, the prelates and estate ecclesiastical, considering that they existed merely by the favor of the queen, consented to resign to her the third part of their benefices; with the reservation that they should be secured during their lives against all farther payments, and relieved from the burden of the maintenance of the reformed clergy. With this offer the queen and the convention of estates were satisfied. Rentals, accordingly, of all their benefices throughout the kingdom, were ordered to be produced by the ancient ecclesiastics; the reformed ministers, superintendants, elders, and deacons, were enjoined to make out registers of the grants necessary to support their establishment; and a power of judging in these matters was committed to the queen and the privy council. While the prelates and estate ecclesiastical submitted to this offer from the necessity of their affairs, it was by no means acceptable to the reformed clergy, who at this time were holding an assembly. It was their wish to effect the entire destruction of the ancient establishment, to succeed to a large proportion of their emoluments, and to be altogether independent of the crown. But the nobles and gentlemen who had promoted the reformation thought very differently. To give too much of the wealth of the church to the reformed clergy was to invest them with a dangerous power. To give too great a proportion of it to the crown was a step still more dangerous. At the same it was equitable that the ancient clergy should be maintained during their lives; and it consisted with the private interests of the noblemen and gentlemen who had figured during the reformation, not to give consent to any scheme that would deprive them of the spoils of which they had already possessed themselves out of the ruins of the church. Thus public as well as private considerations contributed to separate and divide the lay protestants and the preachers. The general assembly, therefore, was not successful in the views which had called them together, and which they submitted to the convention of the estates. Doubts were entertained whether the church had any title to assemble itself. The petition for the complete abolition of idolatry, or for the utter prohibition of the mass, was rejected. The request that Mary would give authority to the book of discipline was not only refused, but even treated with ridicule. The only point pressed by the church, which attracted any notice, was its requisition of a provision or a maintenance; but the measure invented for this end was in opposition to all its warmest desires.

This measure, however, so unpromising to the preachers in expectation, was found to be still more unsatisfactory upon trial. The wealth of the Romish church had been immense, but great invasions had been made upon it. The fears of the ecclesiastics, upon the overthrow of popery, induced them to engage in fraudulent transactions with their relations; in consequence of which many possessions were conveyed from the church into private hands. Long leases of churchlands, or in perpetuity, were granted to strangers.

Sales also of ecclesiastical property, to a great extent, had been made by the incumbents; and a validity was supposed to be given to these transactions by confirmations from the pope. Even the crown had contributed to make improper dispositions of the ecclesiastical land revenues. Laymen had been presented to bishoprics and church-livings, with the power of disposing of the territory in connexion with them. In this diffusion of the property of the church much extensive domain came to be invested in the nobles and the gentry. From these causes, the grant of the third of their benefices, made by the ancient ecclesiastics to the queen, with the burden of maintaining the reformed clergy, was not nearly so considerable as might have been expected. But, the direction of the scheme being lodged in the queen and the privy-council, the advantage to the crown was still greater than that bestowed upon the preachers. Yet the carrying the project into execution was not without its inconveniences. There were still many opportunities for artifice and corruption. The ecclesiastics often produced false rentals of their benefices; and the collectors for the crown were not always faithful to their trust. The complete produce of the thirds did not amount to a great sum; and it was to operate to the expenses of the queen, as well as to the support of the preachers. A scanty proportion went to the latter; and yet the persons chosen to fix their particular stipends were the fast friends of the reformation; for this business was committed to the earls of Argyll and Morton, lord James Stuart, and Maitland of Lethington, with James Mackgill the clerk register, and Sir John Ballenden the justice-clerk: 100 Scottish merks were deemed sufficient for a common minister. To clergymen of greater interest, or who exercised their functions in more extensive parishes, 300 merks were allotted; and, excepting to superintendants, this sum was seldom exceeded. To the earl of Argyll, lord James Stuart, and lord Erskine, who had large ecclesiastical revenues, their thirds were usually remitted by the queen; and, upon the establishment of this fund or revenue, she also granted many pensions to persons about her court and of her household. The complaints of the preachers were made with little decency. To a mean spirit of flattery to the reigning power they imputed the defection of their friends; and against the queen they were animated with the bitterest animosity. The poverty in which they were suffered to remain inflamed all their passions, and inveterate habits of insult fortified them into a contempt of authority. To the queen, whose temper was warm, the rudeness of the preachers was an endless inquietude, which, while it fostered her religious prejudices, had the good effect to confirm her constancy to her friends. Lord James Stuart, who was entitled to her respect and esteem from his abilities, and his proximity to her in blood, had merited rewards and honors by his public services and the vigor of his counsels. After his successful discharge of her commission, as chief justiciary and lord lieutenant, she could not think of allowing him to descend from these offices without bestowing upon him a solid and

permanent mark of her favor. She advanced him into the rank of her nobility, by conferring upon him the earldom of Mar; and contributed to augment his consequence by facilitating his marriage with Agnes the daughter of the earl of Marischal; and the ceremonial of this alliance was celebrated with a magnificence and ostentation so extravagant in that age as to excite the fears of the preachers lest some avenging judgment should afflict the land. They exclaimed with virulence against his riotous feasting and banquets; and especially against his masquerades. In fact the abilities of the earl of Mar, the ascendancy he maintained in the councils of his sovereign, and the distinctions which he had acquired, exposed him to envy. The most formidable and desperate of his enemies was the earl of Huntly. In their rivalry for power, many causes of disgust had arisen. The one was at the head of the Protestants, the other of the papists. Upon the death of Francis II., Huntly and the popish faction had sent a deputation to Mary, inviting her to return to Scotland, and offering to support her with an army of 20,000 men. His offer was treated with civility, but rejected. The invitation of the Protestants, presented by the earl of Mar, was more acceptable to her. Huntly had advised her to detain his rival in confinement in France till the Roman Catholic religion should be re-established in Scotland. This advice she not only disregarded, but treated his enemy with particular civilities. Upon her arrival in Scotland, Huntly renewed his advances, offering to her to set up the mass in all the northern counties. He even conversed upon this subject with her uncles and her French courtiers. Still no attention was paid to him. He came to her palace, and was received only with respect. He was lord high chancellor without influence, and a privy counsellor without trust. The earl of Mar had her confidence, and was drawing to him the authority of government. These were cruel mortifications to a man of high rank, inordinate ambition, immense wealth, and who commanded numerous and warlike retainers. But he was yet to feel a stroke still more severely excruciating, and far more destructive of his consequence. The opulent estate of Mar, which Mary had erected into an earldom, and conferred upon his rival, had been lodged in his family for some time. He considered it as his property, and that it was never to be torn from his house. This blow at once insulted most sensibly his pride, and cut most fatally the sinews of his greatness. After employing against the earl of Mar those arts of detraction and calumny which are so common in courts, he drew up a formal memorial, in which he accused him of aiming at the sovereignty of Scotland. This paper he presented to the queen; but, the arguments with which he supported his charge being weak, she was the more confirmed in her attachment to her minister. Huntly then addressing himself to the earl of Bothwell, a man disposed to desperate enterprises, engaged him to attempt to involve the earl of Mar and the house of Hamilton in open and violent contention. Bothwell represented to Mar the enmity which had long subsisted between him and the house of

Hamilton. It was an obstacle to his greatness; and while its destruction might raise him to the highest pinnacle of power, it would be most acceptable to the queen. He concluded with making an unlimited offer of his services in the execution of this flagitious enterprise. The earl of Mar, however, abhorring the baseness of the project, rejected his advances. Bothwell, thus disappointed, next practised with the house of Hamilton to assassinate the earl, whom they considered as their greatest enemy. The business, he said, might be performed with ease. The queen was accustomed to hunt in the park of Falkland; and there Mar, slenderly attended, might be put to death; the person of the queen might be seized; and, by detaining her in custody, a sanction might be given to their crime. The integrity of the earl of Arran, revolting against this conspiracy, defeated its purposes. Dreading the perpetration of so cruel an action, and yet sensible of the resolute determination of his friends, he wrote privately to the earl informing him of his danger. But the answer of Mar to this letter, thanking him for his intelligence, being intercepted by the conspirators, Arran was confined by them under a guard in Kinneil House. He escaped, however, and discovered the plot to the queen. But, as he could produce no witnesses or written vouchers, he offered to prove his information, by engaging Bothwell in single combat. And though, in his examinations before the privy council, his love to the queen, his attachment to the earl of Mar, the atrocity of the scheme he revealed, and, above all his concern for his father, the duke of Chatelherault, threw him into a perturbation of mind which expressed itself violently in his speech, his countenance, and his actions; yet his declarations were so consistent and firm, that it was thought advisable to take the command of the castle of Dumbarton from the duke of Chatelherault, to confine the other conspirators to different prisons, and to await the farther discoveries which might be made by accident and time. The earl of Huntly, inflamed by these disappointments, invented other devices. He excited a tumult while the queen and the earl of Mar were at St. Andrews with only a few attendants; imagining that the latter would sally forth to quell the insurgents, and that a convenient opportunity would thus be afforded for putting him to the sword without detection. The caution of Mar, however, defeating the purpose, he ordered some of his retainers to attack him in the evening when he should leave the queen; but, these assassins being surprised in their station, Huntly affected to excuse their being in arms in a suspicious place and at a late hour by frivolous apologies. About this period two letters were received by Mary from the pope and the cardinal of Lorraine, in consequence of the intrigues of the earl of Huntly and the Roman Catholic faction. They pressed her to consider that, while this nobleman was the most powerful of her subjects, he was the most zealous in the interests of the church of Rome. They intreated her to marry Sir John Gordon his second son; promised her money and military supplies, if she would set herself to restore the

ancient religion of her country; and recommended it to her to destroy the more zealous Protestants about her court, of whom a roll was transmitted to her, which included the name of her minister the earl of Mar. These letters could not have reached her at a juncture more unfavorable for their success. Mar, to whom she communicated them, was encouraged to proceed with the greatest vigor in undermining the designs of his enemies. New incidents exasperated the animosities of his enemies. Sir John Gordon and lord Ogilvie, having a private dispute, happened to meet each other in the High Street of Edinburgh. They immediately drew swords; and, lord Ogilvie receiving a very dangerous wound, Sir John Gordon was committed to prison by the magistrates. The queen, at this time in Stirling, was informed by them of the riot; and, while they expressed a fear lest the friends of the prisoner should rise up in arms to give him his liberty, they mentioned a suspicion which prevailed that the partisans of lord Ogilvie were to assemble themselves to vindicate his quarrel. The queen, after commending their diligence, desired them to watch over their prisoner; wished that the law should take its course; and advised them to rely upon the earl of Mar for their protection. Sir John Gordon, however, escaped from his confinement; and, flying into Aberdeenshire, filled his retainers with his complaints, and added to the disquiets of his father the earl of Huntly. The queen, upon returning to Edinburgh, held a consultation with her privy council; and soon after set out upon a progress to the northern parts of her kingdom. At Aberdeen she was met by lady Huntly, a woman of deep dissimulation and of refined address, who endeavoured to conciliate her affections, was prodigal of flattery, expressed her zeal for the popish religion, and hinted the great power of her husband. She then interceded with the queen for forgiveness to her son. But Mary having told her that this favor could not possibly be granted till her son should return to prison, and submit to the justice of his country, lady Huntly engaged that he should do so, and only intreated that, instead of Edinburgh, he should be confined in the castle of Stirling. This request was complied with; and in the prosecution of the business, a court of justiciary being called, Sir John Gordon made his appearance, and acknowledged himself to be the queen's prisoner. Lord Glamis was appointed to conduct him to the castle of Stirling. But, upon the road to this fortress, he deceived his guards, hastened back, and gathering 1000 horsemen among his retainers, entrusted his security to the sword. In the mean time the queen continued her progress. The earl of Huntly joined himself to her train. His anxiety to be allowed to attend her to his house of Strathbogy was uncommon. The intelligence arrived of the escape and rebellion of Sir John Gordon. The behaviour of the father and the son awakened in her the most alarming suspicions. Assembling her privy council, she, with their advice, commanded her heralds to charge Sir John Gordon and his adherents to return to their allegiance and to surrender up to her their houses of strength and castles, under the pains of high treason and

forfeiture. Disdaining now to go to the house of the earl of Huntly, where that nobleman had made preparations to hold her in captivity, she advanced to Inverness by a different rout. In the castle of Inverness she proposed to take up her residence; but Alexander Gordon, the deputy governor, a dependent of the family of Huntly, refused to admit her. Her attendants were few in number, the town was without walls, and the inhabitants were suspected. In this extremity, some ships in the river were kept in readiness as a last refuge; and she issued a proclamation commanding all her loyal subjects in those parts to repair to her for her protection. The Frasers and Monros came in crowds to assist her. The Clan Chattan, though called to arms by the earl of Huntly, forsook his standard for that of their sovereign, when they discovered that his intentions were hostile to her. She employed them in laying siege to the castle, which surrendered upon the first assault. The lives of the soldiers were spared, but the deputy governor was executed, and the queen returned to Aberdeen. To punish the earl of Huntly for the troubles he had raised, a measure infinitely humiliating was executed. The earl of Mar resigned the rich estate of that name to lord Erskine, who claimed it as his right; and received in recompense, after its erection into an earldom, the territory of Murray, which made an extensive portion of the possessions of the earl of Huntly. Lady Huntly hastened to Aberdeen to offer the most humble submissions on the part of her husband, to avert the downfall of his greatness. But all access to the queen was refused; and the earl of Huntly was summoned to appear in person before the privy council, to answer for his conduct, and to make a full resignation of all his fortresses. He did not present himself, and was declared to be in open rebellion. A new proclamation was issued by the queen to collect sufficient numbers to subdue the insurgents. The command of her troops was given to the earl of Murray, who put them instantly into motion. Huntly advancing towards Aberdeen to give them battle, was informed of their approach. He halted at Corriehe, hoping for a decisive victory. The army of the queen was the most numerous; but there were several companies in it, in whom little confidence could be placed. These the earl of Murray posted in the front of the battle, to begin the attack. They recoiled upon him, as he expected; but a resolute band, holding out their spears, obliged them to face the foe. Their flight made Huntly think the day was his own. He therefore ordered his soldiers to rush upon the enemy sword in hand. But, when they came to the place where the earl of Murray had stationed himself, his firm battalion put a stop to their progress. In a panic they took to flight. The earl of Huntly was killed in the pursuit. His sons, Sir John Gordon and Adam Gordon, were made prisoners, with the principal gentlemen who had assisted him. Mary, upon receiving the tidings of this success, discovered neither joy nor sorrow. But the earl of Murray and his party were not yet satisfied. Sir John Gordon was brought to trial, confessed his guilt, and was condemned to suffer as a traitor. Adam,

upon account of his tender age, was pardoned; and fines were levied from the other captives, according to their wealth. The lord Gordon, after the battle, fled to his father-in-law, the duke of Chatelherault, but was delivered up by that nobleman. He was convicted of treason, and condemned; but the queen was satisfied with confining him in prison. The body of the earl of Huntly was carried to Edinburgh, and kept unburied, till a charge of high treason was brought against him before the three estates. A display was made of his crimes, and parliament pronounced his guilt. His estates were forfeited; his dignity, name, and memory, were pronounced extinct; his ensigns armorial were torn from the book of arms; and his posterity were rendered unable to enjoy any offices, honor, or rank, within the realm.

While these scenes were transacting, Mary, who was solicitous to establish a secure amity between the two kingdoms, opened a negotiation to procure an interview with Elizabeth. Secretary Maitland, whom she employed, met with a most gracious reception at the court of London. The city of York was appointed as the place where the two queens should express their mutual love and affection, and bind themselves to each other in an indissoluble union; the day of their meeting was fixed; the fashion and articles of their interview were adjusted; and a safe conduct into England was granted to the queen of Scots by Elizabeth. But in this advanced state of the treaty it was unexpectedly interrupted. The disturbances in France, the persecution of the Protestants there, and the dangers which threatened the reformed countries, required Elizabeth to be upon her guard against the machinations of the adversaries of her religion. Upon these pretences she declined for a season the projected interview; sending to Mary, with this apology, Sir Henry Sidney, a minister of ability, whom she instructed to dive into the secret views of the Scottish queen. This was a severe disappointment to Mary; but Elizabeth acted in this negotiation without sincerity. It was not her interest to admit into her kingdom a queen who had pretensions to her crown, who might raise the expectations of her Roman Catholic subjects, and advance herself in their esteem; and who far surpassed her in beauty and the bewitching allurements of conversation and behaviour. Amidst affairs of great moment, a matter of smaller consequence, but interesting in its circumstances, deserves to be recorded. Chatelard, a gentleman of family in Dauphiny, and a relation of the chevalier de Bayard, had been introduced to queen Mary by lord Damville, the heir of the house of Montmorency. Polished manners, vivacity, attention to please, the talent of making verses, and an agreeable figure, were his recommendations. He became necessary in all parties of pleasure at the palace. His assiduities attracted the notice of the queen, and, at times, she did him the honor to dance with him. But her politeness and condescension insinuated into him other sentiments than gratitude. He felt the power of her charms. In an unhappy moment he entered her apartment, and concealed himself under her bed. While the queen was undressing her maids discovered him and gave her the alarm.

Chatelard was dismissed with disgrace, but soon after pardoned. The frenzy, however, of his love compelling him to repeat his crime, it was no longer proper to show him any compassion. The delicate situation of Mary, the noise of these adventures, and the rude suspicions of her subjects, required that he should be tried and punished. He was accordingly condemned to lose his head; and the sentence was executed. The disagreeable circumstances in which Mary found herself involved by her quarrel with Elizabeth, the excessive bigotry and overbearing spirit of her Protestant subjects, together with the adventure of Chatelard, and the calumnies propagated in consequence of it, determined her to think of a second marriage. Her beauty and expectations of the crown of England, with what she already possessed, brought her many suitors. She was addressed by the king of Sweden, the king of Navarre, the prince of Condé, the duke of Ferrara, prince Charles of Spain, the archduke Charles of Austria, and the duke of Anjou. Her own inclination was to give the preference, among these illustrious lovers, to the prince of Spain; but her determination was to render her decision as agreeable as possible to queen Elizabeth, the English nation, and the Protestants in both kingdoms. Her succession to the crown of England was the object nearest her heart; and Elizabeth, who wished to prevent her from marrying altogether, contrived to impress upon her mind an opinion that any foreign alliance would greatly obstruct that much desired event. She therefore pitched upon two of her own subjects, whom she successfully recommended as fit matches for the queen of Scots; and she promised that, upon her acceptance of either of them, her right of inheritance should be enquired into and declared. Lord Robert Dudley, afterwards earl of Leicester, was the first person proposed; but, except a manly face and fine figure, he had not one quality that could recommend him to the Scottish princess. Mary received this suitor with composure, but was more induced to treat him with scorn than love. The English queen then recommended to Mary another suitor, lord Darnley, of the house of Stuart, whose birth was almost equal to her own, and whom the Scottish princess was induced to accept as a husband by motives which we have elsewhere detailed. See MARY. Elizabeth, however, was not more sincere in this proposal than in the former; for, after permitting Darnley, and his father, the earl of Lennox, to visit Scotland, to divert the attention of the queen from the continent, she threw every possible obstacle in the way of the marriage. When Mary was so entangled that she could not draw back, Elizabeth intimated her disapprobation of that marriage, which she herself had originally planned and forwarded; and her whole council declared against it. John Knox, in the mean time, forgetting not only the meek and peaceable behaviour of a Christian, but the allegiance of a subject, interfered with the marriage of his sovereign. Yet the principle upon which he acted now forms an essential part of the British constitution, which expressly prohibits the king or any of the royal family from marrying a Roman Ca-

tholic. As Darnley was a Papist he was of consequence execrated by the whole body of Protestants, laity as well as clergy; while, on the other hand, he was supported by the earls of Athol and Caithness, the lords Ruthven and Hume, and the whole Popish faction. It was exceedingly unfortunate for the queen, that neither lord Darnley himself, nor his father, the earl of Lennox, had any talents for business; and, as they naturally had the direction of the queen's affairs, it is no wonder that they were very ill managed. But a source of opposition, more violent than any imperfections of their own, arose to them in the attachment which they discovered to a person upon whom the queen had of late bestowed repeated favors. David Rizzio, from a mean origin, raised himself to distinguished notice in Mary's court. He was born at Turin, where his father earned a subsistence as a musician. Varieties of situation and adventure, poverty and misfortunes, had taught him experience. In the train of the count de Morette, the ambassador from the duke of Savoy, he had arrived in Scotland. The queen, desirous to complete her band of music, admitted him into her service. In this humble station he had the dexterity to attract her attention; and her French secretary falling into disgrace, from negligence and incapacity, he was promoted to his office. A necessary and frequent admission to her company afforded him now the fullest opportunity to recommend himself to her; and, while she approved his manners, she was sensible of his fidelity and his talents. His mind, however, was not sufficiently vigorous to bear prosperity. Ambition grew upon him with preferment. He interfered in affairs of moment, intruded himself into the conventions of the nobles at the palace, and was a candidate for greatness. The queen consulted with him upon the most important business, and entrusted him with real power. His suppleness and servility, in his former condition, were exchanged for insolence, ostentation, and pride. He exceeded the most potent barons in the stateliness of his demeanor, the sumptuousness of his apparel, and the splendor of his retinue. The nobles, while they despised his low birth, and detested him as a foreigner, were mortified with his grandeur, and insulted by his arrogance. Their anger and abhorrence were driven into fury; and, while this undeserving minion, to uphold his power, courted Darnley, and with officious assiduities advanced his suit with the queen, he hastened not only his own ruin, but laid the foundation of public calamity. To the earl of Murray the exaltation of Rizzio, so offensive in general to the nation, was peculiarly humiliating. His interference for the earl of Leicester, the partiality he entertained for Elizabeth, his connexions with secretary Cecil, and the favor he had shown to Knox, had all contributed to create in Mary a suspicion of his integrity. The practices of Darnley and Rizzio were thence the more effectual; and the fullest weight of their influence was employed to undermine his power. Mary, aware of their critical situation, was solicitous to add to her strength. Bothwell, who had been imprisoned for conspiring against the life of the earl of Murray, and

who had escaped from confinement, was recalled from France; the earl of Sutherland, an exile in Flanders, was invited home to receive his pardon; and George Gordon, the son of the earl of Huntly, was admitted to favor, and was soon reinstated in the wealth and honors of his family. As soon as Bothwell arrived, the earl of Murray insisted that he should be brought to trial for having plotted against his life. This was agreed to; and on the day of trial Murray made his appearance with 800 of his adherents. Bothwell did not choose to contend with such a formidable enemy; he therefore fled to France, and left a protestation that fear of violence was the cause of his flight. The queen commanded the judge not to pronounce sentence. Murray complained of her partiality, and engaged still deeper in cabals with queen Elizabeth. Darnley, in the mean time, pressed his suit with eagerness. The queen endeavoured to cause Murray to subscribe a paper expressing his consent to her marriage; but to no purpose. However, many of the nobility did subscribe this paper; and she ventured to summon a convention of the estates at Stirling, to whom she opened the business of the marriage; and who approved of her choice, provided the Protestant religion should continue to be the establishment. In the mean time ambassadors arrived from England, with a message importing Elizabeth's entire disapprobation of the queen's marriage with lord Darnley. But to these ambassadors Mary only replied that matters were gone too far to be recalled; and that Elizabeth had no cause of displeasure, since, by her advice, she had fixed her affections not upon a foreigner, but upon an Englishman; and since the man she favored could boast of having in his veins the royal blood of both kingdoms. She then created lord Darnley a lord and a knight. He was made a baron and a banneret, and styled lord Armanagh. He was belted earl of Ross. He then promoted fourteen gentlemen to the honor of knighthood, and did homage to the queen, without any reservation of duty to the crown of England, where his family had long resided. But his advancement to the dukedom of Albany was delayed; and this was so much resented by him that he threatened to stab lord Ruthven when he told him of it. In the mean time the meeting of parliament, which was to determine the marriage, was approaching. The earl of Murray, encouraged by the apparent firmness of Elizabeth, and alarmed with the approbation bestowed by the convention on the queen's choice, began to meditate a decisive blow. To inspirit the resentments of his friends, and to justify the violence of his projects, he hinted apprehensions of being assassinated by lord Darnley, and he avoided to go to Perth, where he affirmed that the plot against him was to be carried into execution. He courted the enemies of Darnley, and he united to him in a confederacy the duke of Chatelherault, and the earls of Argyle, Ruthven, and Glencarn. It was not the sole object of their association to oppose the marriage. They meditated the death of the earl of Lennox and lord Darnley; and, while the queen was upon the road to Callander to visit lord Livingston, they proposed to intercept her and to hold her in cap-

tivity. In this event, Murray was to advance himself into the government of the kingdom, under the character of its regent. But, Mary having heard of their conspiracy, the earl of Athol and lord Ruthven raised suddenly 300 men to protect her in her journey. Defeated in this scheme, the earl of Murray and his associates did not relinquish their cabals; and the nation was filled with alarms and suspicions. Amidst other arts employed by the malcontents, they insisted upon the danger which threatened the Protestant religion from the advancement of lord Darnley, and from the rupture that must ensue with England. Letters were dispersed among the Protestants, reminding them of what God had wrought for them in the abolition of idolatry, and admonishing them to oppose the restoration of the mass. A supplication was presented to the queen, complaining of idolaters, and insisting upon their punishment. It was received with unusual respect; and Mary instructed the popish ecclesiastics to abstain from giving offence of any kind to the Protestants. A priest, however, having celebrated mass, was taken by them, and exposed to the insults of the populace at the market place of Edinburgh, in the garments of his profession, and with the chalice in his hand; and, the queen having given a check to this tumultuous proceeding, the Protestants were confirmed in their belief that she meant to overthrow their religion. The most learned and able of the clergy held frequent consultations together; and the general assembly was called to deliberate upon the affairs of the church. The commissioners, whom they sent to the queen, were ordered to demand a parliamentary ratification of their desires. They insisted that the mass, with every remain of popery, should be suppressed throughout the kingdom; that, in this reformation, the queen's person and household should be included; that all papists and idolaters should be punished upon conviction according to the laws; that all persons should resort to the churches upon Sunday, to join in public worship; that an independent provision should be assigned for the support of the clergy, and their successors; that all vacant benefices should be conferred upon persons qualified for the ministry; that no bishopric, abbey, priory, deanery, or other living, having many churches, should be bestowed upon a single person; but that each church should be provided with a minister; that the glebes and manse should be allotted for the ministers, and for the reparation of churches; that all lands, which of old had been devoted to hospitality, should again be made subservient to it; that the lands and rents which formerly belonged to the monks, with the annuities, &c., should be employed in the maintenance of the poor and the upholding of schools; that all horrible crimes should be punished; that judges should be appointed in every district; and that, for the ease of the laboring husbandmen, some order should be devised concerning a reasonable payment of the tithes. To these requisitions the queen made an answer full of moderation and humanity. She was ready to agree with the three estates in establishing the reformed religion over the subjects of Scotland;

and she was steadily resolved not to throw into hazard the life, the peace, or the fortune, of any person whatsoever upon account of his opinions. As to herself and her household, she was persuaded that her people would not urge her to adopt tenets in contradiction to her own conscience, and thereby involve her in remorse. She had been nourished and brought up in the Romish faith; she conceived it to be founded on the word of God; and she was desirous to continue in it. But, setting aside her belief and religious duty, she ventured to assure them that she was convinced, from political reasons, that it was her interest to maintain herself firm in the Roman Catholic persuasion. By departing from it she would forfeit the amity of the king of France, and that of other princes who were now strongly attached to her; and their disaffection could not be repaired or compensated by any new alliance. To her subjects she left the fullest liberty of conscience; and they could not surely refuse to their sovereign the same right and indulgence. With regard to the patronage of benefices, it was a prerogative and property which it would ill become her to violate. Her necessities, and the charge of her royal dignity, required her to retain in her hands the patrimony of the crown. After the purposes, however, of her station, and the exigencies of government, were satisfied, she could not object to a special assignment of revenue for the maintenance of the ministry; and, on the subject of the other articles which had been submitted to her, she was willing to be directed by the three estates of the kingdom, and to concur in the resolutions which should appear to them the most reasonable and expedient. The clergy, in a new assembly, expressed high displeasure at this answer to their address. They told the queen that the doctrines of the reformation, which she refused to adopt, were the religion which had been revealed by Jesus Christ, and taught by the apostles. They required of her, therefore, to embrace the means of attaining the truth which were offered to her in the preaching of the word, or by the appointment of public disputations between them and their adversaries. The errors of the mass were placed before her in all their deformity. The sayer of it, the action itself, and the opinions expressed in it, were all pronounced to be equally abominable. To hear the mass, or to gaze upon it, was to commit the complicated crimes of sacrilege, blasphemy, and idolatry. Her delicacy in not renouncing her opinions from the apprehension of offending the king of France and her other allies they ridiculed. They told her that the true religion of Christ was the only means by which any confederacy could endure; and that it would bring to her the friendship of the King of kings. As to patronages being a portion of her patrimony, they intended not to defraud her of her rights; but it was their judgment that the superintendants ought to make a trial of the qualifications of candidates for the ministry; and, if no trials or examinations of ministers took place, the church would be filled with misrule and ignorance. And as to her opinion, that a suitable assignment should be made for them, they begged her to condescend to adopt a proper scheme for this end, and

to carry it into execution; and that, taking into a due consideration the other articles of their demands, she would study to comply with them, and to do justice to the religious establishment of her people. From the fears of the people about their religion, disturbances and insurrections were unavoidable; and, before Mary had given her answer to the petitions of the clergy, the Protestants, in a formidable number had marched to St. Leonard's Craig; and, dividing themselves into companies, had chosen captains to command them. But, the leaders of this tumult being apprehended, it subsided by degrees; and the queen, upon the intercession of the magistrates of Edinburgh, gave them a free pardon. To quiet the apprehensions which had gone abroad of her inclination to overturn the reformed doctrines, she repeatedly issued proclamations, assuring her subjects that it was her fixed determination not to disturb any person upon account of his religion or conscience; and that she would never attempt any innovation that might endanger the public tranquillity. While Mary was thus conducting her affairs with prudence, the earl of Murray and his confederates continued their intrigues. They perceived that their only hope of success depended upon Elizabeth; and, as Randolph had promised them her protection and assistance, they addressed a letter to her, explaining their views and situation. The pretences of hostility to their sovereign, upon which they affected to insist, were her settled design to overturn the Protestant religion, and her rooted desire to break all amity with England. But with her support and aid they did not doubt of being able to advance effectually the advantage of the two kingdoms. They applied not, however, for any supply of troops. An aid from her treasury was now only necessary; and they engaged to bestow her bounty in the manner most agreeable to her inclinations and her interests. The pleasure with which Elizabeth received their application was equal to the aversion she had conceived against the queen of Scots. She not only granted the relief they requested, but assured them by Randolph of her esteem and favor while they should continue to uphold the reformed religion and the connexion of the two nations. Flattered by her assurances, they were strenuous to gain partizans, and to disunite the friends of their sovereign; and, while they were secretly preparing for rebellion, they disseminated among the people the tenets that a Papist could not legally be their king; that the queen was not at liberty of herself to make the choice of a husband; and that, in a matter so weighty, she ought to be entirely directed by the determination of the three estates in parliament. Elizabeth, carrying her dissimulation to the most criminal extremity, commanded Randolph to ask an audience of Mary; and to counsel her to harbour no suspicions of the earl of Murray and his friends; to open her eyes to their sincerity and honor; and to call to mind that, as their services had hitherto preserved her kingdom in repose, her jealousies of them might kindle it into combustion, make the blood of her nobles to flow, and cast into hazard her person and her crown. Full of astonishment at a message so

rude, the queen of Scots desired him to inform his mistress that she required not her instructions to distinguish between patriotism and treachery; that she was fully sensible when her will was resisted or obeyed; and that she possessed a power which was more than sufficient to repress and to punish the crimes of her subjects. The English resident went now to the earl of Lennox and the lord Darnley, and charged them to return to England. The former expressed an apprehension of the severity of his queen, and sought an assurance of her favor before he could venture to visit her dominions. The latter, exerting greater fortitude, told him that he acknowledged no duty or obedience but to the queen of Scots. The resident, treating this answer as disrespectful to Elizabeth, turned his back upon lord Darnley, and retired without bidding him adieu. This behaviour of Elizabeth, so fierce and so perfidious, was well calculated to confirm all the intentions of Mary. But, while the queen of Scots was eager to accomplish her marriage, she was not inattentive to the rising troubles of her country. The parliament which she had appointed could not now be held: it was therefore prorogued to a more distant day; and the violence of the times did not then permit it to assemble. By letters she invited to her, with all their retainers, the most powerful and the most eminent of her subjects. Bothwell was recalled anew from France; and by general proclamations she summoned to her standard the united force of her kingdom. The castle of Edinburgh was likewise provided amply with stores and ammunition. The alacrity with which her subjects flocked to her from every quarter assured her of her power and popularity; while it struck Murray and his adherents with the danger to which they were exposed. On the 29th of July, 1565, the ceremony of marriage between the queen and lord Darnley was performed. The latter had been previously created duke of Albany. The day before the marriage a proclamation was published, commanding him to be styled king of the realm, and that all letters after their marriage should be directed in the names of her husband and herself. The day after a new proclamation was issued confirming this act; he was pronounced king by the sound of trumpets, and associated with the queen in her government: a measure which seems to have been the effect of the extreme attachment the queen had for her husband, which did not permit her to see that it was an infringement of the constitution.

The earl of Murray remonstrated that a king was imposed upon the nation without the consent of the three estates, and called upon the nation to arm against the beginnings of tyranny. The malcontents were quickly in arms; but their success did not answer their expectations. The majority of the nation were satisfied with the good intentions of their sovereign, and she herself took the earliest opportunity of crushing the rebellion in its infancy. The earl of Murray was declared a traitor; and similar steps were taken with other chiefs of the rebels. She then took the field against them at the head of a considerable army; and, having driven them from

place to place, obliged them at last to take refuge in England. Queen Elizabeth received them with that duplicity for which her conduct was so remarkable. Though she herself had countenanced, and even excited them to revolt, she refused to give an audience to their deputies. Nay, she even caused them to emit a public declaration, that neither she, nor any person in her name, had ever excited them to their rebellious practices. Yet, while the public behaviour of Elizabeth was so acrimonious, she afforded them a secure retreat in her kingdom, treated the earl of Murray in private with respect and kindness, and commanded the earl of Bedford to supply him with money. Mary, however, resolved to proceed against the rebels with an exemplary rigor. The submissions of the duke of Chatelherault alone, who had been less criminal than the rest, were attended to. But even the favor which he obtained was precarious and uncertain; for he was commanded to use the pretence of sickness, and to pass for some time into foreign countries.

A parliament was called; and a summons of treason being executed against the earls of Argyle, Glencairn, and Rothes, with others of the principal rebels, they were commanded to appear before the three estates; in default of which their lives and estates were declared to be forfeited. In the mean time Throgmorton the English ambassador solicited the pardon of the rebels; which Mary was at first inclined to grant. However, by the persuasion of the court of France, she was not only induced to proceed against them with rigor, but acceded to the treaty of Bayonne, by which the destruction of the Protestants was determined. This measure filled the whole court with terror and dismay. The rebels were acquainted with the danger of their situation; and, being now driven desperate, they were ready to engage in the most atrocious designs. Unhappily, the situation of affairs in Scotland rendered the accomplishment of their purposes but too easy. Violent disgusts had taken place between the queen and her husband. Her fondness had been excessive; but she soon perceived that the qualities of his mind were not proportioned to his personal accomplishments. He was proud, disdainful, suspicious, wilful, giddy and obstinate, insolent and mean. The queen in consequence began to show an indifference towards him; which he took care to augment, by showing the like indifference towards her, and engaging in low intrigues and amours, indulging himself in dissipation and riot, &c. However, the desire of dominion was his ruling passion; and the queen, finding his total incapacity for exercising his power to any good purpose, had excluded him from it altogether. He was therefore a proper object for the machinations of the rebels, and readily entered into an agreement with them to depose the queen; vainly thinking that he should thus secure the crown to himself. However as the parliament was soon to assemble, in which the rebels had every reason to believe that they would be condemned for high treason, it was necessary that the kingdom should be thrown into disorder before that time came, otherwise their fate was inevitable. Practising on the imbecility of Darn-

ley, they persuaded him that a criminal correspondence subsisted between the queen and David Rizzio. Of all the slanders circulated against queen Mary, this appears the most ridiculous and incredible; Rizzio was both old and of very unattractive appearance. But the king was resolved upon his destruction; and the conspirators hoped thereby not only to get an indemnity, but to effect a total revolution at court, and the entire humiliation of Bothwell, Huntly, and Athol, who were the associates of Rizzio. However, to save themselves, they engaged the king to subscribe a bond, affirming that the project of assassinating Rizzio was altogether of his own devising; acknowledging that he had solicited them to take a part in it, from the apprehensions that resistance might be made to him; and agreeing, upon the word and honor of a prince, to protect and secure them against every hazard and injury to which they might be exposed from the achievement of his enterprise. Having procured this security, and having allured the earl of Lennox the king's father to approve of their measures, they adjusted the method of the projected murder, and despatched a messenger to the English frontier, advertising the earl of Murray and the rebels of their intentions, and inviting them to return to the court. Upon the 9th of March, about seven o'clock P. M. armed men, to the number of 500, surrounded the palace of Holyrood. The earl of Morton and lord Lindsay entered the court of the palace, with 160 persons. The queen was in her chamber at supper, with her natural sister the countess of Argyle, her natural brother Robert commendator of Holyrood House, Beton of Creich master of the household, Arthur Erskine, and David Rizzio. The king, entering the apartment, seated himself by her side. He was followed by lord Ruthven, who being wasted with sickness, and cased in armour, exhibited an appearance that was hideous and terrible. Four ruffians attended him. In a hollow voice he commanded Rizzio to leave a place which did not become him. The queen, in astonishment, asked the king the meaning of this mysterious enterprise. He affected ignorance. She ordered Ruthven from her presence under pain of treason; declaring that, if Rizzio had committed any crime, she would produce him before the parliament, and punish him according to the laws. Ruthven, drawing his dagger, advanced towards Rizzio. The queen rose to make an exertion of her authority. The unfortunate stranger laid hold of her garments, crying out for justice and mercy. Other conspirators, rushing into the chamber, overturned the table, and increased the dismay and confusion. Loaded pistols were presented to the bosom of the queen. The king held her in his arms. George Douglas, snatching the dagger of his sovereign, plunged it into the body of Rizzio. The wounded and screaming victim was dragged into the antichamber; and so eager were the assassins to complete their work that he was mangled with fifty-six wounds. While the queen was pressing the king to gratify her enquiries into the meaning of a deed so execrable, Ruthven returned into their presence. She gave a full vent to indignation and reproach.

Ruthven, with an intolerable coldness and deliberation, informed her that Rizzio had been put to death by the counsel of her husband, whom he had dishonored; and that by the persuasion of this minion she had refused the crown matrimonial to the king, had engaged to re-establish the ancient religion, had resolved to punish the earl of Murray and his friends, and had entrusted her confidence to Bothwell and Huntly, who were traitors. The king, taking the part of Ruthven, remonstrated against her proceedings, and complained that from the time of her familiarity with Rizzio she had neither regarded, entertained, nor trusted him. His suspicions and ingratitude shocked and tortured her. His connexion with the conspirators gave her an ominous anxiety. Apprehensions of outrages still more atrocious invaded her. In these agitated moments she did not lose herself in the helplessness of sorrow. The loftiness of her spirit communicated relief to her; and, wiping away her tears, she exclaimed, that it was not now a season for lamentation, but for revenge.

The earls of Huntly, Bothwell, and Athol, lords Fleming and Livingston, and Sir James Balfour, who were at this time in the palace, found all resistance to be vain. Some of them, eluding the vigilance of Morton, made their escape; and others were allowed to retire. The provost and magistrates of Edinburgh, hearing of the tumult, ordered the alarm bell to be rung. The citizens ran in crowds to enquire into the welfare of their sovereign; but she was not permitted to address them. The conspirators told her that, if she presumed to make any harangue, they would 'cut her in pieces, and cast her over the walls.' The king called to the people that she was well, and commanded them to disperse. The queen was shut up in her chamber, uncertain of her fate, and without the consolation or attendance of her women. In the morning a proclamation was issued by the king, without the knowledge of his queen, prohibiting the meeting of the parliament, and ordering the members to retire from the city. The rebellious lords now returned from England, and arrived at Edinburgh within twenty-four hours after the assassination of Rizzio. The queen, knowing of how much consequence it was for her to gain the earl of Murray, invited him to wait upon her. Notwithstanding the extreme provocation which she had met with, Mary so far commanded her passions that she gave him a favorable reception. After informing him of the rudeness and severity of the treatment she had met with, the queen observed, that, if he had remained in friendship with her at home, he would have protected her against such excesses of hardness and insult. Murray, with an hypocritical compassion, shed tears; while the queen seemed to entertain no doubt of his sincerity, but gave him room to hope for a full pardon of all his offences. In the mean time, however, the conspirators were consulting, whether they should hold the queen in perpetual captivity, or put her to death; or whether they should content themselves with committing her to close custody in Stirling castle, till they should obtain a parliamentary sanction to their proceedings, establish the Protestant reli-

gion by the total overthrow of the mass, and invest the king with the crown matrimonial and the government of the kingdom. Mary now began to perceive the full extent of her wretchedness; and therefore, as her last resource, applied to the king, whom she treated with all the blandishments of her sex. The king, who, with all his faults, had a natural facility of temper, was easily gained over. The conspirators were alarmed at his coldness, and endeavoured to fill his mind with fears concerning the duplicity of his wife; but, finding they could not gain their point, they at last began to treat of an accommodation. The king brought them a message, importing that Mary was disposed to bury in oblivion all memory of their transgressions; and he offered to conduct them into her presence. The earls of Murray and Morton, with the lord Ruthven, attending him into her presence, and, falling on their knees before the queen, made their apologies and submissions. She commanded them to rise; and having desired them to recollect her abhorrence of cruelty and rapaciousness, she assured them, with a gracious air, that instead of designing to forfeit their lives, and possess herself of their estates, she was inclined to receive them into favor, and to give a full pardon, not only to the nobles who had come from England, but to those who had assassinated David Rizzio. They were accordingly ordered to prepare the bonds for their security and forgiveness, which the queen promised to take the earliest opportunity of subscribing; but in the mean time the king observed that the conspirators ought to remove the guards which they had placed around the queen, that all suspicion of restraint might be taken away. This measure could not with any propriety be opposed, and the guards were therefore dismissed; upon which the queen, that very night, left her palace at midnight, and took the road to Dunbar, accompanied by the king and a few attendants. The news of the queen's escape threw the conspirators into the utmost consternation; as she immediately issued proclamations for her subjects to attend her in arms, and was powerfully supported. They sent therefore lord Semple, requesting, with the utmost humility, her subscription to their deeds of pardon and security; but to this message she returned an unfavorable answer, and advanced towards Edinburgh with an army of 8000 men. The conspirators now fled with the utmost precipitation. Even John Knox retired to Kyle till the storm should blow over. On the queen's arrival at Edinburgh, a privy council was instantly called, in which the conspirators were charged to appear as guilty of murder and treason; their places of strength were ordered to be given up to the officers of the crown; and their estates and possessions were made liable to confiscation and forfeiture. But, while the queen was thus eager to punish the conspirators, she was sensible that so many of the nobility, by uniting in a common cause, might raise a powerful party in opposition to her; for which reason she endeavoured to detach the earl of Murray from the rest, by making him offers of pardon. Sir James Melvil accordingly pledged himself to produce his pardon and that

of his adherents, if he would separate from Morton and the conspirators. He accordingly became cold and distant to them, and exclaimed against the murder as a most execrable action; but, notwithstanding his affected anger, when the conspirators fled to England, he furnished them with letters of recommendation to the earl of Bedford. After the flight of the conspirators, the king thought it necessary for him to deny his having any share in the action. He therefore embraced an opportunity of declaring to the privy council his total ignorance of the conspiracy against Rizzio; and not satisfied with this, by public proclamations at the market place of his capital, and over the whole kingdom, protested to the people at large that he had never bestowed upon it, in any degree, the sanction of his command, consent, assistance, or approbation. In the mean time the queen granted a full and ample pardon to the earls of Murray, Argy'e, Glencairn, and Rothes, and their adherents; but towards the conspirators she remained inexorable. This lenity, to Murray especially, proved a source of the greatest inquietude to the queen; for this nobleman, blind to every motive of action distinct from his own ambition, began to contrive new plots, which, though disappointed for a time, soon operated to the destruction of the queen, and almost to the ruin of the nation.

In 1566 the queen was delivered of a prince, who received the name of James. This happy event, however, did not extinguish the quarrel betwixt her and the king. His desire to intrude himself into her authority, and to fix a stain upon her honor his share in the murder of Rizzio, and his extreme meanness in publicly denying it afterwards, could not fail to impress her with the strongest sentiments of detestation and contempt. Unable, however, totally to divest herself of regard for him, her behaviour, though cold and distant, was yet decent and respectful. Castelnau, ambassador extraordinary from France, endeavoured to bring about a reconciliation; nor were his endeavours altogether ineffectual. The king and queen spent two nights together; and proceeded, in company to Meggatland in Tweeddale, to enjoy the diversion of the chase, attended by the earls of Huntly, Bothwell, Murray, and other nobles. Thence they passed to Edinburgh, and then took the road to Stirling. Had the king been endowed with any prudence, he would have made the best use of this opportunity to have regained the affections of his queen; but, instead of this, finding that he was not immediately entrusted with power, his peevishness suggested to him a design of going abroad. To M. du Croc, the French resident, who had attended Mary at Stirling, he ventured to communicate his chimerical project. This statesman represented to him its wildness and inefficacy; and could hardly believe that he was serious. His father and all the courtiers endeavoured to dissuade him from it. They admonished him to remember that his flight would expose him to every kind of ridicule and disgrace. They pointed out the happiness of his fortune, and counselled him not to part lightly with its flattering advantages. The queen herself, taking his hand into her's, and pressing it with affection, besought him to

say by what act or deed she had unfortunately induced him to conceive so fatal a purpose? Her memory did not reproach her with any crime or indiscretion, which affected his honor or her integrity; yet, if she had undesignedly incurred his displeasure, she was disposed to atone for it: and she begged him to speak freely. M. du Croc then asked him to reveal his inquietudes. But all this attention was ineffectual. Obstinately froward, he refused to confess that he intended any voyage, and made no mention of any reasons of discontent. He acknowledged with readiness that he could not accuse the queen of any offence. In perturbation, he prepared to retire; and, turning to her, said, 'Adieu, madam! you shall not see me for a long time.' He then bowed to the French envoy and to the lords of the privy council, and hastened back to Stirling, leaving the queen and her council in astonishment. They resolved to watch his motions, and could not conjecture what step he would take. Mary despatched a courier to advertise the king of France and the queen-mother of his conduct. But it was not possible that a prince so meanly endowed with ability could make any impression upon her allies. He was universally odious; and at this time the queen was in the highest estimation with the great body of her subjects. After passing some days at Stirling, he addressed a letter to the queen, in which, after hinting at his design of going abroad, he insinuated his reasons of complaint. 'He was not entrusted by her with authority, and she was no longer studious to advance him to honor. He was without attendants; and the nobility had deserted him.' Her answer was sensible and temperate. She called to his remembrance 'the distinctions she had conferred upon him, the uses to which he had put the credit and reputation accruing from them, and the heinous offences he had encouraged in her subjects. Though the plotters against Rizzio had represented him as the leader of their enterprise, she had behaved as if she believed not his participation in the guilt of that project. As to the defects of his retinue, she had uniformly offered him the attendance of her own servants. As to the nobility they were the supports of the throne, and independent of it. Their countenance was not to be commanded, but won. He had discovered too much stateliness to them; and they were the proper judges of their own deportment. If he wished for consequence, it was his duty to pay them attention; and, whenever he should conciliate their regard, she would be happy to give him all the importance that belonged to him.' In the mean time the earls of Murray and Bothwell were industriously striving to widen the breach between the king and queen, and at the same time to foment the division between the king and his nobles. The earl of Morton excited disturbances on the borders; and, as no settled peace had taken place there since Mary's marriage, there was the greatest reason to believe that he would succeed in his attempts. Proclamations were therefore issued by the queen to call her subjects to arms: and she proceeded to Jedburgh to hold justice-courts. In the course of this journey she was

taken dangerously ill: as soon as she was able to travel she visited Kelso, Werk Castle, Hume, Langton, and Wedderburn. The licentious borderers, on the first news of her recovery, laid down their arms. Being desirous to take a view of Berwick, the queen advanced to it with an attendance of 1000 horse. Sir John Forster, the deputy warden of the English marches, came forth with a numerous retinue, and conducted her to the most proper station for surveying it, and paid her all the honors in his power, by a salute of the artillery, and other demonstrations of joy. Continuing her journey, she passed to Eymouth, Dunbar, and Tantallan; proceeding thence to Craigmillar Castle, where she proposed to remain till the time of the baptism of the prince, which was to be celebrated at Stirling. During her severe sickness her husband had kept himself at a distance; but, when she was so far recovered as to be out of danger, he made his appearance; and, being received with some coldness, he retired suddenly to Stirling. This cruel neglect was a most sensible mortification to her. She was seized with a settled melancholy; and in her anguish often wished for death to put a period to her existence. Her nobles, who were caballing against her, remarked her condition, and took advantage of it. Bothwel, who had already recommended himself by his services, redoubled his efforts to heighten the favor which these services had induced her to conceive for him. At this time he sought to gain the affection of the queen, with a view to marry her himself, providing a divorce from her husband could be obtained, which was now become the subject of consultation by Murray and his associates. After much deliberation the queen herself was acquainted with this project; and it was told her that, provided she would pardon the earl of Morton and his associates, the means should be found of effectuating the divorce. This was urged as a matter of state by the earls of Murray, Lethington, Argyle, and Huntly; and the queen was invited to consider it as an affair which might be managed without any interference on her part. The queen replied that she would listen to them, upon condition that the divorce could be obtained according to the laws, and that it should not be any way prejudicial to her son; but, if they meant to operate their purpose by a disregard to these points, they must not think any more of it; for, rather than consent to their views, she would endure all the torments, and abide by all the perils, to which her situation exposed her. Lethington, upon this, in the name of the rest, engaged to deliver her from her husband, without prejudice to her son: words which could not be understood otherwise than as pointing at murder. Lord Murray, added he, who is here present, scrupulous as he is, will connive, and behold our proceedings without opening his lips. The queen is said immediately to have made answer, 'I desire that you will do nothing from which any stain may be fixed upon my honor or conscience; and I therefore require the matter to rest as it is, till God of his goodness send relief. What you think to be of service to me may turn out to my displeasure and harm.' It appears that from this moment a plot was formed by Murray,

Bothwel, and Lethington against the life of Darnley, and by some of them probably against the queen herself; and that Morton, who with the other conspirators against Rizzio had received a pardon, was closely associated with them in their nefarious designs. That profligate peer was, in his way to Scotland, met at Whittingham by Bothwel and the secretary. They proposed to him the murder of the king, and required his assistance, alleging that the queen herself consented to the deed: to which Morton by his own account replied that he was disposed to concur, provided he were sure of acting under any authority from her; but Bothwel and Lethington, having returned to Edinburgh on purpose to obtain such an authority, sent him back a message, that the queen would not permit any conversation upon that matter. In the mean time preparations were made for the baptism of the young prince; to assist at which the queen left Craigmillar, and went to Stirling. The ceremony was performed on the 17th of December, 1566. He was called Charles-James-James-Charles, and proclaimed by the heralds prince and steward of Scotland, duke of Rothesay, earl of Carrick, lord of the isles, and baron of Renfrew. Amidst the scenes of joy displayed on this occasion the king showed greater folly than ever. Though he had often kept at a greater distance before, he took up his residence at Stirling, as if he had meant to offend the queen, and to expose their quarrels: chiefly confining himself to his chamber. His strange behaviour, however, did not give the public any favorable idea of him; and, as the earl of Murray and his faction took care to augment the general odium, no court was paid to him by foreign ambassadors. His situation, therefore, was exceedingly uncomfortable; but, though he must have been conscious of its imprudence, he did not alter his conduct. In a sullen humor he left Stirling, and proceeded to Glasgow. Here he fell sick, with such symptoms as seemed to indicate poison. He was tormented with violent pains, and his body was covered with pustules of a bluish color; so that his death was daily expected. Mary did not repay his coldness to her by negligence. She set out immediately for Glasgow, and waited on him with all the assiduity of an affectionate wife until he recovered; after which she returned with him to Edinburgh; and, as the low situation of the palace of Holyrood House was thought to render it unhealthy, the king was lodged in a house which had been appointed for the superior of the church called St. Mary's in the Fields. This house stood upon a high ground, at the back of that ground where the royal infirmary now stands, and in a salubrious air; and here she staid with him some days. Here the conspirators thought proper to finish their plot in the most execrable manner. On the 10th of February, 1567, about two o'clock in the morning, the house where the king resided was blown up by gunpowder. The explosion, alarming the inhabitants, excited a general curiosity, and brought multitudes to the place whence it proceeded. The king was found dead and naked in an adjoining field, with a servant who used to sleep in the same apartment with him. On neither was there any mark of fire or other external injury. Till the

late improvements of the city, when all incumbrances were cleared away, the gate in the old wall, at the back of the king's house, by which the conspirators entered and returned from their bloody business, was distinctly visible, though long ago built up.

The queen was in the palace of Holyrood House, taking the diversion of a masked ball, which was given to honor the marriage of a favorite domestic, when the news of the king's death was brought to her. She showed the utmost grief, and appeared exasperated to the last degree against the perpetrators of a deed at once so shocking and barbarous. The most express and positive orders were given to enquire after the perpetrators by every possible method. A proclamation was issued by the privy council, assuring the people that the queen and nobility would leave nothing undone to discover the murderers of the king. It offered £2000, and an annuity for life, to any person who should give information of the devisers, counsellors, and perpetrators of the murder; and, besides this reward, the promise of a full pardon, to the conspirator who should make a free confession of his own guilt, and that of the confederates. On the fourth day after this proclamation was published a placard was affixed to the gate of the city prison, affirming that the earl of Bothwell, James Balfour, David Chalmers, and black John Spence, were the murderers. No name, however, was subscribed to this intelligence, nor was any demand made for the proffered reward; so that it was difficult to know whether this advertisement had been dictated by a spirit of calumny or the love of justice. In the mean time the earl of Murray conducted himself with his usual circumspection and artifice. Upon a pretence that his wife was dangerously sick at his castle in Fife, he, the day before the murder, obtained the queen's permission to pay a visit to her. Thus he proposed to prevent all suspicion whatever of his guilt. He was so full, however, of the intended project that, while he was proceeding on his journey, he observed to the person who accompanied him, 'This night, before morning, the lord Darnley shall lose his life.' When the blow was struck, he returned to Edinburgh to carry on his practices. Among foreign nations the domestic disputes of the queen and her husband being fully known, it was with the greater ease that reports could be propagated to her disadvantage. To France letters were despatched, expressing in fervent terms her participation in the murder. In England the ministers and courtiers of Elizabeth could not flatter that princess more agreeably, than by industriously detracting from the honor and the virtue of the Scottish queen. Within her own dominions a similar spirit of outrage exerted itself, and not without success. Her reconciliation with her husband was interpreted to be dissimulation and treachery. The Protestant clergy, who were her most determined enemies, possessed a leading direction among the populace; and they were the friends and the partisans of the earl of Murray. Open declamations from the pulpit were at the same time made against Bothwell; and papers were dispersed making the queen a party with him in the mur-

der. Every art was employed to provoke the frenzy of the people. Voices, interrupting the silence of the night, proclaimed the infamy of Bothwell; and portraits of the regicides were circulated over the kingdom. The queen's determination, however, to scrutinize into the matter was unabated; and to the earl of Lennox, the king's father, she paid an attention which he could only have expected from her upon an emergency of this kind. Having pressed her by letter to the most diligent enquiry after the regicides, she returned an answer so completely to his wishes that he was fully convinced of the sincerity and rigor with which she intended to proceed against them; and he urged her to assemble the three estates, that their advice might direct the order and manner of their trial. She wrote to him that an assembly of the estates was already proclaimed; that it was her earnest and determined will and purpose that no step should be neglected that could conduce to the execution of justice: and that, although she had thought it expedient to call a meeting of the parliament at this juncture, it was not her meaning that the proceedings against the regicides should be delayed till it was actually assembled: adding that if he would condescend to mention the names which, in his opinion, were most suspicious, she would instantly command that those steps should be taken which the laws directed and authorised. He in return named the earl of Bothwell, James Balfour, David Chalmers, black John Spence, Francis Sebastian, John de Bourdeaux, and Joseph, the brother of David Rizzio; and assured her majesty that his suspicions of these persons were weighty and strong. In reply to his information, Mary gave him her solemn promise that the persons he had pointed out should undergo their trial in conformity to the laws, and that they should be punished according to the measure of their guilt: and she invited him to leave immediately his retirement, and to meet her at her court, that he might witness the proceedings against them, and the zeal with which she was animated to perform the part that became her. While the queen carried on this correspondence with the earl of Lennox she resided partly at the palace of lord Seton, a few miles from her capital, and partly at Holyrood House. By the time that she sent her invitation to him she was residing in her capital. She delayed not to confer with her counsellors, and to lay before them the letters of the earl of Lennox. Bothwell was earnest in his protestations of his innocence; and he even expressed his wish for a trial, that he might establish his integrity. No facts pointed to his guilt; there had appeared no accuser but the earl of Lennox; and no witnesses had been found who could establish his criminality. Her privy council seemed to be firmly persuaded that he was suffering under the malice of defamation. Murray, Morton, and Lethington, whatever might be their private machinations, were publicly his most strenuous defenders; and they explained the behaviour of the earl of Lennox to be the effect of jealousy against a nobleman who had outrun him so far in the career of ambition. But though all the arts of Murray and Bothwell, Morton and Lethington, were exerted to mislead the queen, they

were not able to withhold her from adopting the strain of conduct which was the most proper and honorable to her. It was her own ardent desire that the regicides should be punished; she had given her solemn promise to the earl of Lennox that the persons whom he suspected should be prosecuted; and amidst all the appearances in favor of Bothwel, and all his influence, it is a striking proof of her honor, vigor, and ability, that she could accomplish this measure. An order, accordingly, of the privy council was made, which directed that the earl of Bothwel, and all the persons named by Lennox, should be brought to trial for the murder of the king, and that the laws of the land should be carried into full execution. The 12th of April was appointed for the trial. A general invitation was given to all persons whomsoever to prefer their accusations. The earl of Lennox was formally cited to do himself justice, by appearing in the high court of judicary, and by coming forward to make known the guilt of the culprits. In the mean time it was thought proper to repress that spirit of outrage that had manifested itself against the queen. No discoveries, however, were made, except against James Murray, brother to Sir William Murray of Tullibardin, who at different times had published placards injurious to her. He was charged to appear before the privy council; but, refusing to obey its citation, it was made a capital offence for any commander of a vessel to convey him out of the kingdom; and the resolution was taken to punish him with an exemplary severity. Effecting, however, his escape, he avoided the punishment due to his repeated and detestable acts of calumny and treason. The day for the trial of Bothwel approached. The conspirators, notwithstanding their power, were not without apprehensions. Their preparations, however, for their safety had been anxious; and, among other practices, they threw the earl of Lennox into a panic. They were favored by his consciousness of his unpopularity, and his want of strength, by his timidity and spirit of jealousy: by the time he had reached Stirling, in his way to Edinburgh, his fears predominated. He was no longer in haste to proceed against the regicides. He addressed a letter to the queen, in which he said he had fallen into such sickness that he could not travel; and he affirmed that he had not time to prepare for the trial and to assemble his friends. An application for the delay of a trial so important, upon the night immediately preceding the day stated for it, for reasons of no force, could not with propriety be attended to. The privy council refused the earl's demand. The court of judicary was assembled. The earl of Argyle acted as lord high judicary; and was aided by four assessors, Robert Pitcairn, commendator of Dumfermline, and lord Lindsay; with Mr. James Macgill and Mr. Henry Balnaves, two lords of the session. The indictment was read, and the earls of Bothwel and Lennox were called upon; the one as the defender, the other as the accuser. Bothwel, who had come to the court with an attendance of his vassals, and a band of mercenary soldiers, presented himself; but Lennox appeared only by his servant Robert Cun-

nyngnam; who after apologising for the earl's absence, from the shortness of time and the absence of his friends, desired that a new day should be appointed for the trial; and protested that, if the jury should now enter upon the business, they would incur the guilt of a wilful error, and their verdict be of no force. This remonstrance and protestation appeared not to the court of sufficient importance to interrupt the trial. They paid a greater respect to the letters of the earl of Lennox to the queen insisting upon an immediate prosecution, and to the order of the privy council consequent upon them. The jury, who consisted of men of rank, after considering and reasoning upon the indictment for a considerable time, were unanimous in acquitting Bothwel of all share and knowledge of the king's murder. The machinations, however, of Morton were so apparent that the earl of Caithness, the chancellor of the assize, made a declaration, in their name and his own, that no wilful error ought to be imputed to them for their verdict, no proof, vouchers, or evidence, to support or confirm the criminal charge, having been submitted to them. At the same time he offered a protestation, for himself, that there was a mistake in the indictment, the 9th day of February, instead of the 10th, being expressed in it as the date of the murder. It is not to be doubted but that this flaw in the indictment was a matter of design, and with a view to the advantage of Bothwel, if the earl of Lennox had made his appearance against him. And it has been remarked, as very suspicious, that soldiers in arms should have accompanied him to the court of justice; that, during the trial, the earl of Morton stood by his side, to countenance and assist him; and that the four assessors to the chief judicary were warm and strenuous friends of Murray's.

Immediately after his trial, Bothwel set up in a conspicuous place a writing, subscribed by him, challenging to single combat any person of equal rank with himself who should dare to affirm that he was guilty of the king's murder. To this challenge an answer was published, in which the defiance was accepted upon the condition that security should be given for a fair and equal conflict: but, no name being subscribed to this paper, no step was taken for the duel. Two days after the parliament met: and there the party of Bothwel appeared equally formidable. The verdict in his favor was allowed to be true and just. He was continued in his high offices; and obtained a parliamentary ratification of the place of keeper of Dunbar castle, with the estates in connexion with it; and other favors were conferred upon Murray, with the rest of the nobles suspected as accomplices in the murder. A very short time after the acquittal of Bothwel he began to give a greater loose to his ambition, and conceived hopes of gaining the queen in marriage. It has been already remarked that he had insidiously endeavoured to gain her affection during the lifetime of her husband; but the recent death of the king in such a shocking manner, and the strong suspicions still resting upon him, notwithstanding his acquittal, prevented him from making his addresses openly to her. He therefore

endeavoured to gain the nobility over to his side; which having done, by means of great promises, he invited them to an entertainment, where they agreed to ratify a deed pointing him out to the queen as a person worthy of her hand, and expressing their resolute determination to support him in his pretensions. This extraordinary bond was accordingly executed; and Murray's name was the first in the list of subscribers, to decoy others to sign after him; but, that he might appear innocent of what he knew was to follow, he had, before any use was made of the bond, asked and obtained the queen's permission to go to France. In his way thither he visited the court of Elizabeth, where he did not fail to confirm all the reports which had arisen to the disadvantage of Mary; and he now circulated the intelligence that she was soon to be married to Bothwel. Her partizans in England were exceedingly alarmed; and even Elizabeth herself wrote to her, and cautioned her not to afford such a mischievous handle to the malice of her enemies. Mary, upon the dissolution of the parliament, had gone to Stirling to visit the young prince. Bothwel, armed with the bond of the nobles, assembled 1000 horse, under the pretence of protecting the borders, of which he was the warden; and, meeting her upon her return to her capital, dismissed her attendants, and carried her to his castle of Dunbar. The arts which he there used to effect the accomplishment of his wishes are mentioned under the article MARY. But having been married only six months before to lady Jane Gordon, sister to the earl of Huntly, it was necessary to procure a divorce before he could marry the queen. This was easily obtained. The parties were cousins within the prohibited degrees, and had not obtained a dispensation from Rome. The marriage therefore, in the opinion of the queen and her Roman Catholic subjects, was illicit. The husband had also been unfaithful; so that two actions of divorce were instituted. The lady commenced a suit against him in the court of commissaries, charging him as guilty of adultery with one of her maids. The earl brought a suit against his wife before the archbishop of St. Andrews, upon the plea of consanguinity. By both courts their marriage was decided to be void; and thus two sentences of divorce were pronounced.

Bothwel now conducted the queen from Dunbar to her capital. But, instead of attending her to her palace at Holyrood House, his jealousy and apprehensions induced him to lodge her in the castle of Edinburgh, where he could hold her in security against any attempt of his enemies. To give satisfaction, however, to her people, and to convince them that she was no longer a prisoner, a public declaration upon her part appeared to be a measure of expediency. She presented herself, therefore, in the court of session; the lords chancellor and president, the judges, and other persons of distinction, being present. After observing that some stop had been put to the administration of justice upon account of her being detained at Dunbar against her will by the lord Bothwel, she declared that, though she had been highly offended with the outrage offered her, she was yet inclined to forget it. His cour-

teousness, the sense she entertained of his past services to the state, and the hope with which she was impressed of his zeal and activity for the future, compelled her to give him and his accomplices in her imprisonment a full pardon. She also desired them to take notice that she was now at her liberty; and that she proposed, in consideration of his merits, to take an early opportunity of promoting him to new honors. At length the order was given for the proclamation of the banns of marriage between them, and Mr. John Craig, one of the ministers of Edinburgh, was desired to perform this business. But, though the order was subscribed by the queen, he refused his compliance without the authority of the church. The church, after long reasonings, granted him permission to discharge this duty. But his scruples were not yet removed. He protested that, in obeying their desire, he should be allowed to speak his own sentiments concerning the marriage, and that his publishing the banns should infer no obligation in him to officiate in the solemnity. In his congregation, accordingly, before a crowded audience, and in the presence of several noblemen and privy counsellors, he declared that the marriage of the queen and the earl of Bothwel was unlawful, and that he was prepared to give his reasons for this opinion to the parties themselves. He added that, if leave to do this was denied him, he would either abstain altogether from proclaiming the banns, or take the liberty, after proclaiming them, to inform his people of the causes of his disapprobation of the marriage. He was carried before the lords of the privy council; and the earl of Bothwel called upon him to explain his behaviour. He answered that the church had prohibited the marriage of persons separated for adultery; and that the divorce between him and his wife must have been owing to collusion; since the sentence had been given with precipitation, and since his new contract was so sudden; and he objected to him the abduction and ravishment of the queen, and the suspicion of his guilt in the king's murder. This bold language drew no reply from Bothwel that was satisfactory to Mr. Craig, or that could intimidate him. He proclaimed in his church the banns of the marriage; but he told the congregation that he discharged the suggestions of his conscience in pronouncing it to be a detestable and scandalous engagement. He expressed the sorrow he felt for the conduct of the nobility who seemed to approve it from their flattery or silence; and, addressing himself to the faithful, he besought them to pray to the Almighty that he would turn a resolution intended against law, reason, and religion, into a comfort and benefit to the church and the kingdom. These freedoms were too great to pass unnoticed. Mr. Craig was ordered anew to attend the privy council; and he was reprimanded with severity for exceeding the bounds of his commission. He had the courage to defend himself. His commission, he said, was founded in the word of God, positive law, and natural reason; and upon these topics he was about to prove that the marriage must be universally foul and odious, when the earl of Bothwel commanded him to be silent.

The privy council, struck with the vigor of the man, and apprehensive of the public discontents, did not dare to inflict any punishment upon him; and this victory over Bothwel, while it heightened all the suspicions against him, served to encourage the enemies of the queen, and to undermine the respect of her subjects. Mary, before she gave her hand to Bothwel, created him duke of Orkney. The ceremony was performed in a private manner, after the rules of the popish church; but, to gratify the people, it was likewise solemnised publicly according to the Protestant rites by Adam Bothwel bishop of Orkney, who had renounced the episcopal order for the Presbyterian. It was celebrated with little pomp. Many of the nobles had retired to their seats in the country; and those who attended were thoughtful and sad. Du Croc, the French ambassador, sensible that the match would be displeasing to his court, refused to give his countenance to the solemnity. There were no acclamations of the people. Mary herself was not unconscious of the imprudence of the measure, and looked back with surprise and sorrow to the train of circumstances which had conducted her to this fatal event. Forsaken by her nobles, and imprisoned at Dunbar, she was in so perilous a situation that no remedy could save her honor but death. Her marriage was the immediate and necessary consequence of that situation. Melvil vindicates her on this principle, and even lord Hailes apologises for her by observing that 'after Mary had remained a fortnight under the power of a daring profligate adventurer, few foreign princes would have solicited her hand.' But, after making every allowance for her situation and circumstances, it was a most imprudent step, and the most unjustifiable action of her whole life. It was indeed the point for which her enemies had labored with a wicked and relentless policy.

Mary was unfortunate in her second marriage, but much more so in her third. Bothwel had neither talents for business nor affection for his wife. Ambitious to the last degree, he sought only to establish himself in power, while his fears and jealousies made him take the most improper means. The marriage had already thrown the nation into a ferment; and the least improper exercise of power, or indeed an appearance of it, would be sufficient to ruin them both for ever. Perhaps the only thing which at this juncture could have pacified the people, would have been the total abolition of popery, which they had often required. But this was not thought of. Instead of taking any step to please the people, Bothwel endeavoured to force the earl of Mar to deliver up the young prince to his custody. This was sufficient to make the flame, which had hitherto been smothered, break out with all its violence. It was universally believed that Bothwel, who had murdered the father, designed to kill the son also, and the queen was thought to participate in all his crimes. The earl of Murray now took advantage of the queen's unfortunate situation to aggrandise himself. After having visited the English court, he proceeded to France, where he assiduously disseminated all the reports against

the queen which were injurious to her reputation; and where, without being exposed to suspicion, he was able to maintain a close correspondence with his friends Morton and Lethington, and to inspirit their machinations. His associates, true to his ambition and their own, had promoted all the schemes of Bothwel upon the queen with a power and influence which had insured their success. In confederacy with the earl of Murray himself, they had conspired with him to murder the king. Assisted with the weight of the earl of Murray they had managed his trial, and operated the verdict which acquitted him. By the same arts, and with the same views, they had joined with him to procure the bond of the nobles, recommending him to the queen as a husband, asserting his integrity and innocence, recounting his noble qualities, and expressing an unalterable resolution to support the marriage against every opposer and adversary, and recording a wish that a defection of its objects should be branded with everlasting ignominy. When the end, however, was accomplished for which they had been so zealous, and when the marriage of the queen was actually celebrated, they were in haste to entitle themselves to the ignominy which they had imprecated. The murder of the king, the guilt of Bothwel, his acquittal, his divorce, and his marriage, became the topics of their complaints and declamation. Upon the foundation of this hated marriage, they ventured to infer the privacy of the queen to all his iniquity and transactions; and this step seemed doubtless, to the mass of her own subjects, and to more distant observers, a strong confirmation of all the former suspicions which had been circulated with so much artifice. Their imputations and devices excited against her, both at home and abroad, the most indignant and humiliating odium; and, amidst the ruins of her fame, they thought to bury for ever her tranquillity and peace. But, while this cabal were prosecuting their private ends, several noblemen, not less remarkable for their virtue than their rank, were eager to vindicate the national integrity and honor. The earl of Athol, upon the king's murder, had retired from the court, and was waiting for a proper season to take revenge upon the regicides. The earl of Mar, uneasy under the charge of the young prince, was solicitous to make himself strong, that he might guard him from injury. Motives so patriotic and honorable drew applause and partizans. An association was insensibly formed to punish the murderers of the king, and to protect the person of the prince. Morton and Lethington encouraged and promoted this combination. A convention was appointed at Stirling, for consulting upon the measures expedient to be pursued. They agreed to take an early opportunity to appear in the field; and, when they separated, it was to collect their retainers, and to inspirit their passions. Of this confederacy, the leading men were the earls of Argyle, Athol, Morton, Mar, and Glencairn; the lords Hume, Semple, and Lindsay; the barons Kirkaldy of Grange, Murray of Tullibardin, and Maitland of Lethington. The earl of Bothwel was sensible that if he was to sit upon the throne he must wade to it through

blood. By his advice, two proclamations were issued in the name of the queen, under the pretence of suppressing insurrections and depredations upon the borders. By the former she called together in arms, upon an early day, the earls, barons, and freeholders of the districts of Forfar and Perth, Strathern, and Monteith, Clackmannan, Kinross, and Fife. By the latter she charged the greater and lesser baronage, with all the inferior proprietors of the shires of Linlithgow, Edinburgh, Haddington, and Berwick, to prepare immediately for war, and to keep themselves in readiness to march upon her order. These military preparations added to the public discontents. The rumors against the queen were violent and loud. It was said that she meant to overturn the constitution and the laws; that she had been careless of the health of her son, and was altogether indifferent about his preservation; that she had separated herself from the councils and assistance of her nobles; and that she wished to make her will the only rule of her government. Agitated with the hazardous state of her affairs she published a new proclamation, in which she employed herself to refute these accusations; and in which she took the opportunity to express, in a very forcible manner, not only her attachment to her people and the laws, but the fond affection that she bore to the prince, whom she considered as the chief joy of her life, and without whom all her days would be comfortless. The declarations of the queen were disregarded. The nobles abounding in vassals, and having the hearts of the people, were soon in a situation to take the field. They were advancing to the capital. The royal army was not yet assembled; and the queen and Bothwell suspected that the castle of Edinburgh would shut its gates upon them. The fidelity of Sir James Balfour, the deputy governor, had been staggered by the practices of the earl of Mar and Sir James Melvill. Mary left her palace of Holyrood House, and was conducted to Borthwick Castle. The associated lords, informed of her flight, took the road to this fortress, with 2000 horse. Lord Hume, by a rapid march, presented himself before it with the division under his command; but, being unable to guard all its avenues, the queen and Bothwell effected their escape to Dunbar, where the strength of the fortifications gave them a full security against a surprise. Upon this second disappointment, the nobles resolved to enter Edinburgh, and to augment their strength by new partizans. The earl of Huntly and lord Boyd were here on the side of the queen, with the archbishop of St. Andrews, the bishop of Ross, and the abbot of Kilwinning. They endeavoured to animate the inhabitants to defend their town and the cause of their sovereign. But the tide of popularity was favorable to the confederate lords. The magistrates ordered the gates of the city to be shut; but no farther resistance was intended. The lords, forcing St. Mary's port, found an easy admittance, and took possession of the capital. The earl of Huntly and the queen's friends fled to the castle to Sir James Balfour, who had been the confidant of Bothwell, and who agreed to protect them, although he was

now concluding a treaty with the insurgents. The associated lords now formed themselves into a council, and circulated a proclamation. By this paper they declared that the queen, being detained in captivity, was neither able to govern her realm, nor to command a proper trial to be taken of the king's murder. In an emergency so pressing they had not despaired of their country, but were determined to deliver the queen from bondage, to protect the person of the prince, to revenge the murder of the king, and to vindicate the nation from the infamy it had hitherto suffered through the impunity of the regicides. They therefore commanded all the subjects of Scotland whatsoever, and the burgesses and inhabitants of Edinburgh in particular, to take a part with them, and to join in the advancement of purposes so beneficial and salutary. Next day they issued another proclamation in terms still stronger. They expressed their persuasion of Bothwell's guilt in the rape and seduction of the queen, and in the king's murder, to accomplish his marriage; and of his design to murder the young prince, and that he was collecting troops with this view. Addressing themselves, therefore, to all the subjects of the realm, whether they resided in counties or in boroughs, they invited them to come forward to their standard; and threatened all who should disobey them that they should be treated as enemies and traitors. Bothwell in the mean time was not inactive; the proclamations of the queen had brought many to her assistance; 4000 combatants ranged themselves on her side, and Bothwell was impatient to put his fortunes to the issue of a battle. He left the strong castle of Dunbar, where the nobles were not prepared to assail him, and where he might have remained in safety till they dispersed themselves; for their proclamations were not so successful as they had expected; their provisions and stores were scanty; and the zeal of the people, unsupported by prosperity, would soon have abated. Imprudent precipitation served them in a most effectual manner. When the queen had reached Gladsmuir, she ordered a manifesto to be read to her army, and to be circulated among her subjects. By this paper she replied to the proclamations of the confederated nobles, and charged them with treachery and rebellion. She treated their reasons of hostility as mere pretence. As to the king's murder, she protested that she herself was fully determined to revenge it, if she could be so fortunate as to discover its perpetrators. With regard to the bondage from which they were so desirous to relieve her, she observed that it was a falsehood so notorious that the simplest of her subjects could confute it; for her marriage had been celebrated in a public manner, and the nobles could hardly have forgotten that they had subscribed a bond recommending Bothwell to be her husband. With regard to the industrious defamations of this nobleman, it was urged that he had discovered the utmost solicitude to establish his innocence. He had invited a scrutiny into his guilt; the justice of his country had absolved him; the three estates assembled in parliament were satisfied with the proceedings of his judges and jury;

and he had offered to maintain his quarrel against any person whatsoever who was equal to him in rank, and of an honest reputation. The nobles, she said, to give a fair appearance to their treason, pretended that Bothwel had schemed the destruction of the prince, and that they were in arms to protect him. The prince, however, was actually in their own custody; the use they made of him was that of a screen to their perfidiousness; and the real purposes with which they were animated were the overthrow of her greatness, the ruin of her posterity, and the usurpation of the royal authority. She therefore entreated the aid of her faithful subjects; and, as the prize of their valorous services she held out to them the estates and possessions of the rebels.

The associated nobles, pleased at the approach of the queen, put themselves in motion. In Edinburgh they had gathered an addition to their force; and the Scottish officer who commanded the companies which the king of Denmark was permitted to enlist in Scotland had been gained to assist them. He had just completed his levies, and he turned them against the queen. The nobles, after advancing to Musselburgh, refreshed their troops. Intelligence was brought that the queen was upon her march. The two armies were nearly equal in numbers; but the preference, in point of valor and discipline, belonged decisively to the soldiers of the nobles. The queen posted herself on the top of Carberry hill. The lords, taking a circuit, seemed to be retreating to Dalkeith, but, wheeling about, they approached to give her battle. They were ranged in two divisions. The one was commanded by the earl of Morton and the lord Hume; the other was directed by the earls of Athol, Mar, and Glencairn, with the lords Lindsay, Ruthven, Semple, and Sanquhar. Bothwel was the leader of the royal forces; and there served under him the lords Seton, Yester, and Borthwick. It was not without apprehensions that Mary surveyed the formidable appearance of her enemies. Du Croc, the French ambassador, hastened to interpose his good offices, and to attempt an accommodation. He assured the nobles of the peaceful inclination of the queen; and that the generosity of her nature disposed her not only to forgive their present insurrections, but to forget all their former transgressions. The earl of Morton informed him that they had not armed themselves against the queen, but against the murderer of the late king; and that if she would surrender him up to them, or command him to leave her, they would return to their duty. This language confounded Du Croc. He conceived that all negotiation was fruitless, and withdrew. Mary was full of perturbation and distress. It was with infinite regret that she considered the consequences of her situation at Dunbar. Nor had his behaviour since her marriage contributed to allay her inquietudes. The violence of his passions, his suspicions, and his guilt, had induced him to surround her with his creatures, and to treat her with insult and indignity. She had been almost constantly in tears. His demeanor, which was generally rude and indecent, was often so

savage and brutal that she sometimes was tempted to commit suicide. Upon his account she was now encompassed with dangers. Her crown was in hazard. Under unhappy agitations, she rode through the ranks of her army, and found her soldiers dispirited. Whatever respect they might entertain for her, they had none for her husband. His own dependents only were willing to fight for him. He endeavoured to awaken the royal army to valor, by throwing down the gauntlet of defiance against any of his adversaries who should dare to encounter him. His challenge was instantly accepted by Kirkaldy of Grange, and by Murray of Tullibardin. He objected that they were not peers. The lord Lindsey discovered the greatest impatience to engage him, and his offer was admitted; but the queen prohibited the combat. All the pride and hopes of Bothwel sunk within him. His soldiers, in small parties, were secretly abandoning their standards. It was equally perilous to the queen to fight or to fly. The most prudent expedient for her was to capitulate. She desired to confer with Kirkaldy of Grange, who remonstrated to her against the guilt and wickedness of Bothwel, and counselled her to abandon him. She expressed her willingness to dismiss him upon the condition that the lords would acknowledge their allegiance and continue in it. Kirkaldy passed it to the nobles, and received their authority to assure her that they would honor, serve, and obey her as their princess and sovereign. He communicated this intelligence to her. She advised Bothwel to provide for his safety by flight; and Kirkaldy admonished him not to neglect this opportunity of effecting his escape. Overwhelmed with shame, disappointment, terror, remorse, and despair, this miserable victim of ambition and guilt turned his eyes to her for the last time. To Kirkaldy of Grange the queen stretched out her hand; he kissed it; and, taking hold of the bridle of her horse, conducted her towards the nobles. They were approaching her with becoming reverence, when she addressed herself to them thus:—‘I am come, my lords, to express my respect, and to conclude our agreement; I am ready to be instructed by the wisdom of your councils; and I am confident that you will treat me as your sovereign.’ The earl of Morton, in the name of the confederacy, addressed her in these words:—‘Madam, you are among us in your proper place; and we will pay to you as much honor, service, and obedience, as ever in any former period was offered by the nobility to the princes your predecessors.’

This gleam of sunshine was soon overcast. She remained not many hours in the camp, till the common soldiers, instigated by her enemies, presumed to insult her with the most unseemly reproaches. They exclaimed indignantly against her as the murderer of her husband, and reviled her as a lewd adulteress, and in language the most coarse and opprobrious. The nobility forgot their promises, and seemed to have neither honor nor humanity. She had changed one miserable scene for a distress that was deeper and more hopeless. They surrounded her with guards, and conducted her to her capital. She

was carried along its streets, and shown to her people in captivity and sadness. She cried out to them to commiserate and protect her. They withheld their pity, and afforded her no protection. Even new insults were offered to her. The lowest of the populace, whom the declamations of the clergy had driven into rage and madness, vied with the soldiery in the licentious outrage of invective and execration. She besought Maitland to solicit the lords to repress the insupportable atrocity of her treatment. She conjured him to let them know that she would submit herself implicitly to the determination of the parliament. Her intreaties and her sufferings made no impression upon the nobles. They continued the savage cruelty of their demeanor. She implored, as the last request she would prefer to them, that they would lead her to her palace. This consolation, too, was refused to her. They wished to accustom her subjects to behold her in disgrace, and to teach them to triumph over her misfortunes. In the most mortifying and afflicting hour she had ever experienced, oppressed with fatigue, and disfigured with dust and sorrow, they shut her up in the house of the lord provost: leaving her to revolve in her anxious and agitated mind the indignities she had already endured, and to suffer in anticipation the calamities they might yet inflict upon her. The malice of Morton and his adherents was still far from being gratified. In the morning, when the queen looked from the window of the apartment to which she had been confined, she perceived a white banner displayed in such a manner as to fix her attention. There was delineated upon it the body of the late king stretched at the foot of a tree, and the prince upon his knees before it, with a label from his mouth, containing this prayer, 'Judge and revenge my cause, O Lord!' This abominable banner revived all the bitterness of her afflictions. The curiosity of the people drew them to a scene so new and so affecting. She exclaimed against the treachery of her nobles; and she begged the spectators to relieve her from their tyranny. The eventful story of the preceding day had thrown her capital into a ferment. The citizens of a better condition crowded to behold the degraded majesty of their sovereign. Her state of humiliation, so opposite to the grandeur from which she had fallen, moved them with compassion and sympathy. They heard her tale, and were filled with indignation. Her lamentations, her disorder, her beauty, all stimulated their ardor for her deliverance. It was announced to the nobles that the tide of popular favor had turned towards the queen. They hastened to appear before her, and to assure her, with smiles and courtesy, that they were immediately to conduct her to her palace, and to reinstate her in her royalty. Imposing upon her credulous nature, and that beautiful humanity which characterised her even in the most melancholy situations of her life, they prevailed with her to inform the people that she was pacified, and that she wished them to disperse themselves. They separated in obedience to her desire. The nobles now conveyed her to Holyrood House. But nothing could

be farther from their intentions than her re-establishment in liberty and grandeur. They held a council, in which they deliberated concerning the manner in which they ought to dispose of her. It was resolved that she should be confined during her life in the fortress of Lochleven; and they subscribed an order for her commitment. A resolution so sudden, so perfidious, and so tyrannical, filled Mary with the utmost astonishment, and drew from her the most bitter complaints and exclamations. Kirkaldy of Grange, perceiving with surprise the lengths to which the nobles had proceeded, felt his honor alarmed for the part he had acted at their desire. He expostulated with them upon their breach of trust, and censured the extreme rigor of the queen's treatment. They counselled him to rely upon the integrity of their motives; spoke of her passion for Bothwell as most vehement, and insisted on the danger of intrusting her with power. He was not convinced by their speeches; and earnestly recommended lenient and moderate measures. They assured him that when it appeared that she detested Bothwell, and had utterly abandoned his interests, they would think of kindness and moderation. But this, they urged, could hardly be expected; for they had recently intercepted a letter from her to this nobleman, in which she expressed, in the strongest terms, the warmth of her love, and her fixed purpose never to forsake him. This letter is such a palpable forgery that Mr. Hume himself gives it up.

Kirkaldy was desired to peruse this letter; and he pressed them no longer with his remonstrances. The queen sent a message to this generous soldier, complaining of the cruelty of her nobles, and reminding him that they had violated their engagements. He instantly addressed an answer to it, recounting the reproaches he had made to them; stating his advice, describing the surprise with which he had read her intercepted letter; and conjuring her to renounce and forget a most wicked and flagitious man, and, by this victory over herself, to gain the love and respect of her subjects. The forgery of a letter from her to Bothwell completed the amazement of the queen. So unprincipled a contempt of every thing that is most sacred, so barbarous a perseverance in perfidiousness and injustice, extinguished every sentiment of hope in her bosom. She conceived that she was doomed to inevitable destruction, and sunk under a pang of unutterable anguish. The lords Ruthven and Lindsay arrived, in this paroxysm of her distress, to inform her that they were commanded to put in execution the order for her commitment. They charged her women to take from her all her ornaments and her royal attire. A mean dress was put upon her; and in this disguise they conveyed her with precipitation to the prison appointed for her. The lords Seton, Yester, and Borthwick, endeavoured to rescue her, but failed in the attempt. She was delivered over to William Douglas the governor of the castle of Lochleven, who had married the mother of the earl of Murray, and was himself nearly related to the earl of Morton. See MARY. Upon the same day on which the nobles subscribed

the order for the imprisonment of the queen, they entered into a bond of confederacy, by which they bound themselves into a body for the strenuous prosecution of their quarrel. They engaged to punish the murderers of the king, to examine into the queen's rape, to dissolve her marriage, to preserve her from the bondage of Bothwel, to protect the person of the prince, and restore justice to the realm. An oath confirmed their reliance upon one another; and, in advancing their measures, they engaged to expose and employ their lives, kindred, and fortunes. But, notwithstanding all the pretended patriotism of the rebels, nothing was further from their intentions than to prosecute Bothwel and restore the queen to her dignity. They had already treated her in the vilest manner, and allowed Bothwel to escape, when they might easily have apprehended and brought him to trial. To exalt themselves was their only aim. Eleven days after the capitulation at Carberry Hill, they held a convention, in which they very properly assumed the name of lords of the secret council, and called a proclamation for apprehending Bothwel as the murderer of the king; offering a reward of 1000 crowns to any person who should bring him to Edinburgh. A search had been made for the murderers of the king that very night in which the queen was confined in Lochleven castle. One Sebastian a Frenchman, and captain Blackader, were then apprehended; and soon after James Edmondstone, John Blackader, and Mynart Fraser, were taken up and imprisoned. The people expected full and satisfactory proofs of the guilt of Bothwel, but were disappointed. The affirmation of the nobles that they were possessed of evidence which could condemn him, appeared to be no better than a pretence. Sebastian escaped; the other persons were put to the torture, and sustained it without making any confession that the nobles could publish. They were condemned, however, and executed, as being concerned in the murder. In their dying moments they protested their innocence. A sanguine hope was entertained that captain Blackader would reveal the whole secret at the place of execution, and a vast multitude of spectators were present. No information, however, could be derived from what he said with regard to the regicides; but, while he solemnly protested that his life was unjustly taken away, he averred it as his belief that the earls of Murray and Morton were the contrivers of the king's murder. The lords of the secret council now proceeded to the greatest enormities. They robbed the palace of Holyrood House of its furniture and decorations; converted the queen's plate into coin; and possessed themselves of her jewels, which were of great value; and, while the faction committed these acts of robbery, the earl of Glencairn with solemn hypocrisy demolished the altar in the queen's chapel, and defaced and destroyed all its pictures and ornaments. These excessive outrages, however, lost them the favor of the people, and an association was formed in favor of the queen. The court of France, as soon as the news of Mary's imprisonment arrived, despatched M. de Villeroy to condole with

her upon her misfortunes: but the lords of the secret council would not admit him to see her. The earl of Murray was at this time in France; and to the promises of this treacherous wretch the king trusted, imagining him to be a steady friend to the unfortunate queen. Elizabeth also pretended friendship, and threatened the associated lords; but, as they knew her insincerity, they paid no regard to her threats, and even refused to admit her ambassador to Mary's presence. From all these appearances of friendship, Mary derived no real assistance. On the 24th of July, 1567, lord Lindsay, whose imperious behaviour, says Dr. Stuart, approached to infamy, was ordered by the lords to wait upon the queen at Lochleven. He carried with him three deeds or instruments, and was ordered to compel her to subscribe them. By the first she was to resign her crown to her infant son; by the second she appointed the earl of Murray regent of Scotland; and, by the third, she constituted a council to direct the prince till this nobleman should arrive in Scotland, or in the event of his death or refusal of the office. On the part of the queen all resistance was vain. Sir Robert Melvil assured her that what she did by compulsion, and in a prison, could not bind her; as did also Throgmorton, the English ambassador, in a letter which Sir Robert Melvil brought in the scabbard of his sword. Mary, therefore, forlorn and helpless, could not resist the barbarous rudeness with which Lindsay pressed the subscription of the papers, though she would not read them. Five days after, the lords of the secret council met at Stirling, for the coronation of the young prince. A protestation was made, in the name of the duke of Chatellerault, that this solemnity should neither prejudice his rights of succession, nor those of the other princes of the blood. The young prince being presented to them, the lords Lindsay and Ruthven appeared, and in the name of the queen renounced in his favor her right and title to the crown, gave up the papers they had forced her to subscribe, and surrendered the sword, sceptre, and royal crown. After the papers were read, the earls of Morton, Athol, Glencairn, Mar, and Monteith, with the master of Graham, the lord Hume, and Bothwel, bishop of Orkney, received the queen's resignation in favor of her son in the name of the three estates. After this formality, the earl of Morton, bending his body, and laying his hand upon the Scriptures, took the coronation oath for the prince, engaging that he should rule according to the laws, and root out all heretics and enemies to the word of God. Adam Bothwel then anointed the prince king of Scotland, delivered to him the sword, and sceptre, and put the crown upon his head. In the procession to the castle from the church, where the inauguration was performed, and where John Knox preached the inauguration sermon, the earl of Athol carried the crown, Morton the sceptre, Glencairn the sword, and the earl of Mar carried the prince in his arms. The solemnities received no countenance from Elizabeth; and Throgmorton, by her express command, was not present at them.

Soon after this ceremony the earl of Murray returned from France; and his presence gave

such strength to his faction that very little opposition could be given by the partisans of Mary, who were desponding for want of a leader. A little time after his arrival, this monstrous hypocrite and traitor waited upon his distressed and insulted sovereign at Lochleven. His design was to get her to desire him to accept of the regency, which he otherwise pretended to decline. The queen, unsuspecting of the deepness of his arts, conscious of the gratitude he owed to her, and trusting to his natural affection, and their tie of a common father, received him with a tender welcome. She was in haste to pour forth her soul to him; and with tears and lamentations related her condition and her sufferings. He heard her with attention; and turned occasionally his discourse to the topics which might lead her to open to him her mind without disguise, in those situations in which he was most anxious to observe it; but her distress awakened not his tenderness. He seemed to be in suspense; and from the guardedness of his conversation she could gather neither hope nor fear. She begged him to be free with her, as he was her only friend. He yielded to her entreaties as if with pain and reluctance; and, taking a comprehensive survey of her conduct, described it with all the severity that could affect her most. He could discover no apology for her misgovernment and disorders; and, with a mortifying plainness, he pressed upon her conscience and her honor. At times she wept bitterly. Some errors she confessed; and against calumnies she warmly vindicated herself. But all she could urge in her behalf made no impression upon him; and he spoke to her of the mercy of God as her chief refuge. She was torn with apprehensions, and nearly distracted with despair. He dropped some words of consolation; and, after expressing an attachment to her interests, gave her his promise to employ all his consequence to secure her life. As to her liberty, he told her that to achieve it was beyond all his efforts; and that it was not good for her to desire it. Starting from her seat, she took him in her arms, and, kissing him as her deliverer from the scaffold, solicited his immediate acceptance of the regency. He declared that he had many reasons to refuse the regency. She conjured him not to abandon her in the extremity of her wretchedness. There was no other method, she said, by which she herself could be saved, her son protected, and her realm rightly governed. He gave way to her anxiety and solicitations. She besought him to make the most unbounded use of her name and authority, desired him to keep for her the jewels that yet remained with her, and recommended it to him to get an early possession of all the forts of her kingdom. He now took his leave of her, and, embracing anew this pious traitor, she sent her blessing with him to the prince her son. In the mean time the wretched earl of Bothwel was struggling with the greatest difficulties. Sir William Murray and Kirkaldy of Grange had put to sea in search of him. He had been obliged to exercise piracy for subsistence to himself and his followers. His pursuers came upon him unexpectedly at the Orkney Islands, and took three of his ships, but

he himself escaped. Soon after, having seized a Turkish trader on the coast of Norway, two ships of war belonging to the king of Denmark gave chase to him as a pirate. An engagement ensued, in which Bothwel was taken. His officers and mariners were hanged in Denmark, but Bothwel himself, being known by some Scottish merchants, had his life spared. He was thrown, however, into a dungeon, where he remained ten years; and at last died melancholy and distracted. The regent sent commissioners to the king of Denmark to demand him as a prisoner; but that prince, considering Murray as a traitor and usurper, totally disregarded his request. The dreadful fate of Bothwel did not make any alteration in the situation of the queen. Her enemies, bent on calumniating her, produced letters, which they said were written and sent by her to that licentious nobleman during the life of the king. These letters are now universally admitted to have been forged by the rebels themselves, who practised likewise upon some servants of Bothwel to accuse the queen of the murder of her husband. The letters for some time gained credit; but the confessions of the servants were all in her favor. When on the scaffold, they addressed themselves to the people; and, after having solemnly declared the innocence of the queen, they protested before God and his angels that the earl of Bothwel had informed them that the earls of Murray and Morton were the contrivers of the king's murder. It was impossible that such transactions as these could advance the popularity of the regent. His unbounded ambition and cruelty to his sovereign began at last to open the eyes of the nation; and a party was forming itself in favor of the queen. She herself had been often meditating her escape; and she at last effected it by means of a young gentleman, George Douglas, brother to her keeper, who had fallen in love with her. On the second day of May 1568, about 7 P.M. when the keeper was at supper with his family, George Douglas, possessing himself of the keys of the castle, hastened to her apartment, and conducted her out of prison. Having locked the gates of the castle, they immediately entered a boat which waited for them; and, being rowed across the lake, lord Seton received the queen with a chosen band of horsemen in complete armour. That night he conveyed her to his house of Niddrie in West Lothian; where having rested a few hours, she set out for Hamilton.

The escape of the queen threw her enemies into the greatest consternation. Many forsook the regent openly, and still more made their submissions privately, or concealed themselves. He did not, however, despond; but resolved to defend himself by force of arms. The queen soon found herself at the head of 6000 men, and the regent opposed her with 4000. Mary, however, did not think it proper to risk a battle; but in this prudent resolution she was over-ruled by the impetuosity of her troops. A battle was fought on the 13th of May 1568, at Langside, near Glasgow; in which Mary's army was defeated, and her last hopes blasted. The unfortunate queen fled towards Kirkcudbright, where she deliberated on the plan she should afterwards

follow. The result of her deliberations was to take the worst step possible. Notwithstanding all the perfidy which she had found in Elizabeth, Mary could not think that she would now refuse to afford her a refuge in her dominions; and therefore determined to retire into England. To this she had been solicited by Elizabeth herself during her confinement in Lochleven castle; and she now resolved, in opposition to the advice of her most faithful counsellors, to make the fatal experiment. In obedience to her order, the lord Herries addressed a letter to Mr. Lauder, the deputy-commander at Carlisle; and, after detailing her defeat at Langside, desired to know if she might trust herself upon English ground. This officer wrote instantly an answer, that, lord Scroop the warden of the frontier being absent, he could not give a formal assurance in a matter which concerned the state of a queen; but that he would send by post to his court to know the pleasure of his sovereign; and that, if in the mean time any necessity should force Mary to Carlisle, he would receive her with joy, and protect her against her enemies. Mary, however, before the messenger returned, had embarked in a fishing boat with sixteen attendants. In a few hours she landed at Workington in Cumberland, and thence proceeded to Cockermouth, where she continued till Mr. Lauder, having assembled the gentlemen of the country, conducted her with the greatest respect to the castle of Carlisle. To Elizabeth she announced her arrival in a despatch, which described her late misfortunes in general and pathetic terms, and in which she expressed an earnest solicitude to pay her a visit at her court, and the deep sense she entertained of her friendship and generosity. The queen of England, by obliging and polite letters, consoled with her upon her situation, and gave her assurances of all the favor and protection that were due to the justice of her cause. But, as they were not accompanied with an invitation to London, Mary took the alarm. She thought it expedient to instruct lord Fleming to repair to France; and she entrusted lord Herries with a most pressing remonstrance to Elizabeth. Her anxiety for an interview to vindicate her conduct, her ability to do so in the most satisfactory manner, and her power to explain the ingratitude, the crimes, and the perfidy of her enemies, were urged to this princess. A delay in the state of her affairs was represented as nearly equivalent to absolute destruction. An immediate proof was therefore requested from Elizabeth of the sincerity of her professions. If she was unwilling to admit into her presence a queen, a relation, and a friend, she was reminded, that, as Mary's entrance into her dominions had been voluntary, her departure ought to be equally free and unrestrained. She valued the protection of the queen of England above that of every other potentate upon earth; but, if it could not be granted, she would solicit the amity, and implore the aid of powers who would commiserate her afflictions, and be forward to relieve them. Mary likewise gave thanks to Elizabeth for the courtesy with which she had hitherto been treated in the castle of Carlisle. She also begged of her to avert the cruelty of the regent from

her adherents, and to engage him not to waste her kingdom with hostility and ravages; and she paid her compliments in an affectionate letter to secretary Cecil, and asked his kind offices in extricating her from her difficulties. But the queen of England was not to be moved by remonstrances. The offer of Mary to plead her cause before her, and to satisfy all her scruples, was rejected. Her disasters were rather a matter of exultation than of pity. The deliberations of the English queen, and those of her statesman, were not directed by maxims of equity, compassion, or generosity. They considered the flight of Mary into England as an incident that was fortunate for them; and they were solicitous to adopt those measures which would enable them to draw from it the greatest advantage. They considered all the possible consequences of liberating her, of restoring her to her throne, and of allowing her to remain at liberty in England; and how they might affect Scotland, England, Ireland, and the cause of the Reformation; and upon the whole concluded that it was by far the wisest expedient to keep the queen of Scots in confinement, to invent methods to augment her distress, to give countenance to the regent, and to hold her kingdom in dependence and subjection. In consequence of this cruel and unjust resolution Mary was acquainted that she could not be admitted into Elizabeth's presence till she had cleared herself of the crimes imputed to her; she was warned not to think of introducing French troops into Scotland; and it was hinted that for the more security she ought to be removed farther from the frontier. This message showed Mary the imprudence of her conduct in trusting herself to Elizabeth; but the error could not now be remedied. She was watched to prevent her escape, and all her remonstrances were vain. The earl of Murray had offered to accuse her; and it was at last concluded that Elizabeth could not, consistently with her own honor and the tranquillity of her government, suffer the queen of Scots to come into her presence, to depart out of England, or to be restored to her dignity, till her cause should be tried and decided. An order was given to remove her from Carlisle castle to a place of strength at a greater distance from the borders, to confine her more closely, and to guard against all possibility of an escape.

In consequence of these extraordinary transactions a trial took place, perhaps the most remarkable for its injustice of any recorded in history. Mary, confined and apprehensive, submitted to be tried. The regent, who was to be the accuser, was summoned into England, and commissioners were appointed on both sides. On the 4th of October the commissioners met at York; and, four days after, the deputies of the queen of Scots were called to make known their complaints. They related the most material circumstances of the cruel usage she had received. Their accusations were an alarming introduction to the business in which the regent had embarked; and, notwithstanding the encouragement shown to him by Elizabeth, he was assaulted by apprehensions. The artifices of Maitland added to his alarms. Instead of proceeding instantly to

defend himself, or to accuse the queen, he sought permission to relate his doubts and scruples to the English commissioners. In his own name, and with the concurrence of his associates, he demanded to know whether they had sufficient authority from Elizabeth to pronounce, in the case of the murder, Guilty or Not guilty, according to the evidence that should be laid before them; whether they would actually exercise this power; whether, in the event of her criminality, their sovereign should be delivered to him and his friends, or detained in England in such a way as that no danger should ensue from her activity; and whether, upon her conviction, the queen of England would allow his proceedings, and those of his party, to be proper, maintain the government of the young king, and support him in the regency, in the terms of the act of parliament which had confirmed him in that office. To these requisitions it was answered, upon the part of the English deputies, that their commission was so ample that they could enter into and proceed with the controversy; and that the sovereign would not restore the queen of Scots to her crown, if satisfactory proofs of her crime should be produced; but that they knew not in what manner she would finally conduct herself as to her person and punishment. With regard to the sovereignty of the prince, and the regency of the earl of Murray, these might be canvassed in a future period. These replies did not please the regent and his associates; and they requested the English commissioners to transmit their doubts and scruples to be examined and answered by Elizabeth. But, while the regent discovered in this manner his apprehensions, he yet affirmed that he was able to answer the charges imputed to him and his faction; and, this being in a great measure a distinct matter from the controversy of the murder, he was desired to proceed in it. He pretended that Bothwell, who had the chief concern in the murder of lord Darnley, possessed such credit with the queen, that, within three months after that horrible event, he seized her person and led her captive to Dunbar, obtained a divorce from his wife, and married her: that the nobility, being moved with his crimes, did confederate to punish him, to relieve her from the tyranny of a man who had ravished her, and who could not be her husband, and to preserve the life of the prince: that, having taken arms for these purposes, the earl marched against them; but that, proposing to decide the quarrel by single combat, his challenge was accepted: that he declined, notwithstanding, to enter the lists, and fled: that the queen, preferring his impunity to her own honor, favored his escape by going over to the nobility: that they conducted her to Edinburgh, where they informed her of the motives of their proceedings, requested her to take the proper steps against him and the other regicides, and entreated her to dissolve her marriage, to take care of her son, and to consult the tranquillity of her realm: that this treatment being offensive to her she menaced them with vengeance, and offered to surrender her crown, if they would permit her to possess the murderer of her husband; that her inflexible mind, and the necessities of the

state, compelled them to keep her at a distance from him, and out of the way of a communication with his adherents: that during her confinement, finding herself appointed with the troubles of royalty, and unfit for them from vexation of spirit and the weakness of her body and intellect, she freely, and of her own will, resigned her crown to her son, and constituted the earl of Murray to the regency; that the king accordingly had been crowned, and Murray admitted to the regency; that, the sanction of the three estates assembled in parliament having confirmed these appointments, a universal obedience of the people had ensued, and a steady administration of justice had taken place: that certain persons, however, envious of the public order and peace, had brought her out of prison, and had engaged to subvert the government; that they had been disappointed in their wicked attempts; and that it was most just and equitable that the king and the regent should be supported in power, in opposition to a rebellious and turbulent faction.

This apology, so imperfect, so impudent, and so irreconcilable with facts, received a complete confutation from the deputies of the queen of Scots. To take arms against her because Bothwell had her favor was, they said, a lame justification of the earl of Murray and his friends; since it had never been properly manifested to her that he was the murderer of her husband. He had indeed been suspected of this crime; but had been tried by his peers, and acquitted. His acquittal had been ratified in parliament, and had obtained the express approbation of the party who were now so loud in accusing him, and who had conspired against her authority. These rebels had even urged her to accomplish her marriage with him, had recommended him as the fittest person to govern the realm, and had subscribed a bond asserting his innocence, and binding themselves to challenge and punish all his adversaries and opponents. They had never, either before or after the marriage, advertised the queen of his guilt, till, having experience of their strength, they secretly took arms, and invested her in Borthwick castle. The first mark of their displeasure was the display of warlike banners. She made her escape to Dunbar; and they, returning to Edinburgh, levied troops, issued proclamations, took the field against her, under the pretence of delivering her from his tyranny, and got possession of her person. She was willing to prevent the effusion of blood, and was very far from preferring his impunity to her honor. Kirkaldy of Grange, in obedience to instructions from them, desired her to cause him to retire, and invited her to pass to them under the promise of being served and obeyed as their sovereign. She consented, and Kirkaldy advised Bothwell to depart, and assured him that no man would pursue him. It was by their own contrivance that he fled; and it was in their power to have taken him; but they showed not the smallest desire to make him their prisoner. He remained, too, for some time in the kingdom, and was unmolested by them; and it was not till he was upon the seas that they affected to go in search of him. When she surrendered herself, in the sight of their army, the earl of Morton ratified the stipulations

of Kirkaldy, made obeisance to her in their names, and promised her all the service and honor which had ever been paid to any of her predecessors. They were not faithful, however, to their engagements. They carried her to Edinburgh, but did not lodge her in her palace. She was committed to the house of a burghess, and treated with the vilest indignities. She indeed broke out into menaces, and threatened them; nor was this a matter either of blame or of wonder. But it was utterly false that she ever made any offer to give away her crown, if she might possess Bothwell. In the midst of her sufferings she had even required them, by secretary Maitland, to specify their complaints, and besought them to allow her to appear in parliament, and to join and assist in seeking a remedy to them from the wisdom of the three estates. This overture, however, so salutary and submissive, they absolutely rejected. They were animated by purposes of ambition, and had not in view a relief from grievances. They forced her from her capital in the night, and imprisoned her in Lochleven; and there they affirm that, being exhausted with the toils of government and the languors of sickness, she, without constraint or solicitation, resigned her crown to her son, and appointed the earl of Murray to be regent during his minority. But the truth could neither be concealed, nor overturned, nor palliated. She was in the vigor of youth, unassailed by maladies, and without any infirmity that could induce her to surrender the government of her kingdom. The earl of Athol and the barons of Tullibardin and Lethington, principal men of their council, sent Sir Robert Melvil to her with a ring and presents, with a recommendation to subscribe whatever papers should be laid before her, as the only means to save her life, and with an assurance that what she did under captivity could not operate any injury to her. Melvil, too, communicated to her an intimation in writing from Sir Nicholas Throgmorton, which gave her the same advice and the same assurance. To Sir Nicholas Throgmorton she sent an answer, informing him that she would follow his counsel; and enjoining him to declare to his mistress her hapless state, and that her resignation of her crown was constrained. Nor did this ambassador neglect her commission; and it was a popular persuasion that Elizabeth would have marched an army to her relief, if she had not been intimidated by the threat of the rebels that the blood of the queen of Scots would be the wages of her soldiers. It was also not to be contradicted that, when lord Lindsay presented to his sovereign the instruments of resignation, he menaced her with a closer prison and a speedy death, if she should refuse to subscribe them. It was under an extreme terror, and with many tears, that she put her name to them. She did not consider them as her deeds; did not read them; and protested that, when she was at liberty, she would disavow subscriptions which had been extorted from her. Even Douglas, the keeper of Lochleven, could not endure to be a witness of the violence employed against her. He departed out of her presence that he might not see her surrender her rights against her will; and he

sought and obtained from her a certificate that he was not accessory to this compulsion and outrage. Nor did it consist with the slightest probability that she would, of her own will and accord, execute a resignation of her royal estate, and retain no provision for her future maintenance. Yet, by these extraordinary deeds, the condition to which she was reduced was most miserable and wretched; for no portion whatever of her revenue was reserved to her, and no security of any kind was granted either for her liberty or her life.

As to the coronation of the prince, it could have no validity, as being founded in a pretended and forced resignation. It was also defective in its form; for there were in Scotland more than 100 earls, bishops, and lords; and of these there did not assist in it more than four earls, six lords, one bishop, and two or three abbots. Protestations, too, were openly made, that nothing transacted at that period should be prejudicial to the queen, her estate, and the blood-royal of Scotland. As to the ratification of the investiture of the young prince, and the regency of the earl of Murray by the estates, this was done in an illegal parliament. The principal nobility, too, objected in this parliament to this ratification. Protestations were made before the lords of the articles, as well as before the three estates, to interrupt and defeat transactions which were in a wild hostility to the constitution and the laws. Neither was it true that the government of the king and the regent was universally obeyed, and administered with equity and approbation; for a great division of the nobility never acknowledged any authority but that of the queen, and never held any courts but in her name; and it was notorious that the administration of the usurpers had been marked and distinguished by enormous cruelties and oppressions. Many honorable families and loyal subjects had been persecuted to ruin, and plundered of their wealth, to gratify the retainers and soldiers who upheld this insolent domination; and murder and bloodshed, theft and rapine, were prevalent to a degree unheard of for many ages. Upon all these accounts it was inferred that Elizabeth ought to support the queen of Scots, to restore her to her crown, and to overthrow the power of a most unnatural and rebellious faction. To these facts the regent did not pretend to make any objection; and, though required by the English commissioners to produce sounder and better reasons for his treatment of the queen, he did not advance any thing in his own behalf. He even allowed the charges of treason and usurpation to be pressed against him, without presuming to answer. This surprising behaviour, which might readily have been construed into an acknowledgment of his guilt, proceeded from some conferences which he had with the duke of Norfolk. This nobleman was a zealous partizan for the succession of Mary to the English crown. He was of opinion that his mistress, while she wished to gratify her animosity and jealousies against the queen of Scots, was secretly resolved, by fixing a stain upon her, to exclude her from the succession, and to involve her son in her disgrace. He was eager to defeat a purpose which he con-

ceived to be not only unjust in itself, but highly detrimental to his country; and he observed with pleasure that Maitland of Lethington was favorable to Mary. To this statesman he expressed his surprise that the regent could think of an attempt so blameable as that of criminating his sovereign. If Mary had really given offence, by mistakes, it yet was not the business of a good subject industriously to hold her out to scorn. Anxious and repeated conferences were held by them; and at length it was formally agreed that the regent should not accuse the queen of Scots; and that the duke in return should protect him in the favor of Elizabeth, and secure him in the possession of his regency. But, while the regent engaged himself in this intrigue with the duke of Norfolk, he was still desirous of gratifying the resentments of Elizabeth, and of advancing his own interests by undermining secretly the reputation of his sovereign. He instructed Maitland, George Buchanan, James Macgill, and John Wood, to go to the duke of Norfolk, the earl of Sussex, and Sir Ralph Sadler, and to communicate to them, as private persons, and not in their character of commissioners, the letters to Bothwel, and the other proofs upon which he affirmed the guilt of the queen of Scots. He desired that they would examine these papers, give their opinion of them to Elizabeth, and inform him whether she judged them sufficient evidences of Mary's concern in the murder of her husband. If this should be her opinion, he testified his own readiness, and that of his associates, to swear that the papers were genuine, and of the hand-writing of the queen. By this operation, he was solicitous to establish his vouchers as incontestable, and as testimonies of record.

The commissioners examined his papers, and heard the comments of Buchanan and his other assistants; but they do not seem to have bestowed credit upon them. They described them, however, to Elizabeth; pointed out the places of them which were strongest against Mary; and allowed that their force and meaning were very great if genuineness could be demonstrated. But of their genuineness they acknowledged that they had no other evidence than stout assertions, and the offer of oaths. The earl of Sussex, in a private despatch to secretary Cecil, does more than insinuate, that he thought Mary would be able to prove the letters palpable forgeries; and, with respect to the murder of the king, he declares in plain terms, that, from all he could learn, Murray and his faction would, upon a judicial trial, be found by 'proofs hardly to be denied,' more criminal in that charge than the queen. Elizabeth and her ministers, upon the receipt of such despatches, did not think it expedient to empower them to adopt a method of proof so palpably suspicious, and in which she could not openly concur, without grossly violating even the appearance of probity. The regent had before attempted to engage her in a direct assurance of the validity of his papers, when he submitted copies of them to her inspection by his secretary, Mr. Wood. His attempt at this juncture was similar. Nor were these the only transactions

which took place during the continuance of the commissioners at York. The inventive genius of Lethington had suggested to him a project, which he communicated in confidence to the bishop of Ross. It received the warm approbation of this ecclesiastic; and they determined to put it to a trial. While they attended the duke of Norfolk to the diversion of hawking, they suggested to him a marriage with the queen of Scots. Her beauty, her accomplishments, and her kingdom, were high allurements, and as he was the greatest subject of England, perhaps of Europe, he seemed not to be unworthy of them. The proposal was very flattering to the admiration he entertained of Mary, to his ambition, and to his patriotism. The more he thought of it, he was the more convinced of its propriety. His access to be informed of the practices of the regent destroyed in him the operations of those slanders by which her enemies were so active to traduce her. In this state of his mind, the lady Scroop, his sister, who resided at Bolton Castle with Mary, completely confirmed his resolution. For from her he learned the orderly carriage and the amiable dispositions of the queen of Scots. He was now impatient to make her the offer of his hand. Elizabeth in the mean time was thrown into confusion by the refusal of the regent to accuse the queen of Scots. To give a positive answer to his doubts and scruples was not consistent with her honor; and yet, without this condescension, she was assured that the Scottish deputies would not exhibit their charge of crimination. Having deceived Mary, therefore, with fair promises, she was active in gaining the regent over to her views; which having done, he consented at last to prefer his accusation against Mary before the commissioners, who now met at Westminster by her command. The charge was expressed in general and presumptive terms. It affirmed that as James, earl of Bothwel, was the chief executor of the murder of king Henry, so the queen was his persuader and counsel in the device; that she was a maintainer and fortifier of this unnatural deed, by stopping the inquisition into it and its punishment, and by taking in marriage the principal regicide; that they had begun to exercise a cruel tyranny in the commonwealth, and had formed a resolution of destroying the innocent prince, and of transferring the crown from the true line of its kings to a bloody murderer, and a godless tyrant; and that the estates of the realm, finding her unworthy to reign, had ordered her to resign the crown; her son to be crowned, and the earl of Murray to be established in the regency. Before this accusation was preferred the earl of Lennox presented himself before the English commissioners; made a lamentable declaration of his griefs, and produced to them the letters which had passed between him and Mary concerning the murder, with a writing which contained a direct affirmation of her guilt. The deputies of Mary were astonished at this accusation, being a violent infringement of a protestation which they had formerly given in, and which had been accepted, namely, that the crown, estate, person, and honor of the queen of Scots, should be guarded against every assault

and injury; yet in all these particulars she was now injured. It was understood that no judicial proceedings should take place against her; yet she was actually arraigned as a criminal, and her deputies were called upon to defend her. They denied, however, the validity of the charge; and, while they fully explained the motives which actuated the earl of Murray and his faction in their proceedings, they imputed to persons among themselves the guilt of the king's murder. They affirmed that the queen's adversaries were the accomplices of Bothwell; that they had subscribed a bond conspiring the death of the king; and that their guilt had been attested, in the sight of 10,000 spectators, by those of their confederates who had already been executed. They exclaimed against the enormous ingratitude, and the unparalleled audacity of men, who could forget so completely all the obligations which they owed to their sovereign; and who, not satisfied with usurping her power, could even charge her with a murder which they themselves had committed. They represented the strong necessity which had arisen for the fullest vindication of their mistress; and they said, that in so weighty an extremity, they could not suppose that she would be restrained from appearing in her own defence. They had her instructions, if her honor was touched, to make this requisition; and, till it was granted, they insisted that all proceedings in the conference should be at an end. A refusal of this liberty, in the situation to which she was driven, would be an infallible proof that no justice was intended to her. It was their wish to deal with sincerity; and they were persuaded that, without a proper freedom of defence, their queen would fall a victim to partiality and injustice. They therefore earnestly pressed the English commissioners that she might be permitted to present herself before Elizabeth, the nobles of England, and the ambassadors of foreign nations, to manifest to the world the injuries she had suffered, and her innocence. After having made these spirited representations to the English commissioners, the deputies of Mary desired to have access to the queen of England. They were admitted accordingly to an audience; and, in a formal address, they detailed what had happened, insisted that the liberty of personal defence should be allowed to their mistress, and demanded that the earl of Murray and his associates should be taken into custody, till they should answer to such charges as should be preferred against them. She desired to have some time to turn her thoughts to matters of such high importance; and told them that they might soon expect to hear from her. The bishop of Ross, and the other deputies of Mary, in the mean time, struck with the perfidious management of the conference, convinced of the jealousies and passions of Elizabeth, sensible that her power over her commissioners was unlimited, and anxious for the deliverance of their mistress, made an overture for an accommodation to the earl of Leicester and Sir William Cecil. They proposed that the original meaning of the conference should still be adhered to, notwithstanding the accusation presented by the earl of Murray; and that Eli-

zabeth, disregarding it as an effort of faction, should proceed to a good agreement between Mary and her subjects. For this scheme, they had no authority from their mistress, but they were moved to it by their anxiety for peace and the re-establishment of the affairs of the Scottish nation. They were introduced at Hampton-court to Elizabeth; who listened to their motion and was averse from it. They then repeated the desires of the petition they had presented to her; but she did not think it right that the queen of Scots should yet have the liberty to defend herself in person. She confessed, indeed, that it was reasonable that Mary should be heard in her own cause; but she affirmed that she was at a loss at what time she should appear, at what place, and to whom she should address herself. While she expressed, however, the hope that Mary might obtain the permission so repeatedly and so earnestly requested, she said that the earl of Murray should first be heard in support of his charge, and that she should attend to the proofs which he said he was ready to produce. After this business should be transacted, she told the deputies of Mary that she would again confer with them. It was to no purpose that they objected to a procedure so strange. An accusation, said they, is given; the person accused is anxious to defend herself; this privilege is denied to her; and yet a demand is to be made for the vouchers of her guilt. What was this but an open violation of justice? They would not, therefore, consent to a measure which was so alarming to the interests of their queen; and, if it was adopted, a protest against its validity would be lodged with her commissioners. The English commissioners resumed the conference, and were about to demand from the earl of Murray the proofs with which he could support his accusation. The bishop of Ross and his associates, being admitted to them, expressed themselves in conformity to the conversation they had with Elizabeth. They declared that it was unnatural and preposterous in their sovereign to think of receiving proofs of the guilt of the queen of Scots, before she was heard in her own defence; and they protested that, in the event of this proceeding, the negotiation should be dissolved, and Elizabeth be disarmed of all power to do any prejudice to her honor, person, crown, and estate. The commissioners of the English queen were affected with this protestation, and felt more for the honor of their mistress than for their own. They refused to receive it, because there were engrossed in it the words of the refusal which Elizabeth had given to the petition for Mary. They did not choose to authenticate the terms of this refusal by their subscriptions; and were solicitous to suppress so palpable a memorial of her iniquity. They alleged that the language of her refusal had not been taken down with accuracy; and they pressed Mary's deputies to present a simpler form of protestation. The bishop of Ross and his colleagues yielded not, however, immediately to their insidious importunity; but, repeating anew their protestations as they had at first planned it, included the express words of Elizabeth; and, when compelled by the power of the

commissioners to expunge the language of the English queen, they still insisted upon their protestation. An interruption was thus given to the validity of any future proceedings which might affect the reputation of the queen of Scots. The earls of Murray and Morton, with their friends, were very much disappointed. For they had solaced themselves with the hope of a triumph before there was a victory; and thought of obtaining a decree from Elizabeth, which, while it should pronounce the queen of Scots to be an adulteress and a murderer, would exalt them into the station and character of virtuous men and honorable subjects. Though the conference ought naturally to have terminated upon this protestation of the deputies of Mary against the injustice of Elizabeth, yet it did not satisfy the latter princess that the accusation only had been delivered to her commissioners; she was seriously disposed to operate a judicial production of its vouchers. The charge would thus have a more regular aspect, and be a sounder foundation upon which to build not only the infamy of the Scottish queen, but her own justification for the part she had acted. Her commissioners accordingly, after the bishop of Ross and his colleagues had retired, disregarding their protestation, called upon the earl of Murray and his associates to make their appearance. The pretence, however, employed for drawing from him his papers, was sufficiently artful, and bears the marks of that systematic duplicity which so shamefully characterises all the transactions of Elizabeth at this period. Sir Nicholas Bacon, the lord keeper, addressed himself to the earl of Murray. He said that, in the opinion of the queen of England, it was a matter surprising and strange that he should accuse his sovereign of a crime most horrible, odious to God and man, against law and nature; and which, if proved to be true, would render her infamous in all the kingdoms of the world. But though he had so widely forgot his duty, yet had not Elizabeth renounced her love of a good sister, a good neighbour, and a good friend; and it was her will that he and his company should produce the papers by which they imagined they were able to maintain their accusation. The earl of Murray, in his turn, was not wanting in dissimulation. He expressed himself to be very sorry for the high displeasure he had given to Elizabeth by his charge against Mary, and for the obstinacy of the Scottish queen and her deputies, which made it necessary for him to vindicate himself by discovering her dishonor. Under the load of this double and affected sorrow, he made an actual and formal exhibition of the vouchers by which he pretended to fix and establish her criminality. A particular notice of these extraordinary vouchers the reader will find in our life of MARY, and in the works there referred to. To enumerate all the shifts to which Elizabeth and the adversaries of Mary were put, to make the strange evidence that was produced wear some degree of plausibility, would far exceed our bounds. It is sufficient to say that, after having wearied themselves with prevarication and falsehood; after having pressed Mary to abdicate her crown, a requisition with which she never would com-

ply; and after having finally refused to hear her in her own defence; Elizabeth, on the 10th January, 1569, gave leave to the earl of Murray and his accomplices to depart her dominions; telling them that, since they came into England, nothing had been objected to them which could hurt their honor as men, or affect their allegiance as subjects. At the same time she told them that they had produced no information or evidence, by which she was entitled to conceive any bad opinion of the queen of Scots. It was therefore her pleasure to allow the affairs of Scotland to continue precisely in the same condition in which they were at the beginning of the conference. Three days after this they formally took their leave of the queen of England. The deputies of Mary remonstrated, protested, and argued to no purpose; the English privy council, with the most provoking indifference, told them that 'the earl of Murray had promised to their sovereign, for himself and his company, to return to England at any time she should call upon him. But, in the mean time, the queen of Scots could not, for many strong reasons, be suffered to take her departure out of England. As to her deputies, they would move Elizabeth to allow them to return to Scotland; and they believed that she would not detain them.'

Mary was exceedingly disappointed and chagrined by this singular issue of her cause. Her friends during this period had increased, and the cruel and injurious treatment she had met with was so flagrant that the earl of Murray and his faction were apprehensive of a sudden reverse of fortune. The earls of Argyle and Huntly protested against the injustice of their proceedings, at the same time that they openly accused the earl of Murray and Maitland of Lethington as the associates of Bothwell in the murder of the king. This charge, according to the custom of the times, they offered to prove by the law of arms; and they protested that, if their adversaries should delay to answer the challenge, they should be held as confessing themselves guilty of the murder. Elizabeth, however, foreseeing something of this kind, had dismissed Murray and his adherents with precipitation, so that there could now be no formal production of it before the English commissioners. However, it was known and published in the court of Elizabeth. Murray made an evasive reply, and Lethington made none at all. This, however, afforded no relief to the unhappy queen of Scotland. Her inveterate and treacherous enemy held her fast, and endeavoured, by every method in her power, to render her life miserable. Mary, on the other hand, never lost either her spirit or dignity. She attempted to rouse in the minds of her nobles that passion for liberty which had once so much distinguished the Scottish nation, but which now seemed to be exchanged for a servile subjection to the queen of England. But, some despatches which pressed these topics being intercepted, Mary was removed from Bolton to Tutbury castle, where she was entrusted to the earl of Shrewsbury, and committed to closer confinement than she had yet experienced; while Elizabeth dispersed manifestoes all over the

northern counties of England, complaining of reports injurious to her honor, and disclaiming all hostile intentions towards the liberties of Scotland. In the mean time Murray returned to Scotland, where he took every method to establish himself in his ill-acquired power. Mary had commanded the duke of Chatelherault to return to Scotland, to raise forces for her behoof; but this nobleman had been long detained in England by the artifices of Elizabeth, so that Murray had arrived there before him. The duke, however, began to raise forces, and might have proved a troublesome antagonist, had not Murray deceived him by a pretended negotiation, and got him into his power; immediately after which he imprisoned him, and forced most of the other lords who were on that side to submit. When the news of this important event reached the queen of Scots, she instructed the bishop of Ross to repair to Elizabeth, and to make remonstrances in their behalf. By the agency of this ecclesiastic, whom she had constituted her ambassador, she meant to conduct her transactions with the queen of England; and, from the conclusion of the conferences, she had been mediating a proper plan upon which to accomplish her liberty and restoration. The bishop of Ross, after complaining loudly of the rigorous proceedings of the regent, and intimating the general belief which prevailed that he was supported by the English court, pressed the propriety of a final settlement of the affairs of his mistress. With this view, he was admitted by Elizabeth and her privy counsellors to frequent conferences; and they even desired him to present to them in writing the articles which he was commanded to propose as the foundation of a treaty. He failed not to comply with this injunction; and it was the import of his schedule of agreement that Mary should engage never to molest Elizabeth, and the lawful heirs of her body, respecting the succession to the crown of England and Ireland, if she could obtain sufficient security, that upon their demise her rights would be respected; that a new treaty of alliance and friendship should be concluded between the two queens, by the advice of the estates of both kingdoms; that this league should be ratified by their oaths and seals, and confirmed by parliamentary acts; and, if any farther assurance should be deemed necessary on the part of Mary, that she would procure the kings of France and Spain to be the guaranties of her punctuality and concord; that in compliance with the pleasure of Elizabeth, she would extend her clemency to all her subjects who had offended her, under the provision that they would submit to her sovereignty, deliver up the prince her son, restore her castles, give back her jewels, and surrender to her friends and servants the estates and possessions of which they had been deprived; that the murder of the king should be punished against all the actors in it without delay, and according to the laws; that, to prevent Bothwell from returning to Scotland, and to please those who imagined that it was in his power to excite ferments and trouble, she would be bound to institute a process of divorce against him; and that, these articles being adjusted, the queen of England should allow her to proceed to Scotland, under a

safe and honorable convoy, to be re-established by the three estates in her realm and government, and to be granted with the dissolution of all the acts and statutes which had been passed to her prejudice. These heads of alliance were received with a respect and cordiality which were not usually paid to the transactions of Mary in the court of Elizabeth; and the bishop of Ross was elated with expectation. Their justice, however, was not the sole, or even the chief, cause of this attention and complaisance. A combination of the English nobles had taken place against Cecil, whose power and credit were objects of indignation and jealousy; and the duke of Norfolk had been active and successful in promoting the scheme of his marriage with the queen of Scots.

Taking advantage of the condition of parties, he had practised with the principal nobility to encourage his pretensions to Mary; and he secretly communicated to them the promises of support he had received from the earl of Murray. By the advice and influence of Sir Nicholas Throgmorton, he engaged in his behalf the earl of Leicester, and this nobleman imparted the matter to the earls of Pembroke and Arundel. The duke himself was able to conciliate the favor of the earls of Derby, Bedford, Shrewsbury, Southampton, Northampton, Northumberland, Westmoreland, and Sussex. In the mean time he was eagerly pressing Mary herself with his suit and importunities; and they had mutually exchanged the tokens of a constant and sincere love. It was in this forward state of the match that the bishop of Ross drew up his schedule of articles for the accommodation of the rival queens. At the desire of Elizabeth, her privy council conferred with the bishop upon these articles at different times; and they expressed themselves to be highly pleased with their general import and meaning. Little doubt was entertained of their success; and the earl of Leicester, to complete the business, and to serve the duke of Norfolk, undertook to give them a more special force, and to improve them by the introduction of a stipulation about the marriage of the queen of Scots. According to his scheme of agreement, it was required of Mary that she should be a party to no attempt against the rights and titles of the queen of England or her heirs; that she should consent to a perpetual league, offensive and defensive, between the two kingdoms; that she should finally establish the Protestant religion in Scotland; that she should admit to her favor those of her subjects who had appeared against her; that if she had made any assignment of her kingdom to the duke of Anjou, in the expectation of a marriage to be contracted between them, it should be dissolved; and that instead of looking to a foreign prince whose alliance would be dangerous not only to the religion but to the liberty of the two realms, she would agree to marry the duke of Norfolk, the first peer of England. These articles being communicated to the bishop of Ross, he was desired to transmit them to Mary; but, as they touched upon some points concerning which he had no instructions, he declined this office, and recommended to employ a special messenger

of their own in a commission of such high importance. They accordingly appointed Mr. Candish to go with them to the queen of Scots, and, in a formal despatch, they extolled the merits of the duke of Norfolk; assured her of the general favor and support of the English nobility, if she should approve of his love; and intimated their belief that Elizabeth would not be averse from a marriage which gave the certain promise of tranquillity and happiness to the two kingdoms. This despatch was in the handwriting of Leicester; and it was subscribed by this nobleman, and the earls of Arundel and Pembroke, and lord Lumley. Mary, in the solitude of her prison, received this application with pleasure. By the lord Boyd she returned a very favorable answer to it; but took the liberty to admonish them of the necessity of their securing the good-will of Elizabeth, lest her dislike of the treaty of the marriage should excite new disasters, and involve the duke of Norfolk in danger. This advice, the suggestion of her delicacy and prudence, did not draw sufficiently their attention. The duke of Norfolk was now impatient to conclude this great transaction in which he had engaged himself; and admitted into his counsels many nobles whom he had hitherto neglected to court, and many gentlemen who were considerable from their distinction and fortunes. The countenance and consent of the kings of France and Spain were thought necessary to the measures in agitation, and were solicited and obtained. In the universality of the applause with which they were honored, it was supposed that Elizabeth would be allured into a cordial acknowledgment of their propriety, or be compelled to afford them a reluctant approbation; and so ardent a belief prevailed of their fortunate termination that the marriage-contract was actually entrusted to the keeping of M. Fenelon, the French ambassador. The activity of the duke of Norfolk with the English nobles did not so much engross his attention as to make him forget the regent. He kept up with him a close correspondence in consequence of the concert into which they had entered, and received the most ample assurances of his fidelity and service. The most sanguine and seducing hopes elated him. The regent, while he stipulated for terms of favor and security to himself and his faction, appeared to be full of the marriage, as a measure from which the greatest advantages would arise to the two kingdoms, to the two queens, and to the true religion. The match, in the meanwhile, was anxiously concealed from Elizabeth; but she was zealously pressed to conclude an accommodation with Mary, on the foundation of the schedule of agreement presented by the bishop of Ross. After having had many conferences with her privy-council, she seemed inclined to treat definitively for the restoration of the queen of Scots, and actually agreed to open the transaction to the regent. Lord Boyd was sent into Scotland upon this business; and, while he carried her letters, he was intrusted with despatches from Mary, the duke of Norfolk, and Sir Nicholas Throgmorton. As the regent was returning from his northern expedition, he was saluted at

Elgin by lord Boyd, who immediately laid before him the despatches and instructions with which he had been charged. The queen of England, in her letters, made three propositions in behalf of Mary, and intimated a desire that one of them should be accepted. The queen of Scots, she said, might be restored fully and absolutely to her royal estate; she might be associated in the government with her son, have the title of queen, and, till the prince should attain the age of seventeen years, the administration might continue in the regent; or she might be permitted to return to Scotland in a private station, and have an honorable appointment to maintain her in a safe and happy obscurity.

The despatches from Mary to the regent desired that judges might immediately be allowed to enquire into the legality of her marriage with Bothwell; and that, if it was found to have been concluded in opposition to the laws, it should be declared void, and that the liberty be granted to her of entering anew into a matrimonial engagement. The duke of Norfolk expressed to the regent the gratitude he felt for his friendship; promised him the command of the fullest exertions of his consequence and power; entreated him to proceed expeditiously in promoting the business of the marriage, and referred him to the instructions of lord Boyd for a satisfactory answer to any doubts which might give him disgust or uneasiness. By the letters of Throgmorton, the regent was advertised that the marriage of the queen of Scots with the duke of Norfolk was a certain and decided point; and he was counselled to concur heartily and expeditiously in this transaction, that his consent might not seem to have been extorted. Maitland of Lethington was recommended to him by this statesman as the person whom he should choose to represent him in the English court, as he could negotiate best the terms and mode of his security and that of his party. The zeal of Throgmorton induced him also upon this occasion to address to Maitland a despatch, in which he was importunate to hasten his expedition to England, in the character to which he recommended him. He complimented him as the fittest person to open the match to the English queen, on the part of the regent and the Scottish nobility; and he represented the success of the scheme to be infallible, as Elizabeth would never be so unwise as to put her own safety, the peace of her kingdom, and the preservation of her people, in competition with the partial devices that might proceed from the vanity and the passions of any person whatsoever. He enumerated the names of the English nobility who had confederated to promote the marriage. He enlarged upon it as an expedient full of wisdom, and as advantageous in the highest degree to religion and the state. He pointed out the lasting and inseparable connexion of England and Scotland, as its happy and undoubted consequence. For, if James VI. should die, the sceptres of the two kingdoms should devolve to an English prince; and, if he should attain to manhood, he might marry the daughter of the duke of Norfolk, and unite in his person the two crowns. These weighty despatches employed fully the

thoughts of the regent. The calls of justice and humanity were loud in the behalf of Mary; his engagements to Norfolk were precise and definitive; and the commission of Elizabeth afforded him the command of the most important services. But, on the other hand, the restoration of Mary and her marriage would put an end for ever to his greatness; and, amidst all the stipulations which could be made for his protection, the enormity of his guilt was still haunting him with suspicions and terror. His ambition and his selfish sensibilities were an overmatch for his virtue. He practised with his partisans to throw obstacles in the way of the treaty and the marriage; and, on the pretence of deliberating concerning the restoration of Mary, and on her divorce from Bothwel, a convention of the estates was summoned by him to assemble at Perth. To this assembly the letters of Elizabeth were recited; and her propositions were considered in their order. The full restoration of Mary to her dignity was accounted injurious to the authority of the king, and her association with her son in the government was judged improper and dangerous; but it was thought that her deliverance from prison, and her reduction to a private station, were reasonable expedients. No definitive decree, however, was pronounced. The letters of Mary were then communicated to this council, and gave rise to vehement debates. She had written and subscribed them in her character of queen of Scotland. This carriage was termed insolent and imperious by the friends of the regent. They also held it unsafe to examine her requests till they should be communicated to Elizabeth. The favorers of Mary engaged that, while the commissaries were proceeding in the business of the divorce, new despatches in the proper method should be applied for and procured. They were heard with evident symptoms of displeasure; on which they exclaimed 'that it was wonderful to them that those very persons who lately had been so violent for the separation of the queen and Bothwel, should now be so averse from it.' The partizans of the regent replied 'that, if the queen was so eagerly solicitous to procure the divorce, she might apply to the king of Denmark to execute Bothwel, as the murderer of her husband; and that then she might marry the person who was most agreeable to her.' The passions of the two factions were inflamed to a most indecent extremity, and the convention broke up with strong marks of hostility. Notwithstanding the caution with which Mary and Norfolk carried on their intrigues, intimations of them had come to Elizabeth. Norfolk himself, by the advice of the earl of Pembroke, had ventured to disclose his secret to Sir William Cecil, who affected to be friendly to him. The regent, in answer to her letters, transmitted to her the proceedings of the convention at Perth. The application of Mary for a divorce was a key to the ambitious hopes of the duke of Norfolk. He commanded Sir William Cecil to apply himself to discover the conspiracy. This statesman betrayed the confidence with which he had been entrusted; and Elizabeth, while the duke was attending her at Farnham, discovering a mixture of pleasantry and passion, admonished

him to be careful on what pillow he reposed his head. The earl of Leicester, alarmed by his fears, revealed to her at Titchfield the whole proceedings of the duke of Norfolk and his friends. Her fury was ungovernable; and, at different times, she loaded Norfolk with the severest reproaches and contumely for presuming to think of a marriage with the queen of Scots without her concurrence. Insulted with her discourse and her looks, abandoned by Leicester, and avoided by other nobles in whom he had confided, his courage forsook him. He left the court at Southampton without taking leave, and went to London to the earl of Pembroke. New intimations of her displeasure were announced to him, and he retired to his seat at Kinninghall in Norfolk. His friends pressed him to take the field, and to commit his safety to the sword; but, having no inclination to involve his country in the miseries of war, he rejected their advice; and, addressing an apology to Elizabeth, protested that he never meant to depart from the fidelity which he owed to her; and that it was his fixed resolution to have applied for her consent to his marriage with the queen of Scots. In return she ordered him to repair to her court at Windsor; and, as he appeared to be irresolute, a messenger was despatched to take him into custody. He was first confined to the house of Paul Wentworth, at Burnham, in the neighbourhood of Windsor, and then committed to the Tower. The earls of Pembroke and Arundel, lord Lumley, Sir Nicholas Throgmorton, and the bishop of Ross, were also apprehended and confined.

Elizabeth, amidst the ferment of her inquietudes, gratified her revenge by insulting the queen of Scots. The earl of Huntingdon, who affected to have pretensions to the crown of Scotland preferable to those of the Scottish princess, was joined with the earl of Shrewsbury in the office of guarding her. His instructions were rigorous and he was disposed to exceed them. The earl of Shrewsbury considered it as an indignity to have an associate who was a declared enemy to his charge, who had an interest in her death, and who was remarkable for a natural ferocity of disposition. Mary exclaimed against the indelicacy and rudeness of Elizabeth, and protested that all her intentions were commendable and innocent. Huntingdon took a delight in her sufferings. He ransacked her coffers with a view of making discoveries; but her prudence had induced her to destroy all the evidences of her transactions with the duke of Norfolk; and the officious assiduity of this jailor was only rewarded with two cyphers which he could not comprehend. The domestics whom she favored were suspected and dismissed. Her train of attendants was diminished. An unrelenting watch was kept upon her. No couriers were allowed to carry her despatches. No messengers were admitted to her presence; and all the letters from her friends were ordered to be intercepted, and conveyed to the queen of England. The proceedings of the convention at Perth were afflicting to Elizabeth, to Mary, and to the duke of Norfolk. In the former they created suspicions of the regent; and they were a certain annunciation to the latter that he was resolved

to support himself in the government of Scotland. Uncertain rumors had reached Elizabeth of the interviews he had held with Norfolk in the business of the marriage. Mr. Wood, who brought from the regent his answer to her letter, was treated with disrespect. Secretary Cecil sent instructions to lord Hudson, the governor of Berwick, to watch his operations. Elizabeth, by a special envoy, required from him an explanation of his ambiguous carriage. The regent apologised to her for his connexions with the duke of Norfolk, by laying open the design of that nobleman to cut him off, in his way to Scotland, by a full communication of whatever had passed between them in relation to Mary, and by offers of an unlimited submission and obedience. While the duke of Norfolk was carrying on his intrigues with Mary, the scheme of an insurrection for her deliverance was advancing under the direction of the earls of Northumberland and Westmoreland. Motives of religion were the chief foundation of this conspiracy; and the more zealous catholics over England were concerned in it. Mary, however, by the advice of the duke of Norfolk, who was afraid of her matching with a foreign prince, did not enter into it with cordiality. It advanced notwithstanding; and the agents of the pope were lavish of exhortations and donatives. The duke of Alva, by the order of his master the king of Spain, encouraged the conspirators with the offer of 20,000 men from the Netherlands; and, under the pretence of adjusting commercial disputes, he sent to England Chiapini Vitelli, marquis of Celona, an officer of ability, that he might be at hand, and prepare to take the command of them. The report of an insurrection was universal. Elizabeth kept an army of 15,000 men near her person. The queen of Scots was removed to Coventry, a place of strength; and, if a superior and commanding force should appear before it, her ferocious keeper had orders to assassinate her. Repeated commands were sent to the earls of Northumberland and Westmoreland to repair to court. But the imprisonment of the duke of Norfolk and his friends had struck a panic into them. They conceived that their conspiracy was discovered; and, putting themselves at the head of their followers, they issued their manifesto. The restoration of popery, the establishment of the titles of Mary to the English crown, and the reformation of abuses in the commonwealth, were the avowed objects of their enterprise. But they had embarked in a business for which they were altogether unequal. Their efforts were feeble and desultory. The duke of Alva forgot his promises. Wherever the peace was disturbed by insurgents, there were troops to oppose them. The vigilance of Elizabeth disconcerted with ease the operations of men whom no resources or popularity could have conducted to greatness, and who could neither conquer nor die. The earl of Westmoreland, after concealing himself for some time in Scotland, effected an escape into Flanders, where he passed a miserable and useless existence; and the earl of Northumberland, being taken by the regent, was imprisoned in the castle of Lochleven. As the fury of Elizabeth abated, her re-

sentment to the duke of Norfolk lost its power; and she failed not to distinguish between the intrigues of an honorable ambition, and the practices of an obstinate superstition. It was the result of the examination of this nobleman, and of the confessions of the other prisoners, that Lethington had schemed the business of the marriage, and that the earl of Murray had encouraged it; that her consent was understood to be necessary to its completion; and that Mary herself had warmly recommended the expedient of consulting her pleasure. Upon receiving proper admonitions, the earls of Pembroke, Arundel, the lord Lumley, Sir Nicholas Throgmorton, and the bishop of Ross, were released from confinement; and, after a more tedious imprisonment, the duke of Norfolk himself was admitted to his liberty. This favor, however, was not extended to him till he had not only submissively acknowledged his presumption in the business of his marriage; but had fully revealed whatever had passed between Mary and him, and solemnly engaged himself never more to think of this alliance, and never more to take any concern whatsoever in her affairs. The regent, in the meanwhile, was very anxious to recover the good opinion of Elizabeth. Her treatment of Mr. Wood, and her discovery of his practices, had excited his apprehensions. He therefore assembled at Stirling a convention of the estates; and, taking her letters a second time into consideration, returned her an answer to them by Robert Pitcairn abbot of Dunfermline, in a style suited to her temper and jealousies, and from which she could infer that no favor would be shown to the queen of Scots. But this base condescension not being sufficient, in his opinion, to draw completely to him the cordiality of the queen of England, he was preparing to gratify her with another sacrifice. The partiality of Maitland to Mary, and his intrigues with Norfolk and the English malcontents, had rendered him uncommonly obnoxious to Elizabeth. The late commotions had been chiefly ascribed to his arts. Under the pretence of employing his service in despatches to England, the regent invited him to Stirling. He was then with the earl of Athol at Perth; and, suspecting some device, he obeyed the summons with reluctance. When he took his place in the privy council, captain Crawford, the minion of the earl of Lennox, who had distinguished himself in the trial of Mary, accused him, in direct terms, of being a party in the murder of the late king. The regent affected astonishment, but permitted him to be taken into custody. He was soon after sent to Edinburgh under a guard, and admonished to prepare for his trial. Upon similar charges the lord Seton and Sir James Balfour were seized upon and imprisoned. Kirkaldy of Grange, the governor of the castle of Edinburgh, who was warmly attached to Maitland, after having remonstrated in vain with the regent on his conduct, employed address and stratagem in the service of his friend. Under the cover of night, he went with a guard of soldiers to the lodging where Maitland was confined; and, showing a forged warrant for taking his person into keeping, got possession of him. Kirkaldy

had now in his castle the duke of Chatelherault, the lord Herries, and Maitland. The regent sent for him to a conference; but he refused to obey his message. He put himself and his fortress under the direction of his prisoners. The regent, condescending to pay him a visit, was more lavish than usual of his promises and kindness. His arts, however, only excited the disdain of this generous soldier. As the regent could not lead out Maitland to the block, he instituted a process of treason against him, to forfeit his estates. Kirkaldy, by a trumpeter, desired him to commence similar actions against the earl of Morton and Mr. Archibald Douglas, as it was notorious that they were parties to the king's murder. This messenger was likewise charged with delivering a challenge from him to Mr. Archibald Douglas, and another from the lord Herries to the earl of Morton. This disappointment, and these indignities, made a deep impression upon the regent; and, in a thoughtful dissatisfied humor, about this time, he made a short progress towards the English border, courting popularity, and deserving it, by an attention to order and justice. Elizabeth, flattered by his submissive advances, and pleased with his ambition, was now disposed to gratify his fullest wishes; and she perceived that, by delivering to him the queen of Scots, she would effectually relieve herself of a prisoner whose vigor and intrigues were a constant interruption to her repose. A treaty for this purpose was entered into and concluded. The regent was to march an army to the English frontiers, and to receive from her his sovereign into her own dominions, the victim of his power, and the sport of his passions. No hostages and no security were stipulated for her entertainment and good usage. His authority over her was to be unlimited. Upon his part he was to deliver to Elizabeth the young prince, to put her in possession of the principal forts of Scotland, and to assist her with troops in the event of a war with France. This treaty, so fatal to Mary, and so ruinous to the independence of Scotland, escaped not the vigilance of the bishop of Ross. He complained of it in the strongest terms to Elizabeth; and declared it to be equivalent to a sentence of death against his mistress. The ambassadors of France and Spain were also strenuous in their remonstrances to her upon this subject. All resistance, however, was unavailing; and the execution of the treaty seemed inevitable. Yet how vain are the loftiest schemes of human pride! The career of the regent was hastening to its termination; and the hand of an assassin put a period to his dream of royalty. Scotland did not lose its liberties; but Mary continued to be unfortunate. James Hamilton of Bothwellhaugh, who had been taken a prisoner at the battle of Langside, obtained his liberty and life; but his estates were forfeited. His wife, the heiress of Woodhouslie, retired upon this emergency to her paternal inheritance, in the hope that it might escape the rapacity of the regent. He had, however, given it away to one of his favorites, Sir James Ballenden; and the instruments of his power having the inhumanity to strip her of her garments, and to turn her naked out of her house,

in a cold and dark night, she became distracted before the morning. Hamilton vowed revenge; and the regent made a mockery of his threats. This contempt inspirited his passions; and the humiliation of the house of Hamilton, to which he was nearly allied, fostered his discontents, until the madness of party reconciled his mind to assassination. After watching for some time a proper opportunity to commit his horrible purpose, he found it at Linlithgow. The regent was to pass through this town in his way from Stirling to Edinburgh. Intimations reached him that Hamilton was now to perpetrate his design; but he unaccountably neglected them. The assassin, in a house that belonged to the archbishop of St. Andrews, waited deliberately his approach; and, firing his musket from a window, shot him through the body. The wound was not judged to be mortal; but the regent, finding his pain increase, prepared for death; and in a few hours expired. A fleet horse of the abbot of Arbroath's carried the assassin to the palace of Hamilton; and thence he soon after effected his escape into France.

The death of Murray made no favorable alteration in the affairs of Mary. Confusion and disorder prevailed throughout the kingdom; and, though the friends of the queen were promised assistance from France, nothing effectual was done. At last the regency was conferred upon the earl of Lennox; an enemy to his queen, and who treated her friends with the utmost rigor. At the same time Elizabeth continued to amuse with negotiations her unhappy rival. She granted liberty to the bishop of Ross to repair to the queen of Scots, who had been removed to Chatsworth, and to confer with her on the intended accord and treaty. Mary, conforming to the advances of Elizabeth, authorised lord Livingston to pass to her dominions, and to desire her friends to appoint a deputation of their number to give their assistance in establishing the tranquillity of their country; and, after meeting with some interruptions upon the English borders from the earl of Sussex, this nobleman executed successfully his commission. The queen's lords gave power to ten nobles to act in a body, or by two of their number, in the intended negotiation; and a safe conduct from Elizabeth allowed them to enter the English realm, and to remain in it six months. While lord Livingston was consulting the interests of Mary with her friends in Scotland, the bishop of Ross was making earnest suit with Elizabeth to proceed in the projected negotiation. His solicitations were not ineffectual; and Sir William Cecil and Sir Walter Mildmay were ordered to wait upon the queen of Scots at Chatsworth. The heads of accommodation which they proposed were explicit and particular; and the rigor they discovered towards the Scottish princess seemed to vouch their sincerity. They proposed that a perfect amity should take place between the two queens; that all the treaties formerly concluded by the two nations should receive an ample confirmation; that the queen of Scots should ratify the treaty of Edinburgh, and forbear from advancing any title or claim to the crown of England during the life of Elizabeth, or to the prejudice of the heirs of her body;

that, in case of foreign invasions, the two realms should mutually assist each other; that all foreign soldiers should be ordered to depart out of Scotland; that, in the future, strangers of the profession of arms should be prohibited from repairing to it, and from taking up their residence in any of its castles or houses of strength; that Mary should hold no correspondence, directly or indirectly, with any subject of England, without the permission of the English queen; that the earl of Northumberland, and the English rebels in Scotland, should be delivered up to Elizabeth; that redress should be given to the subjects of England for the spoils committed upon them by the Scottish borderers; that the murderers of lord Darnley and the earl of Murray should be punished; that, before the queen of Scots should be set at liberty, the young prince her son should be brought into England, and that he should continue in the keeping of Elizabeth till the death of his mother, or till her resignation to him of her crown on attaining his majority; that the queen of Scots should not enter into a negotiation for her marriage without the knowledge of the queen of England, nor conclude it without her approbation, or that of the greatest part of the Scottish nobility; that none of the subjects of Scotland should be suffered to go to Ireland without the safe conduct of Elizabeth; and that Mary should deliver to her all the testimonies and writings which had been sent from France, renouncing the pretended marriage between her and the duke of Anjou. Besides these articles, it was proposed by another treaty to adjust the differences of the queen of Scots and her subjects; and Sir William Cecil and Sir Walter Mildmay embraced the opportunity of conferring with her upon this business, under the pretence of facilitating its management in the future stages of its progress. During their stay at Chatsworth, these statesmen were completely satisfied with the behaviour of the queen of Scots. The candor, sincerity, and moderation, which she displayed, were full assurances to them, that, upon her part, there was no occasion to apprehend any improper policy or art; and the calamities of her condition were a still securer pledge of her compliance. Elizabeth, upon hearing their report, affected to be highly pleased with her sister, and sent a message to the earl of Lennox, instructing him in the conditions which had been submitted to Mary, and desiring him to dispatch commissioners into England to deliberate in the treaty, and to consult his interest and that of his faction. Nor did Mary neglect to transmit to her friends in Scotland the proposed terms of agreement; and the bishop of Ross, who had assisted her in the conferences with Sir William Cecil and Sir Walter Mildmay, conveyed intimations of them to the pope, the king of France, and the duke of Alva; besought their advice, and informed these princes that, unless an effectual relief could be expected from their favor, the necessities of her condition would compel her to subscribe to the hard and humiliating dictates of the queen of England.

But, while Mary and her friends were indulging the hope of a termination to her troubles, Elizabeth was secretly giving comfort to

her adversaries, and encouraging them to throw obstacles in the way of the treaty. Sir William Cecil wrote to the regent, expressing his disapprobation of the negotiations at Chatsworth; desiring him not to be apprehensive of the boasts of the adherents of the queen of Scots; and advising him to make choice of commissioners, in the name of the king, in whose constancy and fortitude he could rely. The earl of Sussex also sent him despatches, in which he admonished him to turn his anxious attention to the approaching negotiation, and to insist on secure stipulations for the preservation of the prince, for his own safety, and for a general indemnity to the nobles and their adherents, whose party he had espoused. In every event he represented it as proper for him to pay the greatest respect to Elizabeth; and, if no treaty should be concluded, he advised him to be prepared for reducing the friends of Mary to obedience, and for defending himself against invasions from abroad. By these artifices, the regent and his faction intimated to Elizabeth their dissatisfaction with the terms of agreement proposed to Mary; and Pitcairn abbot of Dunfermline, who had been appointed secretary of state in the room of Maitland of Lethington, was sent to her upon this business. He exclaimed against the treaty as wild and impolitic; and contended that no stipulations could bind Mary, whose religion taught her to keep no faith with heretics; that her claims to the English crown, and her resentment against the queen of England, as well as her own subjects, would, immediately upon her restoration, involve the two kingdoms in blood; and that no peace could be enjoyed, but by detaining her in close captivity. Elizabeth did not discourage these iniquitous sentiments; and Pitcairn was assured by her that from her natural love to the king, and her regard to the nobles, she would provide for their security, and maintain their quarrel and their consequence. Mary had been carried to Sheffield, and was recovering from a fever. To this place the bishop of Galloway and lord Livingston, who had been selected by her friends to be her acting deputies in England, repaired to impart to her the state of affairs in Scotland, and to receive her commands. After repeated conferences on the approaching treaty, she gave them her commission and instructions, and, joining them to the bishop of Ross, sent them to Elizabeth. They claimed an audience of this princess, and were admitted to it at Hampton-court. Having presented their credentials, they informed her that they were ready to conclude a treaty of concord and agreement, upon principles the most extensive and liberal; and, representing to her the impoverished and tumultuous state of their country, they begged her to proceed in the business with expedition. The orders, they said, which they had received, and their own inclinations, disposed them to follow her advice and counsel in all points which were honorable and consistent with reason; and, as her protection was the only refuge of the adversaries of their queen, it was completely in her power to put a period to all disturbances, and to accomplish an accord, which would not only confer upon her

the highest reputation, but be of the most signal utility to the two kingdoms. Elizabeth declared that it would please her highly to advance in the negociation ; and that it was a pain to her that the regent, by his delay in sending commissioners, should discover any aversion from it. This answer was deemed very favorable by the bishop of Ross and his associates ; and they obtained her authority to send a messenger to the regent to hasten his operations. In the mean time Mary received despatches from the pope, the king of France, and the duke of Alva ; and they concurred in recommending it to her to accept of the articles of accommodation offered by Elizabeth. The Turk was giving employment to the pope and the king of Spain : Charles IX., already enfeebled by the obstinate valor of the Huguenots, was busy in deceiving them with appearances of peace, and in plotting their massacre ; and the duke of Alva felt himself insecure in his government of the Netherlands. But, while they strongly advised Mary to conclude an agreement with the queen of England, they were yet lavish to her of their expressions of a constant amity ; and, if the treaty should miscarry, they promised to make the most strenuous exertions in her behalf, and to assist her adherents with money, ammunition, and troops. The earl of Morton, the abbot of Dumfermline, and Mr. James Macgill, had been appointed by the regent and his faction to be their commissioners in the name of the king ; and at length their arrival was announced to Elizabeth. They justified to her the deposition of the queen of Scots, and thus interrupted the progress of the treaty. In an elaborate memorial they affected to consider Mary as unworthy to reign, and asserted the constitutional power of the people to throw her down from royalty. They endeavoured to entrench themselves within the authority of laws, civil, canon, and municipal. But though the general position, that the people have a title to resist the domination of the sovereign is clear and undubitable, yet their application of it to the queen of Scots was wildly precarious and improper. To speak of her tyranny, and her violation of the rights of her people, was even a wanton mockery of truth and justice ; for, instead of having assumed an illegal exorbitancy of power, she had suffered in her own person and rights, and had been treated by her subjects with the most cruel and tyrannical insolence. Elizabeth, who was afraid to enter anew into the conduct of Mary, who was fully sensible of the insolence of her adversaries, and who did not approve of any maxims that pressed against the majesty of princes, received their memorial with surprise and indignation. She perceived not, she told them, any reason that could vindicate the severity which had been shown to the queen of Scots by her enemies ; and advised them to consider that in the present negociation it was their proper business to consult the security of the king and of their faction. Upon the part of Elizabeth, the commissioners were the lord keeper Bacon, the earls of Sussex and Leicester, lord Clinton, lord chamberlain, Sir William Cecil (now lord Burleigh), Sir Francis Knollys, Sir James Croft, Sir Walter

Mildmay, and Sir Thomas Smith. The deputies of Mary were invited to meet with the English commissioners in the house of the lord keeper ; and, after he had stated the general purposes of the treaty, he intimated to them that there were two points which required a particular discussion. A proper security, he said, ought to be given by the queen of Scots for her due performance of the stipulations of the agreement with Elizabeth ; and it was expedient to concert the mode of the pardon and indemnity which she was to extend to the subjects of Scotland who had offended her. As an assurance of the accommodation with his mistress, he demanded that the duke of Chatelherault, the earls of Huntly and Argyll, the lords Hume and Herries, with another person of high rank, should be surrendered to her, and remain in England for three years ; that the castles of Dumbarton and Hume should be in her possession during the same period ; and, as to the delivery of the prince into her custody, he observed that it would be required from the regent, the queen of Scots not having the power of its performance. The deputies of Mary, surprised with his language, intreated the English delegates to reflect that their queen, if deprived of the most faithful of her nobles, and of her strongest forts, could have little desire to return to her own kingdom ; for she would thus be unable to protect herself against the turbulence of her subjects, and be a sovereign without friends and without strength. They were inclined, they said, to act upon their commission and powers to the utmost extent to gratify Elizabeth ; and they would agree that two earls and two barons should be surrendered for two years, as hostages of the fidelity of their sovereign, under the restriction that they might be exchanged every six months for persons of an equal condition. As to the giving up of any forts or castles, they would not agree to it, because, among the other inconveniences of this measure, similar claims would be competent to the king of France, by the spirit of the treaty of Edinburgh, which stipulated that no French or English troops should be admitted into Scotland. The lord keeper Bacon told them that the whole kingdom of Scotland was an inadequate pledge, and that, if his advice would be followed, the queen of Scots should not obtain her liberty upon any kind of security which could be granted by the Scottish nation. In all public treaties, said the delegates of Mary, no further assurances can be required from a sovereign than what consists with his safety ; and, when exactions are pressed from a contracting party in a league which are ruinous and impossible, a foundation is sought to break off the negociation. The English commissioners now, interfering in a body, declared upon their honor that it was the meaning of Elizabeth to agree to the restoration of the queen of Scots to her crown and realm, upon receiving sufficient assurances for the articles of the accommodation ; that the security offered for her acceptance should be submitted to her deliberation ; and that they would immediately proceed to confer with the deputies for the king of Scots. The English commissioners were not unacquainted with the sentiments of the earl of Mor-

ton and his colleagues; and it was from this quarter that they expected a resolute and definitive interruption to the treaty. Nor did these delegates disappoint their expectations. After affecting to take a comprehensive view of the articles under debate, they declared that their commission gave them authority to treat about the amity of the two kingdoms, and the maintenance of the true religion; but that it conferred upon them no power to receive their queen into Scotland, or to surrender to Elizabeth the person of their king. They therefore begged not to be urged to accede to a league which, in some future period, might expose them to a charge of high treason. This singular declaration was considered to be solid and weighty by the English commissioners; and, in a new conference, it was communicated by them to the deputies of Mary. The bishop of Ross and his associates were disgusted with this formal impertinence. They did not hesitate to pronounce it to be an unworthy and most frivolous subterfuge. The authors, they said, of the deposition of their sovereign did not need any authority but their own to set her at liberty; the prince was not yet five years of age, and could give them no instructions; and the regent was wholly dependent upon the will and pleasure of the queen of England. It was replied by the English delegates that the commission of king James to his deputies, having been perused by Elizabeth, was accounted by her to be insufficient; and that it was her opinion that the earl of Morton should return to Scotland to hold a parliament for obtaining new powers. The bishop of Ross exclaimed that the queen of Scots had been amused with deceitful promises, that the prudence of Elizabeth had been corrupted by partial counsels, and that the pretences for interrupting the negotiation were affected and unreal. The instructions, he said, from his sovereign to her commissioners were to negotiate and conclude, and not to trifle; and they would not consent to protract, by artificial delays, a treaty which the queen of England, if her intentions were sincere, could immediately terminate upon reasonable and honorable terms. His speech and his demeanor he acknowledged to be free and open; and he besought them to excuse him, since, having been made an instrument to abuse his mistress with false hopes, he could not but resent the indignity, and express what he knew and what he felt. The English deputies, addressing him and his colleagues, observed that as the friends of Mary, and those of the king her son, could not come to an agreement, and as their queen was refused the assurance she expected, they held their commission to be at an end, and were no longer at liberty to negotiate. The insincerity of Elizabeth, and the failure of the league or agreement, filled Mary with resentment and complaints. Her animosities and those of Elizabeth were increased. She was in haste to communicate to her allies the unworthy treatment she had received; and she sent her commands to her adherents in Scotland to rise up in arms, to repose no trust in truces which were prejudicial and treacherous, and to employ all their resources and strength in the humilia-

tion of the regent and his faction. Elizabeth, who by this time apprehended no danger from Charles IX., or the duke of Alva, resolved to give a strong and effectual support to the king's friends, and to disunite by stratagem, and oppress by power, the partisans of the Scottish princess. The zeal of the bishop of Ross having raised her anger, she commanded him to depart from London; and Mary, in contempt of her mandate, ordered him to remain there under the privilege of her ambassador. The high and unbroken spirit of the Scottish queen, in the midst of her misfortunes, never once awakened the generous admiration of Elizabeth. While it uniformly inflamed her rage, it seems also to have excited her terror. With a pusillanimous meanness, she sent a despatch to the earl of Shrewsbury, instructing him to keep his charge in the closest confinement, and to be incessantly on his guard to prevent her escape. He obeyed, and regretted her severity. The expense, retinue, and domestics of the queen of Scots, were diminished and reduced, and every probable means by which she might endeavour to obtain her liberty were removed from her. The rigors, however, that invaded her person could not reach her mind; and she pitied the tyrant that could add distress to oppression, and deny her even the comforts of a prison. All this time Scotland was involved in the miseries of civil war. The friends of Mary were every where punished with fines and forfeitures. Private families took the opportunity of the public confusion to revenge their quarrels against each other. Individuals of every denomination ranged themselves on the side either of the regent or of the queen, and took a share in the hostilities of their country. Acts of outrage and violence were committed in every quarter, while, amidst the general confusion, religion was made the pretence by both parties. Meantime, though many encounters took place between the two factions, yet neither party seems to have been conducted by leaders of any ability or skill in military affairs. This year, in one of these skirmishes, the regent himself was taken prisoner by a party of the queen's faction, and put to death. But this event made little change in the affairs of the nation.

The earl of Mar, another of the queen's enemies, was chosen to the regency; but, though he proposed to act against her party with rigor, he was baffled before Edinburgh castle, which was still held by her friends; and some bloody skirmishes were fought in the north, where victory declared in favor of the queen. These advantages, however, were more than compensated to the other party by the following event. While the negotiations with Elizabeth for Mary's restoration were depending, the scheme of a conspiracy for her deliverance was communicated to her by Robert Ridolphi, a Florentine, who lived in London many years as a merchant, and who was secretly an agent for the court of Rome. But to his letters, while the fate of the treaty was uncertain, she returned no reply. Its miscarriage, through the duplicity of Elizabeth, recalled them forcibly to her attention, and stimulated her to seek the accomplishment of her

liberty by measures bolder and more arduous than any which had been hitherto employed by her. She drew up in cipher an ample description of his communications and of her situation, and despatched it to the bishop of Ross, together with letters for the duke of Norfolk.

Her instructions to this ecclesiastic were to convey these papers and letters expeditiously to Norfolk, and to concert an interview between that nobleman and Ridolphi. The confidential servants by whom the duke acted with the bishop of Ross were Bannister and Barker; and, having received from them the paper, they were deciphered by Hickford, his secretary. Having considered them maturely, he delivered them to Hickford, with orders to commit them to the flames. But his orders were disobeyed; and Hickford deposited them, with other papers of consequence, under the mats of the duke's bed-chamber. The contents of these communications awakening the hope and ambition of Norfolk, he was impatient to see Ridolphi; and the bishop of Ross soon brought them together. Ridolphi, whose ability was inspired by motives of religion and interest, exerted all his address to engage the duke to put himself at the head of a rebellion against his sovereign. He represented to him that there could not be a season more proper than the present for achieving the overthrow of Elizabeth. Many persons who had enjoyed authority and credit under her predecessor were much disgusted; the Roman Catholics were numerous and incensed; the younger sons of the gentry were languishing in inaction; and there were multitudes disposed to insurrection from the love of change, and the ardor of enterprise. He insinuated that his rank, popularity, and fortune, enabled him to take the command of such persons with advantage; and painted out the glory he might purchase by the humiliation of his enemies, and by his marriage with the queen of Scots. To give strength to these considerations he produced a long list of noblemen and gentlemen, whom he affirmed to be ready to hazard their lives for a revolution, if the duke would enter into it with cordiality. He also mentioned the aid with which he might flatter himself from abroad. The pope he assured him had already provided 100,000 crowns for the enterprise; and, if popery should be advanced in England, he would cheerfully defray the whole charges of the war. The king of Spain would supply 4000 horse and 6000 foot, which might be landed at Harwich; and Charles IX. was devotedly attached to the queen of Scots. In fine, he urged that, while he might depend on the assistance and arms of the greatest princes of Christendom, he would entitle himself to the admiration of all of them by his magnanimous efforts and generous gallantry in the cause of a queen so beautiful and so unfortunate. The duke, allured by appearances so plausible, forgot the submissive obligation in which he had bound himself to Elizabeth never more to interfere in the affairs of the Scottish princess. Ridolphi, in this forward state of the business, advised him to write to the pope, the king of Spain, and the duke of Alva, expressive of his concurrence in the design, and inspiring

their activity and resolutions. He even produced letters framed for this purpose; and, while he entreated the duke to subscribe them, he offered to carry them himself to Flanders, Rome, and Spain. The duke, who was ambitious and timid, disposed to treason, and unfit for it, refused to subscribe the letters; but he allowed the bishop of Ross and Barker his servant to go to the Spanish ambassador to express his approbation of the measures of Ridolphi, to acknowledge that the letters were according to his mind, and to empower this statesman to certify their authenticity to his court. Ridolphi, full of hopes, set out to execute his commission. He passed first to the duke of Alva, to whom he communicated the transactions in which he had been engaged, and with whom he held many conferences. There was at this time at Brussels Charles Bailly, a servant of queen Mary's; and Ridolphi, after disclosing to him his proceedings with Alva, entrusted him with letters to her, to the duke of Norfolk, the Spanish ambassador, and the bishop of Ross. When this messenger reached Calais, a letter was delivered to him from the bishop of Ross, desiring him to leave his despatches with the governor of that place. But he neglected this notice; and, being searched at Dover, his letters, books, and clothes were seized, and he himself was sent to London, and imprisoned in the Marshalsea. The bishop of Ross, full of apprehensions, applied to lord Cobham, the warden of the cinque ports, who was friendly to the duke of Norfolk; and, obtaining by his means the packet of despatches from Ridolphi, substituted another in its place, which contained letters of no danger or usefulness. He also sent intelligence of this manoeuvre to Bailly, and admonished him to preserve a profound silence. This simple and unpractised agent had, however, excited suspicions by the symptoms of terror he had exhibited upon being taken, and by exclaiming that the despatches he brought would involve his own destruction and that of others. At his first examination he confessed nothing; but being sent to the tower, and put upon the rack, he revealed his conversations with Ridolphi, and declared that the despatches which he had brought had been delivered to the bishop of Ross. An order was granted for taking the bishop into custody. Having been aware, however, of his perilous situation, his house was searched in vain for treasonable papers; and he thought to screen himself from answering any interrogatories under the sanctity of his character as the ambassador of an independent princess. An unexpected incident excited in the meanwhile new suspicions. Mary being desirous of transmitting 2000 crowns to lord Herries, to advance her interests in Scotland, the duke of Norfolk undertook to convey it to him with safety. He entrusted it to the charge of his confidants Hickford and Barker, who putting it into a bag with despatches from their master to lord Herries, ordered a servant called Brown to carry it to Bannister; who, being at this time on the border, could forward it to Scotland. Brown, suspicious or corrupted, instead of proceeding on his errand, carried the bag and its contents to lord Burleigh. The

privy council, deeming it treason to send money out of the realm for the use of the friends of Mary, whom they affected to consider as enemies, ordered Hickford and Barker to be apprehended. The rack extorted from them whatsoever they knew to the prejudice of their master. Hickford gave intelligence of the fatal communications from Mary; which he had villainously preserved in opposition to the orders given to him. All the proceedings between the queen of Scots, the duke of Norfolk, the bishop of Ross, and Ridolphi, were brought to light. A guard was placed upon the house of the duke to prevent his escape. Sir Ralph Sadder, Sir Thomas Smith, Sir Henry Nevil, and Dr. Wilson, were commissioned to examine him; and, in the belief that the papers and letters so often alluded to had been destroyed, he denied that he had any concern in the affairs of the queen of Scots, or any knowledge of them. He was committed to the tower a close prisoner. Bannister by this time was taken; and he confirmed the relations of Hickford and Barker. In the course of their discoveries, the earls of Arundel and Southampton, lord Cobham, Mr. Thomas Cobham, his brother, Sir Thomas Stanley, Sir Henry Percy, and other gentlemen who were friendly to the queen of Scots and the duke of Norfolk, were apprehended and ordered to be lodged in different prisons; and the rack, and the expectation of a pardon, drew from them the fullest confessions. The duke was unable to defend himself. The concurring testimonies of his friends and servants, with the papers, which he fondly imagined had been burnt, were communicated to him. He was overwhelmed with amazement, and exclaimed that he had been betrayed. He made ample acknowledgments of his guilt, and had no hope but in the mercy of his sovereign. By the confession of the duke himself, and from all the enquiries which had been made by the ministers of Elizabeth, it appeared obvious that the bishop of Ross had been the principal contriver of the conspiracy. Ridolphi had acted under his direction, and he had inspired the duke of Norfolk. He had even advised that nobleman to put himself at the head of a select band to seize the person of Elizabeth. In his examinations the bishop was treated with great rigor and insult. But he made an able defence, and peremptorily refused to make any answer to interrogatories. The counsellors of Elizabeth were disturbed with his obstinacy; and, having told him that the rack would soon render him more pliant, he was ordered into close keeping in a dark apartment of the tower. In a few days four privy counsellors, the lord admiral, lord Burleigh, Sir Francis Knollys, and Sir Thomas Smith, went to the tower, and caused him to be brought to them to the lieutenant's lodging. After having assured him that he was charged by all the prisoners as the principal contriver of the conspiracy, they insisted that he should explain fully the part he had acted. The confessions of the duke of Norfolk and his servants, of the lord Lumley, Sir Thomas Stanley, and other gentlemen, with the despatches of the queen of Scots, were set before him. They now protested upon their honor that, if he would make a free and open declaration of his proceed-

ings, it should neither be employed against himself, nor any other person: but that, if he should continue resolute in refusing to give this satisfaction to their queen, she would absolutely consider him as a private person, and order him to be tried and executed as a traitor. In this extremity he accepted the conditions, and disclosed minutely all the transactions of the principal parties in the conspiracy. But, while he described the offences of his mistress, the duke of Norfolk, and himself, he made many apologies for their conduct. It was natural, he said, for the queen of Scots to exert her most strenuous endeavours to recover her freedom and crown; and the methods she adopted to obtain her purposes ought to be considered in connexion with the arts of Elizabeth, who pertinaciously denied her access to her presence, who kept her a close prisoner, in contempt of all the principles of humanity and justice, and who afforded an open and powerful assistance to her enemies. The duke of Norfolk he was earnest to excuse, on the foundation of the advances which had been made in his marriage with the queen of Scots. Their plighted love, and their engagements, did not allow him to forsake her. As for himself, he was her ambassador and her servant; and, being highly indebted to her generosity and kindness, he could not abandon her in captivity and distress, without incurring the guilt of the most sinful treachery and ingratitude. The daring proposal he had made to seize the person of Elizabeth was the point, he observed, which seemed to press upon him the most severely: and he entreated them to believe that he had moved it only with the view of trying the courage of the duke of Norfolk. The privy counsellors of Elizabeth were now in possession of all the evidence they could expect. Norfolk was admonished to prepare for his trial; and bishop Lesley perceived that, though he might escape with his life, he would never more be permitted to reside in England as an ambassador or friend of the queen of Scots. The defeat of the duke of Norfolk's conspiracy was a blow to Mary which she could never recover. Her most faithful friends were languishing in prisons upon her account; she had no longer the counsels of the bishop of Ross; and the Spanish ambassador, who had entered into her concerns with an unscrupulous cordiality, had been ordered to withdraw from England. The trial and condemnation of Norfolk soon followed, and plunged her into the most calamitous distress.

The massacre of the Protestants at Paris in 1572 proved also extremely detrimental to queen Mary. It was interpreted to be a consequence of the confederacy which had been formed at Bayonne for the extermination of the reformed. The Protestants were every where transported with rage against the papists. Elizabeth prepared herself against an attack from the Roman Catholic powers; and was haunted with the notion that they meant to invade her kingdom, and to give it to the queen of Scots. Her ambassador at Paris, Sir Francis Walsingham, augmented her apprehensions and terror. He compared her weakness with the strength of her enemies, and assured her that, if they should

possess themselves of Scotland, she would soon cease to be a queen. He represented Mary as the great cause of the perils that threatened her personal safety and the tranquillity of her kingdom; and, as violent diseases required violent remedies, he scrupled not to counsel her to unite Scotland to her dominions, and to put to death a rival whose life was inconsistent with her security. The more bigoted protestants of Scotland differed not widely in their sentiments from Sir Francis; while the more moderate were still more attached to their religion than to Mary; and, amidst the indignation and horror into which the subjects of Scotland were thrown by the sanguinary outrages of Charles IX. and Catharine de Mediciis, they surveyed the sufferings of their sovereign with a diminished sympathy. This year the regent, finding himself beset with difficulties which he could not overcome, and the affairs of the nation involved into confusion from which he could not extricate them, died of melancholy, and was succeeded by the earl of Morton. During the regency of the earl of Mar, a remarkable innovation took place in the church, which deserves to be particularly explained, being no less than the introduction of Episcopacy instead of the Presbyterian form of worship.

While the earl of Lennox was regent, the archbishop of St. Andrew's was put to death, because he was strongly suspected to have had some concern in the death of the earl of Murray; after which the earl of Morton procured a grant of the temporalities of that see. Out of these he allotted a stipend to Mr. John Douglas, a Protestant clergyman, who took upon him the title of archbishop. This excited censure and murmurs. In the language of the times, it was pronounced to be a profanation of the kirk, and a high contempt of God; it underwent the scrutiny of the ministry in complaints to the regent; and a commission of privy-counsellors and clergymen was appointed, in the name of the king, to enquire into it, and to reform and improve the policy of the church. This commission, upon the part of the privy council, consisted of the earl of Morton, the lord Ruthven, Robert abbot of Dunfermline, Mr. James Macgill, Sir John Ballenden, and Colin Campbell of Glenorchie; and, upon the part of the church, were Messrs. John Erskine of Dun, John Winram, Hay, Lindsay, Pont, and John Craig. The consultations and debates were long; but the influence of the earl of Morton directed their determinations. It was resolved that, till the majority of the king, or till the wisdom of the three estates should be consulted, the titles of archbishop and bishop should continue as in the times which preceded the reformation; that a chapter of learned ministers should be annexed to every metropolitan or cathedral seat; that the sees, as they became vacant, should be given to those of the Protestant ministry who were most eminent for their qualifications; that the archbishops and bishops should exercise no higher jurisdiction than was permitted to superintendants; and that they should be subject to the control of the general assemblies of the church; that all abbots, priors, and other inferior prelates presented to

benefices, should be examined by the bishop of the diocese; and that their fitness to represent the church in parliament should be enquired into; that the king and the regent should recommend qualified persons to vacant bishoprics; that the elections of them should be made by the chapters of the respective cathedrals; that all benefices with cure under prelaties should be disposed to officiating ministers; and that the bishops and superintendants, upon the ordination of ministers, should exact an oath from them to recognise the authority of the king, and to pay canonical obedience to their ordinary in all things that were lawful. By these artful regulations the earl of Morton did not mean solely to consult his own rapacity or that of the nobles. The exaltation of the Protestant church to be one of the three estates was a consequence of them; and, the clergy being the strenuous enemies of Mary, he might by their means secure a decided influence in parliament. The earl of Mar, as regent, giving his sanction to the proceedings of the commission, they were carried into practice. The delusive expectation of wealth, which this revival of episcopacy held out to the ministry, was flattering to them; and they bore with tolerable patience this severe blow that was struck against the religious policy of Geneva. Mr. John Douglas was elected, notwithstanding the opposition made by John Knox and other ecclesiastics, who stood up for the rules established at the reformation. He was inaugurated by the bishop of Caithness, Mr. John Spotswood, and Mr. David Lindsay, who, violating the book of discipline, communicated to him his admission by the imposition of hands. This was a singular triumph of episcopacy; yet Douglas was in a very advanced age; and his mental qualifications, which had never been eminent, were in a state of decay. A general assembly, held at St. Andrews, considering the new regulations, appointed commissioners to go to John Knox, who was indisposed, and to consult with him whether they were agreeable to the word of God. But from the arts of the nobles, or from the sickness of Knox, this conference was not carried into execution. In a general assembly, however, which met at Perth, the new polity was reported and examined. The titles of archbishop, dean, arch-dean, chancellor, and chapter, were excepted against as popish distinctions. A wish was expressed that they might be exchanged for titles less profane and superstitious; and a unanimous protestation was made that the new polity was merely a temporary expedient, and should only continue till a more perfect order should be obtained from the king, the regent, and the nobility. This tolerating resolution left the new polity in its full force; and a foundation was now established for the laity to partake in the profits of bishoprics. The simoniacal paction of Morton and Douglas was not long singular. Mr. James Boyd was appointed to the archbishopric of Glasgow, James Paton to the bishopric of Dunkeld, and Mr. Andrew Graham to the see of Dumblain; these compromising ecclesiastics, upon being allowed competencies to themselves, gratified their noble friends with a proportion of their revenues. The people, however, approved not

this simoniacal spirit of traffic; and the bishops of the new polity were treated openly with reproach or ridicule. The year 1572 is remarkable for the death of John Knox, whose mistaken zeal had contributed to bring upon the queen many of those misfortunes with which she was now oppressed.

Neither by his death, however, nor by the change of the regency, could she now be relieved. The earl of Morton was so much devoted to Elizabeth that he received particular instructions from her how to guide the young king. His elevation, indeed, gave the finishing stroke to the queen's affairs. He employed himself with success in dividing her party among themselves, and induced the duke of Chatellerault and the earl of Huntly to forsake her. As for Elizabeth, she was bent on putting Mary to death; but, as no crime could be alleged against her in England, she thought it proper that she should be carried back to suffer death in her own dominions. This proposal, however, was rejected; and the friends who remained true to Mary once more began to indulge themselves in hopes of succors from France. New misfortunes, however, awaited them. The castle of Edinburgh, which had hitherto been held for the queen by Kirkaldy of Grange, was obliged to surrender to an English army commanded by Sir William Drury. Kirkaldy was solemnly assured by the English commander of his life and liberty; but Elizabeth violated this capitulation, and commanded him to be delivered up to the regent; 100 of his relations offered to become vassals to Morton, and to pay him 3000 merks yearly, if he would spare his life; but in vain: Kirkaldy and his brother Sir James were hanged at Edinburgh. Maitland of Lethington, who was taken at the same time, was poisoned in the prison-house of Leith. The jealousy of Elizabeth did not diminish with the decline of Mary's cause. She now treated her with more rigor than ever, and patronised Morton in all the enormities which he committed against her friends. Lesly, bishop of Ross, had been long imprisoned in England, on account of his concern in the duke of Norfolk's conspiracy. Morton earnestly solicited the queen to deliver him up, and would undoubtedly have put him to death; but, as he had acted in the character of ambassador from Mary, he was suffered to depart for France. When he arrived there he endeavoured in vain to stir up the emperor, the pope, and the duke of Alva, to exert themselves in behalf of the queen of Scotland; and in 1574 the misfortunes of his royal mistress were farther aggravated by the death of Charles IX. of France, and her uncle the cardinal of Lorraine. The regent, in the mean time, ruled with the most despotic sway. He twice coined base money in the name of his sovereign; and, after putting it into circulation the second time, he issued orders for its passing only for its intrinsic value. The duke of Chatellerault happening to die this year, the regent took every method of ruining all those of his name and family. He committed to prison all the Hamiltons, and every person of distinction who had fought for the queen at the battle of Langside, and compelled

them to buy their liberty at an exorbitant price. He instigated Douglas of Lochleven to assassinate lord Arbroath, and it was with difficulty that the latter escaped the ambush laid for him. Reid, bishop of Orkney, having left his estate to charitable uses, the regent prohibited the execution of the will, and took upon himself the administration. To be rich was a sufficient crime to excite his vengeance. He entered the warehouses of merchants, and confiscated their property; and, if he wanted a pretence to justify his conduct, the judges and lawyers were ready at his call.

In this disastrous period the clergy augmented the general confusion. Andrew Melvil had lately returned from Geneva; and, the discipline of its assembly being considered by him as the most perfect model of ecclesiastical polity, he was much offended with the introduction of episcopacy into Scotland. His learning was considerable, and his skill in languages profound. He was fond of disputation, violent, and pertinacious. The Scottish clergy were in a humor to attend to him; and his merit was sufficient to excite their admiration. Instigated by him, John Drury, one of the ministers of Edinburgh, called in question, in a general assembly, the lawfulness of the bishops, and the authority of chapters in electing them. Melvil, after commending his zeal and his motion, declaimed concerning the flourishing state of the establishment of Geneva; and, having recited the opinions of Calvin and Beza upon ecclesiastical government, maintained that there should be no office-bearers in the church whose titles were not in the book of God. He affirmed that the term bishop was no where to be found in it in the sense in which it was commonly understood, as Christ allowed not any superiority among ministers. He contended that Christ was the only lord of his church, and that the ministers of the word were all equal in degree and power. He urged that the bishops, beside being unlawful, had grown unseemly with corruptions; and that, if they were not removed out of the church, it would fall into decay, and endanger the interests of religion. His sentiments were received with flattering approbation; and, though the archbishop of Glasgow, with the bishops of Dunkeld, Galloway, Brechin, Dumbain, and the Isles, were present in this assembly, they ventured not to defend their vocation. It was resolved that the name of bishop conferred no distinction or rank, and that the office was not more honorable than that of the other ministers. The episcopal estate in the meanwhile was watched with anxious observation; and faults of every kind, which were found in individuals, were charged upon the whole order. In a new assembly this subject was again canvassed. It was moved, whether bishops, as constituted in Scotland, had any authority for their functions from the Scriptures? After long debates, it was thought prudent to avoid an explicit determination of this important question. But a confirmation was bestowed upon the resolution of the former assembly; and it was established as a rule, that every bishop should make choice of a particular church within his diocese, and should

actually discharge the duties of a minister. The regent, disturbed with these proceedings of the brethren, was disposed to amuse and to deceive them. He sent a messenger to advise them not to disfigure the established forms; adding that, if their aversion from episcopacy was insurmountable, it would become them to think of some other mode of ecclesiastical government. The assembly, taking the advantage of this message, intimated to him that they would frame a lasting platform of polity, and submit it to the privy-council. They appointed accordingly a committee of the brethren for this purpose; and in a short time Messrs. David Lindsay, James Lawson, and Robert Pont, were deputed to wait upon the regent with a new scheme of ecclesiastical government. The regent, taking from them their schedule, replied that he would appoint certain persons of the privy council to confer with them. A conference was even begun upon the subject, but, from his arts or the public troubles, no advances were made in it. This year the earl of Bothwell died in Denmark; and in his last moments is said to have confessed that he was guilty of the king's murder, revealed the names of the persons who were his accomplices, and, with the most solemn protestations, declared the honor and innocence of the queen. His confession was transmitted to Elizabeth by the king of Denmark.

The regent still continued his enormities, till, having rendered himself obnoxious to the best part of the nobility, he was, in 1577, compelled to resign his office into the hands of James VI.; but, as the king was then only twelve years of age, a general council of twelve peers was appointed to assist him in the administration. Next year, however, the earl of Morton having gained the favor of the young king, procured the dissolution of this council; and thus, being left the sole adviser of the king, he hoped to be raised to his former greatness. This could not be done, however, without keeping the king in a kind of captivity, so that nobody could have access to him but himself. The king, sensible

of his situation, sent a despatch to the earls of Argyll and Athol, intreating them to relieve him. An army for this purpose was soon raised, and Morton's partisans were in danger of being defeated, had not the opposite party dreaded the vengeance of Elizabeth, who was resolved to support the earl of Morton. In consequence of this a negotiation was entered into, by which it was agreed that the earl of Argyll with some others should be admitted into the king's council; and that four noblemen should be chosen by each party to consider of some proper method of preserving tranquillity in the nation. This pacification did not greatly diminish the power of Morton. He soon got rid of one of his principal antagonists, the earl of Athol, by poisoning him at an entertainment; after which he again gave a loose rein to his resentments against the house of Hamilton, whom he persecuted in the most cruel manner. By these means he drew upon himself a general hatred; and he was supplanted in the king's favor by the lord d'Aubigny, who came from France in 1579, and was created earl of Lennox. In 1580 Morton was

suspected of an intention to deliver up the king to Elizabeth, and a guard was appointed to prevent any attempts of this kind. The queen of England endeavoured to support her zealous partisan, but without effect. He was tried, condemned, and executed, for being concerned in the murder of Darnley. At the place of execution it is said that he confessed his guilt. It is certain that he acknowledged himself privy to the plot formed against the life of the king; and when one of the clergymen attending him before his execution observed that by his own confession he merited death in foreknowing and concealing the murder, he replied, 'Ay but, Sir, had I been as innocent as St. Stephen, or as guilty as Judas, I must have come to the scaffold. Pray, what ought I to have done in this matter? You knew not the king's weakness. If I had informed him of the plot against his life, he would have revealed it even to his enemies and those concerned in the design; and I should, it may be, have lost my own life, for endeavouring to preserve his.'

The elevation of king James, and the total overthrow of Morton, produced no beneficial consequences to the unfortunate Mary. In 1581 she addressed a letter to Castelnau, the French ambassador, in which she complained that her body was so weak, and her limbs so feeble, that she was unable to walk. Castelnau therefore intreated Elizabeth to mitigate the rigors of her confinement; which being refused, the latter had thoughts of resigning her claims to the crowns both of England and Scotland into the hands of her son, and even of advising him to use every effort in his power to establish his claim to the English crown as preferable to that of Elizabeth. But, being apprehensive of danger from this violent method, she again contented herself with sending to the court of England ineffectual memorials and remonstrances. Elizabeth, instead of taking compassion on her situation, assiduously encouraged every kind of disorder in the kingdom, on purpose to have the queen more and more in her power. Thus, the Scottish malcontents finding themselves always supported, a conspiracy was at last entered into, the design of which was to hold James in captivity, and to overthrow the authority of Arran and Lennox, who were now the principal persons in the kingdom. The chief actors in this were the earls of Gowrie, Mar, and Glencairn, the lords Lindsay and Boyd, with the masters of Glamis and Oliphant. Through the youth and imbecility of the king, they easily accomplished their purpose; and, having got him in their power, they promised him his liberty provided he would command Lennox to depart the kingdom. This was accordingly done; but the king found himself as much a prisoner as before. The more effectually to detain him in their custody, the rebels constrained him to issue a proclamation, wherein he declared himself to be at perfect liberty. Lennox was preparing to advance to the king's relief with a considerable body of forces, when he was disconcerted by the king's peremptory command to leave Scotland; upon which he retired to Dumbarton, to wait for a more favorable opportunity. The earl of Arran, being more forward,

was committed to close custody for some time, but afterwards confined only in his house of Kinneil. The rebels took upon them the title of lords for the reformation of the state. The clergy, who had all this time been exceedingly averse to episcopacy, now gave open countenance to the lords of the reformation. On the 13th of October, 1582, they made a solemn act by which the raid of Ruthven, as the capture of the king was called, was deemed a service most acceptable to all who feared God, respected the true religion, and were anxious for the preservation of the king and state; and every minister was commanded to declaim from his pulpit upon the expediency of this measure, and to exhort the people to concur with the lords in prosecuting the full deliverance of the church, and the perfect reformation of the commonwealth. Not satisfied with this, the conspirators got their proceedings approved by the states of Scotland, as a good, a thankful, and a necessary service to the king. At the same time it was enacted that no suit civil or criminal of any kind should ever be instituted against the persons concerned in it. Soon after this Lennox took his leave of Scotland, and sailed to France, where he died. The unfortunate Mary was driven to despair when she heard that her son was taken prisoner by rebels who had been instigated by Elizabeth. In this distress she addressed a most spirited letter to Elizabeth, in which she at once asserted her own innocence, and set forth the conduct of Elizabeth herself in such language as must have put the most impudent of her adversaries to the blush. Elizabeth had recourse to her usual arts of treacherous negotiation. New terms were proposed to Mary, who would gladly have submitted almost to any thing to procure her freedom. It was proposed, as had often been done before, to associate the queen of Scots with her son in the government; but as this was to be referred to the king, who was in the hands of Elizabeth's friends, and to the parliament, who were under the power of the same faction, it is easy to see that no such association ever could take place, or indeed was ever intended. After the death of Lennox, the conspirators apprehended no further danger, little supposing that a prince so young and unexperienced could deliver himself from captivity. This, however, in 1583, he effected in the following manner. A convention of the estates had been summoned to meet at St. Andrews; James, whom the earl of Arran, notwithstanding his confinement at Kinneil, had found means to instruct, pretended a desire of visiting his grand uncle the earl of March, who resided at St. Andrews, and was for that purpose permitted to repair thither a few days before the convention. The better to deceive the earls of Gowrie, Angus, and Mar, who attended him, he took up his lodgings in an old inn, which was quite open and defenceless. But, having expressed a desire to see the castle of St. Andrews, he was admitted into it; and colonel Stuart, who commanded the castle, after admitting a few of his retinue, ordered the gates to be shut. The earls of Argyle, Marischal, Montrose, and Rothes, who were in concert with the king, hastened to make him an offer of their swords. The opposite faction, being unprepared

for hostilities, were filled with consternation. Of all the conspirators, the earl of Gowrie alone was admitted into the king's presence, by the favor of colonel Stuart, and received his pardon. The earls of March, Argyle, Gowrie, Marischal, and Rothes, were appointed to be a council for assisting the king in the management of his affairs; and soon after this James set out for Edinburgh. The king no sooner found himself at liberty, than, by the advice of his privy council, he issued a proclamation of mercy to the conspirators; but they, flattering themselves with the hopes of support from Elizabeth, obstinately refused to accept of his pardon. In consequence of this they were denounced rebels. Elizabeth gave them all the encouragement she could, and the clergy uttered the most seditious discourses against the king and government; but, while they railed against popery, they themselves maintained openly the distinguishing tenet of popery, namely, that the clerical was entirely independent of the civil power. At last the rebels broke forth into open hostilities; but, by the vigilance of Arran, the earl of Gowrie, who had again begun his treasonable practices, was committed to custody; while the rest, unable to oppose the king, who appeared against them with a formidable army, were obliged to fly into England, where Elizabeth with her usual treachery protected them. The earl of Gowrie suffered as a traitor; but the severity exercised against him did not intimidate the clergy.

The clergy still continued their rebellious practices, until, the king being informed that they were engaged in a correspondence with some of the fugitive lords, citations were given to their leaders to appear before the privy-council. Not daring to appear they fled to England; and on the 20th of May, 1584, the king summoned a convention of the estates, on purpose to humble the pride of the church. In this assembly the raid of Ruthven was declared to be rebellion, according to a declaration which had formerly been made by the king. And, as it had grown into a custom with the promoters of sedition to decline the judgment of the king and the council, when called before them to answer for rebellious or contumelious speeches, uttered from the pulpit or in public places, an ordination was made, asserting that they had complete powers to judge concerning persons of every degree and function, and declaring that every act of opposition to their jurisdiction should be accounted treason. It was enacted that the authority of the parliament was full and supreme; and that every attempt to diminish, alter, or infringe its power, dignity, and jurisdiction, should be held and punished as treason. All jurisdictions and judgments, all assemblies and conventions, not approved of by the king and the three estates, were prohibited. It was ordained that the king might appoint commissioners to examine into the delinquencies of clergymen, and, if convicted, to deprive them of their benefices. It was commanded that clergymen should not for the future be admitted to the dignity of lords of session, or to the administration of any judicature civil or criminal. An ordination was made which subjected to capital punishment all persons who

should utter false and slanderous speeches in sermons, declamations, or familiar discourse, to the reproach and contempt of the king, his parents, and progenitors. It was further ordered that a guard, consisting of forty gentlemen, with a yearly allowance to each of £200, should continually attend upon the king. This parliament, which was full of zeal for the crown, did not overlook Buchanan's History of Scotland, which had excited a very general attention. It commanded that all persons who were possessed of copies of his history, and of his Treatise on the Scottish government, should surrender them within forty days, under the penalty of £200, that they might be purged of the offensive and extraordinary matters they contained. This stroke of tyranny was furious and ineffectual; foreign nations, as well as his own countrymen, were filled with the highest admiration of Buchanan. His writings were multiplied in every quarter; and the severity exercised against them only served the more to excite curiosity, and to diffuse his reputation.

While the parliamentary acts, which struck against the importance of the church, were in agitation, the ministers deputed David Lindsay to solicit the king that no statutes should pass which affected the ecclesiastical establishment, without the consultation of the general assembly. But the earl of Arran, having intelligence of this commission, defeated it, by committing Lindsay to prison as a spy for the discontented nobles. Upon the publication, however, of these acts by the heralds, Robert Pont minister of St. Cuthberts, and one of the senators of the court of session, with Walter Balcanquhall, protested formally in the name of the church, that it dissembled from them, and that they were consequently invalid; after which they fled, and were proclaimed traitors. By letters and pamphlets, artfully spread among the people, their passions were roused against the king and his council. All the clergy were commanded to subscribe a declaration, of the supremacy of the king over the church, and their submission to the authority of the bishops. On this, the national ferments increased in violence. Many ministers, refusing to subscribe, were deprived of their livings. It was urged that to make the king supreme over the church was no better than to set up a new pope, and to commit treason against Jesus Christ; that to overthrow assemblies and presbyteries, and to give dominion to bishops, was not only to overset the established polity of the church, but to destroy religion itself; for the bishops were the slaves of the court, schismatical in their opinions, and depraved in their lives. It was urged that the ministers alone were entrusted with ecclesiastical functions, and with the sword of the word; and that it was most wicked to imagine that Jesus Christ had ever committed the keys of the kingdom of heaven to civil magistrates. While the clergy were thus impotently venting their wrath, Elizabeth alarmed beyond measure at this sudden revolution, and terrified by a confession extorted by the rack from one Francis Throgmorton, concerning a combination of the Catholic princes to invade England, began to treat Mary in a more severe manner than

usual; and having gained over the earl of Arran, the only man of activity in Scotland, she resolved on further extremities. The Roman Catholics, at home and abroad, were inflamed against her with a boundless and implacable rage: there prevailed many rumors of plots and conspiracies against her kingdom and life. Books were published which detailed her cruelties and injustice to Mary in the most indignant language of reproach, and which recommended her assassination as a most meritorious act: the earl of Arran had explained to her the practices of the queen of Scots with her son, and had discovered the intrigues of the Catholic princes to gain him to their views. While her fears were thus excited, circumstances happened which confirmed them, and provoked her to give full scope to her malignity. Crichton, a Scottish Jesuit, passing into his own country, was taken by Netherland pirates; and some papers which he had torn in pieces and thrown into the sea, being recovered, were transmitted to England. Sir William Wade put them together, and they demonstrated that the invasion of England was concerted by the pope, the king of Spain, and the duke of Guise. About this time, too, a letter was intercepted from Mary to Sir Francis Englefield. She complained in it that she could have no reliance upon the integrity of Elizabeth, and that she expected no happy issue to any treaty which might be opened for her restoration and liberty. She urged the advancement of the great plot; she intimated that the prince her son was favorable to the design, and disposed to be directed by her advice; she entreated that every delicacy with regard to her own state and condition should be laid aside without scruple; and she assured him that she would most willingly suffer perils and dangers, and even death itself, to give relief to the oppressed children of the church. These discoveries, so exasperating to Elizabeth, were followed by a deep and general consternation. The terror of an invasion spread with rapidity over England; and the Protestants, while they trembled for the life of their champion, were still more alarmed with the dangers which threatened their religion. In this state of perplexity and distraction, the counsellors of Elizabeth, who had been her instruments in persecuting the queen of Scots, and of her severities to the Roman Catholics, were sensible that her greatness and safety were connected with their own; and they concurred in indulging her fears, jealousies, and resentments. It was resolved that Mary should perish. An association was formed, to which persons of every condition and degree were invited, for the preservation of the life of Elizabeth, which it was affirmed was in danger, from a conspiracy to advance some pretended title to the crown; and its members vowed, by the majesty of God, to employ their whole power, bodies, lives, and goods, in her service; to withstand all persons, of whatsoever nation or rank, who should attempt in any form to invade and injure her safety or her life, and to prosecute to destruction any pretended successor, by whom, or for whom, the assassination of Elizabeth should be attempted or committed. The earl of Leicester was the patron of

this association; and the whole influence of Elizabeth and her ministers was exerted to multiply the subscriptions. A combination so resolute and so fierce, which pointed to the death of Mary, which threatened her titles to the crown of England, and which might defeat the succession of her son, could not fail to excite in her bosom the bitterest anxiety and perturbation. Weary of her sad and long captivity, broken down with calamities, dreading afflictions still more cruel, and willing to take away from Elizabeth every possible pretence of severity, she now framed a scheme of accommodation, to which no decent or reasonable objection could be made. By Naw, her secretary, she presented it to Elizabeth and her privy-council. She protested in it that, if her liberty should be granted to her, she would enter into the closest amity with Elizabeth, and pay an observance to her above every other prince of Christendom; that she would forget all the injuries with which she had been loaded, acknowledge Elizabeth to be the rightful queen of England, abstain from any claim to her crown during her life, renounce the title and arms of England, which she had usurped by the command of her husband the king of France, and reprobate the bull from Rome which had deposed the English queen. She likewise protested that she would enter into the association which had been formed for the security of Elizabeth; and that she would conclude a defensive league with her, provided that it should not be prejudicial to the ancient alliance between Scotland and France; and that nothing should be done during the life of the English queen, or after her death, which should invalidate her titles to the crown of England, or those of her son. As a confirmation of these articles, she would consent to stay in England for some time as an hostage; and, if she was permitted to retire from England, she would surrender proper and acceptable persons as sureties. She also engaged that she would make no alterations in Scotland; and that, upon the repeal of what had been enacted there to her disgrace, she would bury in oblivion all the injuries she had received from her subjects; that she would recommend to the king her son those counsellors who were most attached to England, and that she would employ herself to reconcile him to the fugitive nobles: that she would take no steps about his marriage without acquainting the queen of England; and that, to give the greater firmness to the proposed accommodation, he should be called as a party to it: in fine, that she would procure the king of France and the princes of Lorraine to be guarantees for the performance of her engagements. Elizabeth, with great hypocrisy, professed the greatest satisfaction and joy at these overtures. She made no advances, however, to conclude an accommodation with Mary; and her ministers and courtiers exclaimed against lenient and pacific measures. It was insisted that the liberty of the Scottish queen would be the death of Elizabeth: that her association with her son would be the ruin both of England and Scotland; and that her elevation to power would extend the empire of popery, and give a deadly blow to the doctrines of the reformation. In the

mean time an act of attainder had passed against the fugitives nobles, and their estates and honors were forfeited to the king; who, not satisfied with this, sent Patrick master of Gray to demand a surrender of their persons from the queen of England. As this ambassador had resided some time in France, and been intimate with the duke of Guise, he was recommended to Mary: but being a man of no principle he was easily corrupted by Elizabeth; and, while he pretended friendship to the unfortunate queen, discovered all that he knew of the intentions of her and her son. The most scandalous falsehoods were forged against Mary; and, the less she was able to execute, the more she was said to design. That she had an amour with her keeper the earl of Shrewsbury, as was now reported, was possible, but of this there was no proof. This, however, could be no treason against Elizabeth: yet, on account of this, Mary was committed to the charge of Sir Amias Paulet and Sir Drue Drury, zealous puritans, who would treat her with that strict severity which might drive her to despair, and induce her to commit some rash action.—The earl of Leicester, said to be Elizabeth's paramour, even ventured to send assassins, on purpose, by the murder of Mary, at once to deliver his mistress from her fears. But the new keepers of the castle, though religious bigots, were men of strict probity, and rejected with scorn such an infamous proposal.

In 1585 Mary began to feel all the rigors of a severe imprisonment. She had been removed from Sheffield to the castle of Tutbury; and under her new keepers she experienced a treatment which was in the highest degree unjust, disrespectful, and acrimonious. Two apartments or chambers only were allotted to her, and they were small and inconvenient, meanly furnished, and so full of apertures and chinks that they could not protect her against the inclemencies of the weather. The liberty of going abroad for exercise was denied to her. She was assailed by rheumatisms and other maladies; and her physician would not undertake to effect a cure unless she should be removed to a more commodious dwelling. Applications for this purpose were often made, but uniformly rejected. Here, however, her own afflictions did not extinguish in her mind her sensibility for the misfortunes of others; and she often indulged herself in the satisfaction of employing a servant to go through the village in search of objects of distress. But her inhuman keepers, envying her this pleasure, commanded her to abstain from it. Imputing their rigor to a suspicious fidelity, she desired that her servant might, on these occasions, be accompanied by one of the soldiers of their guard, or by the constable of the village. But they would not alter their prohibition. To insult her the more, the castle of Tutbury was converted into a common jail: and a young man, whose crime was the profession of the Romish religion, was committed to a chamber which was opposite to her window, that he might be persecuted in her sight. He was dragged every morning to join in the Protestant worship; and, after enduring several weeks this extraordinary violence to his conscience, was strangled, it is said, without any

form of law. Mary remonstrated to Elizabeth against indignities so shocking and so horrible; but in vain. In the midst of her misfortunes, however, she had still solaced herself with hope, from the exertions of her son. He had hitherto behaved with a becoming cordiality; and, in the negotiation which she had opened with him for her association in the government, he had been studious to please her. He had informed her that he found the greatest comfort in her maternal tenderness, and that he would accomplish her commands with humility and expedition; that he would not fail to ratify her union and association with him in the government; that it would be his most earnest endeavour to reconcile their common subjects to that measure; and that she might expect from him, during his life, every satisfaction and duty which a good mother could promise to herself from an affectionate and obedient son. But these fair blossoms of kindness were all blasted by the arts of Elizabeth. The master of Gray had now obtained an ascendancy over James. He delayed to ratify her association in the government; and he even appeared unwilling to press Elizabeth for her liberty. The master of Gray had convinced him that, if any favor was shown to Mary by the queen of England, it would terminate in his humiliation. He assured him that, if his mother were again to mount the Scottish throne, her zeal for Popery would induce her to seek a husband in the house of Austria; that she would dissolve his association with her in the government, on the pretence of his attachment to the reformed doctrines; and that he would not only lose the glory of his present power, but endanger his succession. Mary expostulated with him by letter upon the timidity of his behaviour; and he returned her an answer full of disrespect. Her amazement, indignation, and grief, were infinite. She wrote to Castelnau the French ambassador to inform him of her inquietudes and anguish. 'My son,' said she, 'is ungrateful; and I desire that the king your master shall consider him no longer as a sovereign.' Elizabeth, having thus sown dissension between the queen of Scots and her son, made the best use she could of her quarrel. The pope, the duke of Guise, and the king of Spain, had concluded an alliance, called the holy league, for the extirpation of the Protestant religion all over Europe. Elizabeth was thrown into the greatest consternation by this; and the idea of a counter association among the Protestant princes of Europe immediately suggested itself. Sir Edward Wotton was deputed to Scotland; and so completely gained upon the imbecility of James that he concluded a firm alliance with Elizabeth, without making any stipulation in favor of his mother. Nay, so far was he the dupe of this ambassador and his mistress, that he was persuaded to take into his favor Archibald Douglas, one of the murderers of lord Darnley; and even appointed this assassin to be his ambassador to England. Mary, thus abandoned by all the world, in the hands of her most inveterate and cruel enemy, fell a victim to her resentment and treachery, in 1537. A plot of assassination had been formed in the spring of 1586 against the English queen, partly to rescue the Scottish princess, but chiefly

to serve the interests of the Roman Catholic religion. This conspiracy, which originated with Roman Catholic priests, was soon imparted to Babington, a person of great fortune, of many accomplishments, and who had formerly shown himself a zealous friend of queen Mary. That she had corresponded with Babington there is no doubt; but it was some years previous to the formation of this plot. A long silence had taken place between them; and Morgan, one of the English fugitives in France, and a warm friend of Mary's, in May 1586, wrote a letter to her, repeatedly, and in the most pressing manner, recommending a revival of that correspondence. In consequence of which, in her answer to Morgan, dated the 27th day of July, she informed him that she had made all apologies in her power to Babington, for not having written to him for so long a time; that he had generously offered himself and all his fortune in her cause; and that, agreeably to Morgan's advice, she would do her best to retain him in her interests; but she throws out no hint of her knowledge of the intended assassination. On the very same day she wrote likewise to Paget, another of her most confidential friends; but not a word in it with respect to Babington's scheme of cutting off the English queen. To Morgan and to Paget she certainly would have communicated her mind, and would have consulted them about the plot, had she been accessory to it. Indeed it seems to have been part of the policy of Mary's friends to keep her a stranger to all clandestine and hazardous undertakings in her favor. Morgan, in a letter of the 4th of July, expressly recommended to have no intelligence at all with Ballard, who was one of the original contrivers of the plot, and communicated it to Babington. The queen, in consequence, shut the door against all correspondence with that person. The conspiracy, which goes under the name of Babington, was detected in June: the names, proceedings, and residences of those engaged in it were then known; the life of Elizabeth was in imminent hazard; yet the conspirators were not apprehended; they were permitted to enjoy complete liberty; treated as if there had not been the least suspicion against them; and in this quiet state were they suffered to continue till August, for a period of nearly two months. The queen of Scots continued still detached from Babington and his associates. Their destruction was a small matter compared with her's. Elizabeth's ministers knew how much they had rendered themselves justly obnoxious to the Scottish princess: should she come to mount the throne of England their downfall was inevitable; from which consideration they were even more zealous than their mistress to accomplish her ruin. Of these, Sir Francis Walsingham secretary of state appears to have taken upon himself the chief management in concerting a plan of operations against the queen of Scots. His spies having early obtained the confidence of the inferior conspirators, he learned that a packet from France was intended to be conveyed by them to queen Mary, and by the hands of one Gilbert Gifford a priest, whom he had secretly gained over from their association, he wrote a letter to Sir Amias Paulet,

who had now the custody of Mary, requesting that one of his domestics might be permitted to take a bribe for conveying that packet to his captive. This was on purpose to communicate to her a letter, forged in the name of Babington, in which that conspirator was made to impart to the Scottish queen his scheme of assassination, and to claim rewards to the perpetrators of the deed. Paulet, however, to his honor, refused to act a part in this plan of villany; upon which Gifford corrupted a brewer in the neighbourhood, who put his letters to Mary in a hole in the castle-wall. By the same conveyance it was thought that Mary would answer the letters; but she never saw them, and of course no return was made. It was then contrived that answers, in the name of the queen of Scots to Gifford, should be forged and found in the hole of the wall. Walsingham, to whom these letters were carried, deciphered them by the help of one Thomas Philips, and, after exact copies were taken, they were all artfully sealed and sent off to the persons to whom they were directed. The answers which Babington made to the queen's supposed letters were carried directly to Walsingham.

A foundation for criminating Mary being thus laid, the conspirators suffered the death of traitors. The unhappy princess, eagerly watched by Paulet, and unacquainted with the late occurrences, received a visit from Sir Thomas Gorges. This envoy, as instructed by Elizabeth, surprised her when she had mounted her horse to take the pleasure of the chase. His salutation was abrupt and unceremonious; and after informing her of the discovery and circumstances of the conspiracy of Babington, he rudely charged her with a concern in it. Her astonishment was great, and she desired to return to her chamber: but this favor was refused; and after being carried from one house to another, in an anxious and perplexing uncertainty, she was committed to Fotheringay castle in Northamptonshire. Naw and Curl, her two secretaries, the former a Frenchman the latter a Scotsman, were taken into custody. Paulet, breaking open the doors of her private closet, possessed himself of her money, which amounted to only 7000 crowns. Her cabinets were sealed up; and, being sent to London, were examined in the presence of Elizabeth. They contained many despatches from persons beyond the sea, copies of letters which had been dictated by her, and about sixty tables of ciphers and characters. There were also discovered in them many despatches from English noblemen, which were full of admiration and respect. These Elizabeth concealed. Naw and Curl declared that the copies of her letters were in their hand-writing. They had been dictated by her in the French language to Naw, translated into English by Curl, and then put into cipher. They contained not any matters with which which she could be criminated. It was upon the foundation of the letters which Gifford had communicated to Walsingham that her guilt was to be inferred; and with copies of these, and with an attested account of the conspiracy of Babington and his associates. Sir Edward Wotton was now dispatched to France

to accuse her to Henry III., and to explain to him the dangers to which Elizabeth was exposed from the machinations of the English exiles. The privy counsellors of Elizabeth deliberated upon the most proper method of proceeding against Mary. To some it appeared that as she was only accessory to the plot, and not the designer of it, the most eligible severity to be exercised against her was a closer and more rigorous confinement. By others, who were haunted by the terrors of Popery, it was urged that she ought to be put instantly to death by the formalities of the law. The earl of Leicester recommended it as most prudent to despatch her secretly by poison. But this counsel was rejected as mean and disgraceful. The lawyers were of opinion that she might be tried upon the statute of Edward III. respecting high treason. Elizabeth, however, and her ministers had provided a more plausible foundation for her trial. This was a parliamentary statute approving the act of association, which had been passed while Mary was in England. The next point of debate was the designation under which it was most advisable to arraign her: and it was resolved to designate her, Mary, daughter and heir of James V., king of Scotland, commonly called queen of Scots, and dowager of France. Elizabeth next appointed above forty peers, and five judges, with authority to enquire into the matters compassed and imagined against her by the Scottish princess, and to pass sentence according to the spirit and tenor of the act. Of these commissioners a great majority proceeded to the castle of Fotheringay; and, the day after their arrival, they deputed to Mary, Sir Walter Mildmay, Sir Amias Paulet, and Edward Barker a public notary, to deliver to her a letter from Elizabeth. In this letter the English queen gratified her unhappy passions, and after reproaching Mary with her crimes, informed her that her commissioners were appointed to take cognizance of them. The Scottish princess, though astonished with the project of being brought to a public trial, was able to preserve her dignity, and addressed them with a composed manner and air. 'It is a matter,' said she, 'altogether uncommon and strange that Elizabeth should command me to submit to a trial, as if I were her subject. I am an independent sovereign, and will not tarnish by any means my high birth, the princes my predecessors, and my son. Misfortunes and misery have not yet so involved me in dejection as that I am to faint and sink under this new calamity and insult. I desire that you will remember what I formerly protested to Bromley, who is now lord chancellor, and to the lord La War. To speak to me of commissioners is a vain mockery of my rank. Kings alone can be my peers. The laws of England are unknown to me; and I have no counsellors to whose wisdom I can apply for instruction. My papers and commentaries have been taken from me; and no person can have the perilous courage to appear as my advocate. I have indeed recommended myself and my condition to foreign princes; but I am clear of the guilt of having conspired the destruction of Elizabeth, or having incited any person whatsoever to destroy her. It is only by my own

words and writings that an imputation of this kind can be supported; and I am conscious, beyond the possibility of a doubt, that these evidences cannot be employed against me.' The day after she had in this manner refused to allow the jurisdiction of the commissioners, Pauset and Barker returned to her, and informed her that they had put her speech into writing, and desired to know if she would abide by it. She heard it read distinctly, acknowledged it to be rightly taken, and avowed her readiness to persist in the sentiments she had delivered. But she added there was a circumstance to which she had omitted to speak. 'Your queen,' said she 'affects in her letter to observe that I am subject to the laws of England, because I have lived under their protection. This sentiment and mode of thinking are very surprising to me. I came into England to crave her assistance and aid; and, ever since, I have been confined to a prison. The miseries of captivity cannot be called a protection, and the treatment I have suffered is a violation of all law.'

This afflicted but undaunted princess, after having thus disputed the competency and repelled the pretexes of the commissioners, was induced at last, by arguments under the insidious mask of candor and friendship, to depart from the proper and dignified ground which she had taken, and consent to that mode of trial which had been proposed. It was represented to her, by Hatton the vice-chamberlain, that by rejecting a trial she injured her own reputation and interests, and deprived herself of the only opportunity of setting her innocence in a clear light to the present and to future times. Imposed upon by this artifice, she consented to make her appearance before the judges; at the same time, however, she still protested against the jurisdiction of the court, and the validity of their proceedings. After various formalities, the lord chancellor opened the case; and was followed by serjeant Gawdry, who proceeded to explain the statute, and to demonstrate that she had offended against it. He then entered into a detail of Babington's conspiracy; and concluded by affirming 'that Mary knew it, had approved it, had promised her assistance, and had pointed out the means to effect it.' Proofs of this charge were exhibited against her, and displayed with great art. The letters were read which Sir Francis Walsingham or his emissaries had forged. Her secretaries had afforded all the necessary intelligence about the conspiracy, upon which to frame a correspondence between Mary and Babington, and upon which despatches might be fabricated in her name to her foreign friends; and the ciphers were furnished by them. But, beside these pretended letters, another species of evidence was held out against her. Babington, proud of the despatch sent to him in her name by Walsingham and Gifford, returned an answer to it; and a reply from her by the same agency was transmitted to him. Deluded, and in toils, he communicated these marks of her attention to Savage and Ballard, the most confidential of his associates. His confession and theirs became thus of importance. Nor were her letters and the confessions of these conspirators deemed

sufficient vouchers of her guilt. Her secretaries, therefore, were engaged to subscribe a declaration that the despatches in her name were written by them at her command, and according to her instructions. These branches of evidence, put together with skill, and heightened with all the imposing colors of eloquence, were pressed upon Mary. Though she had been long accustomed to the perfidious inhumanity of her enemies, her amazement was infinite. She lost not, however, her courage; and her defence was alike expressive of her penetration and magnanimity: 'the accusation preferred to my prejudice is a most detestable calumny. I was not engaged with Babington in his conspiracy; and I am altogether innocent of having plotted the death of Elizabeth. The copies of Babington's letters which have been produced may indeed be taken from originals which are genuine; but it is impossible to prove that I ever received them. Nor did he receive from me the despatches addressed to him in my name. His confession, and those of his associates, which have been urged to establish the authority of my letters to him, are imperfect and vain. If these conspirators could have testified any circumstances to my hurt, they would not so soon have been deprived of their lives. Tortures, or the fear of the rack, extorted improper confessions from them; and then they were executed. Their mouths were open to utter false criminations; and immediately were shut for ever, that the truth might be buried in their graves. It was no difficult matter to obtain ciphers which I had employed; and my adversaries are known to be superior to scruples. I am informed that Sir Francis Walsingham has been earnest to recommend himself to his sovereign by practices both against my life and that of my son; and the fabrication of papers, by which to effectuate my ruin, is a business not unworthy of his ambition. Evidence, the most clear and incontestable, is necessary to overthrow my integrity; but proofs, the most feeble and suspicious, are held out against me. Let one letter be exhibited, written in my hand, or that bears my superscription, and I will instantly acknowledge that the charge against me is sufficiently supported. The declaration of my secretaries is the effect of rewards or of terror. They are strangers; and to overcome their virtue was an easy achievement to a queen whose power is absolute, whose riches are immense, and whose ministers are profound and daring in intrigues and treachery. I have often had occasion to suspect the integrity of Naw; and Curl, whose capacity is more limited, was always most obsequious to him. They may have written many letters in my name without my knowledge or participation: may have put many things into despatches which are prejudicial to Elizabeth; and may even have subscribed their declaration to my prejudice, under the prepossession that the guilt which would utterly overwhelm them might be pardoned in me. I have never dictated any letter to them which can be made to correspond with their testimony. And what, let me ask, would become of the grandeur, the virtue, and the safety of princes, if they depended upon the writings and declarations of secretaries? Nor let it be forgotten

that, by acting in hostility to the duty and allegiance which they solemnly swore to observe to me, they have utterly incapacitated themselves from obtaining any credit. The violation of their oath of fidelity is an open perjury; and of such men the protestations are nothing. But, if they are yet in life, let them be brought before me. It argues not the fairness of the proceedings against me that this formality is neglected. I am also without the assistance of an advocate; and, that I might be defenceless and weak in the greatest degree, I have been robbed of my papers and commentaries. As to the copies of the despatches which are said to have been written by my direction to Mendoza, the lord Paget, Charles Paget, the archbishop of Glasgow, and Sir Francis Inglefield, they are most unprofitable forgeries. For they tend only to show that I was employed in encouraging my friends to invade England. Now, if I should allow that these despatches were genuine, it could not be inferred from them that I had conspired the death of Elizabeth. I will even confess that I have yielded to the strong impulses of nature; and that, like a human creature, encompassed with dangers and insulted with wrongs, I have exerted myself to recover my greatness and my liberty. The efforts I have made can excite no blushes in me; for the voice of mankind must applaud them. Religion even cannot look to them with reproach. I have sought by every art of concession and friendship to engage my sister to put a period to my sufferings. Invited by her smiles, I ventured into her kingdom, in the pride and gaiety of my youth; and, under her anger and the miseries of captivity, I have grown into age. During a calamitous confinement of twenty years, my youth, my health, my happiness, are for ever gone. To her tenderness and generosity I have been indebted as little as to her justice; and, oppressed and agonizing with unmerited afflictions and hardships, I scrupled not to beseech the princes my allies to employ their armies to relieve me. Nor will I deny that I have endeavoured to promote the advantage and interest of the persecuted Catholics of England. My intreaties in their behalf have even been offered with earnestness to queen Elizabeth herself. But the attainment of my kingdom, the recovery of my liberty, and the advancement of that religion which I love, could not induce me to stain myself with the crimes that are objected to me. I would disdain to purchase a crown by the assassination of the meanest of the human race. To accuse me of scheming the death of the queen my sister is to brand me with the infamy which I abhor. It is my nature to employ the devotions of Esther, and not the sword of Judith. Elizabeth herself will attest that I have often admonished her not to draw upon her head the resentment of my friends by the enormity of her cruelties to me. My innocence cannot sincerely be doubted; and it is known to the Almighty God that I could not possibly think to forego his mercy, and to ruin my soul, to compass a transgression so horrible as that of her murder. My crimes are, my birth, the injuries I have been compelled to endure, and my religion. I am proud of the first; I can forgive the second; and the third is to me a

source of such comfort and hope that for its glory I will be contented that my blood shall flow upon the scaffold. To the defence of Mary no answer was made beside stout and unsupported affirmations of the truth of the evidence produced to her prejudice. In the course of the trial, however, lord Burleigh, who was willing to discompose her, charged her with a fixed resolution of conveying her claims and titles to England to the king of Spain. She acknowledged that the Spaniard professed to have pretensions to the kingdom of England, and that a book in justification of them had been communicated to her. But she declared that she had incurred the displeasure of many by disapproving of this book; and that no conveyance of her titles had ever been executed. The trial continued during the space of two days; but the commissioners avoided to deliver their opinions. Lord Burleigh, in whose management Elizabeth chiefly confided, and whom the Scottish queen discomposed in no common degree by her ability and vigor, being eager to conclude the business, asked if she had any thing to add to what she had urged in her defence. She informed him that she would be infinitely pleased if it should be permitted to her to be heard in her justification before a full meeting of the parliament, or before the queen and her privy-council. This intimation was unexpected; but the request was rejected. The court, in consequence of previous instructions from Elizabeth, adjourned to a farther day, and appointed that the place of its convention should be the star-chamber at Westminster. It accordingly assembled there; and Naw and Curl, who had not been produced at Fotheringay castle, were now called before the commissioners. They swore that the declaration they had subscribed was in every respect just and faithful. Nothing farther remained but to pronounce sentence against Mary. The commissioners unanimously concurred in delivering it as their verdict, or judgment, that she 'was a party to the conspiracy of Babington; and that she had compassed and imagined matters within the realm of England tending to the hurt, death, and destruction of the royal person of Elizabeth, in opposition to the statute framed for her protection.' Upon the same day in which this extraordinary sentence was given the commissioners and the judges of England issued a declaration, which imported that it was not to derogate in any degree from the titles and honor of the king of Scots. The sentence against Mary was very soon afterwards ratified by the English parliament.

King James was struck with horror at hearing of the proposed execution of his mother; but that spiritless prince could show his resentment no farther than by unavailing embassies and remonstrances. France interposed in the same ineffectual manner; and on the 6th December, 1586, Elizabeth caused the sentence of the commissioners against her to be proclaimed. After this she was made acquainted with her fate, and received the news with the greatest composure, and even apparent satisfaction. Her keepers now refused to treat her with any reverence or respect. They entered her apartment with their heads covered, and made no obeisance to her.

They took down her canopy of state, and deprived her of all the badges of royalty. By these insulting mortifications they meant to inform her that she had sunk from the dignity of a princess to the abject state of a criminal. She smiled, and said, 'In despite of your sovereign and her subservient judges, I will live and die a queen. My royal character is indelible; and I will surrender it with my spirit to the Almighty God, from whom I received it, and to whom my honor and my innocence are fully known.' In this melancholy situation Mary addressed a magnanimous letter to Elizabeth, in which, without making the least solicitation for her life, she only requested that her body might be carried to France; that she might be publicly executed; that her servants might be permitted to depart out of England unmolested, and enjoy the legacies which she bequeathed them. But to this letter no answer was given. In the mean time James, who had neither address nor courage to attempt any thing in behalf of his mother, announced her situation to his bigoted subjects, and ordered prayers to be said for her in all the churches. The form of the petition he prescribed was framed with delicacy and caution, that the clergy might have no objection to it. He enjoined them to pray 'that it might please God to enlighten Mary with the light of his truth, and to protect her from the danger which was hanging over her.' His own chaplains, and Mr. David Lindsay minister of Leith, observed his command. But all the other bigoted clergy refused to prefer any petitions to the Almighty for a papist. James, shocked with their spirit of intolerance and sedition, appointed a new day for prayers to be said for Mary, and issued a stricter injunction to the clergy; and, that he might be free himself from any insult, he ordered the archbishop of St. Andrews to preach before him. The ecclesiastics persuaded John Cowper, a probationer, to occupy the pulpit designed for the archbishop. When the king entered the church he testified his surprise, but told Cowper that if he would obey his injunction, he might proceed to officiate. Cowper replied 'that he would do as the Spirit of God should direct him.' The king commanded him to retire, and the captain of his guard advanced to compel him to obedience. The enraged probationer exclaimed that this violence 'would witness against the king in the great day of the Lord;' and denounced a curse against the spectators for not exerting themselves in his defence. The archbishop, now ascending the pulpit, performed with propriety the function to which he had been called, and recommended moderation and charity to the audience. In the afternoon Cowper was cited before the privy-council; and was accompanied there by Mr. Walter Balcanquhal and Mr. William Watson, two ministers remarkable for their zeal. As a punishment for his audacious petulance he was committed to the castle of Blackness; and his attendants, having distinguished themselves by an impudent vindication of him, were prohibited from preaching during the pleasure of the king. Elizabeth, in the mean while, felt the torment of miserable passions. At times she courted the sadness of solitude, and refused to be consoled

or to speak. In other seasons her sighs were frequent, and she broke out into loud and wild exclamations expressive of the state of her mind. Her subjects waited the determination of her will in distracting agitation. Her cruel ministers, who knew that it is the nature of fear to exclude pity, were industrious in inventing terrifying intelligence, and in circulating it through the kingdom; such as that the Spanish fleet had arrived at Milford Haven; that a formidable army of Scottish combatants was advancing to the capital; that the duke of Guise had disembarked many troops of veteran soldiers in Sussex; that Mary had escaped out of prison, and was collecting the English Catholics; that the northern counties had thrown aside their allegiance; and that there was a new plot to kill Elizabeth, and to reduce London to ashes. An actual conspiracy was even maliciously charged upon L'Aubespine the French resident; and he was forced to withdraw from England in disgrace. From the terrors which the ministers of Elizabeth were so studious to excite, they invariably inferred that the tranquillity of the kingdom could alone be re-established by the speedy execution of the Scottish queen. While the nation was thus artfully prepared for the destruction of Mary, Elizabeth ordered secretary Davidson to bring to her the warrant for her death. Having perused it, she observed that it was expressed in proper terms, and annexed her subscription. Though she earnestly desired the death of Mary, she was yet terrified to encounter its infamy. She was solicitous to accomplish this base transaction by some method which would conceal her consent to it. After intimating to Davidson an anxious wish that its blame should be removed from her, she counselled him to join with Walsingham in addressing a letter to Sir Amias Paulet and Sir Drue Drury, recommending it to them to manifest their love to her by shedding privately the blood of her adversary. The unlawfulness of this deed affected Davidson, and he objected to it. She repeated absolutely her injunctions, and he departed to deliver them. A letter under his name and that of Walsingham was despatched to Mary's keepers, communicating to them her purpose. Corrupted by her passions, and lost to the sensibilities of virtue, Elizabeth had now reached the last extremity of this wickedness. Though a sovereign princess, and entrusted with the cares of a great nation, she blushed not to charge her ministers to enjoin a murder—a murder connected with every circumstance that could make it most frightful and horrid. The victim for whose blood she thirsted was a woman, a queen, a relation, splendid with beauty, eminent in ability, magnanimous under misfortunes, and who had fled to her for refuge from her enemies. A wild Arab would have spared his enemy on this principle alone. Sir Amias Paulet and Sir Drue Drury, though the slaves of religious prejudices, felt an elevation of mind which reflected the greatest disgrace upon the sovereign. They considered themselves as grossly insulted by the proposal; and they assured Walsingham that the queen might command their lives and their property, but that they would never consent to part with their honor, and to stain themselves and their posterity with

the guilt of an assassination. When Davidson carried their despatch to her she broke out into anger. Their scrupulous delicacy, she said, was an infringement of their oath of association; and they were nice, precise, and perjured traitors. She then recommended one Wingfield to strike the blow. The astonished secretary exclaimed with warmth against a mode of proceeding so unwarrantable. He protested that, if she should take upon herself the blame of this deed, it would pollute her with the blackest dishonor; and that, if she should disavow it, she would overthrow for ever the reputation, the estates, and the children of the persons who should assist in it. She heard him with pain, and withdrew from him with precipitation. The warrant, after having been communicated to Walsingham, was carried to the chancellor, who put the great seal to it. This formality was hardly concluded when a message from Elizabeth prohibited Davidson from waiting upon the chancellor till he should receive farther instructions. Within an hour after he received a second message to the same purpose. He hastened to court, and Elizabeth asked eagerly if he had seen the chancellor. He answered in the affirmative; and she exclaimed with bitterness against his haste. He said that he had acted exactly as she had directed him. She continued to express warmly her displeasure; but gave no command to stop the operation of the warrant. In a state of uneasiness and apprehension he communicated her behaviour to the chancellor and the privy-council. These courtiers, however, who were well acquainted with the arts of their mistress, and who knew how to flatter her, paid no attention to him. They perceived, or were secretly informed, that she desired to have a pretence upon which to complain of the secretary, and to deny that he had obeyed her instructions. They observed to him that, by subscribing the warrant, she had performed what the law required of her; and that it was not proper to delay the execution any longer. While they were anxious to please Elizabeth, they were conscious of their own cruelty to Mary, and did not imagine that they could be in security while she lived. They despatched the warrant to the earls of Shrewsbury and Kent, with instructions to them to fulfil it. When the two earls and their retinue reached Fotheringay castle they found Mary sick, and reposing upon her bed. They insisted, notwithstanding, on being introduced to her. Being informed by her servants that the message they brought was important and pressing, she prepared to receive them. They were conducted into her presence by Sir Amias Paulet and Sir Drue Drury; and with little formality they told her that Elizabeth had consented to her death, and that she was to suffer the next morning at eight o'clock. Then Beale, one of the clerks of the privy-council, who accompanied them, read over the warrant, which she heard with pious composure and unshaken fortitude. They then affected to justify their mistess by entering into details concerning the conspiracy of Babington. She put her hand upon the Scriptures, which lay upon a table near her, and swore in the most solemn manner that she never devised, consented to, or pursued the

death of Elizabeth in any shape whatsoever. The earl of Kent, unwisely zealous for the Protestant religion, excepted against her oath, as being made upon a popish Bible. She replied to him mildly, 'It is for this very reason, my lord, to be relied upon with the greater security; for I esteem the popish version of the Scriptures to be the most authentic.' Indulging his puritanical fervor he declaimed against popery, counselled her to renounce its errors, and recommended to her attention Dr. Fletcher dean of Peterborough. She heard the dean with some impatience. Rising into passion he exclaimed, that 'her life would be the death of their religion, and that her death would be its life.'

After informing him that she was unalterably fixed in her religious sentiments, she desired that her confessor might have the liberty to repair to her; when the two earls observed that their consciences did not allow them to grant this request. She made enquiries concerning her secretaries Naw and Curl; and asked whether it had ever been heard of, in the wickedest times of the most unprincipled nation, that the servants of a sovereign princess had been suborned for the purpose of destroying her? They looked to one another and were silent. Bourgoyn her physician, who with her other domestics was present at this interview, seeing the earls ready to depart, besought them with an emphatic earnestness to reflect upon the short and inadequate portion of time that they had allotted to his mistress to prepare herself for death. He insisted that a respect for her high rank, and the multiplicity and importance of her concerns, required at least a period of some days. They pretended not to understand the propriety of his petition, and refused it. Upon the departure of the two earls, her domestics gave a full vent to their afflictions; and while she experienced a melancholy pleasure in their tears, lamentations, and kindness, she endeavoured to console them. Their grief, she said, was altogether unavailing, and could neither better her condition nor their own. Her cause had every thing about it that was most honorable; and the miseries from which she was to be relieved were the most hopeless and the most afflicting. Instead of dejection and sadness, she therefore enjoined them to be contented and happy. That she might have the more leisure to settle her affairs, she supped early, and, according to her usual custom, ate little. While at table, she remarked to Bourgoyn, her physician, that the force of truth was insurmountable; for that the earl of Kent, notwithstanding the pretence of her having conspired against Elizabeth, had plainly informed her that her death would be the security of their religion. When supper was over, she ordered all her servants to appear before her, and treated them with the kindness which we have mentioned in her life. See MARY. She then entered her bed-chamber with her women; and employed herself in religious duties. At her accustomed time she went to sleep; and, after enjoying some hours of sound rest, awoke; then gave herself to further pious meditation, and partook of a consecrated host, which a melancholy presentiment of her calamities had induced her

to obtain from pope Pius V. At the break of day she arrayed herself in rich, but becoming apparel; and, calling together her servants, she ordered her will to be read, and apologised for the smallness of their legacies from her inability to be more generous. Following the arrangement she had previously made, she then dealt out to them her goods, ward-robe, and jewels. To Bourgoign her physician she committed the care of her will, with a charge that he would deliver it to her principal executor, the duke of Guise. She also entrusted him with tokens of her affection for the king of France, the queen-mother, and her relations of the house of Lorraine. Bidding now an adieu to all worldly concerns, she retired to her oratory, where she was seen sometimes kneeling at the altar, and sometimes standing motionless with her hands joined, and her eyes directed to heaven. While she was thus engaged, Thomas Andrews, the high sheriff, announced to her that the hour for execution was arrived. She came forth dressed in a gown of black silk; her petticoat was bordered with crimson-velvet; a veil of lawn bowed out with wire, and edged with bone lace, was fastened to her caul, and hung down to the ground; an *Agnus Dei* was suspended from her neck by a pomander chain; her beads were fixed to her girdle; and she bore in her hand a crucifix of ivory. Amidst the screams and lamentations of her women she descended the stairs; and in the porch she was received by the earls of Kent and Shrewsbury with their attendants. Here, too, she met Sir Andrew Melvil the master of her household, whom her keepers had long debarred from her presence. Throwing himself at her feet, and weeping aloud, he deplored his sad destiny, and the sorrowful tidings he was to carry into Scotland. After she had spoken to Melvil, she besought the two earls that her servants might be treated with civility, that they might enjoy the presents she had bestowed upon them, and that they might receive a safe conduct to depart out of the dominions of Elizabeth. These slight favors were readily granted. She then begged that they might be permitted to attend her to the scaffold, that they might be witnesses of her behaviour at her death. To this request the earl of Kent discovered a strong reluctance. He said that they would behave with an intemperate passion; and that they would practise superstitious formalities, and dip their handkerchiefs in her blood. She replied that she was sure that none of their actions would be blameable; and that it was but decent that some of her women should be about her. The earl still hesitating, she was affected with the insolent and stupid indignity of his malice, and exclaimed, 'I am cousin to your mistress, and descended from Henry VII. I am a dowager of France, and the anointed queen of Scotland.' The earl of Shrewsbury interposing, it was agreed that she should select two of her women who might assist her in her last moments, and a few of her men-servants, who might behold her demeanour, and report it. She entered the hall where she was to suffer, and advanced with an air of grace and majesty to the scaffold, which was built at its farthest extremity. The spectators were nu-

merous. Her magnanimous carriage, her beauty, which was still striking, and her matchless misfortunes, affected them. They gave way to contending emotions of awe, admiration, and pity. She ascended the scaffold with a firm step and a serene aspect, and turned her eye to the block, the axe, and the executioners. The spectators were dissolved in tears. A chair was placed for her, in which she seated herself. Silence was commanded; and Beale read aloud the warrant for her death. She heard it attentively, yet with a manner from which it might be gathered that her thoughts were employed upon a subject more important. Dr. Fletcher, taking his station opposite to her without the rails of the scaffold, counselled her to repent of her crimes; and, while he inveighed against her attachment to popery, he threatened her with everlasting fire if she should delay to renounce its errors. His behaviour was highly indecent and coarse. Twice she interrupted him with great gentleness. But he pertinaciously continued his exhortations. Raising her voice she commanded him with a resolute tone to withhold his indignities and menaces, and not to trouble her any more about her faith. I was born, said she, in the Roman Catholic religion; I have experienced its comforts during my life, in the trying seasons of sickness, calamity, and sorrow; and I am resolved to die in it. The two earls, ashamed of his savage obstinacy, admonished him to desist, and to content himself with praying for her conversion. He entered upon a long prayer; while Mary falling upon her knees, and disregarding him, employed herself in devotion. Her women now assisted her to disrobe; and, the executioners offering their aid, she repressed their forwardness, observing that she was not accustomed to be attended by such servants, nor to be undressed before so large an assembly. Her upper garments being laid aside, she drew upon her arms a pair of silk gloves. Her women and men servants burst out into loud lamentations. She put her finger to her mouth to admonish them to be silent, and then bad them a final adieu with a smile that seemed to console, but that plunged them into deeper woe. She kneeled resolutely before the block, and said, 'In thee, O Lord! do I trust; let me never be confounded.' She covered her eyes with a linen handkerchief in which the eucharist had been enclosed; and stretching forth her body with great tranquillity, and fitting her neck for the fatal stroke, called out, 'Into thy hands, O God! I commit my spirit.' The executioner, from unskilfulness, or from inquietude, struck three blows before he separated her head from her body. He held it up mangled with wounds, and streaming with blood; and her hair, being discomposed, was discovered to be already gray. The dean of Peterborough alone cried out, 'So let the enemies of Elizabeth perish.' The earl of Kent alone, in a low voice, answered, 'Amen.' All the other spectators were melted into the tenderest sympathy and sorrow. Her women hastened to protect her dead body from the curiosity of the spectators; and solaced themselves with the thoughts of mourning over it undisturbed when they should retire, and of

laying it out on its funeral garb. But the two earls prohibited them from discharging these melancholy yet pleasing offices to their departed mistress, and drove them from the hall. Bourgoignier his physician applied to them that he might be permitted to take out her heart for the purpose of preserving it, and of carrying it with him to France. But they refused his entreaty with anger. The executioners carried her remains into an adjoining apartment; and, tearing a cloth from an old billiard table, thus covered that form, once so beautiful. The block, the cushion, the scaffold, and the garments, which were stained with her blood, were consumed with fire. Her body, after being embalmed and committed to a leaden coffin, was buried with royal splendor and pomp in the cathedral of Peterborough. See MARY. Elizabeth, who had treated her like a criminal while she lived, seemed disposed to acknowledge her for a queen when she was dead.

On the death of his mother the full government of the kingdom devolved on James her son: and Elizabeth, justly apprehensive of his resentment for her treatment of his mother, wrote him a letter, in which she disclaimed all knowledge of the fact. James had received intelligence of the murder before the arrival of this letter, sent by one Cary. The messenger was stopped at Berwick by an order from the king, telling him that, if Mary had been executed, he should proceed at his peril. James shut himself up in Dalkeith Castle, to indulge himself in grief; but the natural levity and imbecility of his mind prevented him from acting in any degree as became him. Instead of resolutely adhering to his first determination of not allowing Cary to set foot in Scotland, he in a few days gave his consent that he should be admitted to an audience of certain members of his privy council, who took a journey to the borders on purpose to wait upon him. In this conference, Cary demanded that the league of amity between the two kingdoms should be inviolably observed. He said that his mistress was grieved at the death of Mary, which had happened without her consent; and, in Elizabeth's name, offered any satisfaction that James could demand. The Scottish commissioners treated Cary's speech and proposal with becoming disdain. They observed that they amounted to no more than to know whether James was disposed to sell his mother's blood; adding that the Scottish nobility and people were determined to revenge it, and to interest in their quarrel the other princes of Europe. Upon this Cary delivered to them the letter from Elizabeth, together with a declaration of his own concerning the murder of the queen. This reception of her ambassador threw Elizabeth into the utmost consternation. She was apprehensive that James would join his force to that of Spain, and entirely overwhelm her; and, had the resentment or the spirit of the king been equal to that of the nation, it is probable that the haughty English princess would have been made severely to repent her perfidy and cruelty. It does not, however, appear that James had any serious intention of calling Elizabeth to an account for the murder of his mother; for which, perhaps, his

natural imbecility may be urged as an excuse, though it is more probable that his own necessity for money had swallowed up every other consideration. By the league formerly concluded with England it had been agreed that Elizabeth should pay an annual pension to the king of Scotland. James had neither economy to make his own revenue answer his purposes, nor address to get it increased. He was therefore always in want; and, as Elizabeth had plenty to spare, her friendship became a valuable acquisition. To this consideration, joined to his view of ascending the English throne, must be ascribed the little resentment shown by him to the atrocious conduct of Elizabeth, who continued to exert her usual arts of dissimulation and treachery. She prosecuted and fined secretary Davidson and lord Burleigh for the active part they had taken in Mary's death: their punishment was indeed much less than they deserved, but they certainly did not merit such treatment at her hands. Walsingham, though equally guilty, escaped by pretending indisposition, or perhaps because the queen had still occasion for his services. By her command he drew up a long letter addressed to lord Thirlston, king James's prime minister; in which he showed the necessity of putting Mary to death, and the folly of attempting to revenge it. He boasted of the superior force of England to that of Scotland; showed James that he would for ever ruin his pretensions to the English crown, by involving the two nations in a war; that he ought not to trust to foreign alliances; that the Roman Catholic party were so divided among themselves that he could receive no assistance from them, even supposing him so ill advised as to change his own religion for that of popery, and they would not trust his sincerity. Lastly, he attempted to show that James had already discharged all the duty towards his mother and his own reputation that could be expected from an affectionate son and a wise king; that his interceding for her, with a concern so becoming nature, had endeared him to the kingdom of England; but that it would be madness to push his resentment farther. This letter had all the effect that could be desired. James gave an audience to the English ambassador; and being assured that his blood was not tainted by the execution of his mother for treason against Elizabeth, but that he was still capable of succeeding to the crown of England, he consented to make up matters, and to address the murderer of his mother by the title of loving and affectionate sister.

The reign of James, till his accession to the crown of England by Elizabeth's death in 1603, affords little matter of moment. His scandalous concessions to Elizabeth, and his constant applications to her for money, filled up the measure of royal meanness. Ever since the expulsion of Mary, the country had in fact been reduced to the condition of an English province. The sovereign had been tried by the queen of England and executed for treason; a crime, in the very nature of the thing, impossible, unless Scotland had been in subjection to England; and, to complete all, the contemptible successor of Mary thought himself well off that he was not a traitor too to his sovereign the queen of England.

During the reign of James the religious disturbances which began at the Reformation, and that violent struggle of the clergy for power, which never ceased till the Revolution in 1688, went on with great violence. Continual clamors were raised against popery, at the same time that the very fundamental principles of popery were held, nay, urged in the most insolent manner, as the effects of immediate inspiration. These were the total independence of the clergy on every earthly power, at the same time that all earthly powers were to be subject to them. Their fantastic decrees were supposed to be binding in heaven; and they took care that they should be binding on earth; for whoever had offended so far as to fall under a sentence of excommunication was declared an outlaw. This circumstance must have contributed to disturb the public tranquillity in a great degree. But, besides this, the weakness of James's government was such that, under the name of *peace*, the whole kingdom was involved in the miseries of civil war; the feudal animosities revived, and slaughter and murder prevailed all over the country. James, fitted only for pedantry, disputed, argued, modelled, and remodelled the constitution to no purpose. The clergy continued their insolence, and the laity their violences upon one another; at the same time that the king, by his unhappy credulity in the operation of demons and witches, declared a most inhuman and bloody war against poor old women, many of whom were burnt for the imaginary crime of conversing with the devil. In autumn 1600 happened a remarkable conspiracy against the liberty, if not the life of the king. The attainer and execution of the earl of Gowrie for the part he acted in the raid of Ruthven, and for subsequent practices of treason, have been already mentioned. His son, however, had been restored to his paternal dignity and estates, and had in consequence professed gratitude and attachment to the king. But the Presbyterian clergy continued to express their approbation of the raid of Ruthven, and to declare on every occasion that in their opinion the earl had suffered by an unjust sentence. One of the most eminent and popular of that order of men was preceptor to the younger Gowrie and his brothers, who, from their frequent conversations with him, must have been deeply impressed with the belief that their father was murdered. The passion of revenge took possession of their breasts; and having invited the king from Falkland to the earl of Gowrie's house at Perth, under the pretence of showing him a secret treasure of foreign gold, which he might lawfully appropriate to his own use, an attempt was made to keep him close prisoner, with threats of putting him to instant death, if he should make any attempt to regain his liberty. The reality of this conspiracy has been questioned by many writers, because they could not assign a rational motive for Gowrie's engaging in so hazardous an enterprise; and some have even insinuated that the conspiracy was entered into by the king against Gowrie, to get possession of his large estates. It has been shown, however, by Arnot, in his *Criminal Trials*, that the conspiracy was the earl's, who seems to have intended that the king should be cut off by the hand of an assassin; and the

same writer has made it appear probable that he entertained hopes, in the then distracted state of the nation not ill founded, of being able to mount the throne of his murdered sovereign. Mr. Cant, however, gives a very different opinion on this event. The late learned and judicious lord Hailes, and the celebrated Dr. William Robertson, also totally discredit the story. From this danger, whether real or fictitious, James was rescued by his attendants the duke of Lennox, the earl of Mar, Sir Thomas Erskine, afterwards earl of Kellie, and Sir John Ramsay who was ennobled; and Gowrie and his brother, falling in the struggle, were attainted by an act of parliament, their arms cancelled, and their whole estates forfeited and annexed to the crown. The most memorable transaction of James's reign, and that most to his honor, is the effort he made for civilising the western islands. For this purpose he instituted a company of gentlemen adventurers, to whom he gave large privileges: the method he proposed was to transport numbers of the islanders to the low countries of Scotland, and to give their islands, which were very improveable, in fee to such of his lowland subjects as should choose to reside in the islands. The experiment was to be made upon the Lewes, a long range of the Ebridae; whence the adventurers expelled Murdoch Macleod, the tyrant of the inhabitants Macleod, however, kept the sea; and, intercepting a ship which carried one of the chief adventurers, he sent him prisoner to Orkney, after putting the crew to the sword. Macleod was soon after betrayed by his own brother, and hanged at St. Andrews. The history of this new undertaking is rather dark; and the settlers themselves seem to have been defective in the arts of civilisation. The arrangements they made were considered by the inhabitants as very oppressive; and one Norman, of the Macleod family, attacked and subdued them so effectually that they not only consented to yield the property of the islands to him, but engaged to obtain the king's pardon for what he had done. In 1589 king James married the princess Anne of Denmark, daughter of king Christian IV., to receive whose hand he made a voyage to that country: a visit which his father-in-law twice repaid. In 1603 James was called to the throne of England by the death of Elizabeth, and the same year took a final leave of Scotland. From this period the history of Scotland, being blended with that of England, is included in the article GREAT BRITAIN.

Dr. Robertson depicts, in his best manner, the arrival in Scotland of the actual tidings of the accession of James to the English throne—his journey—and the revolutions in the constitution of Scotland consequent upon his accession. The latter have been sufficiently important to justify a considerable extract in this place from the pen of so able a writer:—

'As soon as she [queen Elizabeth] had breathed her last,' observes our author, 'the lords of the privy council proclaimed James king of England. All the intrigues carried on by foreigners in favor of the Infanta, all the cabals formed within the kingdom to support the titles of lady Aracella and the earl of Hartford, disap-

peared in a moment; the nobles and people forgetting their ancient hostilities with Scotland, and their aversion for the dominion of strangers, testified their satisfaction with louder acclamations than were usual at the accession of their native princes. Amidst this tumult of joy, a motion made by a few patriots, who proposed to prescribe some conditions to the successor, and to exact from him the redress of some grievances, before they called him to the throne, was scarcely heard; and Cecil, by stifling it, added to his stock of merit with his new master. Sir Charles Percy, brother of the earl of Northumberland, and Thomas Somerset, the earl of Worcester's son, were despatched to Scotland with a letter to the king, signed by all the peers and privy councillors then in London, informing him of the queen's death, of his accession to the throne, of their care to recognise his title, and of the universal applause with which the public proclamation of it had been attended. They made the utmost haste to deliver this welcome message; but were prevented by the zeal of Sir Robert Carey, lord Hunsdon's youngest son, who, setting out a few hours after Elizabeth's death, arrived at Edinburgh on Saturday night, just as the king had gone to bed. He was immediately admitted into the royal apartment, and, kneeling by the king's bed, acquainted him with the death of Elizabeth, saluted him king of England, Scotland, France, and Ireland; and, as a token of the truth of the intelligence which he brought, presented him a ring, which his sister, lady Scrope, had taken from the queen's finger after her death. James heard him with a decent composure. But, as Carey was only a private messenger, the information which he brought was not made public, and the king kept his apartment till the arrival of Percy and Somerset. Then his titles were solemnly proclaimed; and his own subjects expressed no less joy than the English at this increase of his dignity. As his presence was absolutely necessary in England, where the people were extremely impatient to see their new sovereign, he prepared to set out for that kingdom without delay. He appointed his queen to follow him within a few weeks. He committed the government of Scotland to his privy-council. He entrusted the care of his children to different noblemen. On the Sunday before his departure he repaired to the church of St. Giles's, and after hearing a sermon, in which the preacher displayed the greatness of the divine goodness in raising him to the throne of such a powerful kingdom without opposition or bloodshed, and exhorted him to express his gratitude, by promoting to the utmost the happiness and prosperity of his subjects; the king rose up, and, addressing himself to the people, made many professions of unalterable affection towards them; promised to visit Scotland frequently; assured them that his Scottish subjects, notwithstanding his absence, should feel that he was their native prince, no less than when he resided among them; and might still trust that his ears should be always open to their petitions, which he would answer with the alacrity and love of a parent. His words were often interrupted by the tears of the whole audience; who, though

they exulted at the king's prosperity, were melted into sorrow by these tender declarations.

On the 5th of April he began his journey with a splendid, but not a numerous train; and next day he entered Berwick. Wherever he came, immense multitudes were assembled to welcome him; and the principal persons in the different counties through which he passed, displayed all their wealth and magnificence in entertainments prepared for him at their houses. Elizabeth reigned so long in England that most of her subjects remembered no other court but hers, and their notions of the manners and decorums suitable to a prince were formed upon what they had observed there. It was natural to apply this standard to the behaviour and actions of their new monarch, and to compare him at first sight with the queen on whose throne he was to be placed. James, whose manners were extremely different from hers, suffered by the comparison. He had not that flowing affability by which Elizabeth captivated the hearts of her people; and, though easy among a few whom he loved, his indolence could not bear the fatigue of rendering himself agreeable to a mixed multitude. He was no less a stranger to that dignity with which Elizabeth tempered her familiarity. And, instead of that well-judged frugality with which she conferred titles of honor, he bestowed them with an undistinguishing profusion, that rendered them no longer marks of distinction, or rewards of merit. But these were the reflections of the few alone; the multitude continued their acclamations; and amidst these James entered London on the 7th of May, and took peaceable possession of the throne of England. Thus were united two kingdoms, divided from the earliest accounts of time, but destined, by their situation, to form one great monarchy. By this junction of its whole native force, Great Britain has risen to an eminence and authority in Europe, which England and Scotland, while separate, could never have attained.

Our historian's reflections, on the alteration produced in the political constitution of Scotland by this event, regard the state of the aristocracy; the new consequence given to the commons; the first establishment of Presbyterianism; and the gradual assimilation of the Scottish to the English nation in matters of taste, genius, and literature:—

'The Scots,' he says, 'had so long considered their monarchs as next heirs to the English throne, that they had full leisure to reflect on all the consequences of their being advanced to that dignity. But dazzled with the glory of giving a sovereign to their powerful enemy, relying on the partiality of their native prince, and in full expectation of sharing liberally in the wealth and honors which he would now be able to bestow, they attended little to the most obvious consequences of that great event, and rejoiced at his accession to the throne of England, as if it had been no less beneficial to the kingdom than honorable to the king. They soon had reason, however, to adopt very different sentiments, and from that period we may date a total alteration in the political constitution of Scotland.

'The feudal *aristocracy*, which had been sub-

verted in most nations of Europe by the policy of their princes, or had been undermined by the progress of commerce, still subsisted with full force in Scotland. Many causes had contributed gradually to augment the power of the Scottish nobles; and even the Reformation, which, in every other country where it prevailed, added to the authority of the monarch, had increased their wealth and influence. A king, possessed of a small revenue, with a prerogative extremely limited, and unsupported by a standing army, could not exercise much authority over such potent subjects. He was obliged to govern by expedients; and the laws derived their force, not from his power to execute them, but from the voluntary submission of the nobles. But though this produced a species of government extremely feeble and irregular; though Scotland, under the name, and with all the outward ensigns of a monarchy, was really subject to an aristocracy, the people were not altogether unhappy; and, even in this wild form of a constitution, there were principles which tended to their security and advantage. The king, checked and overawed by the nobles, durst venture upon no act of arbitrary power. The nobles, jealous of the king, whose claims and pretensions were many, though his power was small, were afraid of irritating their dependents by unreasonable exactions, and tempered the rigor of aristocratical tyranny, with a mildness and equality to which it is naturally a stranger. As long as the military genius of the feudal government remained in vigor the vassals both of the crown and of the barons were generally not only free from oppression, but were courted by their superiors, whose power and importance were founded on their attachment and love. But, by his accession to the throne of England, James acquired such an immense accession of wealth, of power, and of splendor, that the nobles, astonished and intimidated, thought it vain to struggle for privileges which they were now unable to defend. Nor was it from fear alone that they submitted to the yoke: James, partial to his countrymen, and willing that they should partake in his good fortune, loaded them with riches and honors; and the hope of his favor concurred with the dread of his power, in taming their fierce and independent spirits. The will of the prince became the supreme law in Scotland; and the nobles strove, with emulation, who should most implicitly obey commands which they had formerly been accustomed to contemn. Satisfied with having subjected the nobles to the crown, the king left them in full possession of their ancient jurisdiction over their own vassals. The extensive rights vested in a feudal chief became in their hands dreadful instruments of oppression, and, the military ideas on which these rights were founded being gradually lost or disregarded, nothing remained to correct or to mitigate the rigor with which they were exercised. The nobles, exhausting their fortunes by the expense of frequent attendance upon the English court, and by attempts to imitate the manners and luxury of their more wealthy neighbours, multiplied exactions upon the people, who durst hardly utter complaints which they knew would

never reach the ear of their sovereign, nor move him to grant them any redress. From the union of the crowns to the Revolution, in 1688, Scotland was placed in a political situation of all others the most singular and the most unhappy: subjected at once to the absolute will of a monarch, and to the oppressive jurisdiction of an aristocracy, it suffered all the miseries peculiar to both these forms of government. Its kings were despotic; its nobles were slaves and tyrants; and the people groaned under the rigorous domination of both. During this period, the nobles, it is true, made one effort to shake off the yoke, and to regain their ancient independence. After the death of James, the Scottish nation was no longer viewed by our monarchs with any partial affection. Charles I., educated among the English, discovered no peculiar attachment to the kingdom of which he was a native. The nobles, perceiving the sceptre to be now in hands less friendly, and swayed by a prince with whom they had little connexion, and over whose councils they had little influence, no longer submitted with the same implicit obedience. Provoked by some encroachments of the king on their order, and apprehensive of others, the remains of their ancient spirit began to appear. They complained and remonstrated. The people being, at the same time, violently disgusted at the innovations in religion, the nobles secretly heightened this disgust; and their artifices, together with the ill conduct of the court, raised such a spirit that the whole nation took arms against their sovereign, with a union and animosity of which there had formerly been no example. Charles brought against them the forces of England, and notwithstanding their own union, and the zeal of the people, the nobles must have sunk in the struggle. But the disaffection which was growing among his English subjects prevented the king from acting with vigor. A civil war broke out in both kingdoms; and after many battles and revolutions, which are well known, the Scottish nobles, who first began the war, were involved in the same ruin with the throne. At the restoration Charles II. regained full possession of the royal prerogative in Scotland; and the nobles, whose estates were wasted, or their spirit broken, by the calamities to which they had been exposed, were less able and less willing than ever to resist the power of the crown. During his reign, and that of James VII., the dictates of the monarch were received in Scotland with the most abject submission. The poverty to which many of the nobles were reduced rendered them meaner slaves and more intolerable tyrants than ever. The people, always neglected, were now odious, and loaded with every injury on account of their attachment to religious and political principles, extremely repugnant to those adopted by their princes.

The Revolution introduced other maxims into the government of Scotland. To increase the authority of the prince, or to secure the privileges of the nobles, had hitherto been almost the sole object of our laws. The rights of the people were hardly ever mentioned, were disregarded, or unknown. Attention began, hence-

forward, to be paid to the welfare of the people. By the 'claim of right,' their liberties were secured; and, the number of their representatives being increased, they gradually acquired new weight and consideration in parliament. As they came to enjoy more security, and greater power, their minds began to open, and to form more extensive plans of commerce, of industry, and of police. But the aristocratical spirit which still predominated, together with many other accidents, retarded the improvement and happiness of the nation.

'Another great event completed what the Revolution had begun. The political power of the nobles, already broken by the union of the two crowns, was almost annihilated by the union of the two kingdoms. Instead of making a part, as formerly, of the supreme assembly of the nation; instead of bearing the most considerable sway there, the peers of Scotland are admitted into the British parliament by their representatives only, and form but an inconsiderable part of one of those bodies in which the legislative authority is vested. They themselves are excluded absolutely from the house of commons, and even their eldest sons are not permitted to represent their countrymen in that august assembly. Nor have their feudal privileges remained, to compensate for this extinction of their political authority. As commerce advanced in its progress, and government attained nearer to perfection, these were insensibly circumscribed; and at last, by laws no less salutary to the public than fatal to the nobles, they have been almost totally abolished. As the nobles were deprived of power, the people acquired liberty. Exempted from burdens to which they were formerly subject, screened from oppression to which they had been long exposed, and adopted into a constitution whose genius and laws were more liberal than their own, they have extended their commerce, refined their manners, made improvements in the elegancies of life, and cultivated the arts and sciences.

'This survey of the political state of Scotland, in which events and their causes have been mentioned rather than developed, enables us to point out three eras, from each of which we may date some great alteration in one or other of the three different members of which the supreme legislative assembly in our constitution is composed. At their accession to the throne of England, the kings of Scotland, once the most limited, became, in an instant, the most absolute princes in Europe, and exercised a despotic authority, which their parliaments were unable to control, or their nobles to resist. At the union of the two kingdoms, the feudal aristocracy, which had subsisted so many ages, and with power so exorbitant, was overturned, and the Scottish nobles, having surrendered rights and pre-eminences peculiar to their order, reduced themselves to a condition which is no longer the terror and envy of other subjects. Since the Union, the commons, anciently neglected by their kings, and seldom courted by the nobles, have emerged into dignity; and, being admitted to a participation of all the privileges which the English had purchased at the expense of so much blood,

must now be deemed a body not less considerable in the one kingdom, than they had long been in the other.

'The church felt the effects of the absolute power which the king acquired by his accession; and its revolutions, too, are worthy of notice. James, during the latter years of his administration in Scotland, had revived the name and office of bishops. But they possessed no ecclesiastical jurisdiction or pre-eminence; their revenues were inconsiderable, and they were scarcely distinguished by any thing but by their seat in parliament, and by being the object of the clergy's jealousy, and the people's hatred. The king, delighted with the splendor and authority which the English bishops enjoyed, and eager to effect a union in the ecclesiastical polity which he had in vain attempted in the civil government of the two kingdoms, resolved to bring both churches to an exact conformity with each other. Three Scotsmen were consecrated bishops at London. From them their brethren were commanded to receive orders. Ceremonies unknown in Scotland were imposed; and though the clergy, less obsequious than the nobles, boldly opposed these innovations, James, long practised and well skilled in the arts of managing them, obtained at length their compliance. But Charles I., a superstitious prince, unacquainted with the genius of the Scots, imprudent and precipitant in all the measures he pursued in that kingdom, pressing too eagerly the reception of the English liturgy, and indiscreetly attempting a resumption of church lands, kindled the flames of civil war; and, the people being left at liberty to indulge their own wishes, the episcopal church was overturned, and the Presbyterian government and discipline were re-established with new vigor. Together with monarchy, episcopacy was restored in Scotland. A form of government so odious to the people required force to uphold it; and though not only the whole rigor of authority, but all the barbarity of persecution, were employed in its support, the aversion of the nation was insurmountable, and it subsisted with difficulty. At the Revolution, the inclinations of the people were thought worthy the attention of the legislature; the Presbyterian government was again established, and, being ratified by the Union, is still maintained in the kingdom.

'Nor did the influence of the accession extend to the civil and ecclesiastical constitutions alone; the *genius* of the nation, its taste, and spirit, things of a nature still more delicate, were sensibly affected by that event. When learning revived, in the fifteenth and sixteenth centuries, all the modern languages were in a state extremely barbarous, devoid of elegance, of vigor, and even of perspicuity. No author thought of writing in language so ill adapted to express and embellish his sentiments, or of erecting a work for immortality with such rude and perishable materials. As the spirit which prevailed at that time did not owe its rise to any original effort of the human mind, but was excited chiefly by admiration of the ancients, which began then to be studied with attention in every part of Europe, their compositions were deemed not only the standards

of taste and of sentiment, but of style ; and even the languages in which they wrote were thought to be peculiar, and almost consecrated to learning and the muses. Not only the manner of the ancients was imitated, but their language was adopted ; and extravagant as the attempt may appear to write in a dead tongue, in which men were not accustomed to think, and which they could not speak, or even pronounce, the success of it was astonishing. As they formed their style upon the purest models ; as they were uninfected with those barbarisms which the inaccuracy of familiar conversation, the affectation of courts, intercourse with strangers, and a thousand other causes, introduce into living languages ; many moderns have attained to a degree of elegance in their Latin compositions which the Romans themselves scarcely possessed beyond the limits of the Augustan age. While this was almost the only species of composition, and all authors, by using one common language, could be brought to a nearer comparison, the Scottish writers were not inferior to those of any other nation. The happy genius of Buchanan, equally formed to excel in prose and in verse, more various, more original, and more elegant, than that of almost any other modern who writes in Latin, reflects, with regard to this particular, the greatest lustre on his country. But the labor attending the study of a dead language was irksome ; the unequal return for their industry which authors met with, who could be read and admired only within the narrow circle of the learned, was mortifying ; and men, instead of wasting half their lives in learning the language of the Romans, began to refine and to polish their own. The modern tongues were found to be susceptible of beauties and graces, which, if not equal to those of the ancient ones, were at least more attainable. The Italians having first set the example, Latin was no longer used in works of taste ; it was confined to books of science ; and the politer nations have banished it even from these. The Scots, we may presume, would have had no cause to regret this change in the public taste, and would still have been able to maintain some equality with other nations, in their pursuit of literary honor. The English and Scottish languages, derived from the same sources, were, at the end of the sixteenth century, in a state nearly similar, differing from one another somewhat in orthography, though not only the words, but the idioms, were much the same. The letters of several Scottish statesmen of that age are not inferior in elegance, or in purity, to those of the English ministers with whom they corresponded. James himself was master of a style far from contemptible ; and, by his example and encouragement, the Scottish language might have kept pace with the English in refinement. Scotland might have had a series of authors in its own, as well as in the Latin language, to boast of ; and the improvements in taste, in the arts, and in the sciences, which spread over the other polished nations of Europe, would not have been unknown there. But, at the very time when other nations were beginning to drop the use of Latin in works of taste, and to make trial of the strength and compass of their own languages,

Scotland ceased to be a kingdom. The transports of joy which the accession at first occasioned were soon over ; and the Scots being at once deprived of all the objects that refine or animate a people—of the presence of their prince, of the concourse of their nobles, of the splendor and elegance of a court—a universal dejection of spirit seems to have seized the nation. The court being withdrawn, no domestic standard of propriety and correctness of speech remained ; the few compositions that Scotland produced were tried by the English standard, and every word or phrase that varied in the least from that was condemned as barbarous ; whereas, if the two nations had continued distinct, each might have retained idioms and forms of speech peculiar to itself ; and these, rendered fashionable by the example of a court, and supported by the authority of writers of reputation, might have been viewed in the same light with the varieties occasioned by the different dialects in the Greek tongue : they even might have been considered as beauties, and in many cases might have been used promiscuously by the authors of both nations. But, by the accession, the English naturally became the sole judges and lawgivers in language, and rejected as solecisms every form of speech to which their ear was not accustomed. Nor did the Scots, while the intercourse between the two nations was considerable, and ancient prejudices were still so violent as to prevent imitation, possess the means of refining their own tongue according to the purity of the English standard. On the contrary, new corruptions flowed into it from every different source. The clergy of Scotland, in that age, were more eminent for piety than for learning ; and, though there did not arise many authors among them, yet being in possession of the privilege of discoursing publicly to the people, and their sermons being too long, and perhaps too frequent, such hasty productions could not be elegant, and many slovenly and incorrect modes of expression may be traced back to that original. The pleadings of lawyers were equally loose and inaccurate, and that profession having furnished more authors, and the matters of which they treat mingling daily in common discourse and business, many of those vicious forms of speech which are denominated *Scotticisms* have been introduced by them into the language. Nor did either the language or public taste receive any improvement in parliament, where a more liberal and more correct eloquence might have been expected. All business was transacted there by the lords of articles, and they were so servilely devoted to the court that few debates arose, and, prior to the Revolution, none were conducted with the spirit and vigor natural to a popular assembly.

Thus, during the whole seventeenth century, the English were gradually refining their language and their taste ; in Scotland, the former was much debased, and the latter almost entirely lost. In the beginning of that period, both nations were emerging out of barbarity ; but the distance between them, which was then inconsiderable, became, before the end of it immense. Even after science had once dawned upon them, the Scots seemed to be sinking back into ignorance and

obscurity; and, active and intelligent as they naturally are, they continued, while other nations were eager in the pursuit of fame and knowledge, in a state of languor. This, however, must be imputed to the unhappiness of their political situation, not to any defect of genius; for no sooner was the one removed in any degree, than the other began to display itself. The act abolishing the power of the lords of articles; and other salutary laws passed at the Revolution, having introduced freedom of debate into the Scottish parliament, eloquence, with all the arts that accompany or perfect it, became immediate objects of attention; and the example of Fletcher of Salton alone is sufficient to show that the Scots were still capable of generous sentiments; and, notwithstanding some peculiar idiosyncrasies, were able to express themselves with energy and with elegance. At length the Union having incorporated the two nations, and rendered them one people, the distinctions which had subsisted for many ages gradually wear away; peculiarities disappear; the same manners prevail in both parts of the island; the same authors are read and admired; the same entertainments are frequented by the elegant and polite; and the same standard of taste and purity of language is established. The Scots, after being placed, during a whole century, in a situation no less fatal to the liberty than to the taste and genius of the nation, were at once put in possession of privileges more valuable than those which their ancestors had formerly enjoyed; and every obstruction that had retarded their pursuit, or prevented their acquisition of literary fame, was totally removed.

Two curious papers, one published by Haynes, and the other by Strype, are referred to by Dr. Robertson as affording a remarkable proof of the little intercourse between the English and Scots before the union of the two crowns. 'In the year 1567 Elizabeth commanded the bishop of London to take a survey of all the strangers within the cities of London and Westminster. By this report, which is very minute, it appears that the whole number of Scots at that time was fifty-eight. Haynes 455. A survey of the same kind was made by Sir Thomas Row, lord mayor, A.D. 1568. The number of Scots had then increased to eighty-eight. Strype, iv. Supplement, No. I. On the accession of James, a considerable number of Scots, especially of the higher rank, resorted to England; but it was not till the Union that the intercourse between the two kingdoms became great.' We could almost suppose the number of our Northern countrymen to be found in the Bank of England, at the present time, would exceed that of either of the above remarkable reports!

STATISTICS OF SCOTLAND.

In our article BRITAIN many of the great common features of the island of Great Britain are pointed out. In this place it can be only necessary to enter more at large into what is peculiar to Scotland: and we shall first conduct the reader round her romantic and commercial coasts. Our notice of the places must of course

be cursory. For farther information, in regard to the chief towns, the reader will consult their alphabetical places.

I. THE EAST COAST OF SCOTLAND, from the entrance of the Tweed to the Frith of Forth, is precipitous and rocky: the shore is covered with sea-weed, chiefly fucus palmatus, which is used as a manure and burnt into kelp. The cliffs are the resort of a prodigious number of sea birds, chiefly scouts and kittiwakes (*larus rissa*) which arrive in the spring, and, after having reared their young, depart in the autumn; they are taken for food by the poorer class. The tides on this coast rise twenty feet.

Berwickshire.—The only harbour between Berwick and the Forth is Eyemouth, a tide haven formed by two piers, with twenty feet in the spring and sixteen in common tides. The town has a considerable share in the fishery, and exports many thousand quarters of grain, chiefly to Leith. Between Eyemouth and St. Abb's Head is a fine bay with good anchorage. St. Abb's is a noted promontory with the ruins of a chapel; it is said to have its name from a certain lady Ebba, abbess of Coldingham, who, together with her nuns on an invasion of the Danes, cut off their noses to prevent their violation by the barbarians. Coldingham Loch is a fresh water lake, one mile west of the head, and a mile in circuit: though it receives no visible stream it always remains full. Lunsden is a fishing village north of the head.

East Lothian or Haddington.—Dunbar, on an eminence, is a genteel and healthy town with a castle on a ledge of rocks running into the sea, and memorable as the scene of the simulated outrage on Mary, queen of Scots, by Bothwell. It has a small pier haven, defended by a battery: its chief business is the fishery and the export of corn. The Tyne River, the only one of any consideration in the county, empties itself below the village of Lintan; though in summer it is a torpid stream, the melting of the snows or rains causes it at times to overflow. It has salmon and trout. Tamtallon Castle, two miles east of North Berwick, is a ruin on a rock overhanging the sea which washes it on three sides. North Berwick is a small town of about 2000 inhabitants; it has a pier haven and exports corn.

The *Frith of Forth* (Bodotria) is a great estuary, whose entrance between the coasts of Haddington and Fifeness, in Fifeshire, is seven miles broad. The breadth decreases regularly to Queensferry, where it is contracted by two promontories to two miles. Above which it again expands to a fine basin four miles broad, and continues this breadth for several leagues. In the Frith are several islands and rocks worthy of notice. The Isle of Bass, near the south shore, is a rock of great elevation overhanging the sea; on the north side, and on the brow of the precipice, is an abandoned castle, at one period the state prison of Scotland. The isles of Inch Gowry, Inchcolm, Inchkeith, and May, are the others worth notice. Inch Gowry has the ruins of a castle; and the ruins of a fort are seen on Inchkeith, near the Fife shore of the Frith. A few sheep are pastured on this island; it abounds with rabbits, has three good wells and

a light-house. The other islands have nothing deserving mention. See FORTH.

Both shores of the Frith of Forth are thickly dotted with towns and villages, from which a considerable fishery is carried on, and which export salt and coals. Those of the south shore are port Seaton, a dry tide haven with twelve feet depth, in spring tides. Preston Pans, named from its salt pans, has also a tide haven for small craft, and employs ten boats in the oyster fishery. It is the grand rendezvous of Scottish pedlars, who meet here to enact regulations for their community.

Edinburghshire.—Musselburgh, at the mouth of the little river Esk, has its name from the mussel banks before it. Fine pearls are often found in these fish. The town has a small haven.

Leith, the port of Edinburgh, is two miles distant from the city; but the increase of houses has now nearly united them. Leith is on both banks of the little river of the same name, and has a large trade both foreign and coasting, particularly with London (see LEITH); it also sends ships to the Greenland fishery.

Lindlithgow.—Queensferry, the usual crossing place of the Frith of Forth, is a considerable village, with some trade, and ship-building yards. Borrowstownness, on the inner basin of the Frith, is a busy place, having a considerable herring fishery, a large coal trade, and a trade to the Baltic. Its haven has sixteen to eighteen feet spring tides, and is kept clean by a large basin with four sluices, which are shut when the basin is full at high water, and opened at low water, so that the rush of the streams carry out the mud.

Fife.—The places deserving notice on the north or Fife shore of the Frith are Crail, on an elevation; it has some sloops, and about a dozen herring smacks. Kilrenny, East and West Anstruthers, are also fishing villages, with some sloop trade. Pittenween has a tide haven, with eleven or twelve feet springs. It exports grain, salt, and coals. Largo, on a considerable bay. Dysart, a town of one principal street, builds merchant ships for the Baltic trade; has large manufactories of salt. Kirkcaldy, on a fine cove, but is ill built, its principal street being most disagreeably serpentine and narrow. It has considerable manufactures, and employs 4000 tons of shipping. Kinghorn, opposite Leith, and five miles from it, is on a cliff overhanging the sea; its port, named Pettycur, is a fine basin at some distance to the west, and is the usual crossing place to Leith. Burnt Island is a village on a peninsula, forming an excellent haven of easy access, adapted for repairing or laying up ships; it has some trade and ship building. Stanlyburn has a pier haven. Inverkeithing is on the rising ground of a bay, affording good anchorage; it is one of the quarantine harbours for Scotland; it exports coals and salt; as do Terry Burn and St. David's villages. St. Andrew's Bay is between Fifeness on the south, and Redhead on the north, seven leagues distant. Nearly midway is the dangerous Cape or Bell Rock, which nearly dries at low water, and on which a light-house has been recently built.

The city of St. Andrew's is on the south side

of the bay on a rocky point, and has a haven formed by a pier, built on a natural ledge of free stone running into the sea; the depth is seven to ten feet high water neaps, and fifteen to sixteen in the springs. East and West Havens are fishing villages or creeks on the south shore of St. Andrew's Bay. The Tay, which carries a greater quantity of water to the sea than any other river of Britain, issues from the loch of the same name, and empties itself by an estuary named the Frith of Tay, filled with shifting banks. Vessels of considerable burden ascend the river to Perth, the chief town of Perthshire, and export its corn, linen, linseed, oil, and salmon, the produce of the Tay fishery. This river had formerly a mussel pearl fishery that some years produced £10,000, but it has been entirely exhausted.

Angus.—Dundee on the north or Angus shore of the Tay, twelve miles from its mouth, where it is two miles broad, is a flourishing town with a haven, formed by a pier, dry at low water; but, having nine or ten feet at high water neaps, and fourteen at springs; receiving vessels of 200 tons. Its trade is very considerable with the Baltic and London; its exports are sail-cloth, leather, cordage, thread, buckram, corn, salmon, and herrings; and its imports of various objects are estimated at 80,000 tons. It also sends vessels to the Greenland fishery. Passage vessels sail weekly to London. On Bartonness, the north point of the Frith of Tay, are two lights. Aberbrothick or Arbroath, at the mouth of the Brothick, has a fine tide haven for vessels of 200 tons, defended by a battery of six twelve-pounders. It exports the linen and sailcloth of its manufactories. Here are the ruins of a celebrated Benedictine monastery founded in 1178. From the mouth of the Tay to beyond Arbroath the coast is sandy and lined with rocks. Here it becomes bold and precipitous, with large caverns worn in the cliffs. Redhead terminates this tract, rising in red cliffs 200 feet high, and bounding Lunan Bay on the south, the shores of which are sandy, with sunken rocks as far as the North Esk River. In this bay is good anchorage in southerly winds. On Redhead are the ruins of a strong castle said to have been built in the twelfth or thirteenth century.

Montrose, the chief town of the county, is a neat and genteel place, half a mile from the mouth of the South Esk, which at the town forms a basin 250 yards broad, accessible to vessels of 400 tons. The town is built on a point of land surrounded on three sides by water. It exports chiefly salmon of the river and lobsters (60,000 to 70,000 a year) to London. It has also a considerable coasting trade, and some to the Baltic; and builds vessels.

Kincardine.—Fiscall is a village at the mouth of the North Esk, which separates Angus and Kincardine shires, to which succeeds Johnshaven. Gourdon, a fishing village with a haven, properly the port of Inverberie, two miles further north at the mouth of the Bervie, which receives only fishing boats. Eight or ten sloops belong to this port. Dunnottar Castle is on a high perpendicular cliff, almost surrounded by

the sea, and towards the land defended by a deep ravine. Stonehaven, a fishing town of two streets, on the Cowie, with a good haven formed on the south-east by a projecting rock, and on the north-east by a pier: it dries at low water, but has nine or ten feet high water neaps, and sixteen to seventeen in the springs. There is a good salmon fishery here. Girdleness, a promontory eighty feet high, is the termination of a ridge of the Grampian hills. On the shores near it beautiful Scotch pebbles and jasper are found, and most of the hills are composed of breccia or pudding stone.

Aberdeenshire.—The coast of Aberdeen is in general bold and rocky, the cliffs presenting many caverns of unknown extent. Aberdeen Bay is limited by Girdleness on the south; it affords good anchorage in off shore winds. The Dee is a rapid and considerable stream, descending from the Grampians: its mouth, enclosed by two piers, forms the haven of Aberdeen, which is crossed by a bar with but two feet at low water, and twelve and a half feet at high. Vessels that can go over the bar lie at a handsome quay. The north pier is 1200 feet long, and terminates in a round head sixty feet in diameter at the base, and thirty-eight feet high; the whole built of huge rocks of granite. The entrance is defended by two batteries of twelve-pounders. Old Aberdeen on the Don, a mile north of the new town, is almost joined to it by a long village. Small vessels enter the river's mouth. Newborough, on a rock forming a good haven, with twelve feet depth high water common tides; close to it on the north is the river Ythan, in which the tide flows up to the pleasant village of Ellon. This river abounds with pearl mussels. Slane's Castle, the seat of the earl of Errol, is built on a cliff overhanging the sea; near it is a cavern named the Dropping Cave, remarkable for the quick petrification of the water that drops from its roof. The ward of Gruden is a fishing village south of Buchanness, near which is a singular natural curiosity called the Buller of Buchan; it is a circular basin surrounded by a ring of frightful rocks, in which on the side next the sea the waves have worn an arched opening, through which boats can pass into the basin, which latter has a depth of thirty fathoms; the summit of the ring of rocks is covered with earth and grass, forming a narrow walk all round. Peterhead, a league north of Buchanness, has a tide haven formed by a pier, and sheltered by the little island Chalk Inch. It has some trade to the Baltic, is engaged in the cod and herring fisheries, and is visited for a mineral spring. Kinnaird Head is the south point of the great gulf formed on the north-east coast of Scotland, terminating in the Murray Frith. A league from the head is Frazerburgh, to which succeed Rosehearty and Aberdour, fishing villages with little tide havens.

Banff.—The coast of Banff county is in general very bold, presenting in many parts a front of perpendicular rock 200 to 300 feet high. In the parish of Guarie is a steep rock, frequented by innumerable kittiwakes, which arrive in spring to breed and depart in the autumn. On the same coast is a natural abyss called Hell's

chimney, communicating at its base with the sea, whose waves rush into and force a column of water through it, which breaks into vapor. A second cave is pierced through a neck of land, and from an entrance through which a man can only creep opens into a cavern 150 feet long, thirty broad, and twenty high, supported by vast natural columns of rock. On this coast are many small fishing places, beginning with Gardenstone, to which succeeds Macduff, a little town recently founded by the earl of Fife on the right bank of the Doveran, which has the best haven of the Murray gulf. On the opposite bank of the river is Banff, on the declivity of a hill, a genteel town, but with a bad haven from shifting sand-banks. The Doveran is useless to navigation, but has a salmon fishery that rents for £1000. The other exports are ale, corn, thread, cotton and yarn stockings, by coasters. Portsoy is a populous town on a point of land, which forms a safe harbour for vessels of considerable size; besides the produce of its fishery it exports thread and fine linen to London. The other places accessible to navigation are Cullen, which has only an open and dangerous road, Port Nockie, and Buckie, which receive small craft.

Murray.—The river Spey separates Banff and Murray shires; its course is about ninety miles to the Murray Frith, where it empties itself at Gairmouth, forming a good haven for small vessels. Gairmouth is a neat town of 700 inhabitants, and has a good deal of business, chiefly from the great quantity of timber floated down the Spey from the forest of Strathspey. A number of vessels of 500 tons are built here of this timber; and it has a good salmon fishery, several sloops being employed in conveying the fish to London. On the coast of Murray is a considerable tract of sand downs, called the Maviston Sand-hills, which, according to tradition, were formed by the same inundation of the sea that produced the Goodwin Sands. These downs are constantly increasing towards the north-east, and within the last century have entirely covered the fertile barony of Culbin; and the same cause has also necessitated the removal of the town of Findhorn, whose ancient site is now obliterated by sand-hills.

On this coast are some fresh water lakes, which were apparently bays of the sea, particularly Loch Spynie, three miles long and one broad, now separated from the sea by a fertile tract of land called Ross Island; many beds of oyster shells are found on the banks of the lake considerably below the level of the land. The lake abounds in perch and pike, and is frequented by swans. The Loch of Cots is described as a bay in the thirteenth century. The Frith of Murray is entered between Burgh Head in Murray, and Tarbet Ness in Ross, distant from each other five leagues; it contracts gradually to a strait between Fort George and Fortrose, formed by two promontories, within which it again widens to a lake nine miles long and three broad; at the upper end of which two projecting points at Inverness contract it to a second strait, beyond which it again expands, and forms a second lake nearly as large as the

first, at the head of which the river Beauley empties itself. The river Ness, which issues from Loch Ness, falls into the Frith at Inverness. Lossie Mouth, at the entrance of the little river Lossie, is the port of Elgin, and receives vessels of eighty tons, by which it exports corn to Leith, &c. Findhorn is a small town at the mouth of a river, which is navigable to within two miles of Forres, five miles above Findhorn. In the river is a good salmon fishery. In the bay of Findhorn is 1000 acres of soil covered by the tide of flood, which it is in contemplation to embank.

Nairne.—Nairne, at the mouth of a river, is the only port of the little county of Nairne; it is neatly built, and exports the produce of its salmon fishery. Its harbour is convenient, and capable of great improvement.

Inverness.—Fort George, on the Inverness side of the strait that communicates between the two inner lakes of the Murray Frith, is a regular fortification, on a promontory surrounded on three sides by the sea, and covering ten acres of ground, mounting 100 cannon, chiefly forty-two pounders, and having barracks for 6000 men. Inverness is a considerable town at the mouth of Ness River, accessible to vessels of 500 tons at all times; it exports salmon, herrings, cordage, canvas, and sacking, chiefly to London.

The Friths of Murray and Cromarty are separated by a peninsula named Black Isle (Elan-du), through which runs a ridge of hills covered with heath, declining to both gulfs. The peninsula is twenty miles long and four broad, the south shore forming the county of Ross, and the north that of Cromarty. Fortrose and Beauley are in Ross-shire, on the Murray Frith, the former opposite to Fort George.

Cromarty.—Cromarty Frith is a deep inlet, called for excellence 'the Harbour of Safety;' it is entered between two high heads called the Sutors of Cromarty, a mile and a half distant from each other, within which it expands to three miles for a length of sixteen, and has good anchorage for the largest ships in every part, so that it is often run into for shelter in easterly winds. The south Sutor is a bold promontory topped with pines, and commanding a magnificent view over the sea and over Ross-shire. Cromarty, on the south shore of the strait, has a commodious quay, at which vessels of 400 tons lie; it has little other business than the fishery.

Ross.—The Frith of Dornoch, or of Tain, is separated from that of Cromarty by a peninsula of the county of Ross, of which Tarbet Ness is the extreme point. The entrance of the Frith is five leagues wide, decreasing gradually to Mickle Ferry, where it is two miles; within this it again expands, and forms a good harbour for vessels of considerable burden, though it is crossed by a bar with but four feet at low water. The south shore of the outer gulf is lined by a bank called the Gizzing Briggs, from the noise the sea makes on it; in it are several breaks, admitting small craft within it: but all this gulf requires a pilot.

Tain, on the south shore of the Frith, has some coasting trade; it is an old irregular built town, with a few new houses.

Sutherland.—On the north or Sutherland shore of the Frith of Tain is Dornoch, the principal one of Sutherland, and the only one deserving mention. North of the entrance of Dornoch Frith are Fleet Lake, Dunrobin Castle, the seat of the earls of Sutherland, in good repair, and Brora Haven, at the mouth of the little river of that name.

Caithness.—The county of Caithness occupies the north-east extremity of Great Britain; its east coast is bold and rocky, forming many little coves into which the fishing boats run, and to which the fishermen descend from the perpendicular cliffs by dangerous flights of steps cut in the rock. To secure their boats from the sea they hoist them to the rocks, into which rings are fixed for the purpose above the reach of the waves. At one of these coves, named Faigoli, a fine cascade falls over the cliffs into the sea. At the bases of the rocks are many sea-worn caverns, accessible only in boats, and frequented by seals, which are killed for their oil and skins. Many rocky pyramids also start up from the sea. The sea air prevents the growth of any kind of trees on this coast. It abounds in sea weed, which is burnt into kelp.

The principal places in Caithness are Dunbeath Castle and Wick, on the east coast; the latter is the county town; its haven is natural and very indifferent. Staxig, one mile north of Wick, has a little dry tide haven. Freswick castle, on Sinclair Bay, north of Noss Head, is strongly situated on a promontory. Dungis, or Duncan's Bay Head, the Berubium of Ptolemy, is the north-east point of Scotland; it is a rocky precipitous promontory, eaten into caverns by the waves. The Stalks of Dungis Bay are two isolated pyramids of freestone, the resort of sea birds, and the breeding place of eagles. The north coast of Caithness, west of Dungis Bay Head, forms a fine bay, with a white sandy and shelly beach, near which was the celebrated John O'Groat's house, noted as well for the tradition respecting its erection, as for being the northernmost habitation in Britain. Thurso is on a spacious bay, limited by Dunnet Head (Occas Promont), the north point of England, on the east, and by Welbrow Head on the west, both of which shelter it from the fury of the waves and the stream of the tides. Dunnet Head is a broken rocky promontory, from 100 to 400 feet feet high, joined to the main by an isthmus, one mile and a half broad. It is one of the few places of Britain frequented by puffins.

Thurso, on the river of the same name, has a river navigable two miles for vessels of sixty tons, and its harbour is about to be improved by act of parliament. Thurso has eight vessels employed in coasting, and several fishing boats. It exports corn and meal to the amount of £12,000, and fish to a greater amount, particularly salmon, which is so abundant that 2500 were caught in one draft, two miles above the town, in 1743. The annual export is estimated at 700 kits of boiled salmon, 250 barrels of pickled, besides 7000 barrels of salted and smoked herrings.

Sutherland.—The north coast of Sutherland is indented by numerous bays, forming good roads

for shipping. The first is Port Skerry, at the mouth of the Hollarale River, which separates this county from Caithness. Five miles north-west of it is Strathay Head, a long promontory, sheltering a cove, called Port Strathay, at the mouth of a river of the same name. West of Strathay Head, the River Naver, the most considerable of the county, falls into a fine bay, after a course of twenty-eight miles. Torrysdale River empties itself at a village of the same name, and has a good salmon fishery. Tongue Bay, farther west, is an inlet of the sea, five miles deep, skirted with farm houses and corn fields. Farther west the coast is high and rocky, with many little coves, on one of which, named Voisgag, a quarry of gray slate is worked. There are here also many sea-worn caverns, supported by pillars, of which that named the Great Cave of Fraisgall runs in more than half a mile, and is covered with stalactites of different resplendent colors. There are some islands here, of which the most worthy of notice are, Saints, Seal, and Rabbit Islands, in the entrance of Tongue: the former presents a singular appearance, produced by the spouting of the waves of the sea through a natural tunnel. Ealan na Roan, or Seal Island, is two miles in circuit and inhabited by four families. Rabbit Island has its name from abounding in rabbits.

West of the Bay of Tongue is Loch Eribol, a spacious inlet, on the west shore of which is Port Ruspín, a small dry haven. Next in succession is Far-out Head, the point of a peninsula between Loch Eribol and the bay of Durness. Cape Wrath, or Barvhead (Ebudium), the north-west point of Britain, is a desolate rocky head, which apparently has its name from the furious beating of the waves and the rushing of the tide, which are increased by a rocky ledge running off from the cape five or six miles, with sixteen to twenty-four fathoms on it. Nine miles due north of the cape is a dangerous sunken rock covered at high water. The cave of Sino, near the cape, is seventy or eighty yards high, and extends backwards in a lake of which the extent is unknown.

II. THE WEST COAST OF SCOTLAND. *Dumfries*.—The Solway Frith separates England and Scotland, and is nine leagues wide at its entrance, but is much encumbered by sand banks, that increase annually in height and surface, thereby contracting its navigation. At its head it receives the river Esk, which is also the boundary of the two kingdoms; and about a mile from which, on the Scottish side, is Gretna Green, celebrated in the annals of clandestine marriage. The other places of any note in Dumfriesshire are Anan, on a river of the same name, a neat town, with a small coasting trade and considerable fishery. Dumfries, on the east bank of the Nith, nine miles from its mouth, having vessels employed in the Baltic and Portugal trade, besides coasters. The Nith separates Dumfries and Kircudbright shires.

Kircudbrightshire.—The River Urr, the most eastern in Kircudbrightshire, is two miles wide at its mouth, spreading to a large basin and forming a good port. It is navigable eight miles for vessels of eighty tons, and by it lime is introduced into the interior from the opposite coast

of Cumberland. Kircudbright, on the west bank of the Dee, five miles from its mouth, is the county town. The Dee flows through Kenmuire Lake, and is navigable to Tongland, two miles above Kircudbright, above which its bed becomes encumbered with rocks. It abounds in salmon, perch, and eels. In the mouth of the river is the little island of Ross, the entrance between it and the east shore being one mile and a half wide, safe and bold on both sides. Above this island are several good anchoring places, with sixteen feet water at low water, and forty-six at high. Opposite Kircudbright the depths are eight feet at low water and twenty-eight at high. On the sand in the river below the town is St. Mary's Island, on which the earl of Selkirk has a mansion. Here are also the remains of a magnificent castle. The River Fleet empties itself on the east shore of Wigton Bay, and is navigable for vessels of eighty tons to the village of Gatehouse. Creetown, at the mouth of the Cree, which falls into the head of Wigton Bay, is a newly founded and increasing place, having a number of coasters, and vessels of 500 tons can ascend to it.

Wigtonshire.—Wigton Bay separates the counties of Kircudbright and Wigton; it is three miles broad for six miles from its entrance, and has several good anchorages. Borough Head is its west point. Ascending from which along the west shore the places are Whitehorn, having a good haven sheltered by a little Island, and passage vessels sailing to the Isle of Man in three hours, to Whitehaven in four, and to Dublin, Greenock, and Liverpool in eighteen. Wigton, the county town, is on a hill on the bank of the Bladenoch. Luce Bay is between Burrough Head, on the east, and the Mull of Galloway, on the west. Nearly mid-channel between these points are the rocks named the Scars. In foggy weather this bay has been frequently mistaken for the opening of the north channel, and vessels have run on shore on the quicksands, which line several parts of the bay, and out of which it is impossible to extricate a vessel. There are, however, several good fair weather anchorages in this bay, but in westerly winds there is always a great swell in it. The peninsula of Galloway is bold and cavernous on the west. Its south point, or Mull, is also the south point of Scotland. Port Nessick, on the west side, has a little pier for craft of five or six feet. Port Patrick is a neat town with a small haven and a handsome quay and light-house. A packet sails daily between it and Donaghadee, the distance being twenty miles. The principal trade is the import of cattle from Ireland. One mile south of it is the castle of Dunskey, on the brink of a frightful precipice. Loch Ryan is a deep inlet at the north extremity of the peninsula of Galloway, ten miles long and two broad at the entrance, widening to four miles within, and forming an excellent harbour, the only danger being a sand bank running off from the west shore, which makes it necessary to keep pretty close to the east shore. This sand-bank is covered with excellent oysters, and the bay abounds in cod, haddock, and other fish, lobsters and crabs. Stranraer, at the head of the Loch, is one of the

principal towns of the west of Scotland, neatly built, and a small river runs through it. Vessels of 300 tons ascend to within a mile of the town, and those of sixty tons lie at its quay. It has 1400 tons of shipping, and trades to Norway and the Baltic.

Airshire.—The Frith of Clyde is a deep gulf between the coast of Air, on the east, and the peninsula of Kintyre, on the west. The Air coast towards the south and north is rocky and elevated, but in the middle between the River Doon and Saltcoats, a distance of twenty miles, is a sandy beach, shoaling a considerable way off. As the ports of Air and Irvine, on this coast, can only receive vessels of 200 tons at spring tides, ships embayed in the curve can only find shelter in westerly winds under Lady Island four miles north-west of Air. The proper marks for anchoring here are the spires of the two beacons on the island in one, where a cable's length off shore, there is ten or twelve fathoms. Trune is the only place on this coast where a good artificial haven may be formed, as it is naturally sheltered from all winds but north-west by a rocky peninsula running a mile into the sea. A vessel taking shelter in it at present may anchor half a cable's length within its extremity, in three fathoms at half flood. It is a sea bathing place. Ballinbay, on the Stinser, is a good village. Four miles north of which is Ailsa Island, in the middle of the entrance of the Frith of Clyde. It is a conical rock, with many goats and rabbits on it, and the resort of soland geese and other sea birds, whose feathers, as well as the rabbit skins, pay the rent of the tenant, which is £25. On it are the ruins of an old castle. Grivan, on the river of the same name, is a poor village, with half a dozen boats. In the river the depths are nine to eleven feet.

Air, the county town, on a river of its name, is a small well-built place. The river is crossed by a bar with but twelve feet high water springs. It sends some vessels to the Baltic, and to Ireland with coals, and builds vessels. Irvine, three miles up a river of its name, has a haven with nine to eleven feet water at common springs; but with a gale from south-west the tide often rises to sixteen feet. It has a small ship-building establishment, some trade with the Baltic, and exports 24,000 tons of coals. Saltcoats, the most fashionable sea-bathing place of the west coast of Scotland, is built on a rock near Sandy Hills. It has a manufactory of salt, some coasting trade, ship building, and a herring fishery. Largs, opposite the Isle of Bute, has 1400 inhabitants, and is the general market of the neighbouring country. The River Clyde, supposing its entrance to be at the Isle of Bute, is four miles wide, but the channel is narrowed by the Great and Little Cumbray Islands, nearly in the middle. The tide flows above Paisley, and it abounds in salmon and trout.

Renfrewshire.—Greenock, on the south bank of the Clyde, is the emporium of the north and west of Scotland. In 1700 it was a mean village, but now carries on a direct trade to all parts of the world. It also builds a great many merchant ships for sale, and has a share in the Greenland whale fishery. The harbour is nearly dry at

low water, and vessels of eleven feet only can go in with spring tides.

Port Glasgow is three miles east of Greenock. The Clyde here is two miles wide, but so filled with banks as only to afford a channel 200 yards wide close to the Port Glasgow shore. The largest vessels lie here at the quays, or discharge their cargoes into lighters to be conveyed up to Glasgow. Renfrew, the chief town of the county, formerly stood on the bank of the Clyde, but the river, changing its course, deserted it. At present it communicates by a little canal.

Glasgow, the principal town of Lanerk, and the second of Scotland, is fifteen leagues above Port Glasgow, vessels of seventy tons ascending to its quays, the rise of tide being seven feet. A board of commissioners is here appointed to improve the river, and operations are constantly carrying on to deepen it. This city receives the greater part of the merchandise imported by the Greenock and Port Glasgow vessels.

Dumbartonshire.—The only port town of Dumbartonshire is Dumbarton, on the Leven, which, issuing from Loch Lomond, falls into the Clyde. The town has 2500 inhabitants, and some brigs belong to it. Near the town is a castle on a two-headed rock, washed on one side by the Clyde and on the other by the Leven. Gare Loch and Long Loch are the first of the numerous sea lakes that intersect the north-west coasts of Scotland. Gare Loch is seven miles long and two wide; and Long Loch is twelve miles long, approaching the celebrated fresh water lake of Lomond within one mile and a half. It separates Dumbarton and Argyle counties.

Argyleshire.—The county of Argyle is composed of several peninsulas formed by sea locks: the first of the latter is Loch Fyne, thirty miles long and three wide, in which a great herring fishery has been carried on at different periods. At its head is Inverary, the chief town of the county.

The peninsula of Kintyre is united to the main land of Argyle by an isthmus a mile broad, between the east and west Lochs Tarbet; the former is a safe and capacious basin, with an entrance only 100 yards wide. On the south point of the peninsula, named the Mull of Kintyre, is a light. Campbelltown, on the east side, has an excellent natural harbour, within the little island Dever; it is surrounded by high hills, and has a depth of six fathoms. Here is the grand rendezvous of the herring busses. Sanda Island, two miles north-east of the Mull, is celebrated in the Scandinavian annals by the name of Avona, as the rendezvous of the Danes in their descents on Britain. The circuitous and difficult navigation round Kintyre, from the Clyde to the Hebrides and north-west coast of Scotland, is now avoided by means of a canal, nine miles long, cut from Loch Gilp (a bend of Loch Fyne) to Loch Crinan. Having rounded Kintyre and passed West Loch Tarbet and Loch Crinan, above-mentioned, we come to Loch Fellam, on which is Oban, the principal place on the north-west coast of Scotland, though but a village. The Loch forms a harbour capable of receiving 500 merchant vessels. Dunstaffnage, or Loch Etive, the place next in consequence, is a small hamlet, with an ancient castle

Inverness-shire.—Lochs Linne and Lochabar, which communicate by a strait, penetrate into the heart of the bleak and dreary county of Inverness. At the head of the loch is Fort William, a triangular fortress, with two bastions and barracks for 800 men. The little town of Maryborough adjoins Castle Duart, or Loch Linne, and has a garrison of forty men from Fort William. Glenely is a poor hamlet opposite the east end of the Isle of Sky. A mile north of it are Berneira barracks usually occupied by a serjeant's guard.

Ross.—The western coast of the county of Ross has no place deserving even the name of village except Ullapool, on Loch Broom, a fishing station, established by the British Society in 1788; it may contain 500 persons. The loch is one of the most abundant in fish, and forms an excellent harbour for the largest fleets.

Sutherlandshire.—The west coast of Sutherland, which terminates at Cape Wrath, is worn into many sea lochs and inlets, where shipping can find shelter in all winds, but has not even a hamlet.

We have noticed the chief mountain ranges, and some of the most remarkable mountains of Scotland, in the article *BRITAIN*.

The first and great division of Scotland is into the Highlands and Lowlands. The former engross more than one-half of Scotland; extending from Dumbartonshire to the most northern part of the island, a space of 200 miles in length, and in breadth from fifty to 100. This tract, however, includes several extensive districts of low, fruitful ground, inhabited by people who are in all respects different from the mountaineers. Nothing can be more wild and tremendous to the eye of a stranger than the appearance of the Highlands, composed of blue rocks and dusky mountains heaped upon one another even above the clouds, their interstices rendered impassable by bogs, their sides embrowned with heath, and their summits covered with snow, which lies all the year untawed, pouring from their jagged sides a thousand torrents and roaring cataracts that fall into gloomy vales or glens below, some of them so narrow, deep, and dismal, as to be altogether impenetrable by the rays of the sun: yet these mountains are in some places sloped into agreeable green hills fit for pasture, and skirted or interspersed with present straths or valleys capable of cultivation. Some authors have divided Scotland into that part which lies to the southward of the Frith, and that which lies to the northward. Others consider Scotland, agriculturally, as embracing three natural divisions. The first lies north of the chain of Highland lakes, which stretches from Murray to Mull, and consists of little else than dreary mountains and some moors; the second, or middle division, extends from this chain of lakes to the rivers Forth and Clyde; it is mountainous, but cultivated in the valleys, and on the eastern shore to a considerable extent; the remaining division is covered by hills with some mountains, but every where cultivated or improvable, and highly favorable for most branches of agriculture: and, though Scotland was far behind England in cultivation till the middle of the last century, it has now outstripped this country; particularly in

arable husbandry: in proof of which Mr. Loudon adduces the fact that the improvements introduced, or attempted to be introduced, on arable land in England and Wales are, with few exceptions, the implements and practices of Scotland. In the management of meadows or old pasture, Scotland cannot be conspicuous; as the climate is not naturally calculated for that kind of husbandry. The winters are too long and severe, and the surface too irregular: and in regard to live stock this writer admits the palm of improvement is undoubtedly borne away by England. But though there is not that enthusiasm in Scotland, nor such large prices given for capital specimens, it may be safely asserted that breeding and feeding are conducted as systematically and successfully there as in England.

The number of the counties is thirty-three, most of which are again subdivided by local acts of parliament into two or more districts for the purposes of police and internal economy; and several of them comprise a variety of territorial divisions, founded on the natural circumstances of the country. Berwick is thus divided into the three districts of the Merse, Lauderdale, and Lammermuir; Lanarkshire into the Upper, Middle, and Lower Wards; and, in the extensive Highland counties, the subdivisions are still more numerous. The number of parishes is 899, but liable to vary from annexations and disjunctions. Every parish contains a church and burying-ground, with a manse, or dwelling-house, and a few acres of land as a glebe, for the clergyman, who, by a happy provision and observance of the law, is always resident; and a school, with a schoolmaster's house and garden. In several of the towns one church has two ministers, so that the number of the clergy is greater than that of the parishes. In 1813 the parochial clergy amounted to 938, besides assistants. An indefinite number of parishes form the ecclesiastical division, called a presbytery, and several presbyteries a synod.

Rivers.—In the northern part of Scotland are several fine streams, amongst which the Beaully, Canon, and Naver, may be mentioned; but those of the middle division of the country far surpass them. Here rise the Spey, the Dee, the Don, the north and south Esk, and the Tay, one of the largest rivers of Great Britain. In the south of Scotland we have the Forth, the Clyde, the Tweed, and numerous minor rivers which empty themselves into the Irish sea and Solway Frith; the Ayr, the Girwan, the southern Dee, the Nith, the Annan, and the Liddel. The lakes or lochs of Scotland are also numerous and have been many of them long celebrated for their grand and picturesque scenery. Of these, the chief are Loch Lomond, Loch Aw, Loch Tay, Loch Ness, Loch Shin, Loch Lochay, Loch Naver, Loch Leven, &c.

Minerals.—Scotland has boasted mines of the precious metals, as we have seen in the historical part of this article; but no mines are now wrought solely for silver or gold; the lead mines are, however, rich in the former. In the last century a silver mine was wrought in the Ochil hills, in the parish of Alva. Ironstone, iron ore, and septaria ironstone, are abundant, and

copper has been discovered in many places. Other metallic substances discovered here are cobalt, bismuth, manganese, wolfram, plumbago, and mercury. Coal is abundant in the southern and middle districts, running from north-east to south-west, and limestone, freestone or sandstone, and slate, are found in every district. Of late, too, attention has been paid to the marbles, which prove very fine. Most of the gems and precious stones, except the diamond, have been found in Scotland. Pearls are found in the great horse mussel (the *mytilus cygnus* and *anatinus*), a native of the northern rivers; in the common oyster and in mussels. The sapphire, of equal hardness with the oriental, is found in several places, and of different shades, from a deep red to a transparent white. The topaz is found in the mountains of Marr, and in the range which stretches towards Perth, Inverness, and Banff. It is the most brilliant of the Scottish gems hitherto found. It occurs in rolled pieces, often imbedded in the granite, and most commonly of a very light green, or greenish white. The ruby and hyacinth have been found in Fifeshire, adhering to the rocks. They are in general small, and of inferior lustre. Emeralds and amethysts are also frequently met with, and some have been valued at thirty or forty guineas. Garnets are found in the Highlands of good sizes; and agates, under the various names of onyx, sardonyx, and pebble, in every part of the country where basaltic rocks are found. The Scotch pebbles are of many beautiful hues: blue and white, red and white, in veins, and in every gradation of shade. Jasper is so abundant as to be included among the building stones; there are also many delicate specimens to be met with. The rock crystal, commonly denominated cairngorum, from the mountain of that name in Banffshire, is found in every mountain in the primary districts of Scotland. The colors are yellow of different shades, and clove brown, approaching to black. The deeper yellow specimens sell high: the clove brown colors, more peculiarly termed cairngorums, are also valued in jewellery; and chalcedony, equal in hardness and other qualities to the oriental, is found in Fife. The northern and southern mountains are chiefly composed of granite: Ben Nevis is said to be equally beautiful with the Egyptian; at Portsoy that singular kind of granite is found called Moses' Tables; besides these, there are various rare and curious fossils.

Springs.—The chalybeate springs are very numerous; we may particularise those at Moffat, Peterhead, Dunse, and Aberbrothock. Sulphureous springs are also found in the neighbourhood of Moffat, and near Edinburgh, at St. Bernard's well. Some of the springs also hold some neutral salt dissolved, as at Piteathly. Many of the springs proceeding from a bed of limestone, acquire a petrifying property, of which there are examples at the Dropping Cave of Slains in Aberdeenshire, and in many places in Lanark and Ayr.

Of the Caledonian *forests*, the most considerable remains are in the districts of Mar and Glentworth in Rannoch, in Glenmore and Strathspay, and in Alfarg in Ross-shire. Fir is the

most common wood; but the oak and other deciduous trees are not wanting. Some of these forests extend thirty or forty miles in length, and great quantities of timber are floated down the Spey, the Dee, and the Tummel.

The *soil* must be considered in general inferior in point of fertility to England; but there are many valleys or straths, even in the Highlands, which are productive; and the three Lothians, Berwickshire, Fifeshire, the Carse of Stirling and Falkirk, Strathern, the Carse of Gowrie, the province of Moray, &c., contain excellent land. In the middle and southern districts the country has every where assumed a most marked and visible improvement. The soil of Scotland produces wheat, rye, barley, oats, pease, beans, hay, potatoes, turnips, &c.; also flax and hemp, but in no great quantities, nor does the soil appear to be well qualified for their production. Horticulture is making rapid progress every where, and apples and other fruits are produced in abundance. Of late many extensive tracks of waste land have been planted with wood, and the success attending this improvement evinces that the soil and climate are well adapted for forest trees. The Scotch fir is the most common pine in the Scottish plantations; the larch has also been introduced, and is a valuable acquisition. Ash, elm, plane, beech, oak, laburnum, and a great variety of other kinds, are intermixed in the plantations, and have a fine effect. The juniper shrub grows naturally on the hills, and the whortle or blaë berries grow on the highest mountains. The alga marina, or sea weed, is in great luxuriance on the rocky coasts, and becomes when burnt into kelp, a valuable article of commerce.

Speaking of the west of Scotland at the present period as contrasted with sixty years ago, a practical writer observes,—Good roads and wheel carriages are in such general use, that we reckon them as common place; yet, by reflecting on the former situation of this country, we may soon form a proper idea of their importance. About the period above-mentioned, hay was a scarce article in Glasgow; and in some of the surrounding parishes, ten or twelve miles off, the roads were so bad, that their hay intended for sale was made up in trusses of ten stones only, and it took a whole day's work for a man and horse to bring that quantity to town, a business which was then performed by placing it across the horse's back, and the man led the animal with one hand, while he employed the other to balance it, owing to the ruggedness of the roads. If hay was scarce at that time, money was more so, for, after all the labor of making and transporting the hay, all that the farmer received for it was 3*d.* per stone, or 2*s.* 6*d.* for the whole load, out of which he had to pay part of his rent and the expenses attendant upon raising the crop and keeping his horse. Now—a-days a horse and cart can bring into town 120 stones from the same district, with the greatest ease, and the farmer will be far better paid for his trouble. Sour or butter milk was also then, as it still is, an article much in use in this country, and it was likewise all brought in upon horse's backs. I have myself seen about thirty

horses in a morning, bring in two small casks a piece, one on each side of them, not exceeding in content (from recollection of their appearance) a vessel of forty pints each. At present the farmer can, with the greatest ease, bring in upon a cart a cask containing 140 pints, and frequently two of this content, so much are our roads improved, and the facility of communication with the surrounding country increased. In these times, on almost all farms, the country people had cars for bringing in their crops; these cars are now so completely given up that few individuals in this town under thirty years of age have ever seen them, though I believe they are in a small degree still used in very steep hilly parts of the country, or where the crop is to be brought in from high grounds. Farmers now only use carts, drawn by good horses, and well made harness; whereas formerly the collars for these animals were made of straw or rushes. The farming system is equally improved in every other respect; you now see fields of wheat waving their yellow heads, in places which formerly produced but a very poor crop of oats; and excellent green crops are common over all the country. The comfort of the cottagers has partaken of the general improvement; instead of clay, they have wooden floors in their cottages, and even in these humble abodes you will frequently find carpets and other luxuries which were unknown to our forefathers. From these, and many other examples that might be adduced of manifest improvement in the comfort of the agricultural part of the community, we may see the gradual progress of civilisation, and the superior blessings we enjoy when compared with those of the former inhabitants of this part of the island.

Though somewhat departing from our arrangement, we shall allow this writer to speak of other improvements in his neighbourhood:—When we turn, on the other hand, to the manufacturing portion, we are struck in a still more forcible manner with the rapid strides of improvement in their varied departments. The weaving manufacturer, for instance, who, at the same period to which I have so repeatedly called your attention, employed thirty or forty looms to work for him, was esteemed a person of very extensive trade and importance in society. Now, some individuals in this line employ 1200 looms, and in many shops there are 200 under one roof. The most wonderful improvement, however, in this branch of manufacture, is that of the steam loom; and, though at present it is restricted to the weaving of plain cotton goods, yet, I believe, the period is not far distant when it will be extended to the fabrication of all kinds of woollen manufactures whatever. I have indeed seen within these few days an ingenious English mechanic who has lately visited Lyons, and he informs me that the best weaver in that city can only earn a franc a day, and that at the finest work, namely, the fabrication of those beautiful silk ribbons so much admired by our ladies. Having visited Paisley, our grand workshop of ingenious manufactures, he was pleased with the beautiful fabrics he saw there, and he is determined to establish in the neighbourhood of Glas-

gow a silk manufactory, which he has no doubt will ere long rival those of Lyons. By the improvements he intends to introduce from what he has seen at both places, united to his own skill, I have little doubt but Glasgow will soon become as famed for her silk manufactures as any place in the world.

The Great Canal affords us another instance of the improvements in this part of the country. It has been so long in use that we can scarcely sympathise with strangers when, standing at the Broomielaw and viewing our shipping, they turn round and behold immediately above the city a navigation 150 feet higher than the level of the Clyde; and when we consider that so many vessels ply on this canal, that £40,000 was collected at Port-Dundas in the year 1824, to which if we add that from £10,000 to £15,000 were collected at the sea-port and Bowling Bay, we cannot fail to be convinced of the great importance of this navigation. But, independent of the advantages of this inland navigation, there is no spot round Glasgow so well deserving the inspection of strangers; for, at the basin of the canal, you are elevated above the whole city, and enjoy a most extensive view over the whole surrounding country, having Dumbarton and Paisley at all times in sight, and in clear weather even the island of Arran, objects of interest which are frequently overlooked by the mere passenger, who generally confines his attention to those at hand. Even in this case, however, the canal affords scope for interesting reflection; here may be often seen vessels belonging to the French, the Danes, the Dutch, and other European states, and even some vessels have sailed from the Black Sea through this canal to Port-Dundas, and thence to the West Indies. The Paisley and Ardrossan Canal (though it has not yet reached the latter place) is also an object of very considerable interest to the districts through which it passes; but, not being finished, its trade is on that account much confined, and not in a very prosperous state. One feature, however, in its construction deserves to be noticed, namely, that it passes through a tunnel under some streets and houses in Paisley. About the period formerly mentioned, there was only one bridge over the Clyde, at or near Bothwell, and that so narrow that two carts could not pass each other properly; now there are three commodious bridges for carriages near the city, and one for foot passengers.

The *climate* of Scotland, from its insular situation and high latitude, is cold and variable, but the cold in winter is not so intense as in similar latitudes on the continent, and seldom so severe as in the south of England: that dreary season, on the other hand, is more protracted than in those countries. The greatest height of the thermometer that has ever yet been observed is 92° Fahrenheit, and the lowest at Edinburgh, 31st of December, 1783, is 3° below zero. Its ordinary range is from 84° to 8°, though it seldom maintains these extremes for a length of time. The annual average temperature may be estimated at from 45° to 47°. The average quantity of rain that falls appears to be from thirty to thirty-one inches. The western coasts, owing to the general

prevalence of the west winds from the Atlantic Ocean, is more liable to rain than the eastern. In general, the proportion of rain is one-fifth more. It has been estimated that it rains or snows on the west coast for 205 days annually.

The winds are, as might be expected, extremely variable, both in force and direction. In the more elevated districts, the glens serve as funnels, to receive the blast which was proceeding, perhaps by many points, in a different course, but which, being arrested by the mountains, is now diverted into the valleys, and, gathering strength from the interruption, sweeps along with redoubled fury. On the west coast it has been repeatedly asserted, by intelligent observers, that the wind blows, for two-thirds of the year, from a southerly point. In the summer and autumn these winds frequently are injurious to the grain and fruit. North or north-east winds appear to prevail, especially on the eastern coast, through somewhat less than one-third of the year. They generally prevail in the months of March and April, frequently extending into those of May and June, and generally throughout the summer. South-west winds prevail nearly two-thirds of the year; hence trees not sheltered incline to the north-east. Owing chiefly to the vicinity of the sea, the air in general is more pure, temperate, and salubrious, than might be expected in so northern a climate. The following is an abstract of a register of the weather, kept near Perth, for the year 1820: the temperature is thought not very different from the average temperature of Scotland, except that the number of rainy days, and quantity of rain, are less than on the western coast.—(From the Edinburgh Annual Register, 1820.)

	Fair Days.	Rainy Days.	Quantity of rain.	Mean Temperature.
January . .	21	10	1.321	30.4
February . .	24	5	1.193	39.1
March . .	25	6	0.332	40.6
April . .	24	6	0.690	46.7
May . .	10	21	5.447	49.4
June . .	18	12	1.745	54.6
July . .	22	9	1.635	57.6
August . .	12	19	2.228	56.0
September .	16	14	0.973	52.6
October . .	20	11	2.295	44.5
November .	20	10	1.658	41.6
December .	20	11	2.165	38.7
	232	134	21.687	45.98

The wild *animals* of Scotland include the fox, badger, otter, wild-cat, and hedge-hog; but all are now becoming scarce: the stag, wild roe, hare, rabbit, weasel, and mole. The domestic animals are the same as those of England; but the native breed of black cattle and sheep is considerably different, being smaller in size, and thought to be more delicious food. The colley, or true shepherd's dog, is peculiar to Scotland. Pheasants are found in the woods, but are scarce; also the beautiful capercaillie, or cock of the

wood, now become exceedingly rare; the ptarmigan, the black game, and grouse, are abundant in the heathy mountains; and, in the low grounds, partridges, snipes, plovers, &c. Scotland has also most of the English singing birds, except the nightingale. All the aquatic fowls of temperate climes are also common in the islands. The domestic fowls are the same as those of England. The fish are the same which are usually found in the North Sea, and the rivers teem with trout, salmon, eels, &c.; the lakes with pike and perch. Whales are sometimes thrown upon the coasts of Orkney, Shetland, and the Hebrides; and, besides other fish which are caught for their oil, we may mention the carban, or sun-fish, the fishery of which is prosecuted with considerable success. Shell-fish are abundant on all the coasts.

For a considerable time after the union with England, this country appears to have made little progress in *manufactures*; and it was not till about the year 1750 that a spirit of enterprise and ingenuity was excited, which has ever since continued. Scotland at present carries on almost every species of manufacture. Flax and hemp are manufactured into sheetings, osenburghs, bagging, and canvas, which are made chiefly in Forfarshire, and are finally exported, the first of these at least, to the West Indies, and the last is purchased for the use of the British navy: but the manufacture of finer linen has fallen off in Scotland, having been superseded partly by the importation of Irish cloth, and partly by the substitution of cotton manufactures. The spinning of flax by the hand used to be an important branch of industry; but spinning machinery has now almost banished it. These machines have now been generally introduced in the counties of Aberdeen, Mearns, Fife, and Angus: the cotton manufactures have also been carried, particularly in the neighbourhood of Glasgow and Paisley, by means of machinery, to an astonishing degree of perfection in Scotland; and attention has been particularly directed to those of a finer quality. Muslins and other fabrics are beautifully executed: as well as brocades, lappets of all sorts, imitation shawls, plain and Lincolne gauzes, spidered, seeded, and numerous species of draw-loom. Many of these fabrics, with the entire mechanism by which they are executed, are exclusively of Scottish invention. Immense quantities of cambrics, shirtings, sheetings, tweels, stripes, checks, pulicates, gingham, shawls, &c., are also manufactured in Scotland in a superior manner. Of cotton thread, likewise, large quantities are exported to the West Indies. Calico printing in all its branches is also carried to a great extent.

The *iron-works* established in Scotland deserve particular attention, and that at Carron, near Falkirk, is the largest manufactory in Europe. Iron is not only extracted from the ore, but it is finished into every variety of form. The quantity of metal smelted at Carron is about 6500 tons yearly, and about 2000 people are constantly employed; and, from all the different works in Scotland, above 30,000 tons of iron are annually extracted. A considerable proportion of Scottish ironmongery is exported to America, the West Indies, and other British colonies.

An idea may be formed of the number of workmen employed on timber of various kinds, and the value of the articles they make, when it is known that in Scotland there are about 3600 water-mills, 5000 thrashing-mills, above 100 wind-mills, and from 350 to 400 steam-engines, employed in preparing flour, meal, barley, snuff, bark, and lint; for teasing, carding, roving, and spinning wool, flax, and cotton; for preparing dye-stuffs, bleaching salts, paints, fire-clay, &c.; for winding, weaving, tambooring, printing, washing, wauking, calendering, &c.; for boring, blowing, hammering, &c.; and for raising water and minerals. The manufacture of machinery is therefore a most important branch of Scottish industry. Coach-making, musical instrument-making, &c., are also carried on in all the principal towns; and ship-building forms a most important branch of national industry. The average of the number of vessels belonging to the ports of Scotland amounts to 2509 annually. Minor manufactories we cannot here notice. In all of the considerable towns there are tanneries, breweries, and distilleries, on an extensive scale; and it may be generally remarked that almost all articles of ordinary use are manufactured in Scotland. The fisheries have been prosecuted likewise with great industry and success. See our article FISHERIES.

In the time of Cromwell the shipping of Scotland consisted of only ninety-three vessels, carrying 2724 tons, and eighteen barks. Soon after, however, her foreign trade with the northern and eastern states of Europe began to increase; and the Dutch cultivated a connexion with the Scots for the convenience of prosecuting the herring fishery on the coasts of Scotland. About the middle of the last century an extensive commercial intercourse was carried on from the ports on the eastern coast of Scotland, to Holland, Norway, Sweden, and the states on the shores of the Baltic. Of late years the imports consist of flax, hemp, yarn, linen, iron, corn, wood, tallow, and other commodities produced in those countries; and, in return, colonial produce, cotton goods, and other manufactured articles are exported. The trade between Scotland and Russia, including that of Archangel, forms the most considerable branch of the commerce of the eastern coast; and the chief shipping ports are Leith, Dundee, Arbroath, Montrose, Aberdeen, Peterhead, Banff, and Inverness. The trade with Spain, Portugal, and the Mediterranean, is carried on from Leith and other ports; and the connexion with Canada extends to all the most considerable towns on the east coast of Scotland. The commerce of the west centres almost entirely in the Clyde, which is the grand emporium of the American, West Indian, and South American trade. From Greenock a constant intercourse is carried on with the West Indies, with the British colonies in North America, with the United States, the Brasils, and South America. Several vessels have also sailed from that port, to carry on the trade to India, since 1814. From the eastern ports a trade is carried on with the northern countries lying round the Baltic; and the coasting trade with London is now placed under admirable regulations.

The following is the *revenue* for the first four years of this century:—

	£	s.	d.
1801 . . .	1,985,794	7	11½
1802 . . .	2,230,993	8	3
1803 . . .	2,246,028	0	3½
1804 . . .	2,171,973	16	8
1805 . . .	2,692,624	19	9½
1806 . . .	3,182,677	13	11
1807 . . .	3,558,784	7	7½
1808 . . .	3,544,111	7	7½
1809 . . .	3,632,832	2	3
1810 . . .	4,188,814	15	0
1811 . . .	4,031,347	1	7½
1812 . . .	4,236,797	5	0½
1813 . . .	4,383,751	7	10
1814 . . .	4,483,014	10	10½

The *population* of Scotland is naturally divided into the two classes of Highlanders and Lowlanders; differing in manners, language, and character, as much as many distinct nations. This distinction cannot be better exhibited than in the language of Mrs. Grant:—

‘The low country was inhabited by a people driven at a later period from the south, by successive invaders and oppressors, who were further advanced in the arts of industry and the progress of civilisation than the Highlanders, whom these last regarded as intruders, and who had scarcely any thing in common with them. Though their mountain chiefs were in due time brought to yield a reluctant fealty to the Scottish monarchs, their followers were scarcely conscious of this submission, and most unwilling to believe that a greater man than their own chief existed. No two nations ever were more distinct, or differed more completely from each other, than the Highlanders and the Lowlanders; and the sentiment with which they regarded each other was at best a kind of smothered animosity.

‘The Lowlander considered the Highlander as a fierce and savage depredator, speaking a barbarous language, and inhabiting a gloomy and barren region, which fear and prudence forbade all strangers to explore. The attractions of his social habits, strong attachments, and courteous manners, were confined to his glens and to his kindred. All the pathetic and sublime charms of his poetry, and all the wild wonders of his records, were concealed in a language difficult to acquire, and utterly despised, as the jargon of barbarians, by their southern neighbours. If such were the light in which the cultivators of the soil regarded the hunters, graziers, and warriors of the mountains, their contempt was amply repaid by their high-spirited neighbours. They again regarded the Lowlanders as a very inferior mongrel race of intruders; sons of little men, without heroism, ancestry, or genius. Mechanical drudges, who could neither sleep on the snow, compose extempore songs, recite long tales of wonder or woe, or live without bread and without shelter, for weeks together, following the chase. Whatever was mean or effeminate, whatever was dull, slow, mechanical, or torpid, was in the Highlands imputed to the Lowlanders, and exemplified by some allusion to them: while, in the low country, every thing ferocious

or unprincipled, every species of awkwardness or ignorance, of pride or of insolence, was imputed to the Highlanders.

'No two communities, generally speaking, could hate each other more cordially, or despise each other more heartily. Much of this hatred, however, proceeded from ignorance of each other's character and manners.'—*Essays on the Highlanders*.

The Highlanders are a brave and hardy race, ardently attached to the manners, customs, and language of their forefathers, their chieftains, and their country. Stout and active, they are generally capable of sustaining almost every bodily privation and hardship; but their ancient costume has now fallen greatly into disuse, and a Highland chief, in the full dress of his country, is seldom seen. This dress, however, is retained by many of the peasantry. Over the shirt, the Highlander wears a waistcoat of the same kind as the plaid, which is twelve or thirteen yards long, and made of a woollen stuff, called tartan, which is composed of various colored stripes, disposed at right angles to each other, and in the arrangement and harmony of which his taste is often displayed. The plaid, thrown over the shoulder, is sometimes fastened round the waist with a leathern belt or girdle, and hangs down before and behind, supplying the place of small clothes. This dress the Highlanders call a *phelig*, the Lowlanders a kilt. A kind of short petticoat, made of the same variegated stuff, is also frequently worn, and is called *philebeg*; this reaches nearly to the knee, and with short stockings made of tartan, and tied below the knee with garters formed into tassels, completes the dress. A large leathern purse, richly adorned with silver, hanging before, was always an appendage to a Highland chieftain's dress. Almost every Highlander has a large pouch of skin, dressed with its hair on and ornamented with tassels, dangling before him, to contain his money and tobacco. The lower class wear a flat blue cap, of a particular kind of cloth, called a *bonnet*, and brogues of untanned skins. The female dress in the Highlands consists of a petticoat and a kind of jerkin, with close sleeves, over which they wear a plaid fastened under the chin, and falling in folds to the feet, sometimes most gracefully. Round the head they fold a piece of linen of different shapes. The young women seldom have more than a ribbon for this purpose. Shoes and stockings are little worn by the Highland females, except the higher classes, who dress as in England. In bad weather the plaid, instead of resting upon the shoulders, is thrown over the head, and then resembles the mantella of Spain.

The generality of the cottages of the Highlands are so unlike what are to be seen in England, that we shall insert Sir John Carr's description of what they were about fifteen years ago. 'At a distance,' he says, 'they resemble piles of turf. In general they are built in glens and straths, on the side of a lake, or near a river or stream, adjoining to which there is a little arable land. The walls are built of turf or stones, according to the nature of the adjoining soil, and raised about six feet high, on the top of which a roof

of branches of trees is constructed; this is covered with squares of turf, of about six inches thick, closely pressed together, and put on fresh from its parent moor, with the grass or heath upon it, which afterwards continues to grow, and renders it difficult for a traveller, unless he be very sharp-sighted, to distinguish at a little distance the hut from the moor. A tolerable hut is divided into three parts: a butt, which is the kitchen; a benn, an inner room; and a byar, where the cattle are housed. Frequently the partition of the chambers is effected by an old blanket, or a piece of sail-cloth. In the kitchen, and frequently in the inner room, there are cupboard-beds for the family; or, what is more frequent, when the fire on the ground is extinguished, they put their bed of heath and blankets upon the spot where it has burned, on account of the ground being dry. A true farmer loves to sleep near the byar, that he may hear his cattle eat. These patriarchal dwellings frequently tremble, and sometimes fall before the fury of the tempest.'

The Highlander appears to have no idea of property beyond that of sheep and cattle. His 'whole wealth consisting of cattle, what he most valued himself upon was that pride and joy of life, 'a fine fold of cows,' to use his own favorite phrase. With his cows his rents were paid, and with his cows his daughters were portioned and his sons established in life.'

As he is almost invariably a farmer, the distribution of labor in a Highland farm becomes an interesting topic. 'The lesser boys take charge of the weaned lambs; the stronger attend the goats to the rocks and perilous precipices, upon which they love to browse; the young girls are employed at the distaff; the young men attend the cattle upon the mountains, while the father cultivates his little patch of ground, repairs his hut, of which he is the designer and builder, and upon which occasion the knife, the axe, and the auger, are his simple tools. In this respect, however, he is better provided than the Russian boor, who works with more skill, neatness, and ingenuity, with only his axe. At evening fall, the children return, the bearers of fish which they have caught in some neighbouring stream, and of alder bark, and buds of heath and moss, with which their mother may stain her home-spun plaid. Among the Highlanders, both old and young, the season of 'summer flitting,' when they remove for the summer to the mountains with their flocks, is always hailed with a rapturous welcome. At this time they live in the mountains in shealings, or little huts constructed for the purpose, and sleep upon beds of heath, leading a life perfectly natural until the autumn is advanced, when they return to their glens.' The same author also remarks that 'the hardihood of the islander is proverbial. It is well known that in cold dry windy weather, when these mountaineers are obliged to sleep among the hills to attend the cattle, they soak their plaid in a burn or brook, in which having rolled themselves, they select a spot of heath on the leeward side of some hill for their bed, where they are kept warm by the wet, which prevents the wind from penetrating the stuff.'—Sir John Carr's *Caledonian Sketches*.

Mrs. Grant, the wife of a minister, settled in the Highlands, seems eminently to have possessed the requisite qualifications for observing all the minute shades of character by which they are discriminated. The following particulars are selected from her admirable Essays.

On the secluded character of the country, and the obstacles to its improvement, she observes, 'There really was not room for a stranger, in a country already overpeopled in proportion to its productions. Especially when it is considered that every inch of ground was occupied by heads of families, who were perhaps the tenth generation on the same spot, and held their lands from a patriarchal chief, to whom, and his ancestors, they and their forefathers had performed services the most important. One of these tenants could not be removed to make room for a stranger, without giving mortal offence to the whole tribe, their ideas of morality as well as attachment being outraged by such a proceeding. Thus, though a stranger passing through the country, or merely visiting it, was treated with kindness, and indeed with the most liberal hospitality, if he attempted to settled there, he had nothing but prejudice and persecution to expect; by attempting to domicile himself, he lost all the courtesy of a stranger, without establishing any claims to good-will as a friend or a neighbour. Such was the state of society; and so little could a single individual, even in tolerable circumstances, do for himself, that a man who did not possess the general good-will, and receive the hourly good offices of his neighbours, lived in the state of an outlaw, excluded from the comforts, and deprived of the privileges of social life.

'No Highlander ever once thought of himself as an individual. Amongst these people, even the meanest mind was in a manner enlarged by association, by anticipation, and by retrospect. In the most minute, as well as the most serious concerns, he felt himself one of many connected together by ties the most lasting and endearing. He considered himself merely with reference to those who had gone before, and those who were to come after him; to those immortals who lived in deathless song and heroic narrative; and to those distinguished beings who were to be born heirs of their fame, and to whom their honors, and perhaps their virtues, were to be transmitted. Whatever might be the motive that produced a marriage, it was seldom unhappy. To a genuine Highlander, the mother of his children was a character so sacred, that to her he was never deficient in indulgence, or even respect. To her he could forgive any thing, provided her conduct did not impeach the honor of their mutual progeny, or create doubt, where suspicion would be misery.

'A Highlander thrown prematurely among the polished classes of society, and one obliged to mingle with the lower orders of civilised countries, equally cease to be fair specimens of the mountain race from which they spring: the one becomes that sort of being which good qualities, good education, and good company every where form; the other, whom ignorance excludes from the decent class of artisans, is obliged to mingle with the dregs of the people, and with their vulgar

language he acquires their low ideas, and, shrinking in the ungenial clime of plebeian grossness, he assumes an entirely new character. If anything recovers him from his hopeless apathy, it must be the 'spirit-stirring fife,' or the martial pipe of his ancestors, calling him to the field of honorable strife. Here, if at all, the Highlander resumes the energy of his character, and finds room to display once more the virtues of habit and of sentiment; for here he is generally associated with beings like himself. Here his enthusiasm finds an object; his honorable feelings, his love of distinction, his contempt for danger, and, what is of equal importance in the military life, his calm fortitude, stern hardihood, and patient endurance, all find scope for exercise. Here, too, mingled with his countrymen, he tells and hears the tales of other times,—beguiles the weary watch of night with songs that echoed through the halls of his chief,—or repeats, on the toilsome march, the love ditty inspired by the maiden that first charmed him with the smile of beauty, and the voice of melody in his native glen. These recollections and associations preserve, in pristine vigor, the fairest trait of the Highland character. Social and convivial as Donald's inclinations are when others join the mirthful band, and share the cup of festivity, he retires to his barrack or his tent, and adds the hard saved sixpence to the little hoard which the paymaster promises to remit home, to pay his father's arrear of rent, or purchase a cow for his widowed mother.

'Poor Donald is no mechanic; he cannot, like other soldiers, work at a trade when in quarters; yet day after day, with unwearied perseverance, he mounts guard for those who have this resource, to add a little to this fund, sacred to the dearest charities of life—the best feelings of humanity. This sobriety preserves alive the first impressions of principle—the rectitude, the humble piety, and habitual self-denial, to which a camp life, or unsettled wanderings that belong to it, are so averse. There are instances, of a very late occurrence, not of individuals only, but of whole regiments of Highlanders, exercising this generous self-denial, to remit money to their poor relations at home, to an extent which would stagger credulity, were it particularised.

'The officers of one of the regiments to which I allude, finding such means remitted through their hands, and seeing their men constantly either on guard or at hard labor, began to fear that they were living too low to support such perpetual exertion. Every day they visited the barracks, to be assured that their men made use of a proportion of animal food. They were at first deceived by seeing pots on, with meat boiling in them, as they thought; but, on a nearer inspection, found that in many of them a great stalk of what we in Scotland call kail was the only article contained in them. They brought long sticks with them afterwards, and sounded the pots, to make sure. This was indeed

'Spare fast, which oft the gods doth diet.'

'I should rather have kept this quotation to grace another instance of still nobler self-denial,

which ought to be recorded in a more durable manner than this perishing page will admit of:—

‘A Highland regiment, commanded, I think, at that time, by general Macleod, was, during the wars with Tippoo Saib, engaged in an unfortunate rencontre, in which above 200 of them fell into the hands of that remorseless tyrant. They were treated with the most cruel indignity, and fed upon a very sparing portion of unwholesome rice, which operated as a slow poison; assisted by the burning heat of the sun by day, and the unwholesome dews of night, to which they were purposely exposed, to shake their constancy. Daily some of their companions dropped before their eyes, and daily they were offered liberty and plenty, in exchange for their lingering torture, on condition of relinquishing their religion, and taking the turban; yet not one could be prevailed upon to purchase life on these terms. These Highlanders were from the isles, and entirely illiterate. Scarcely one of them could have told the name of any particular sect of Christians; and all the idea they had of the Mahometan religion, was, that it was averse to their own; and that, adopting it, they should renounce Him who had died that they might live, and who loved them, and could support them under all sufferings. The great outlines of their religion, the peculiar tenets which distinguish it from every other, were early and deeply impressed upon their minds, and proved sufficient in the hour of trial. The self-devoted band at Thermopylæ have had their fame; they expected, and deserved it. These did not even aspire to such distinction; far from their native land, without even the hope of having their graves beheld by the eyes of mournful regret, they passed away unseen, like the flower in the desert, when its head is heavy with the dews of the night, and the sun arises in its strength, to scatter its leaves on the gale. The voice of applause—the hope of future fame—the sympathy of friendship—all that the heart leans to in the last extremity, was withheld from these victims of principle. It was not theirs to meet death in the field of honor, but the mind, wrought up to fervid eagerness, went forth in search of him. They saw his slow approach; and, though sunk in languid debility, such as quenches the fire of mere temperament, they never once hesitated at the alternative set before them. Their fortitude at least should be applauded, though their faith and the hope that supported them were not taken into the account.

‘Nature never meant Donald for a manufacturer; born to cultivate or defend his native soil, he droops or degenerates in any mechanical calling. He feels it as losing his cast; and, when he begins to be a weaver, he ceases to be a Highlander. Fixing a mountaineer on a loom too much resembles yoking a deer to a plough, and will not in the end suit much better.’—*Essays on the Highlanders.*

For the following summary of the *antiquities* and curiosities of nature and art in Scotland, we are principally indebted to Dr. Myers’ able *Geography*, vol. i.

Druidical monuments are to be found prin-

cipally in the northern parts of Scotland, and the adjacent isles. They are easily distinguished by their circular forms; but they are not of equal magnitude with those of the same kind in South Britain. The vestiges of Roman antiquities, such as the stations of their legions, their castella, and their prætentures, or walls, can now only be discovered by critical inspection. Various Roman coins, urns, utensils, and inscriptions, have been found in several parts, and especially near the site of the celebrated wall which extended from the Frith of Clyde to that of Forth. It was marked out by Agricola, but completed by Antoninus Pius, and is still discernible. This wall, which has been traced with great precision by antiquaries and historians, is called Graham’s Dyke by the country people. from a tradition that a Scottish warrior of that name was the first who passed it. The remains of several Roman camps are also visible in this part of Scotland. One, near the foot of the Grampian Hills, is perhaps the most striking and best preserved specimen in North Britain. It is situated at Ardoch, in Perthshire, and is generally thought to have been the camp which Agricola occupied before his engagement with the Caledonian king, Galgacus. The vestiges of this camp still present five ditches and six ramparts on the south side; and three of the four gates, which led into the area, may yet be distinctly traced. A Roman temple, in the form of the pantheon at Rome, stood on the banks of the Carron, supposed to have been built by Agricola, or his successors, and dedicated to their god *Terminus*, as it stood near the confines of the empire. This venerable relic of antiquity was barbarously demolished for the purpose of repairing a mill-pond.

The monuments ascribed to the Picts are singular buildings. The two principal were hollow columns; the one at Brechin in Angus, and the other at Abernethy, in Perthshire. That at Brechin is the most entire, and is covered with a kind of spiral roof of stone, with three or four windows above the cornice. It consists of regular courses of hewn stone, tapering to the top. In Perthshire is a barrow, which appears to be of British origin, and resembles the hull of a ship with the keel upwards. It is styled *Ternay*, which some have supposed to be a contraction of *Terræ navis*, the ship of earth. Danish camps and fortifications are discernible in several northern counties of Scotland, and are distinguished by their square forms and difficult situations. The vestiges of ancient Scottish antiquities are often both curious and instructive, as they frequently relate to events in their history; and, from the emblematical figures with which they are ornamented, were evidently erected to commemorate victories. These monuments are chiefly obelisks, and are commonly called Danish stones. Of these, the great stone near Fortrose, in Moray, surpasses all the others. According to Mr. Gordon it ‘is perhaps the only one of that kind in Europe; it rises about twenty-three feet above the ground, and is, I am credibly informed, not less than twelve or fifteen below: so that the whole height is at least thirty-five feet and its breadth nearly five. It is one

entire stone, with a great variety of figures in relief carved on it, and some of them are still visible; but the injury of the weather has obscured those towards the upper part.' This monument is by some ascribed to the Danes.

The wide-spread fame of Iona will permit an additional account of its relics in this place. In any other situation, and under almost any other circumstances, the architectural ruins of Iona would be consigned to neglect and oblivion. It is not from their magnificence or splendor, from their magnitude or proportions, that they have acquired celebrity, but from their connexion with a barbarous age, and their standing a solitary monument of religion and literature amidst the gloom of ignorance. It is almost impossible for the mind to contemplate the fragments of these venerable structures, now fast mouldering beneath the hand of time, without involuntarily recurring to the period when this little isle was the 'light of the western world.' 'Even at a distance,' says Dr. Maccullock, in his *Description of the Western Islands*, 'the aspect of the cathedral, insignificant as its dimensions are, produces a strong feeling of delight in him who, long coasting the rugged and barren rocks of Mull, or buffeted by turbulent waves, beholds its tower first rising out of the deep; giving to this desolate region an air of civilisation, and recalling the consciousness of that human society, which, presenting elsewhere no visible traces, seems to have abandoned these rocky shores to the cormorant and the sea-gull.'

The following perspicuous delineation of these remains of antiquity is extracted from Dr. Playfair's *Statistical Description of Scotland*. 'From the beginning of the seventh century to the reformation, Iona was the seat of the regular clergy of St. Columba. After that period, the learning of ages, the records of nations, and the archives of remote antiquity, were destroyed or removed to Douay College, in France. Some fragments of buildings remain. St. Mary's church, which served as a cathedral of the diocese of the bishops of the Isles, and is almost entire, was built of red granite, 115 feet long, and twenty-three broad, with a transept of seventy feet. Over the centre is a handsome tower. From the south-east corner are two parallel walls, ten feet distant from each other, which reach to the sea. West of the church is a cross of one stone nearly eight feet high, and twenty inches broad, and six thick. From this place to the nunnery there is a causeway 300 yards in length, and fifteen in breadth, intersected at right angles by another of the same kind, that reaches from the shore to the village. On the left hand of it, as you go from the shore to the church, there is a cross of whinstone, ten feet high, ornamented, but without any inscription. The nunnery is a plain square building; and its church, which contains the tombs of ladies of high rank, is fifty-eight feet long, and twenty broad. St. Oran's chapel, which is sixty by twenty-two feet, is surrounded by the burying-ground, where, according to tradition, forty-eight Scots, four Irish, and eight Norwegian chiefs are interred. In 1540 there were three tombs, like little chapels, with an inscription on a broad stone in the gable

of each; but scarcely a vestige of these tombs now exists. North of the monastery are the remains of a small edifice, called the bishop's house. Such is the present state of that illustrious island, 'which was once the seminary of the Caledonian regions, whence savage clans and roving barbarians derived the benefits of knowledge and the blessings of religion.'

At Sandwich, in Ross-shire, is a curious obelisk, but of a more recent date than those above-mentioned. It stands on a basement of flat stones rising like steps, and is enriched with various specimens of carved works more highly finished than those on the obelisk near Fortrose. On one face is a large cross with a figure of St. Andrew on each side, and some uncounted forms of animals beneath. The reverse contains figures of birds and animals. The ruins of Elgin Cathedral present some dignified remains. The west door is highly ornamented, and the whole edifice displays much elaborate workmanship. Among the ancient castles of North Britain that of Kildrummy is most distinguished, and was formerly a place of great strength and magnificence, frequently the asylum of noble families in times of civil war and national distress. The castle of Inverurie is a massy pile, standing on the steep bank of a river, rearing its lofty towers above the aged trees, and appearing majestic even in ruins. At Huntley, also, the remains of a venerable castle attest its former magnificence.

In *natural curiosities* Scotland is very rich. The picturesque falls of the Clyde, near Lanark, and the beauties of Loch Lomond, have excited much attention, and given rise to many animated descriptions. The rocks on the coast of Aberdeenshire frequently assume singular forms of arches and pillars; while the vast basaltic columns between the castle and harbour of Dunbar resemble the Giant's Causeway in Ireland. Several large caverns in Fifeshire, a petrifying cave at Slains, in Aberdeenshire, and a quantity of sea-shells and white stones, some of them very clear, are to be met with on the top of a mountain in Ross-shire, about twenty miles from the sea. Nor are traces of extinguished volcanoes totally unknown in this country. The hill of Finchaven is one instance, and that of Bergonium, near Dunstaffnage Castle is another. Both of these exhibit large quantities of pumice stone, or scoriae, of the same kind as those thrown out by the volcanoes of Iceland. On the isle of Scalpay, one of the Hebrides, there is a hill which affects the mariner's compass, and causes the needle to deviate 9° from the north towards the west. At Ralphiitrisk is the famous ringing stone, about seven feet long, six broad, and four and a half thick. It is of a dull gray color, spotted with black mica. It is very hard, and when struck with a hammer or stone sounds like brass or cast iron.

Between the islands of Jura and Scarba is the noted whirlpool, denominated Cor-y-bhreachan supposed to have derived its name from a Danish prince who perished there. 'Soon after the flood tide has entered the sound the sea at this place is violently agitated. It boils, foams, and passes away in successive whirls. The commotion increases till near the fourth hour of

flood, when it is most impetuous. The waves are tossed with a great noise, that may be heard twelve miles distant. But from the middle of the fifth to the sixth hour of flood, and in neap-tides from the fourth to the sixth hour, the commotion gradually abates, until at length it totally subsides; and, at the approach of the lowest ebb, the same tranquillity is restored as takes place at high water.

But perhaps the most remarkable natural curiosity in Scotland is the precipitous and columnar island of Staffa. The bending pillars and the noted caves of this small island have often been described. The island itself is an irregular oval, faced with nearly perpendicular rocks, in which various caves yawn and receive the restless waves that dash against the shore. The height of these rocky coasts varies from about 112 feet to less than ten above the surface of the sea. The natural pillars in many of these places are inclined in various positions from the perpendicular. In some they are bent so as to resemble the inside timbers of a ship. In others, where the ends present themselves in forming the surface, they have the appearance of a honey-comb. The celebrity of this island, however, is chiefly derived from its various caves. The principal of these are the Boat Cave, Mackinnon's Cave, and Fingal's Cave. The Boat Cave apparently derives its name from its being accessible by sea only. This cave is small, but its entrance is highly picturesque from the symmetry of the columnar surface of the cliff in which it is situated. Its height is about fifteen feet, breadth twelve, and depth 150 feet. It can be entered by means of boats only, as the tide never ebbs quite out.

Mackinnon's Cave presents an aperture of nearly fifty feet square, with a depth of more than 220 feet, which causes it to reflect a deep shadow, that produces a powerful effect. Its dimensions are nearly the same throughout its extent. The roof and sides, being smooth, are deprived of many of those beauties which a more varied appearance, accompanied with a symmetrical arrangement of parts, would present. Fingal's Cave is the most celebrated, and upon it the utmost powers of description have frequently been lavished. It is situated near the eastern ex-

tremity of the principal face, and presents two nearly perpendicular sides; with a roof resembling that kind of Gothic arch which is termed the contracted. The height from the surface of the water at mean tide is about sixty-six feet; and from the top of the arch to the summit of the cliff it is thirty feet: the breadth is about forty-two feet. The height of the cave soon diminishes to less than fifty feet, and terminates at forty-four, after running into the rock a depth of 227 feet. These are the dimensions given by Dr. Macculloch, who lately measured it; but those given by Sir Joseph Banks, by whom it was first visited, in his voyage to Ireland, are considerably greater. The sides of the cave, like the rock in front, are columnar and nearly perpendicular, and the roof is formed of pillars that have been broken off, which sometimes produce an ornamental effect. The breadth is preserved nearly to the furthest extremity, and the whole cave is lighted from without, so that the end may be distinctly seen. The air is kept in a pure state from the motion occasioned by the flux and reflux of the tide; and, as this never ebbs out, it forms the only flooring to the cave. 'It would be no less presumptuous than useless,' Dr. Macculloch observes, 'to attempt a description of the picturesque effects of that to which the pencil itself is inadequate. But if this cave were even destitute of that order and symmetry, that richness arising from multiplicity of parts, combined with greatness of dimension and simplicity of style which it possesses, still the prolonged length, the twilight gloom, half concealing the playful and varying effects of reflected light, the echo of the measured surge as it rises and falls, the transparent green of the water, and the profound and fairy solitude of the whole scene, could not fail strongly to impress the mind gifted with any sense of beauty in art or nature.'

It is said that by far the greater part of exported British linens are of Scottish manufacture: some estimate of the importance of that manufacture may be formed by the following table of the countries to which these exports were made in 1821 and 1822, ordered to be printed by the House of Commons May 1823:—

	1821.			1822.

The quantity of malt made in Scotland from 1786 to 1800 fluctuated from 1,500,000 to 2,000,000 of bushels annually; the ordinary rate of duty being then 7½*d.* per bushel. In 1804, when the duty on malt made from barley was raised to 3*s.* 8½*d.*, and from bear or bigg to 3*s.* 0½*d.*, the number of bushels fell to 1,125,482, and never reached 1,500,000 while these duties were gathered. In 1817, 1818, and 1819, when the duty was 1*s.* 8½*d.*, the quantity increased from 1,129,992½ to 1,556,586 bushels. But in 1820, when it was raised to 3*s.* 6*d.*, the number of bushels fell to 1,284,918¾. In 1822, under new modifications of the duty, it was 1,347,432

bushels; and for the year ending 5th April 1823 the number had increased to 2,150,795 bushels; of which 1,816,691½ were made from barley, and 334,103½ from bear or bigg. The beer made in Scotland in 1822 was about 350,000 barrels, or about 3000 barrels less than in 1792. Such is the effect of high war duties on the necessities of life.

The spirits made in Scotland for home consumption only, from 1813 to 1822, and all from grain or malt (no sugar or molasses being used in those years), appears, from the Report of the Malt Duties of Scotland, May 1821, to stand thus:—

Years.	Gallons of Spirits made and charged with duty.	Rate of duty per gallon.	Total Revenue produced.		
			£	s.	d.
From 10th Dec. 1813 } to 1st Oct. 1814 }	1,653,735	{ 7 <i>s.</i> 1¼ <i>d.</i> in Lowlands, } { 5 <i>s.</i> 11½ <i>d.</i> in Highlands }	587,781	8	1½

The established religion of Scotland is Presbyterianism, on the Geneva model, finally settled by an act of the Scottish parliament in 1696, and afterwards secured by the treaty of union with

England. As considerable light has been thrown of late by Dr. Cook and Dr. McCrie on the early progress of the Reformation in Scotland, we shall avail ourselves here of a portion of this information.

In preparing the scheme of future church polity for his country, her great reformer, Knox, adopted the general maxims of Calvin; yet he accommodated them considerably to the peculiar situation of Scotland. While he abolished the episcopal order as by divine right superior to that of presbyters, finding that absolute equality amongst the pastors would not be expedient, he appointed superintendents, who were in some respects similar to bishops, but in others plainly and explicitly distinguished from them. They superintended the parochial ministers, whose labors were confined to their own parishes, and the readers who, from the small number of pastors, were employed to read and explain the Scriptures, where ministers could not be procured. This intermediate system between episcopacy and presbytery, although it was regarded with much partiality by Knox, did not long continue. It had little hold of the minds of the people; and the poverty of the clergy under it rendered them eager that it might be so modified as that their temporal condition should be improved. When, therefore, in 1572, the earl of Mar, who was then regent, was eager, perhaps more from political than religious considerations, to restore the order of bishops, little resistance was made to his wishes; and, with the acquiescence even of Knox, an episcopalian polity supplanted the superintendent scheme, or rather was combined with it. But it soon appeared that the prejudices which had been early formed against the hierarchy had not subsided; and the celebrated Andrew Melville, on his arrival in Scotland from Geneva in 1574, taking advantage of these prejudices, and of every political event that might facilitate his design, was enabled to effect, in 1592, the introduction of that presbyterian polity which he found established in Geneva, and which has finally been fixed in Scotland.

To James VI., although he was occasionally forced to dissemble his real sentiments, this form of church government was most obnoxious. The boldness with which the ministers defended what they believed to be right ill corresponded with the deference which he considered to be due to royalty; and, having been often thwarted by them in what they deemed the unconstitutional exercise of his prerogative, he was desirous that episcopacy, as more consonant to monarchy, should be restored. To effect this he made many efforts, even before his accession to the English throne; and after that event he was enabled to accomplish his object; at the same time gratifying the feelings or the prejudices of his Scottish subjects, by putting restraints upon the bishops, without which he dreaded that he would fail in establishing their authority. His unfortunate son, Charles I., who was attached to episcopacy from sincere religious conviction, as well as from views of political expediency, formed the scheme of assimilating in all respects the churches in England and Scotland. With this view he determined to intro-

duce a liturgy, which in Scotland had never been regularly used; and he insisted upon the reception of a set of canons abolishing the control over ecclesiastical measures which the inferior church judicatories had been permitted to exercise. The violence with which all this was resisted is known to every reader of the history of Scotland. The zeal of the multitude was inflamed to fury: the clergy were insulted, and episcopacy was again contemplated as the engine of popery and of despotism. The dissensions which soon arose in England cherished this state of mind: the discontented in Scotland made a common cause with the disaffected in the southern part of the island: they bound themselves, by the strange deed which they entitled 'the solemn league and covenant,' to exterminate prelacy as a corruption of the Gospel; and they took an active part in those commotions which terminated in the death of Charles, and the erection of the Commonwealth. Some feeble efforts indeed were made to preserve to Charles II. a shackled sceptre; but he was soon compelled to leave Britain; and under Cromwell the violent presbyterians, who were denominated Protesters, enjoyed the free exercise of the form of worship, and of the power which they had acquired. Upon the restoration of Charles, to which it must be admitted that many attached to presbytery zealously contributed, although at his coronation at Scone he had solemnly sworn to defend that mode of ecclesiastical government, and had, in the prospect of being restored, renewed his protestations that he would do so, he established episcopacy in Scotland, under circumstances little calculated to conciliate the affections and to secure the reverence of the people to that ancient and admirable form of church polity. The desertion of Dr. Sharp from the presbyterians was rewarded by his exaltation to the primacy; and powers were vested in the bishops much more ample than they had possessed at any time before. The discontent that now prevailed among the presbyterians was openly displayed, and the attempts to restrain it were conducted with a severity more calculated to divide than to heal. The presbyterians, undismayed, adhered to their principles; and, upon the abdication of James II., they looked forward with confidence to the triumph of their cause. And, though the prince of Orange was eager to preserve in both parts of the island the same form of ecclesiastical government, the bishops conceived that they could not conscientiously transfer their allegiance to him, whereby the way was opened for that establishment of presbytery which some of his most zealous adherents had pressed upon him, and which was ratified by act of parliament in 1690. Thus, Scotland and England having been separate kingdoms at the time of the Reformation, a difference of circumstances in the two countries led to different sentiments on the subject of religion, and at last to different religious establishments; and when they were incorporated into one kingdom, by the treaty of union in 1707, the same regard to the inclinations of the commonalty of Scotland, to which presbytery owed its first establishment in that country, produced a declaration, to which both kingdoms gave their

assent, that 'Episcopacy shall continue in England, and that the presbyterian church government shall be the only government of Christ's church in that part of Great Britain called Scotland.

It is also guaranteed, by the fifth article of the union with Ireland, not only 'that the churches of England and Ireland as now established, be united into one Protestant Episcopal church, to be called the united church of England and Ireland;' but also that 'in like manner the doctrine, worship, discipline, and government of the church of Scotland shall remain and be preserved, as the same are now established by law and by the acts for the union of the two kingdoms of England and Scotland.'

The *distinguishing tenets* of the church of this important part of the United Kingdom seem to have been first embodied in the formulæ of faith attributed to Knox, and compiled by that reformer in 1560. Amidst all the outward changes of polity already detailed this has been preserved unchanged. It was approved by the parliament, and again ratified in 1567, and consists of twenty-five articles, and was the confession as well of the episcopal as of the presbyterian church. The Covenanters indeed, during the grand rebellion, adopted the Westminster Confession, in the compilation of which some delegates from their general assembly had assisted. And, at the Revolution, this confession was received as the standard of the national faith; and the same acts of parliament which settled presbyterian church government in Scotland, ordain, 'That no person be admitted or continued hereafter to be a minister or preacher within this church, unless that he subscribe the (i. e. this) confession of faith, declaring the same to be the confession of his faith.' By the act of union, in 1707, the same is required of all professors, principals, regents, masters, and others bearing office in any of the four universities in Scotland.

The Westminster Confession of Faith, then, and what are called the Larger and Shorter Catechisms, which are generally bound up with it, contain the public and avowed doctrines of this church; and it is well known that these formulæ are Calvinistical, if not Supralapsarian. 'The character of these formulæ is, in general,' says a highly respectable Calvinistic writer, 'too exclusive, severe, and systematic for certain deliberative minds. Called to the reception of them, they are staggered by the extent of the requisition. For a time, perhaps, they hesitate to obey the voice of conscience, and to desert the national standard. But the resolution, once taken, and the reputation for orthodoxy and conformity sacrificed, they give loose to their fancy or ingenuity, and at length fashion to themselves a system perfectly at variance with truth and reason. It appears to us that Scotland, in this respect, furnishes an important lesson to the more dogmatic and exclusive theologians of this country, &c.'—*Christian Observer*, for 1815, p. 685, 686.

It has indeed been often insinuated, or asserted, that many of the ministers, as well as lay members, of the establishment, have departed widely from that confession, holding the Arian or Socinian views of our Lord's person, and the

Arminian opinions as to predestination and grace. Such a charge, however, should be received with much caution, and is perhaps entitled to little or no attention. No party in the church avows enmity to the Westminster Confession: and there can be no doubt that the great majority of the clergy are attached to the doctrines which it inculcates. There is a wide difference in the way of preaching these doctrines; but this is not confined to any one party. Amongst those who are denominated the popular clergy, there are many practical preachers; whilst those who are styled moderate, not unfrequently inculcate the highest tenets of Calvinism.

In this church the *public worship* is extremely simple, and but few ceremonies are retained. John Knox, like his master Calvin, seems to have been less an enemy to liturgies and established forms, than their more modern followers; for, though he laid aside the Book of Common Prayer about the year 1662, he then introduced one of his own composition, which more strongly resembled the liturgy of the church of Geneva. There is now, however, no liturgy or public form in use in this church; and the minister's only guide is the Directory for the Public Worship of God, which prescribes rather the matter than the words of our addresses to God: nor is it thought necessary to adhere strictly to it; for, as in several other respects, what it enjoins with regard to reading the holy Scriptures in public worship is, at this day, but seldom practised. By the ecclesiastical laws, the sacrament of the Lord's supper should be dispensed in every parish four times in the year; but this law is now seldom adhered to, unless in most chapels of ease. In country parishes it is often administered not above once a year, and in towns generally only twice a year. The people are prepared for that holy ordinance by a fast and public worship on some day of the preceding week, generally on Thursday, and by a sermon on the Saturday; and they meet again in the kirk on the Monday morning for public thanksgiving.

They have no altars or chancels in the kirks, and the communion tables are not fixed, but introduced for the occasion; and are sometimes two or more in number, and of considerable length. At the first table, the minister, immediately upon concluding what they call the consecration prayer, usually proceeds to read the words of the institution, and, without adding more, to distribute the elements, which he does only to the two communicants who sit nearest him on each hand. It is usual for the elders to administer them to the rest. But before, or during, the services of the succeeding tables, addresses at some length are made to the communicants by the minister, or by one of the ministers (for there are generally two, three, or more present), standing at the head of the communion table.

In conducting public worship, the creed, the ten commandments, and the doxology are not introduced as essential parts of the service; and there is no observation in this church of festivals. Days of public fasting and thanksgiving she does indeed sometimes observe, particularly

those commanded by his majesty, together with the fast previous to the celebration of the holy communion, and the day of thanksgiving after it. But she has no Lent fast—no kneeling at public prayer—no public worship of God, without a sermon, or public instruction—no instrumental music—no consecration of churches or of burying grounds—no funeral service or ceremony—no sign of the cross in baptism—no regular use of the Lord's Prayer—and no administration of the holy communion in private houses.

With regard to confirmation, her members reject it; but they do not condemn it. On the contrary, 'we endeavour,' says Dr. Hill, 'to supply the want of it in a manner which appears to us to answer the same purpose. We account ourselves bound to exercise a continued inspection over the Christian education of those who have been baptised, that, as far as our authority and exertions can be of any avail, parents may not neglect to fulfil their vow; and when young persons partake, for the first time, of the Lord's Supper, we are careful, by private conference and public instruction, to impress upon their minds such a sense of the nature of that action, that they may consider themselves as then making that declaration of faith, and entering into those engagements, which would have accompanied their baptism had it been delayed till riper years.

By the First Book of Discipline, which was compiled by Knox and his associates, and ratified by an act of council in 1560, the apostolical rite of ordination by the imposition of hands was laid aside as superstitious; but it was restored in the second book of Discipline, in 1578, and is now practised as formerly in the kirk of Scotland, where, as in other presbyterian churches, ordination is vested in the presbytery; and every minister is ordained to his charge in the face of his congregation.

The metre of the version of the Psalms used in this church must be allowed to be very inferior; but, besides the Psalms of David, a collection of translations and paraphrases in verse, of several passages of sacred Scripture, together with some hymns, has been introduced into this church of late years, by permission of the general assembly; and a new version of the Psalms in metre is now in progress.

The church government and discipline are amongst the most important features of the Scottish church. At the Revolution, the famous statute of 1592 was taken as the model: the different courts specified in it were restored: viz. sessions, presbyteries, provincial synods, and general assemblies. Regard was also had to the form of church government agreed upon in the assembly of Westminster divines, and ratified afterwards by an act of the general assembly, in the year 1645; and, of the societies at present formed upon the presbyterian model, it may safely be affirmed that the church of Scotland is by much the most respectable. A short view of her constitution may not therefore be unacceptable to the reader; and hers may be considered as the fairest specimen, now existing, of presbyterian church government in general. In this church, every regulation of public worship, every act of dis-

cipline, and every ecclesiastical censure, which in episcopal churches flows from the authority of a diocesan bishop, or from a convocation of the clergy, is the joint work of a certain number of ministers and laymen acting together with equal authority, and deciding every question by a plurality of voices.

The laymen, who thus form an essential part of the ecclesiastical courts of Scotland, are called elders, and ruling elders; but, though they have the same name, it does not appear that they hold the same office with the elders mentioned by St. Paul in 1 Tim. v. &c.; for these last labored in the word and doctrine.

The number of elders is proportioned to the extent and population of the parish; and few parishes, except where the unpopularity of the minister has induced most of the people to secede, have fewer than two or three. In Edinburgh every parish has, at least, twelve elders. The Canongate parish has betwixt twenty and thirty; and the West Kirk, or St. Cuthbert's, which is one of the most populous parishes in Scotland (containing within its bounds upwards of 40,000 souls), has above fifty. These elders are grave and sober persons, chosen from among the heads of families of known orthodoxy and steady adherence to the worship, discipline, and government of the kirk. Being solemnly engaged to use their utmost endeavours for the suppression of vice, and the cherishing of piety and virtue, and to exercise discipline faithfully and diligently, the minister, in the presence of the congregation, sets them apart to their office by solemn prayer, and concludes the ceremony, which is called ordination, with exhorting both elders and people to their respective duties.

This office, in many respects, resembles that of the churchwardens in the church of England; but the lay elders seem to possess more spiritual jurisdiction than the churchwardens in their respective parishes.

The kirk session, which is the lowest ecclesiastical judicatory, or court, and which the Westminster Assembly in 1645 asserted to be of divine right, consists of the minister and those elders of the congregation. The minister is, ex officio, moderator, but has no negative voice over the decision of the session; nor indeed has he a right to vote at all, unless when the voices of the elders are equal and opposite. He may, indeed, enter his protest against their sentence, if he think it improper, and appeal to the judgment of the presbytery; but this privilege belongs equally to every elder, as well as to every person who may believe himself aggrieved by the proceedings of the session. Nor can the minister, though he may examine, admit any person to the privilege of membership, till the whole of his session, as well as himself, are satisfied both as to the candidate's knowledge and piety.

The next judicatory is the Presbytery, which answers to the consistories in the Protestant churches on the continent, and is also maintained by some to be *jure divino*. It consists of all the pastors within a certain district, and one ruling elder from each parish, commissioned by his brethren to represent, in conjunction with the minister, the session of that parish. It treats of

such matters as concern the particular churches within its bounds—as the examination, admission, ordination, and censuring of ministers: the licensing of probationers; rebuking of gross or contumacious sinners; the directing the sentence of excommunication; the deciding upon references and appeals from kirk sessions; resolving cases of conscience: explaining difficulties in doctrine or discipline; and censuring, according to their views of the word of God, any heresy or erroneous doctrine, which hath either been publicly or privately maintained within the bounds of its jurisdiction. But that part of the constitution of this church, which gives an equal vote, in questions of heresy, to an illiterate mechanic and his learned pastor, has not been universally approved, but has been considered by some as having been the source of much trouble to many a pious clergyman, who, from the laudable desire of explaining the Scriptures, and declaring to his flock all the counsel of God, has employed a variety of expressions, of the same import, to illustrate those articles of faith which may be obscurely expressed in the established standards. The fact, however, is, that in presbyteries the only prerogatives which the pastors have over the ruling elders are the power of ordination by imposition of hands, which is lodged in this ecclesiastical court, and the privilege of having the moderator chosen from their body.

The number of presbyteries in Scotland is seventy-eight; and those of Edinburgh, Glasgow, Perth, and two or three more, meet every month; but in country districts they seldom meet above four or five times a year, unless when some business occurs which requires them to meet oftener.

From the judgment of the presbytery there lies an appeal to the provincial synod, which ordinarily meets twice in the year, is opened with a sermon, and exercises over the presbyteries within the province a jurisdiction similar to that which is vested in each presbytery over the several kirk sessions within its bounds. Of these synods, there are in the church of Scotland sixteen, including that of Shetland, which are composed of the members of the several presbyteries within the respective provinces which give names to the synods.

The highest ecclesiastical court, and the fountain of jurisdiction in this church, is the general assembly, which consists of a certain number of ministers and ruling elders, delegated from each presbytery, and of commissioners from the royal boroughs. By act 5th of the assembly 1694, a presbytery, in which there are fewer than twelve parishes, sends to the general assembly two ministers and one ruling elder; if it contain between twelve and eighteen ministers, it sends three of these and one ruling elder; if it contain between eighteen and twenty-four ministers, it sends four ministers, and two ruling elders; and of twenty-four ministers, when it contains so many, it sends five, with two ruling elders. Every royal borough sends one ruling elder (and Edinburgh two), whose election must be attested by the kirk sessions of their respective borough; and every university sends one commissioner from its own body.

VOL. XIX.

According to this proportion of representation, the general assembly, in the present state of the church, consists of the following members, viz.—

Ministers representing presbyteries . . .	200
Elders representing presbyteries . . .	89
Elders representing royal boroughs . . .	67
Ministers or elders representing universities	5

361

The representatives are chosen annually about six weeks before the meeting of the assembly (which always takes place in May) and in Edinburgh; and the ruling elders are seldom the lay elders of the different parishes, but often gentlemen of the law in Edinburgh, and men of eminence in the kingdom for rank and talents. Yet many of them, it is well known, are not so deeply impressed with a sense of religion, as to be interested in the proceedings of an ecclesiastical court where temporalities are not concerned, and much less to be duly qualified for deliberating and deciding on religious subjects. This assembly is honored with a representative of the sovereign, in the person of the lord high commissioner, who is always a nobleman, and presides, and has a salary of £1500 per annum; but he has no voice in their deliberations.

The order of their proceedings is regular, and in general much decorum is observed; but sometimes opposition runs high between the two parties in the church, who often take this opportunity of trying their strength; and a confusion arises from the number of members, the collision of ministers and laymen, &c.; which the moderator, who is annually chosen from among the former, to be, as it were, the speaker of the house, has not sufficient authority to prevent. The assembly continues to sit for ten days; at the end of which time it is dissolved, first by the moderator, who appoints another assembly to be held upon a certain day of the month of May in the following year; and then by the lord high commissioner, who, in his majesty's name, appoints another assembly to be held upon the day which had just been mentioned by the moderator.

Appeals are brought from all the other ecclesiastical courts in Scotland to the general assembly; and, in questions purely religious, no appeal lies from its determinations. At the close of each general assembly, a commission of assembly is appointed; but to the laws already made no new one can be added, till it has been proposed in one general assembly, and by them transmitted to every presbytery for their consent. If this, or at least the consent of the majority, is obtained, the assembly next year may pass it into an act, which henceforth must be regarded as a constitutional law of the kirk. In the subordination of these assemblies and courts of review, parochial, presbyterial, provincial, and national, the less unto the greater, consists the external order, strength, and stedfastness of the church of Scotland.

The discipline of this church, though now somewhat relaxed, was never so rigorous as that of Geneva, the church on whose model it was formed. In that temporal exercise of discipline

which the general practice of the church of Scotland recognises as congenial to her constitution, 'care is taken,' says Dr. Hill, 'to avoid every appearance of intermeddling officiously with those matters that fall under the cognisance of the civil magistrate. No solicitude is ever discovered to engage in the investigation of secret wickedness: counsel, private admonition, and reproof are employed in their proper season; and the public censures of the church are reserved for those scandalous sins which bring reproach upon religion, which give offence to the Christian society, and which cannot be overlooked without the danger of hardening the sinner, of emboldening others to follow his example, and of disturbing and grieving the minds of many worthy Christians.'

It was formerly the general practice to oblige adulterers and fornicators to present themselves in the kirk, for three different Sundays, on a bench, known by the name of the stool of repentance, when they were publicly rebuked by their minister, in the face of the congregation; but this punishment is now often changed into a pecuniary fine. For this change, however, there seems to be no law; and the old practice of publicly rebuking such transgressors, though very much disliked and cried down by the gentry and others, as an occasion of child murder, &c., is still continued in a great majority of the parishes. In Edinburgh it is entirely discontinued, because believed to be impracticable; but in Glasgow, Paisley, Stirling, and other towns, the old discipline is maintained.

By the discipline of the church, a parent who is under public scandal is disqualified from presenting his child for baptism, till such time as his character is cleared up, or he has satisfied the kirk; but as it sometimes happens that this does not soon take place, and in the mean time the child is refused the benefit of baptism, this practice is disapproved of by many, as having the appearance of punishing the children for the iniquity of the parents. '*Anima quæ peccaverit, ista morietur.*'

In Scotland, and the islands of Scotland, the kirk contains within her bounds 893 parishes, and about 1,500,000 members. The number of ministers belonging to her, who enjoy benefices, and possess ecclesiastical authority, is 940. Of this number, seventy-seven are placed in collegiate charges, mostly in the proportion of two ministers for each of these charges; and the remaining 863 ministers are settled in single charges, each of them having the superintendence of a whole parish. In very populous parishes, chapels of ease are erected with consent of the kirk, and are supported by voluntary subscriptions; but the ministers who officiate in them are not included in this number, as they are not members of any ecclesiastical courts.

The duties of the Scotch clergy are numerous and laborious. They officiate regularly in the public worship of God; and, in general, they must go through this duty twice every Sunday (exclusive of other occasional appearances), delivering every Sunday a lecture and a sermon, with prayers. It is also expected, throughout Scotland, that the prayers and discourses shall be

of the minister's own composition; and the prayers in all cases, and the discourses in most instances, are delivered without the use of papers. They are expected to perform the alternate duties of examining their people from the Scriptures, and catechisms of the church, and of visiting them from house to house, with prayers and exhortations. This is done commonly once in the year, being omitted only in those cases wherein the ministers deem it impracticable, or not acceptable, or at least not necessary. The charge of the poor devolves, in a very particular manner, on the clergy; and in them also is vested the superintendence of all schools within their bounds.

The provision which has been made, by the law of Scotland, for the support of the established clergy, consists in a stipend, payable in victual or money, or partly in each; a small glebe of land; and a manse (parsonage-house) and office-houses. In cities and towns the stipends are generally paid in money; in 'landward' (i. e. country) parishes, they are, for the most part, liquidated in money and victual. They are derived from a charge on the rents of land, paid by the landlord, throughout Scotland, upon principles fixed so far back as the reigns of Charles I. and II., confirmed by king William, and now made permanent by the treaty of Union. So long as there are any free teinds (i. e. tithes) in a parish, belonging to the minister, he can bring a process for augmenting his stipend, at the end of every twenty years, before the court of session, whose members sit as commissioners for the plantation of kirks and valuation of teinds. In this process all the heritors of land in the parish are called as parties; and if the minister can prove that, from change of circumstances, his stipend should be augmented, the judges grant his request; but, if they see no cause for entertaining his reasons, they refuse his application.

An act of parliament passed in 1810, granting £10,000 per annum for augmenting the smaller parish stipends in Scotland. By this act, the lowest stipend assigned to a minister of the establishment is £150 sterling, with a small sum, generally £8 6s. 8d., for communion elements. Stipends, where the teinds are not exhausted, are, with the exclusion of communion elements, wholly paid in victual, generally oatmeal and barley, in equal proportions; and the court frequently allocates, as it is termed, to a minister, from sixteen to eighteen chalders. If the stipend exhaust the teind, it is sometimes paid in money; and there are cases in which the teind was originally set apart in money, and not in victual.

The glebe consists legally of at least four acres of arable land, and, in fact, generally exceeds that measure. Most of the ministers of country parishes enjoy glebes; but those of royal boroughs in general, as well as those of cities and towns, have no glebes. Besides the glebe, the minister of a landward parish is entitled to as much of grass-lands as may support a horse and two cows; 'yet perhaps one half of the clergy have no grass, nor any allowance for it.'

The whole church establishment, as a burden on land, may be stated in one view, as follows—

viz. a glebe, of perhaps about six or seven acres, out of nearly 21,000, and the grass, where it is allowed; a stipend of about 9*d.* in the pound of the land rents; and buildings and communion charges, amounting to 4*d.* or 5*d.* more in the pound, of these land rents. All these put together constitute the burdens of the Scottish ecclesiastical establishment, in so far as proprietors of land are affected by them; and are not supposed to exceed £300,000 per annum. Thus the clergy are removed from the extremes of wealth and poverty. Their revenues, though sufficient, are not ample enough to tempt the cupidity of the higher classes; and the livings are therefore engrossed by persons sprung from the middle and lower classes, who naturally identify themselves with these classes, understand their situations, and participate in all their joys and sorrows. Being all on nearly a footing of equality, they have no unattained object of ambition to distract their attention from the important labors of their professions. They have seldom any prospect of changing their livings, and therefore find it their interest, as well as their duty, to establish their character and respectability by a diligent and faithful discharge of professional duties.

The dissenters from the Scottish kirk are numerous, and embrace, in the metropolis and on the eastern coast, particularly in the county of Aberdeen, a considerable number of episcopalians. They are supposed to amount to upwards of 40,000, having six bishops and seventy clergymen; and are the only body of dissenters that have been distinctly recognized by the parliament of Great Britain. Each bishop, as in Sweden, Denmark, and America, as well as exercising a superintendence over the other clergy, is the pastor of a particular congregation. The history of this body is interesting. At the Revolution the Scottish church, as we have seen, became by act of parliament presbyterian; chiefly from the circumstance of her bishops and clergy holding the extreme doctrines, as they have been called, of non-resistance and passive obedience to the powers that be. That is, they became nonjurors in respect to the government of William and Mary.

Such, say the episcopal writers, being the conduct and consequent circumstances of the governors and clergy of the Scottish episcopal church, they have, on this occasion, exhibited an instance of disinterestedness, of generous attachment to fallen majesty, and of conscientious adherence to principle, than which the history of the world does not furnish one more illustrious. Whether they acted rightly or not is a question that, from the opposite views and discordant principles and passions of mankind, we can scarcely suppose will ever be determined to the satisfaction of all parties. This much, however, is certain, that had those venerable fathers possessed the more pliant principles of many distinguished characters of that turbulent period—had they truckled without scruple to the authorities which then prevailed, or measured their notions of what was just and right by their feelings of what was most conducive to their present and temporal interest—

‘Trojaque nunc stares—Priamique arx alta maneres!’

they might have remained in the peaceable possession of their dignities and benefices; for it is well known that the prince of Orange, afterwards king William III., offered to protect them, and preserve their establishment inviolate, provided they would come over to his interests, and support his pretensions to the throne. But this, from a principle of conscience, they unanimously declined to do; and the consequences were that they and many of their clergy were given up a prey to their enemies, and were exposed to such hardships and indignities as one cannot read of without emotion, or think of without pain.

Some relaxation of the severities with which they were treated under king William was, however, granted them by queen Anne, in 1712, when an act of parliament was passed ‘to prevent the disturbing of those of the episcopal communion in Scotland, in the exercise of their religious worship, and in the use of the liturgy of the church of England.’ In consequence of this indulgence that liturgy, which the ablest of them had long professed to admire, and which some of them had already introduced into their assemblies, was universally adopted by them; and public chapels, which had till then been prohibited, were every where built, and well frequented. The same principles which had influenced them to withhold their allegiance from king William and queen Anne, would not allow them, as a body, to transfer it to a new family, clogged as it was by so many oaths, especially by that of abjuration. Yet many individuals complied with the government, and gave every test of allegiance which was required of them; but, as if the insurgents of 1715 had been wholly of their communion, new restraints were then laid upon their public worship, and upon theirs only, which no doubt revived in some degree their original prepossessions. These restraints, however, were neither very severe, nor of long continuance; for by the year 1720 their congregations were as numerous as formerly, consisting, especially in the north, of men of all ranks, even such as held offices of trust under the established government.

Yet nothing less than the extinction of this body seems to have been the aim of those whose enmity proposed, and whose influence procured to be enacted, those penal statutes of 1746 and 1748, which were less calculated to eradicate the attachment of this society to the house of Stuart than to produce disaffection to the existing government, where it did not previously exist. They had also an unhappy effect on the religion of the country; for, by driving out of the episcopal church many persons of distinction, whose principles or prejudices would not allow them to communicate with any other society of Christians around them, the consequence was, as foreseen and foretold by bishop Sherlock, that neglect of religion, and of the duties of public worship, which has long furnished matter of serious regret, and which is still too visible even at the present day. Upon the clergy, however, who even then amounted to nearly 200, those rigorous laws were not long rigorously executed.

After a few years, the burning of chapels, and the imprisonment of ministers, were occurrences that seldom happened; but in as far as those laws affected the political privileges of those laymen who frequented their chapels, in that part of their operation they were in no degree relaxed till 1792, when they were wholly repealed, and the Scottish episcopalians tolerated, like other well-affected dissenters from the national establishment.

The act of parliament which at this time passed for their benefit requires them to subscribe the thirty-nine articles of the church of England.

The other dissenters from the kirk are of the same variety in denomination and general character as the dissenters of England, and embrace burghers and antiburghers, now united under the title of the United Secession; Quakers, Bereans, Baptists, and Glassites. There are Catholic churches also in almost all the principal towns; in the northern parts of Scotland this religion has survived the reformation.

In no country is there ampler provision for education than in Scotland: perhaps in no other part of the world is equal attention paid to the subject. To the efficacy of her institutions for this purpose is to be ascribed that general cultivation which is diffused among the mass of the people. An act passed in the reign of William and Mary, ordaining that there shall be a school and a school-master in every parish, his fee not to be under 100 merks, and not to be above 200. These establishments, in which were taught reading, writing, arithmetic, Latin and Greek, placed a superior education within the reach of the poor; every person was instructed in the ordinary branches of education; knowledge was eagerly sought after, and ignorance was accounted disgraceful. This laudable spirit is now so universally spread that a more moral, orderly, or better instructed class of people than the great body of the community in Scotland, is no where found. In consequence of the depreciation of money, the allowances to those parish schoolmasters became gradually insufficient for their decent maintenance; and in 1803 the legislature most wisely augmented the schoolmaster's salary to 300 merks the lowest, and 400 merks the highest, together with a dwelling-house of at least two apartments, a commodious school-house, and a garden containing a quarter of an acre of ground. Besides these parish-schools, there are academies in most of the large towns, where every branch of education is taught. Scotland has also four universities, namely, at Edinburgh, St. Andrew's, Glasgow, and Aberdeen. That of Edinburgh has acquired the most extensive and well merited reputation, for the great attainments of its professors in literature and science; students of medicine in particular have long resorted to it from all parts of the world; and it has often been considered the very first of medical schools. At the time of the union with England, the ancient constitution of Scotland was so far superseded, that in the parliament of the United Kingdom the Scots nobility are represented by sixteen peers. In the house of commons, the freeholders of the coun-

ties, amounting to 2429, are represented by thirty commissioners or knights of the shires. The royal burghs, which are sixty-five in number, exclusive of the city of Edinburgh, which sends one member, are divided into fourteen districts, which return as many members, elected by a delegate from each burgh. Scotland, however, still retains her own ancient laws and institutions; and civil and criminal justice is administered by the college of justice, instituted by James V. in 1532, after the model of the French parliament, to supply an ambulatory committee of parliament, who took on themselves the name of the lords of council and session, which the great members of the college of justice still retain.

The court of session is the highest court in Scotland, and consists of a president, and fourteen ordinary lords. This court may be termed a standing jury, who determine all civil causes according to the statutes, the custom of the nation, and the civil law. No appeal lies from it but to the house of lords. In 1807 the court of session was formed into two divisions, the first, consisting of seven members, under the lord president; the second division, under the lord justice clerk, consisting of six members. In 1815 a jury court was established under a lord chief commissioner, and two other commissioners for the trial of civil cases. The court of justiciary is the highest criminal court in Scotland. It consists of a lord justice general, who has a salary of £2000 per annum; a lord justice clerk, who is president; and five other judges nominated from the senators of the college of justice. The pannel has not the power, as in England, of setting aside a juryman, without assigning a reason. He must be served with a copy of his indictment, and a list of the witnesses who are to appear against him, and another list of forty-five men, out of which his jury is to be chosen, fifteen free days before his trial.

The lords commissioners of justiciary make a circuit twice a year to the different districts of Scotland. All criminal cases before this court are tried by a jury of fifteen persons, whose verdict condemns or acquits by a bare plurality of votes. The court of exchequer has the same powers, privileges, jurisdictions, and authority over the revenue of Scotland, as that of England over the revenue of England. This court consists of a lord chief baron and four other barons, two remembrancers, a clerk of the pipe, &c. All the causes are here tried by jury. In the high court of admiralty there is only one judge, who is the king's lieutenant and justice general upon the seas, and in all ports and harbours. He has a jurisdiction in all maritime causes; and by prescription he has acquired a jurisdiction in mercantile causes not maritime. His decisions are subject to the review of the court of session in civil, and to that of the court of justiciary in criminal, cases.

The college or faculty of advocates answers to the English inns of court; and, subordinate to them, is a body of inferior lawyers or attornies, styled writers to the signet, because they alone can substantiate the writings that pass the sig-

net. The commissary court consists of four judges nominated by the crown, and has an original jurisdiction in questions of marriage and divorce, and reviews the decrees of local commissary courts. It sanctions the appointment of executors, and ascertains debts relating to the last illness and funeral charges of persons deceased, or obligations arising from testaments, or actions of scandal, and upon all debts which do not exceed £40. The keeper of the great and privy seals, the lord register, and the lord advocate, are officers of state.

Every county has a chief magistrate called a sheriff, whose jurisdiction extends to certain

criminal cases, and to all civil matters which are not by special law or custom appropriated to other courts. In cases of inferior importance, also, the magistrates of cities and royal burghs have a jurisdiction, which is subject to review of the sheriff. Justice of peace courts were instituted in 1809, which are in almost every respect similar to those in England, though their powers are not so well defined. There is also a small debt court held monthly in every town of any note, where cases not exceeding £5 are decided in a summary manner. See our article *LAW*, part III., for a more particular account of the statute and other laws of Scotland.

SCOTT (Daniel), LL.D., a learned English author and critic, who received the first part of his education at Tewksbury, and finished it at Utrecht, where he was graduated. He wrote several treatises on Theology; and, in 1745, published an Appendix to Henry Stephens's *Greek Lexicon*, 2 vols. folio.

SCOTT (John), D.D., an eminent English divine, born, in 1638, at Chippenham in Wiltshire. He was educated at Oxford; admitted a commoner in 1657, and made great progress in logic and philosophy. He became minister of St. Thomas's in Southwark. In 1684 he was collated to a prebend in the cathedral of St. Paul's. Dr. Hickee tells us that after the revolution, 'he first refused the bishopric of Chester, because he would not take the oath of homage; and afterwards another bishopric, the deanery of Worcester, and a prebend of the church at Windsor, because they were all places of deprived men.' In 1691, however, he was made rector of St. Giles's, and canon of Windsor. He published several works:—1. *The Christian Life*, which has been often reprinted; 2. *Examination of Bellarmine's Eighth Note on Sanctity*; 3. *Texts Examined which Papists quote for Prayer in an Unknown Tongue*; 4. *Cases of Conscience*. He died in 1695.

SCOTT (Rev. Thomas), an English clergyman of the established church, was born at Braytoft in Lincolnshire, February 4th, 1746, 1747. His father, a small farmer with a large family, was a man of strong sense, and ambitious of bringing up one of his family to a profession. The eldest son, therefore, was bred a surgeon, but died young; on which Thomas was put to school to learn Latin. At the age of sixteen he was bound apprentice to a medical practitioner at Alford; but at the end of two months he was dismissed, for what cause is not stated by his biographers. He was now employed to keep sheep, but, having a strong desire to enter into orders, he consulted a clergyman at Boston, who encouraged his attempt at qualifying himself for the ministry: and he had acquired a competent knowledge of Greek as well as Latin, when the bishop of Lincoln, Dr. Green, admitted him to orders in 1773. His first situation was a curacy in Buckinghamshire, where he held a correspondence and controversy with Mr. John Newton, which ended in the conversion of Mr. Scott to the Calvinistic sentiments of his friend: and, on

Mr. Newton's removal, Mr. Scott succeeded him in the curacy of Olney: this was in 1781. Four years afterwards he removed to the chaplainship of the Lock Chapel, near Hyde Park Corner, and held besides two lectureships in the city. In 1801 he obtained the living of Aston Sandford, in Buckinghamshire; and here he died, April 16th, 1821, much beloved and respected. Mr. Scott was an able defender of Calvinism, and a good practical expositor of the Scriptures. His *Family Bible* has gone through several editions. His other works are numerous, and very popular with his party.

SCOTT, a county of the north part of Kentucky, United States. The chief place is George Town. Also a county of Virginia, formed in 1814 out of the counties of Lee, Russel, and Washington.

SCOTUS (Joannes), or John Erigena, a famous scholastic divine, born about the beginning of the ninth century; but where is a matter of dispute among authors. All agree, however, in relating that he travelled to Athens, where he acquired a competent knowledge of the Greek and other oriental languages; and, that he afterwards resided many years in the court of Charles the Bald, king of France, who, on account of his singular abilities, treated him as his intimate friend and companion. During his residence with Charles, he wrote several books of scholastic divinity; which, though absurd enough, were at that time not sufficiently so to secure him from the imputation of heterodoxy; and on that account the pope commanded Charles the Bald to send him to Rome; but the king had too great a regard for his companion to trust him with his holiness. One of the chief controversies in which Scotus was engaged, and with which the pope was much offended, was concerning the real presence of the body and blood of Christ in the wafer. His opinion was expressed in these few words:—'What we receive corporally is not the body of our Lord; but that which feeds the soul, and is only perceived by faith.' Whether Scotus returned to England, or ended his days in France, is a matter of doubt. Some historians tell us that he left France in 864; and that, after residing about three years in Oxford, he retired to the abbey of Malmesbury. He died about 874. Some relate that he was invited to England by king Alfred; but in this they confound him with John, abbot of Ethe-

ling, who was assassinated in 835; and to this mistake the various contradictory accounts of him are to be attributed. He appears from his writings to have been a man of talents, and, in point of learning, superior to any of his contemporaries. He wrote 1. *De Divisione Naturæ*, lib. v. 2. *De Predestinatione Dei*. 3. *Excerpta de Differentiis et societatibus Græci Latinique Verbi*. 4. *De Corpore et Sanguine Domini*. 5. *Ambigua S. Maxima seu Scholia ejus in difficiles locos S. Gregorii Nazianzeni, Latine Versa*. 6. *Opera S. Dionysii quatuor in Latinam Ling. Conversa*. 7. *De Visione Dei*, and several other works in MS. preserved in different libraries.

SCOTUS, DUNS (John). See DUNS SCOTUS.

SCOUGAL (Henry), M.A., second son of Patrick Scougal, bishop of Aberdeen, was born, June 1650, at Salton. On finishing his courses, he was appointed professor of philosophy in the university of Aberdeen. In four years, he was, at the age of twenty-three, ordained a minister, and settled at Auchterless, twenty miles from Aberdeen; where his zeal and ability were eminently displayed. In the twenty-fifth year of his age he was admitted professor of divinity in the king's college, Aberdeen. He died of a consumption on the 20th of June, 1678, in the twenty-eighth year of his age, and was buried in the King's College Church in Old Aberdeen. The principal work of Scougal is a small treatise entitled, *The Life of God in the Soul of Man*.

SCOUNDREL, *n. s.* Ital. *scandaruolo*. A hider.—Skinner. A mean rascal; a low petty villain. A word rather ludicrous.

Now to be baffled by a *scoundrel*,

And upstart sec'try, and a mungrel. *Hudibras.*

Scoundrels as these wretched Ombites be,

Canopus they exceed in luxury. *Tate.*

Go, if your ancient but ignoble blood

Has crept through *scoundrels* ever since the flood,

Go, and pretend your family is young;

Nor boast your fathers have been fools so long.

Pope.

SCOUR, *v. a. & v. n.* } Goth. *skurr*; Dan.

SCOURER, *n. s.* }

skurer; Belg. *scheur*;

Ital. *scorrere*. To brush hard in order to

clean; clean by rubbing; cleanse; purge; range

about; to perform scouring operations: be

purged or lax; rove; range; run here and

there: a scourer is a person or thing that scours.

Divers are kept continually to *scour* these seas,

infested greatly by pirates. *Sandys.*

The kings of Lacedæmon having sent out some

gallies, under the charge of one of their nephews, to

scour the sea of the pirates, they met us. *Sidney.*

She from him fled with all her power

Who after as hastily 'gan to *scour*. *Færie Queene.*

Barbarossa, *scouring* along the coast of Italy,

struck an exceeding terror into the minds of the ci-

zens of Rome. *Knolles.*

were better to be eaten to death with rust, than

to be *scoured* to nothing with perpetual motion.

Shakspeare.

Never came reformation in a flood

With such a heady current, *scouring* faults;

Nor ever hydra-headed wilfulness

So soon did lose his seat, and all at once,

As in this king. *Id. Henry V.*

I keep his house, and wash, wring, brew, bake,

scour, dress meat, and make the beds. *Shakspeare*

I saw men *scour* so on their way: I eyed them

Even to their ships. *Id. Winter's Tale.*

In some lakes the water is so nitrous, as if foul clothes be put into it, it *scoureth* them of itself; and, if they stay, they moulder away.

Bacon's Natural History.

Some apothecaries, upon stamping coloquintida, have been put into a great *scouring* by the vapour only. *Bacon.*

Sometimes

He *scours* the right-hand coast, sometimes the left.

Milton.

Convulsion and *scouring*, they say, do often cause one another. *Graunt's Bills of Mortality.*

A garden worm should be well *scoured* eight days in moss, before you fish with him. *Walton's Angler.*

By dint of sword his crown he shall increase,

And *scour* his armour from the rust of peace.

Dryden's Æneid.

If with thy guards thou *scourest* the streets by night,

And dost in murders, rapes, and spoils delight,

Please not thyself the flattering crowd to hear.

Dryden.

So four fierce coursers, starting to the race,

Scour through the plain, and lengthen every pace;

Nor reigns, nor curbs, nor threatening cries they

fear,

But force along the trembling charioteer. *Id.*

If they be men of fraud, they'll *scour* off themselves, and leave those that trust them to pay the reckoning.

L'Estrange.

If you turn sheep into wheat or rye to feed, let it not be too rank, lest it make them *scour*.

Mortimer's Husbandry.

As soon as any foreign object presses upon the sense, those spirits, which are posted upon the out-

guards, immediately take the alarm, and *scour* off to the brain, which is the head quarters.

Collier.

Beneath the lamp her tawdry ribbons glare,

The new *scoured* manteau, and the slattern air.

Gay.

Some blamed Mrs. Bull for grudging a quarter of a pound of soap and sand to *scour* the rooms.

Arbutnot

Poor Vadius, long with learned spleen devoured,

Can taste no pleasure since his shield was *scoured*.

Pope.

When Ajax strives some rock's vast weight to throw,

The line too labours, and the words move slow;

Not so when swift Camilla *scours* the plain,

Flies o'er the 'unbending corn, and skims along the

main. *Id. Essay on Criticism.*

SCOURGE, *n. s. & v. a.* Fr. *escourgée*; Ital.

scorggia; Lat. *corregia*. A whip; lash; an in-

strument of discipline; punisher of any kind:

to scourge is to use such an instrument.

When he had made a *scourge* of small cords, he

drove them all out of the temple. *John ii. 15.*

Is it lawful for you to *scourge* a Roman?

Acts xxii. 25.

Famine and plague are sent as *scourges* for amendment.

2 Esdras.

The gods are just, and of our pleasant vices

Make instruments to *scourge* us. *Shakspeare. King Lear.*

Is this the *scourge* of France?

Is this the Talbot so much feared abroad,

That with his name the mothers still their babes?

Id. Henry VI.

The *scourge*

Inexorable, and the torturing hour,

Call us to penance. *Milton.*

He *scourged* with many a stroke the' indignant waves. *Id.*

If they had a top, the *scourge* stick and leather strap should be left to their own making. *Locke.*

Such conquerors are not the favourites but *scourges* of God, the instruments of that vengeance. *Atterbury's Sermons.*

Immortal Jove!

Let kings no more with gentle mercy sway,
Or bless a people willing to obey;

But crush the nations with an iron rod,
And every monarch be the *scourge* of God. *Pope.*

When a professor of any religion is set up to be laughed at, this cannot help us to judge of the truth of his faith, any better than if he were *scourged*. *Watts.*

SCOUT, *n. s. & v. n.* Fr. *escout*, from *escouter*; Lat. *auscultare*, to listen; Ital. *scolla*. One who is sent privily to observe the motions of the enemy: to go out in this way.

Are not the speedy *scouts* returned again,
That dogged the mighty army of the Dauphin? *Shakspeare.*

This great vessel may have lesser cabins, wherein *scouts* may be lodged for the taking of observations. *Wilkins.*

As when a *scout*,
Through dark and desert ways with peril gone
All night, at last, by break of cheerful dawn,
Obtains the brow of some high-climbing hill. *Milton.*

Off on the bordering deep
Encamp their legions; or with obscure wing
Scout far and wide into the realm of night,
Scorning surprise. *Id.*

The *scouts* to several parts divide their way,
To learn the natives' names, their towns, explore
The coasts. *Dryden's Æneid.*

As a hunted panther casts about
Her glaring eyes, and pricks her listening ears to
scout,
So she, to shun his toils, her cares employed. *Dryden.*

SCOWL, *v. n. & n. s.* Sax. *scýlan*, to squint;
Isl. *skella sig*, to look sour. To frown; pout; look
angry, or sullen: a look of this kind; gloom.

Miso, her authority increased, came with *scowling*
eyes to deliver a slaving good morrow to the two
ladies. *Sidney.*

With bent lowering brows, as she would threat,
She *scowled* and frowned with froward countenance. *Faerie Queene.*

Not a courtier,
Although they wear their faces to the bent
Of the king's look, but hath a heart that is
Glad at the thing they *scowl* at. *Shakspeare. Cymbeline.*

Fly, fly, prophane fogs! far hence fly away,
With your dull influence; it is for you
To sit and *scowl* upon night's heavy brow. *Crashaw.*

I've seen the morning's lovely ray
Hover o'er the new-born day
With rosy wings so richly bright,
As if he scorned to think of night;
When a ruddy storm, whose *scowl*
Made heaven's radiant face look foul,
Called for an untimely night,
To blot the newly-blossomed light. *Id.*

The dusky clouds o'erspread
Heaven's cheerful face; the lowering element
Scowls o'er the darkened landscape snow or shower. *Milton.*

In rueful gaze

The cattle stand, and on the *scowling* heavens
Cast a deploring eye. *Thomson's Summer.*

Across her placid azure sky,
She sees the *scowling* tempest fly.
Chill runs my blood to hear it rave,
I think upon the stormy wave,
Where many a danger I must dare,
Far from the bonnie banks of Ayr. *Burns.*

SCRABBLE, *v. n.* Belg. *krabbelen*, *scrapple*,
len, to scrape or scratch; Dan. *scrabble*. To paw
with the hands.

He feigned himself mad in their hands, and *scrab-
bled* on the doors of the gate. 1 Samuel xxi. 13.

SCRAGGY, *n. s.* } Belg. *scraghe*. Any thing
SCRAGGY, *adj.* } thin or lean: the adjective
corresponding.

From a *scraggy* rock, whose prominence
Half overshades the ocean, hardy men,
Fearless of rending winds and dashing waves,
Cut samphire. *Philips.*
Such a constitution is easily known, by the body
being lean, warm, hairy, *scraggy*, and dry, without a
disease. *Arbuthnot.*

Is there then any physical deformity in the fa-
brick of a human body, because our imagination
can strip it of its muscles and skin, and shew us
the *scragged* and knotty back-bone? *Bentley's Sermons.*

SCRAMBLE, *v. n.* The same with **SCRAB-
BLE**, says Johnson. A frequent. of Goth. *krama*,
Dan. *granic*, the hand.—Thomson. To catch
at any thing eagerly and tumultuously with the
hands; to catch with haste preventive of another;
to contend tumultuously which shall catch any
thing.

England now is left
To tug and *scramble*, and to part by the teeth
The unowed interest of proud swelling state. *Shakspeare.*

Of other care they little reckoning make,
Than how to *scramble* at the shearer's feast,
And shove away the worthy bidden guest. *Milton.*

It is not to be supposed that, when such a tree
was shaking, there would be no *scrambling* for the
fruit. *Stillingfleet.*

As they were in the middle of their gambols,
somebody threw a handful of apples among them,
that set them presently together by the ears upon
the *scramble*. *L'Estrange.*

Because the desire of money is constantly almost
every where the same, its vent varies very little, but
as its greater scarcity enhances its price and in-
creases the *scramble*. *Locke.*

They must have *scrambled* with the wild beasts
for crabs and nuts. *Roy on the Creation.*

All the little *scramblers* after fame fall upon him. *Aldison.*

SCRANNEL, *adj.* [Of this word I know
not the etymology, nor any other example.—
Johnson.] Swed. *skrenna*.—Thomson. Vile;
worthless. Perhaps grating by the sound.

When they list, their lean and flashy songs
Grate on their *scrannel* pipes of wretched straw. *Milton.*

SCRAP, *n. s.* From scrape, a thing scraped
or rubbed off; a small particle or piece: a frag-
ment; crumb; small piece of paper.

The contract you pretend with that base wretch,
One bred of alms, and fostered with cold dishes,
With *scraps* o' th' court, is no contract. *Shakspeare. Cymbeline.*

The attendants puff a court up beyond her bounds,
for their own *scraps* and advantage. *Bacon.*

It is an unaccountable vanity to spend all our
time raking into the *scraps* and imperfect remains of
former ages, and neglecting the clearer notices of
our own. *Glanville.*

Trencher esquires, spend their time in hopping
from one great man's table to another's, only to pick
up *scraps* and intelligence. *L'Estrange.*

Languages are to be learned only by reading and
talking, and not by *scraps* of authors got by heart.
Locke.

On bones, on *scraps* of dogs, let me be fed,
My limbs uncovered, and exposed my head
To bleakest colds. *Granville.*

No rag, no *scrap*, of all the beau, or wit,
That once so fluttered, and that once so writ. *Pope.*

I can never have too many of your letters; I am
angry at every *scrap* of paper lost. *Id.*

What has he else to bait his traps,
Or bring his vermin in, but *scraps*?

The offerings of a church distrest,
A hungry vicarage at best. *Swift.*

SCRAPE, *v. a. & n. s.* Sax. *scrapian*; Belg.
schrapen; apparently from Gr. *γραφο*. To de-
prive of the surface by the light action of a sharp
instrument; pare even; in a low sense, a diffi-
culty; perplexity: a scraper is an instrument
for cleansing by scraping shoes: also a miser
and a vile fiddler.

They shall destroy the walls, and I will *scrape* her
dust, and make her like the top of a rock.

Ezek. xxvi. 4.

Be thrifty, but not covetous; therefore give
Thy need, thine honour, and thy friend his due;
Never was *scraper* braver man. Get to live;

Then live, and use it; else it is not true
That thou hast gotten: surely, use alone
Makes money not a contemptible stone. *Herbert.*

Out! ye sempiternal *scrappers*. *Cowley.*

These hard woods are more properly *scraped* than
planed. *Morton.*

Let the government be ruined by his avarice, if
by avarice he can *scrape* together so much as to make
his peace. *South.*

The chiming clocks to dinner call;

A hundred footsteps *scrape* the marble hall. *Pope.*

Have wild boars or dolphins the least emotion at
the most elaborate strains of your modern *scrappers*,
all which have been tamed and humanised by an-
cient musicians? *Arbuthnot.*

Bread for toast lay on the coals; and, if toasted
quite through, *scrape* off the burnt side, and serve it
up. *Swift.*

Never clean your shoes on the *scraper*, but in the
entry, and the *scraper* will last the longer. *Id.*

Unhappy those who hunt for a party, and *scrape*
together out of every author all those things only
which favour their tenets. *Hatts.*

SCRATCH, *v. a. & n. s.* Belg. *kratzer*. To
tear or mark with slight ragged incisions: a
mark thus made.

The valiant beast turning on her with open jaws,
she gave him such a thrust through his breast, that
all the lion could do was with open paw to tear off
the mantle and sleeve of Zelmaen, with a little
scratch rather than a wound. *Sidney.*

Making him turn close to the ground, like a cat,
when *scratchingly* she wheels about after a mouse.
Id.

How can I tell but that his talons may
Yet *scratch* my son, or rend his tender hand?

Faerie Queene.

I should have *scratched* out your unseeing eyes,
To make my master out of love with thee.

Shakespeare.

I had rather hear my dog bark at a crow, than a
man swear he loves me.—Keep your ladyship still in
that mind; so some gentleman or other shall 'scape
a predestinate *scratcht* face. *Id.*

Heaven forbid a shallow *scratch* should drive
The prince of Wales from such a field as this.

Id. Henry IV.

Francis Cornfield did *scratch* his elbow, when he
had sweetly invented to signify his name St. Francis,
with a friary cowl in a corn field. *Cumden.*

Or if too hard and deep
This learning be for a *scratch'd* name to teach
It as a given death's-head keep,
Lovers' mortality to preach,
Or think this ragged bony name to be
My ruinous anatomy. *Donne.*

Scots are like witches: do but whet your pen,
Scratch till the blood come, they'll not hurt you then.
Cleveland.

To wish that there were nothing but such dull
tame things in the world, that will neither bite nor
scratch, is as childish as to wish there were no fire
in nature. *More.*

The lab'ring swain
Scratched with a rake a furrow for his grain,
And covered with his hand the shallow seed again.
Dryden.

Unhand me, or I'll *scratch* your face;
Let go, for shame. *Id.*

The coarse file cuts deep, and makes deep *scratches*
in the work; and, before you can take out those deep
scratches with your finer cut files, those places where
the risings were when your work was forged, may
become dents to your hammer dents.

Moxon's Mechanical Exercises.

A sort of small sand-colored stones, so hard as to
scratch glass. *Grew's Museum.*

These nails with *scratches* shall deform my breast,
Lest by my look and color be expressed
The mark of aught high-born, or ever better dressed.
Prior.

The smaller the particles of those substances are,
the smaller will be the *scratches* by which they conti-
nually fret and wear away the glass until it be po-
lished; but be they never so small, they can wear
away the glass no otherwise than by grating and
scratching it, and breaking the protuberances; and
therefore polish it no otherwise than by bringing its
roughness to a very fine grain, so that the *scratches*
and frettings of the surface become too small to be
visible. *Newton's Opticks.*

Other mechanical helps Aretæus uses to procure
sleep, particularly the *scratching* of the temples and
the ears. *Arbuthnot.*

Be mindful, when invention fails,
To *scratch* your head, and bite your nails. *Swift.*

If any of their labourers can *scratch* out a pam-
phlet, they desire no wit, stile, or argument. *Id.*

SCRATCH-PANS, in the English salt-works.
See SALT. Their use is to receive a selenitic
matter, known by the name of soft *scratch*,
which falls during the evaporation of the salt-
water.

SCRAW, *n. s.* Irish and Erse. Surface or
scurf.

Neither should that odious custom be allowed, of
cutting *scraws*, which is flaying off the green surface
of the ground, to cover their cabins, or make up
their ditches. *Swift.*

SCRAWL, *v. a., v. n., & n. s.* [I suppose to be corrupted from *scrabble*.—Johnson.] To draw or mark irregularly or clumsily : to write thus ; the writing itself.

The left hand will make such a *scrawl*, that it will not be legible. *Arbutnot's H. of John Bull.*

Mr. Wycherly hearing from me how welcome his letters would be, writ to you, in which I inserted my *scrawl*. *Pope.*

Peruse my leaves through ev'ry part,
And think thou seest its owner's heart,
Scrawled o'er with trifles thus, and quite
As hard, as senseless, and as light. *Swift.*

Think not your verses sterling,
Though with a golden pen you *scrawl*,
And scribble in a berlin. *Id.*

SCREAM, *v. n. & n. s.* Sax. *pneman*. To cry out shrilly, as in terror or agony ; the cry made.

I heard the owl *scream*, and the crickets cry. *Shakspeare.*

Our chimnies were blown down ; and, as they say,
Lamentings heard in the air, strange *screams* of death. *Id.*

The fearful matrons raise a *screaming* cry,
Old feeble men with fainter groans reply ;
A jarring sound results, and mingles in the sky. *Dryden.*

Then flashed the livid lightning from her eyes,
And *screams* of horror rend the affrighted skies. *Pope.*

If chance a mouse creeps in her sight,
Can finely counterfeit a fright ;
So sweetly *screams*, if it comes near her,
She ravishes all hearts to hear her. *Swift.*

SCREAMER, in zoology. See **PALAMEDEA**.
SCREECH, *v. n. & n. s.* } Islan. *skrakia*, to
SCREECH-OWL, *n. s.* } cry. To cry out
as in terror or anguish ; the cry : the screech-owl is noted for a cry of this kind.

Deep night,

The time of night when Troy was set on fire,
The time when *screechowls* cry, and bandogs howl. *Shakspeare.*

Screeching is an appetite of expelling that which suddenly strikes the spirits. *Bacon.*

By the *screechowl's* dismal note,
By the black night-raven's throat,
I charge thee, Hob. *Drayton.*

Jupiter, though he had joggled the balance to weigh down Turnus, sent the *screechowl* to discourage him. *Dryden.*

Sooner shall *screechowls* bask in sunny day,
Than I forget my shepherd's wonted love. *Gay.*

The birds obscene, that nightly flocked to taste
With hollow *screeches* fled from the dire repast ;
And ravenous dogs, allured by scented blood,
And starving wolves, ran howling to the wood. *Pope.*

SCREEN, *n. s.* Fr. *cscran*. Any thing that affords shelter or concealment ; a sieve.

Now near enough : your heavy *screens* throw down,

And show like those you are. *Shakspeare. Macbeth.*
Some ambitious men seem as *screens* to princes in matters of danger and envy. *Bacon.*

When there is a *screen* between the candle and the eye, yet the light passeth to the paper whercon one writeth. *Id.*

Back'd with a ridge of hills,
That *screened* the fruits of the earth, and seats of men,
From cold Septentrion blasts. *Milton's Paradise Regained.*

A good magistrate's retinue of state *screens* him from the dangers which he is to incur for the sake of it. *Atterbury.*

This gentle deed shall fairly be set foremost,
To *screen* the wild escapes of lawless passion. *Rowe.*

Our people, who transport themselves, are settled in those interjacent tracts, as a *screen* against the insults of the savages. *Swift.*

One speaks the glory of the British queen,
And one describes a charming Indian *screen*. *Pope.*

SCREW, *n. s.* Fr. *cscrou* ; Belg. *scroeve*. One of the mechanical powers, of which there are two kinds, the male and female ; the former being cut convex, so that its threads rise outwards ; the latter channelled on its concave side, so as to receive the former. See below. To turn, or move, or fasten, by a screw ; deform ; oppress.

We fail !

But *screw* your courage to the sticking place,
And we'll not fail. *Shakspeare. Macbeth.*

The *screw* is a kind of wedge, that is multiplied or continued by a helical revolution about a cylinder, receiving its motion not from any stroke, but from a vectis at one end of it. *Wilkins's Mathematical Magick.*

Sometimes a violent laughter *screwed* his face,
And sometimes ready tears dropped down apace. *Cowley.*

He resolved to govern by subaltern ministers, who *screwed* up the pins of power too high. *Howell's Vocal Forest.*

He *screwed* his face into a hardened smile,
And said, Sebastian knew to govern slaves. *Dryden.*

After your apples are ground, commit them to the *screw* press, which is the best. *Mortimer's Husbandry.*

To *screw* your lock on the door, make wide holes, big enough to receive the shank of the *screw*. *Moxon.*

Some, when the press, by utmost vigour *screw'd*,
Has drained the pulpos mass, regale their swine
With the dry refuse. *Philips.*

With *screwed* face, and doleful whine, they ply
with senseless harangues against human inventions on the one hand, and loud outcries for a further reformation on the other. *South.*

No discourse can be, but they will try to turn the tide, and draw it all into their own channel ; or they will *screw* in here and there some intimations of what they said or did. *Government of the Tongue.*

Let others *screw* their hypocritic face,
She shews her grief in a sincerer place. *Swift.*

Our country landlords, by unmeasurable *screwing*, and racking their tenants, have already reduced the miserable people to a worse condition than the peasants in France. *Id.*

Ask him, if your knotted scourges,
Matches, blood-extorting *screws*,
Are the means that duty urges
Agents of his will to use ? *Cowper.*

SCREW. The general principles on which this instrument is constructed will be found detailed under our article **MECHANICS**, and we have now to examine the theory of the screw in connexion with its application to the useful arts.

The screw may be considered as composed of the lever and the inclined plane ; as will be evident from a more minute account of the manner in which it may be conceived to be generated. If an isosceles triangle *BFG* turn about the axis *AZ* (plate **SCREW**, fig. 1), there will be generated

by that revolution two conic frustums united by their greater ends; conceive now that, besides the motion of rotation, this triangle has also a motion of translation in the direction of the axis AZ , so regulated that, while the triangle makes a complete revolution, the point B is moved to G , and the whole triangle is found in the position $G P' G'$, and so on: the solid thus generated is called the interior screw; and the height GB is called the distance of the threads. The exterior screw is so adapted to the other as if it were its mould; and is nothing else than the solid generated by the polygon $HGFBC$, supposing it to partake of the same motions as the triangle BGF . For the sake of distinction we shall apply the name spindle to the interior screw, calling the exterior one only the screw. The spindle then is a cylinder invested with a spiral band of uniform thickness, and of which the inclination with respect to the axis of the cylinder is constant: the screw, on the contrary, is a solid having a correspondent spiral hollow. In some cases the spindle is fixed in a solid block, as $A B$, fig. 2, while the screw E is moved upon it by means of a lever DC . At other times the screw is fixed and the spindle moveable; but this causes no difference in the theory.

The curve which any one of the points of the generating polygon, as N for instance, describes about AZ , is obviously traced on the surface of a right cylinder whose axis is AZ , and radius of its base EN (fig. 3). If we develop this, then dc (fig. 4), being the circumference which has EN for its radius, and taking the perpendicular bc equal to the distance between two contiguous threads, the hypothenusal line db will be the development of an entire revolution of the point N . In effect, the helix being throughout of constant inclination with respect to any position whatever of the generating line of the cylinder, every parallel to AD will make with the development of that curve the same angle; thus, the development will be a right line, as db ; and in like manner the right line af will be the development of a second revolution. This being granted, we may demonstrate, in a very satisfactory manner, the truth of the following proposition:—

There will be an equilibrium in the screw when the power is to the resistance as the distance between two contiguous threads in a direction parallel to the axis is to the circumference described by the power.

Let us suppose the spindle AB to be fixed (fig. 2), and that the screw is moveable by the aid of a power P applied to the extremity C of a lever $CE=R$, acting horizontally perpendicular to the lever. Let W be the weight of the screw, or that which the screw supports, or the resistance opposed by the screw to the power P . If the screw pressed only on one of the points of the spindle, suppose it to be at the distance r from the axis, and that its position on the development db of the spiral be at u ; then will the pressure on the spindle be exactly the same as on the inclined plane db . From the theory the power M , which we suppose applied horizontally in the direction Mn , must retain the equilibrium. We may thus illustrate this proportion:

$$M : W :: cb : cd; \text{ whence } M = W \cdot \frac{cb}{cd} = W \cdot \frac{h}{2\pi r}$$

where $h=bc$, and $\pi=3.141593$, as heretofore. The force M , which is supposed applied in n , when the helix is not developed is perpendicular to the edge of the cylinder, or acts in a tangential direction to the cylinder, and in consequence always parallel to the power P .

Now, substituting for this subsidiary power M the power P , acting at the distance R , we have from the principles of the lever $PR=M r$, the lengths of the arms being R and r . For M , in this equation, substitute its value in the former one, and there arises $2\pi R P=W h$. This equation, not containing r , is entirely independent of the distance at which the point n is supposed from the axis; it will therefore be the same if we suppose that point any where else on the spindle. Hence we deduce a general result; for this equation will even be true, if the screw, instead of touching the spindle in a single point, as we have hitherto supposed, touch it in any number of points whatever. In this latter case, every point on the thread of the spindle bears a portion of the weight W ; these portions being denoted by W', W'', W''' , &c., give $W+W''+W'''$, &c. $=W$. But, on the other hand, the force P , which supports the weight of the screw, may be considered as the sum of as many forces P', P'', P''' , &c., as there are points of contact, each of which is employed in supporting the weights W', W'', W''' , &c. To each of these the last equation applies; we have, therefore, $W' h=2\pi R P', W'' h=2\pi R P'', W''' h=2\pi R P'''$, &c., their sum manifestly producing the equation $W h=2\pi R P$; whence $P : W :: h : 2\pi R$. (Q. E. D.)

If the screw had a square or rectangular fillet instead of a triangular one, the conclusion would be the same; for it is independent of the form of the generating polygon.

In the same screw the effect is always the greater as the power is applied farther from the axis.

In two different screws, a force acting with the same distance of lever produces a greater effect in proportion as the threads of the screw are nearer together.

In the endless or perpetual screw BC (fig. 5), which drives the teeth of the wheel FD , we shall, in the case of an equilibrium, have $P \times AB \times \text{rad. of } FD = W \times \text{distance of threads} \times \text{rad. of axle}$. For the perpetual screw is a combination of the axis in peritrochio and the screw.

The screw may be used to measure minute distances; for its point advances through 1 while the radius by which it is turned describes 360° . Instruments for this purpose are named micrometers; their principal part is a fine and accurate screw which carries a frame, across which a fine wire is stretched at right angles to the axis of a telescope or microscope, and in the plane of its principal image; by turning the screw the wire moves parallel to itself, and its distance from a parallel fixed wire is the magnitude of the portion of the image included between them; and from this we draw the magnitude of the object. This distance is indicated by a circular head on the screw which is graduated; thus, if the interval be $\frac{1}{10}$ of an inch, and the circum-

ference of the head three inches, divided into sixty parts for every one of these which passes an index, the wire moves through $\frac{1}{6000}$ of an inch. Smeaton asserts that he had used a screw which agreed with itself to $\frac{1}{6000}$. The power of the screw in producing pressure depends on the fineness of its thread, and this is limited by the strength of materials; as, if too fine, it would be broken from the cylinder, and on the other hand micrometer screws cannot be made beyond a certain interval. The endless screw is supposed to be the engine by which the geometer of Syracuse launched by his single strength one of Hiero's galleys, when challenged by that sovereign to give a specimen of the use of mechanics.

In the Philosophical Transactions, vol. lxxi., a new method of applying the screw, so as to make it act with the greatest accuracy, is described by Mr. Hunter. This method depends upon these general principles, applicable to most machines: 1. That the strength of the several parts of the engine be adjusted in such a manner, to the force they are intended to exert, that they shall not break under the weight they ought to counteract, nor yet encumber the motion by a greater quantity of matter than is necessary to give them a suitable degree of strength. 2. That the increase of power by means of the machine be so regulated that, while the force is thereby rendered adequate to the effect, it may not be retarded in procuring it more than is absolutely necessary. 3. That the machine be as simple as is consistent with other conditions. 4. That it be as portable, and as little troublesome as possible in its application. 5. That the moving power be applied in such a manner as to act to the greatest advantage; and that the motion ultimately produced may have that direction and velocity which is most adapted to the execution of the ultimate design of the machine. 6. Of two machines, equal in other respects, that deserves the preference in which the friction least diminishes the effect proposed by the whole.

To attain all these advantages in any one machine is perhaps impossible; but Mr. Hunter's method of applying the screw certainly combines a great portion of them. Let *AB* (fig. 6) be a plate of metal in which the screw *CD* plays, having a certain number of threads in an inch, suppose ten. Within the screw *CD* there is an exterior screw which receives the smaller screw *DE* of eleven threads in an inch. This screw is kept from moving about with the former by means of the apparatus at *A F G B*. If the handle *C K L* be turned ten times round, the screw *CD* will advance an inch upwards; and, if we suppose the screw *DE* to move round along with *CD*, the point *E* will advance an inch. If we now turn the screw *DE* ten times backward, the point *E* will move downwards $\frac{10}{11}$ of an inch, and the result of both motions will be to lift the point *E* an eleventh of an inch upwards. But if, while the screw *CD* is turned ten times round, *DE* be kept from moving, the effect will be the same as if it had moved ten times round with *CD*, and been turned back again ten times; that is, it will advance $\frac{1}{11}$ of an inch. At one turn, therefore, it will advance $\frac{1}{10}$ of $\frac{1}{11} = \frac{1}{110}$ of an inch. If now the handle be six inches long,

the power to produce an equilibrium must be to the weight as 1 to $110 \times 6 \times 2 \pi = 4146.912$. Thus, the force of Mr. Hunter's screw is greatly superior to the common one; for a common one with a six inch handle must have 110 threads in an inch to produce the same effect, and this great number of threads would render it too weak to resist any considerable violence.

With regard to the second general maxim, both kinds of screws are equally applicable; only that the more complicated structure, and consequently greater expense of Mr. Hunter's screw, renders it convenient to use the common screw where only a small increase of power is requisite, and the improved one where a great power is wanted. The handle being short makes this machine accord with the fourth maxim.

To answer the fifth both seem equally proper; but, for the sixth, the preference must be given to such as best answer the specific purpose proposed. Thus, if the screw *DE* be designed to carry an index which must turn round at the same time that it rises upward, the common screw seems preferable; though Mr. Hunter proposes a method by which his may answer the same purpose: with this view a still smaller screw ought to play within *DE*, and be connected with *CD*, so as to move round along with it. It must have, according to the foregoing proportions, 111 threads in an inch: and they must lie in a contrary direction to those of *CD*; so that when they are both turned together, and *CD* moves upwards, this other may move downwards. At one turn this will move upwards $\frac{1}{111}$ of an inch, and at the same time will move in a circular direction. Similar methods may be applied in many other cases: indeed they have lately been applied very frequently; though few of those who have adopted them have acknowledged by whom they were first proposed; on which account we have given this brief description of Mr. Hunter's contrivance, and of his judicious practical maxims.

Mr. Walsh has invented a mode of cutting screws by means of a very simple apparatus independent of the guide and slide-rest usually employed for that purpose. The process may be thus described:—The first step is to turn a short cylinder of soft steel exactly twice the diameter of the intended screw. This is then to be fitted on an arbor in the lathe; and, by means of a common screw-stool of the required number of teeth, is to be cut into a double-threaded screw, and is then to be hardened: of this latter screw *bb*, fig. 7, represents a lateral and front view. Another short cylinder of soft steel is then to be made of exactly the diameter of the intended screw; it is then to be fitted on a pin and put into the frame *d*; in this situation it is to be pressed against the cylinder *b*, while revolving in the lathe, until a good thread is raised on its surface. The thread thus formed will be a single one, although taken from a double thread, because, during the process, it revolves in proportion to the larger cylinder as one to two, it will also be a left-handed thread, because taken by impression from a right-handed one. After a few revolutions from the cylinder *c* the frame in which it is placed is to be turned upside

down, and the same number of revolutions are to be made with the frame in this position, by which alteration the thread will be kept quite perpendicular to its axis, and the more the two cylinders are worked together the more will the cylinder *c* be free from errors of the first cylinder. Being completed it is then to be hardened, and is again to be put into the frame *d*. The cylinder *a a* being put into a lathe, the screw *c* is to be pressed hard against it in the manner of a milling-tool, beginning on the right hand: when it has made a sufficient impression, or thread, it is to be shifted one thread towards the left hand, the following threads of the screw always working in the preceding impression, which serves as their guide. This is to be continued till the whole cylinder is impressed with the spiral thread, which will of course be right-handed, because the impressing screw is left-handed. The thread thus obtained is to be eased or cut deeper by the pointed tool *e*, and is then to be finished by the screw *c*, taking care, as before directed, to reverse the frame *d* from time to time. To make a left-handed screw to suit a given right-handed one, tap a cylinder of steel in the same dies and of the same diameter as the given screw, and turn each end down to a pivot and harden it; place it in the open frame *d*, and work it hard against the prepared cylinder exactly as described above for the original screw, by which a left-handed thread will be obtained, which is to be deepened with the point tool, and finished by the roller as before. When this screw is obtained it may be hardened, and left-handed dies may be made from it.

A very ingenious patent process for making screws, by Mr. Colbert, must now be described:

'Fig. 11 is a side view of the apparatus; *a a a* is the lower piece of a pair of cutting shears; this is fixed to a work bench or other solid frame; the upper part *b b* works on a centre *d*, by the handle *e*; *e e* is the face of a plate used to regulate the lengths of wire to be cut, adjustable by apparatus shown in fig. 12.

'Fig. 12 is a perpendicular geometrical view of the same, in which the same letters of reference are affixed respectively to the same parts; *e e* is the upper edge of the plate *e e*, and *g g* an horizontal face of the same plate; this plate is adjustable as to its distance from the cutters *a* and *b*, by a sliding motion on the two bars *h, h*, on sockets *i, i*; to cut the wires he elevated the upper arm *b*, of the shears, and introduced the wires horizontally, and at right angles to the face of the shears, and as far between the cutters as the vertical plate *e e* will allow: the patentee then works the shears in the usual manner of shears, and similar cutting instruments; the required length of the wires being cut, they are placed between the cheeks of a vice.

'Fig. 13 is a groove or cavity of suitable dimensions to the size required, and, the cheeks of the vice being closed, the head of the intended screw is formed by the spreading of the metal by strokes of a hammer; and the solid form of the intended screw thus obtained. There remained the thread to be cut on the cylinder of the length, and the nick or cut to be made across the head; the thread is cut, and head of the screw turned ready for the making of the nick or cut by the

machinery represented in figs. 14, 15, 16, 17; *a a a* is a steel axis, working in supports or uprights, *b, c, d*, on a frame *DD*; at the extremity *e* of the axis, a piece crosses it at right angles, to which is affixed by screws and nuts the two bent arms *f, f*, *f, f*, which move on the screws *g, g*, as centres; each is furnished with a strong spring *h*, which bears against the axis, and presses the corresponding extremity *i* strongly towards each other: in each of these extremities *i, i* is fixed, by dovetailed slides and screws, a steel cutter *k*; *m* is a conical tube, which may be moved forward along the axis *a a a* (towards the end to which the bent arms *f, f* are fixed), for the purpose hereinafter described, to cut the thread of the screw and turn the head of it. The patentee places the piece of wire of which the screw is intended to be made, between the holding pieces *f, f*, the head of the intended screw between and just within the extremities of the two cutters *k, k*, as shown in fig. 15.

'The fig. 16 represents a side elevation of a metal frame of two parts *a* and *b*, opening from each other on the joint at *c*, by the handle or stem *d*, the upper or movable piece *a*, moving between two cheek pieces, of which one is seen at *e*; into each of these pieces *a* and *b*, and in a direction at right angles to their length, is placed in dovetailed grooves, and there secured by screws, a steel cutter having teeth, or being serrated in the usual way, for the purpose of cutting a screw thread on a metal cylinder introduced between them; these pieces are shown in the figure at *g* and *h*, and they are sufficiently held together for that purpose, by the action of the lever and weight shown in the figure at *m* and *n*. This part of the machinery is placed when in use in a direction at right angles to the direction of the piece shown at fig. 14. The cutters *g* and *h*, being directly opposite to the extremity of the cutters *k, k*, of the fig. 14, and within a small distance of it, so that the wire introduced and held by one extremity by the cutters *k, k*, may by the other extremity introduce itself between the serrated or toothed cutters *g, h*, of fig. 16. The position herein described for the piece represented in fig. 16 is shown in the engraving of fig. 14, at *X, Y, Z*, which represents a perpendicular geometrical view of the same; the same parts of it being respectively marked with the same letters of reference as in the side elevation of the same piece shown at fig. 16.

'The patentee thus gives motion to the machinery: the fig. 17 is a front elevation of the upright piece *d*, of fig. 14, showing an aperture *O*, a thin steel edge piece *ZZ*, moveable on a centre *r*. It has a suspended weight *W*, at a little distance beyond the centre, and a treadle *S* affixed to the other extremity. A steel screw *R* is fixed to the extremity of the axis *a a*, fig. 14, and secured by a small screw *T*; this screw *R* passes through the aperture *O*, of fig. 14, without touching it; when the treadle is not pressed, the steel edge *ZZ* remains clear of the screw *R*; but, when the treadle is pressed, the steel edge is forced to enter one of the threads of the screw *R*: this being done, and the axis *a a* made to revolve by the box *BB*, or any

other well known method of turning an axis, the axis, being cylindrical through its whole length, will, by the action of the screw R on the fixed edge Z, make a forward progress, viz. towards that part of the machinery marked *x y z*, and the rate of that progressive advance will be always regulated and be adjustable by the fineness of the screw R; if the screw R be coarser, the progress will be quicker, and vice versa; for this purpose of regulation and adjustment, the screw R may be changed at pleasure; the aforesaid progressive advance of the axis *aa* will thus force the wire, placed as already described at *kk*, into the small space between the screw cutters *gh*, of fig. 16, and will thus produce the thread of the screw. The conical piece *m* is now moved forward over the bent arms *f, f, f, f*, so as by means of the rollers *g, g*, and the springs *h, h*, the extremities *i, i*, are separated a little, and with them the cutters *k, k*; the new screw, which was before held by the cutters *k, k*, is thus released from them, and is now held between the screw cutters *g* and *h*, of fig. 16, but is still at liberty to turn on its thread; a pressure on the handle *t*, such as to bring the screw *k*, fig. 15, to bear on the spring *x*, will hold the screw more firmly so that it cannot be turned; and now if the conical piece *m* be moved back on the axis *aa*, to its former situation, so that the cutters *k, k*, may again approach each other; the axis *aa* is then caused to revolve, on which the cutters *k, k*, turn, and forms the bevel of the head of the screw; Mr. Colbert then slides the conical piece a little distance over the bent arms *f, f, f, f*, as before, so as to detach the cutters *k k* from the screw; and releases the pressure on the treadle S, of fig. 17, and thus causes the steel edge Z to leave the thread of the screw R, fig. 14. The patentee then causes the axis *aa* to revolve, and the small cutter marked at the extremity of the axis will turn the flat surface of the head of the screw. The screw is now completed except the nick or cut in the head. By means of the handle *t*, of the piece *x y z*, the workman afterwards moves the upper part of the said piece on its lower part by the joint or centre at C, fig. 16, and then lifts the axis *aa* a little way upwards, by that extremity of it which has the cutters fixed to it, and the screw, so far formed as described, will drop out and clear of the machinery; the axis *aa*, fig. 14, may be lifted as described, by means of a contrivance shown in fig. 18, in which figure *b* is a front elevation of the upright piece also marked *b*, in fig. 14; in this upright the part of it in which is the aperture *y*, through which the axis passes, has a sliding motion up or down, sufficient to allow the lifting of the axis as described.

Fig. 19 is a geometrical plan of a rectangular box or frame, of which ABCD is the lower part, and E, E, two lids or covers, which are in this figure shown as opened and thrown back to show the interior of the frame; the pieces G G, and M M, form a channel or groove, in which may be introduced the metal slide II, which passes on through the whole length of the frame; it passes under the projections of the screw heads *h, h, h, h*, which thus confine it to its intended place; the plate II is perforated, as

shown in the engraving, to receive the screws on which the machine is intended to operate; they are placed in it as shown at fig. 20, in which II represents a part of the slide, and SS the heads of screws placed in it. The plate II being passed entirely into the frame, as far as the projecting pin *k* allows, the unfinished screws are placed in it, and the covers E, E, are shut down and fastened. The covers E, E, when they are shut down, do not quite meet, but leave a narrow open space through which the blade of a steel saw is introduced, and with which the heads of all the screws placed in the machine have their nicks or cuts made at the same time.

The following observations published by a 'workman' in the Repertory of Arts are of great importance:—"Having had considerable experience in the construction of new and complicated machinery, and knowing of no method by which minute and accurate movements or divisions may be obtained with such certainty as by means of the screw, it has not unfrequently been the most trying part of my labors to obtain a screw that shall be tolerably accurate throughout, when it has been required of any considerable length. The tapping of screws with new and sharp dies, and great care and slowness, is undoubtedly one of the best, if not absolutely the best method of making a good and true screw. But it is found that, when a stock is worked by hand, there is generally a stopping place perceptible on the screw itself, where the workman changes hands, which is most probably the chief imperfection that produces inaccuracy when such screws are set to subdivide their own threads. If one handle be more depressed than the other, the screw will have a periodical variation of obliquity, which workmen call a drunken screw, and it is difficult to avoid this error where the screw is short. As the dies at best cut rather by the force of the setting screws than the keenness of their own edge, they not only bend the tap or screw, but scarcely ever take equally off from all sides. The best remedy for this is to use long dies; but, even with these, a centred and turned tap will seldom prove straight and round after it has received the thread. In minutely considering the action of the dies it will be seen that the opposite sides of the thread incline towards different regions, and therefore, in effect, cross each other. Hence it is impossible for the dies to be made to approach each other in the plane of the helix. (A tangential plane to the helix, having a vertical axis, will in fact revolve round the axis itself, preserving a constant angular inclination to the same.) But the dies approach in a plane at right angles to the axis. It follows, therefore, that there are limits to diameter, depth of cut, and inclination, beyond which the dies cannot operate. These limits are the cause why a true flat thread screw cannot be cut in dies; and a many-threaded screw, or screw of great obliquity, in a single pair of dies, is impracticable, and can only be cut by a succession of different pairs of dies. If dies are not well fitted in the stock, and the stuff be veiny or unequally hard, they will yield to the hard parts, and by the effect of this shake produce an undulated thread. Long dies do indeed

greatly remedy this imperfection; but it must always exist, however small. As a pair of well fixed dies can never both run along the same stroke till quite home to their natural place, the cut made by the one will tend to draw the other along the cylinder, so that while one die cuts the upper side of the thread, the other die will cut the opposite or under side. In this cross action the frame and the dies themselves will yield from elasticity, and that the more, where the stuff is most hard or the work forced. Hence, with a like pressure, the soft side will have the widest cut, and be soonest cut down, and the sides of the thread will be waving. This seems to be the chief reason why tapping a screw throws it out of centre and roundness. It is found by experience, in the attempt to tap a screw much larger than the original of the dies, that the corners of the dies, taking hold first, are nearly indifferent as to the run; and, if left to operate without pressure in the line of the axis, would as probably cut mere rings, or a left-handed screw, as the right-handed screw (supposed to be in the dies). In these circumstances, therefore, the thread at first turns out to be wavy, with very little rise in the run of each corner, until it suddenly falls into the cut made by the corner it follows. Each turn consists accordingly of four waves, which are amended as the dies sink deeper, and are led by their own slope. But it may be questioned if these waves, once produced, are ever completely removed, so that the screw probably approximates to the truth, without ever attaining it. And, in the nature of the operation of tapping, this error in the first instance can only be diminished, but not absolutely removed, because all cutting is begun by the corner of the dies.

Eddy's screw-wrench.—This screw wrench is actuated by a screw, as that is which is in common use, but differs from this latter in the screw being introduced into the sliding part instead of into the handle. By this arrangement the instrument is rendered much stronger, and is not liable to open and shut by the turn of the hand while using it, as is the case with the common one.

In manufactories where the work is heavy, the common wrench is often breaking in the screw, an accident which cannot occur with the new one, as the strain is not on that part which contains the screw. It may be made at nearly the same expense as the one in common use.

Plate *SCREW*, fig. 8, is a side view. Fig. 9 is an edge view. Fig. 10 is a longitudinal section. [The same letters refer to the same parts in all the figures.] *a* is the fixed chap, *b* is the fixed bar, *c* is the moveable chap which passes through and slides upon the bar, *b*; *d* the moveable bar fixed to the chap *c*. This bar has a hollow barrel screwed at its orifice, in which the solid thumb-screw *f* works. At the extremity of the bar, *b*, is formed a shoulder, on which rests the square piece, *g*; or the bar may be turned up at right angles, forming a short projecting leg, which will answer the purpose of the piece *g*, and will be both stronger and cheaper. A square hole is to be made in *g*, to admit the screw *f*, and this hole is to be contracted in one part by the insertion of two square pins, *i* and *k*

which confine the neck of the screw so as to allow it to turn round, but not to move backwards or forwards: *e* is a plate of iron, wrapped round the end of the instrument in order to keep the parts in their proper places, and to prevent the screws from being choked with dirt. Hence it is obvious that, when the screw *f* is turned in one direction, the barrel *d*, with the chap *c*, is pushed towards the chap *a*, and that it is withdrawn when the screw is turned in the opposite direction.

SCRIBANI (Charles), a Jesuit, born at Brussels in 1561, was successively professor and rector of the college of his native place, but afterwards removed to Antwerp, as provincial of his order, and head of the university. He died in 1629, and is chiefly known by a virulent publication against the Calvinists, printed under the fictitious name of Clarus Bonarscius, and entitled *Amplithæatrum Honoris Adversus Calvinistas*, 4to. 1606. His other works are—1. *History of the Civil Wars of the Low Countries*, in Latin, 8vo. 2. *Origines Antwerpensium*, 4to. 3. *Orthodoxæ Fidei controversa*, 4to. 4. *Ans Mentiendi Calvinistica*. 5. *Meditationes Sacræ*, 2 vols. 8vo. 6. *Medicus Religiosus*. 7. *Cano-barachia*. 8. *Politico Christianis*.

SCRIBE, *n. s.* } *Fr. scribe*; *Lat. SCRIBBLE*, *v. a. & n.* } *scriba*. A writer: *SCRIBBLER*, *n. s.* } scribble is a diminutive of scribe.

Hearts, tongues, figures, scribes, bards, poets, cannot
Think, speak, cast, write, sing, number, ho!
His love to Antony.

Shakespeare. Antony and Cleopatra.

My master, being the scribe to himself, should write the letter. *Shakespeare.*

How gird the sphere

With centrick and eccentrick, scribbled o'er
Cycle and epicycle, orb in orb.

Milton's Paradise Lost

By solemnly endeavouring to countenance my conjectures, I might be thought dogmatical in a hasty scribble. *Boyle.*

The actors represent such things as they are capable, by which they and the scribbler may get their living. *Dryden.*

The most copious writers are the arrantest scribblers, and in so much talking the tongue runs before the wit. *L'Estrange.*

We are not to wonder, if he thinks not fit to make any perfect and unerring scribes. *Grew's Cosmologia.*

The following letter comes from some notable young female scribe. *Spectator.*

The scribbler, pinched with hunger, writes to dine, And to your genius must conform his line.

Granville.

If a man should affirm that an ape, casually meeting with pen, ink, and paper, and falling to scribble, did happen to write exactly the *Leviathan* of Hobbes, would an atheist believe such a story? And yet he can easily digest things as incredible as that. *Bentley.*

If Mævius scribble in Apollo's spite,
There are who judge still worse than he can write. *Pope.*

Nobody was concerned or surprised, if this or that scribbler was proved a dunce.

Letter to Pope's Dunciad.

If it struck the present taste, it was soon transferred into the plays and current scribbles of the week, and became an addition to our language.

Swift.

To affirm he had cause to apprehend the same treatment with his father is an improbable scandal flung upon the nation by a few bigotted French scribblers.

Id.

His court, the dissolute and hateful school Of Wantonness, where vice was taught by rule, Swarmed with a scribbling herd, as deep inlaid With brutal lust as ever Circe made. From these a long succession, in a rage Of rank obscenity, debauched their age.

Cowper.

SCRIMER, *n. s.* Fr. *escrimeur*. A gladiator; a fencing-master. Not in use.

The *scrimers* of their nation,

He swore, had neither motion, guard, nor eye, If you opposed them.

Shakspeare. Hamlet.

SCRINE, *n. s.* Lat. *scrinium*. A place in which writings or curiosities are reposit.

Help, then, O holy virgin,

Thy weaker novice to perform thy will;

Lay forth out of thine everlasting scrine,

The antique rolls which there lie hidden still.

Faerie Queene.

SCRIP, *n. s.* Isl. *skrappa*. A small bag; a satchel: and (Lat. *scriptio*) a small writing.

Come, shepherd, let us make an honourable retreat; though not with bag and baggage, yet with scrip and scrappage.

Shakspeare.

Call them man by man, according to the scrip.

Id.

He'd in requital ope his leathern scrip,

And shew us simples of a thousand names,

Telling their strange and vigorous faculties.

Bills of exchange cannot pay our debts abroad, till scrips of paper can be made current coin.

Locke.

SCRIPTURE.

SCRIPTURE, *n. s.* Lat. *scriptura*. Writing. SCRIPTURAL, *adj.* Sing; particularly sacred writings; the Bible: commonly used in the plural: the adjective signifies contained in the Bible; biblical.

With us there is never any time bestowed in divine service, without the reading of a great part of the holy scripture, which we account a thing most necessary.

Hooker.

The devil can cite scripture for his purpose:

An evil soul producing holy witness

Is like a villain with a smiling cheek.

Shakspeare.

It is not only remembered in many scriptures, but famous for the death and overthrow of Crassus.

Raleigh.

Forbear any discourse of other spirits, till his reading the scripture history put him upon that enquiry.

Locke.

There is not any action which a man ought to do, or to forbear, but the scripture will give him a clear precept, or prohibition, for it.

South.

Creatures, the scriptural use of that word determines it sometimes to men.

Atterbury.

Scripture proof was never the talent of these men, and 'tis no wonder they are foiled.

Id.

Why are scripture maxims put upon us without taking notice of scripture examples that lie cross them?

Id.

The Author of nature and the scriptures has expressly enjoined, that he who will not work shall not eat.

Seed's Sermons.

SCRIPTURE. The word scripture is most commonly used to denote the writings of the Old and New Testament; called also sometimes The Scriptures, sometimes the Sacred or Holy Scriptures, and sometimes Canonical Scriptures. These books are called the Scriptures by way of eminence, as they are the most important of all writings; they are holy or sacred on account of the doctrines which they teach; and they are termed canonical, because, when their number and authenticity were ascertained, their names were inserted in ecclesiastical canons, to distinguish them from other books; which, being of no authority, were kept as it were out of sight,

and therefore styled apocryphal, from *αποκρυπτω*, to put out of sight. See APOCRYPHA.

Our article BIBLE (to which we beg the attention of the reader as an introduction to this) is chiefly critical; and regards the formation of the Jewish and Christian canon considered as a whole. We shall in this article enter more at large into the question of the authenticity and inspiration of Scripture, and an analysis of its contents.

PART I.

OF THE OLD TESTAMENT.

INTRODUCTION.

The authenticity of the Old Testament may be proved from the character of the Jews, from internal evidence, and from testimony.

1. The character of the Jews forms a strong presumptive evidence that they have not forged or corrupted the Old Testament. Were a person brought before a court of justice on a suspicion of forgery, and yet no presumptive or positive evidence of his guilt could be produced, it would be allowed by all that he ought to be acquitted. But if the forgery alleged were inconsistent with the character of the accused; if it tended to expose to disgrace and reproach his general principles and conduct; or if we were assured that he considered forgery as an impious and abominable crime, it would require very strong testimony to establish his guilt. This case corresponds exactly with the character and situation of the Jews. If a Jew had forged any book of the Old Testament, he must have been impelled to so bold and dangerous an enterprise by some very powerful motive. It could not be national pride; for there is scarcely one of these books which does not severely censure the national manners. It could not be the love of fame; for that passion would have taught him to flatter and extol the national character; and the punishment, if detected, would have been infamy and death. The love of wealth could not produce such a forgery; for no wealth was to be gained by it. The Jews were selected from

all other nations, and preserved a distinct people, from the time of their emigration from Egypt to the Babylonish captivity, a period of 892 years; and they still continue to be a distinct people, though scattered among all the nations in the world; which is itself a standing and perpetual miracle in proof of Christianity, unparalleled in the history of mankind; and which the Christian may defy all the enemies of revelation to account for, without admitting the truth of the Christian system. The principal purposes for which they were selected was to preserve, in a world running headlong into idolatry, the knowledge and worship of the one true God, and to be the guardians of those sacred books that contained the prophecies which were to prove to future ages the divine mission of the Redeemer of mankind. To fit them for these important trusts, the spirit of their laws and the rites of their religion had the strongest tendency. Miracles were openly performed, to convince them that the God of Israel was the God of all the earth, and that he alone was to be worshipped. Public calamities always befel them when they became apostates from their God; yet they continued violently attached to idolatry, till their captivity in Babylon made them for ever renounce it. The Jews then had two opposite characters at different periods of their history. At first they were addicted to idolatry; afterwards they acquired a strong antipathy against it. Had any books of the Old Testament been forged before the Babylonish captivity, when the Jews were devoted to idolatry, is it to be conceived that the impostor would have inveighed so strongly against this vice, and so often imputed to it the calamities of the state; since by such conduct he knew that he would render himself obnoxious to the people, and to those idolatrous monarchs who persecuted the prophets? But it may be alleged that the sacred books were forged after the Babylonish captivity, when the principles of the Jews would lead them to inveigh against the worship of idols. But these principles would surely never lead them to expose the character of their ancestors, and to detail their follies and their crimes. Never had any people more national pride, or a higher veneration for their ancestors than the Jews. Miracles and prophecies ceased soon after their return to Jerusalem; and from that period their respect for the sacred books approached to superstition. They preserved them with pious care, they read them often in their synagogues, and they considered every attempt to alter the text as an act of sacrilege. Is it probable that such men could be guilty of forgery, or could false writings be easily imposed on them?

2. There is internal evidence in the books of the Old Testament that proves them to have been written by different persons, and at distant periods; and enables us with precision to ascertain a time at or before which they must have been composed. It is an undeniable fact that Hebrew ceased to be the living language of the Jews during their captivity in Babylon, and that the Jewish productions after that period were in general written either in Chaldee or in Greek.

The Jews of Palestine, some ages before the coming of our Saviour, were unable, without the assistance of a Chaldee paraphrase, to understand the Hebrew original. It necessarily follows, therefore, that every book which is written in pure Hebrew was composed either before or about the time of the Babylonish captivity. This being admitted, we may advance a step farther, and insist that the period which elapsed between the composition of the most ancient and the most modern book of the Old Testament was very considerable; or, in other words, that the most ancient books of the Old Testament were written many ages before the Babylonish captivity. No language continues stationary; and the Hebrew, like other tongues, passed through its several stages of infancy, youth, manhood, and old age. If, therefore, on comparison, the several parts of the Hebrew Bible are found to differ not only in regard to style, but also in regard to character and cultivation, we have strong internal evidence that they were composed at different and distant periods. No classical scholar would believe, independent of the Grecian history, that the poems ascribed to Homer were written in the age of Demosthenes, the Orations of Demosthenes in the time of Origen, or the Commentaries of Origen in the time of Lascaris and Chrysoloras. For the very same reason, it is certain that the five books which are ascribed to Moses were not written in the time of David, the Psalms of David in the age of Isaiah, nor the prophecies of Isaiah in the time of Malachi; and, since the Hebrew became a dead language about the time of the Babylonish captivity, the book of Malachi could not have been written much later. Before that period, therefore, were written the prophecies of Isaiah, still earlier the Psalms of David, and much earlier than these the books which are ascribed to Moses. But infidels are never critics. A modern one, the apostle of vulgar infidelity, boasts that he had never opened a Bible for many years when he sat down to impugn its divine character.

3. Let us now consider the evidence of testimony for the authenticity of the Old Testament. As the Jews were a more ancient people than the Greeks or Romans, and for many ages totally unconnected with them, it is not to be expected that we should derive much evidence from the historians of those nations; it is to the Jews alone we must look for information. But it has unfortunately happened that few of their works, except the Scriptures themselves, have been preserved. Josephus is one of the most ancient of the Jewish historians to whom we can appeal. He informs us that the Old Testament was divided into three parts, the Law, the Prophets, and the Hagiographa, or the Holy Writings, or poetical books. No man, says he; hath ever dared to add or take away from them. He tells us, also, that other books were written after the time of Artaxerxes; but, as they were not composed by prophets, they were not reckoned worthy of the same credit (see BIBLE). Since the promulgation of the Christian religion, it is impossible that any material alterations or corruptions could have taken place in the books

of the Old Testament; for, from that period they have been in the hands both of Jews and Christians. Had the Jews attempted to make any alterations, the Christians would have detected and exposed them; nor would the Jews have been less severe against the Christians, if they had corrupted the sacred text. But the copies in the hands of Jews and Christians agree; and therefore we justly conclude that the Old Testament is still pure and uncorrupted.

The division mentioned by our Saviour into the Law, the Prophets, and the Psalms, corresponds with that of Josephus. We have therefore sufficient evidence to convince even a deist, that the Old Testament existed at that time. And, if the deist will only allow that Jesus Christ was a person of a virtuous and irreproachable character, he will acknowledge that we draw a fair conclusion, when we assert that the Scriptures were not corrupted in his time; for when he accused the Pharisees of making the law of no effect by their traditions, and when he enjoined his hearers to search the Scriptures, he could not have failed to mention the corruptions or forgeries of Scripture, if any in that age had existed. But we are assured by very respectable authority that the canon of the Old Testament was fixed some centuries before the birth of Jesus Christ. Jesus, the son of Sirach, the author of *Ecclesiasticus*, makes evident references to the prophecies of Isaiah, Jeremiah, and Ezekiel, and mentions these prophets by name. He speaks also of the twelve minor prophets. It appears also, from the prologue, that the law and the prophets, and other ancient books, existed at the same period. The book of *Ecclesiasticus*, according to the best chronologers, was written in Syriac, about A. M. 3772, that is 232 years before the Christian era, and was translated into Greek in the next century by the grandson of the author. The prologue was added by the translator; but this circumstance does not diminish the evidence for the antiquity of Scripture; for he informs us that the law and the prophets, and the other books of their fathers, were studied by his grandfather; a sufficient proof that they existed in his time. As no authentic books of a more ancient date, except the sacred writings themselves, have reached our time, we can ascend no higher in search of testimony.

There is, however, one remarkable historical fact which proves the existence of the law of Moses at the dissolution of the kingdom of Israel, when the ten tribes were carried captive to Assyria by Shalmaneser, and dispersed among the provinces of that extensive empire; that is, about 741 years before Christ. About that time the Samaritans were transported from Assyria to repeople the country which the ten captive tribes of Israel had formerly inhabited. The posterity of the Samaritans still inhabit the land of their fathers, and have preserved copies of the Pentateuch, two or three of which were brought to this country in the seventeenth century. The Samaritan Pentateuch is written in old Hebrew characters, and therefore must have existed before the time of Ezra. But so violent were the animosities which subsisted between the Jews and Samaritans, that in no period of

their history would the one nation have received any books from the other. They must therefore have received them at their first settlement in Samaria, from the captive priest whom Shalmaneser sent to teach them how they should fear the Lord (2 Kings xvii.). The canon of the Old Testament, as both Jewish and Christian writers agree, was completed by Ezra and some of his immediate successors. (See BIBLE.) In our copies the sacred books are divided into thirty-nine. The Jews reckoned only twenty-two, corresponding to the number of letters in the Hebrew alphabet. They united the books of Judges and Ruth; they joined the two books of Samuel; the books of Kings and Chronicles were reckoned one; Ezra and Nehemiah one; the Prophecies and Lamentations of Jeremiah were taken under the same head; and the twelve minor prophets were considered as one book—so that the whole number of books in the Jewish canon amounted to twenty-two.

In our article REVELATION will be found several of the general arguments in favor of revealed religion: its connexion with natural religion, &c. Before closing this introductory essay we may add some excellent observations which modern infidelity has been the means of eliciting on the genuineness as distinct from the authenticity of a book; and then advert to the proofs of the inspiration of scripture as distinguishable from both.

The late bishop Watson, addressing Thomas Paine, says, 'You know but of one ancient book that authoritatively challenges universal consent and belief, and that is Euclid's Elements. If I were disposed to make frivolous objections, I should say that even Euclid's Elements had not met with universal consent; that there had been men, both in ancient and modern times, who had questioned the intuitive evidence of some of his axioms, and denied the justness of some of his demonstrations: but, admitting the truth, I do not see the pertinency of your observation. You are attempting to subvert the authenticity of the Bible, and you tell us that Euclid's Elements are certainly true.—What then? Does it follow that the Bible is certainly false? The most illiterate scrivener in the kingdom does not want to be informed that the examples, in his Wingate's Arithmetic, are proved by a different kind of reasoning from that by which he persuades himself to believe that there was such a person as Henry VIII., or that there is such a city as Paris. It may be of use to remove this confusion in your argument to state, distinctly, the difference between the genuineness and the authenticity of a book. A genuine book is that which was written by the person whose name it bears as the author of it. An authentic book is that which relates matters of fact as they really happened. A book may be genuine without being authentic; and a book may be authentic without being genuine. The books written by Richardson and Fielding are genuine books, though the histories of *Clarissa* and *Tom Jones* are fables. The history of the island of *Formosa* is a genuine book; it was written by *Psalmazar*: but it is not an authentic book (though it was long esteemed as such, and translated into different languages); for the author, in the latter

part of his life, took shame to himself for having imposed on the world, and confessed that it was a mere romance. Auson's Voyage may be considered as an authentic book, it, probably, containing a true narration of the principal events recorded in it; but it is not a genuine book, having not been written by Walter, to whom it is ascribed, but by Robins.

‘This distinction between the genuineness and authenticity of a book will assist us in detecting the fallacy of an argument, which you state with great confidence in the part of your work now under consideration, and which you frequently allude to, in other parts, as conclusive evidence against the truth of the Bible. Your argument stands thus: if it be found that books ascribed to Moses, Joshua, and Samuel, were not written by Moses, Joshua, and Samuel, every part of the authority and authenticity of these books is gone at once.—I presume to think otherwise. The genuineness of these books, in the judgment of those who say that they were written by these authors, will certainly be gone; but their authenticity may remain; they may still contain a true account of real transactions, though the names of the writers of them should be found to be different from what they are generally esteemed to be.

Had, indeed, Moses said that he wrote the first five books of the Bible; and had Joshua and Samuel said that they wrote the books which are respectively attributed to them; and had it been found that Moses, Joshua, and Samuel, did not write these books; then, I grant, the authority of the whole would have been gone at once; these men would have been found liars, as to the genuineness of the books; and this proof of their want of veracity, in one point, would have invalidated their testimony in every other; these books would have been justly stigmatised as neither genuine nor authentic. A history may be true, though it should not only be ascribed to a wrong author, but though the author of it should not be known; anonymous testimony does not destroy the reality of facts, whether natural or miraculous. Had Lord Clarendon published his History of the Rebellion, without prefixing his name to it; or had the history of Titus Livius come down to us under the name of Valerius Flaccus, or Valerius Maximus, the facts mentioned in these histories would have been equally certain.’

This same specious advocate of Christianity may well introduce the arguments for the *inspiration* of Scripture.

Addressing his opponent, with more courtesy than he merited at such hands, he says, in the conclusion of the able Apology for the Bible, ‘You admit the possibility of God's revealing his will to man: yet ‘the thing so revealed,’ you say, is ‘revelation to the person only to whom it is made; his account of it to another is not revelation.’—This is true; his account is simple testimony. You add, ‘there is no possible criterion to judge of the truth of what he says.’—This I positively deny: and contend that a real miracle, performed in attestation of a revealed truth, is a certain criterion by which we may judge of the truth of that attestation. I am per-

fectly aware of the objections which may be made to this position; I have examined them with care; I acknowledge them to be of weight; but I do not speak unadvisedly, or as wishing to dictate to other men, when I say that I am persuaded the position is true. So thought Moses, when, in the matter of Korah, he said to the Israelites—‘If these men die the common death of all men, then the Lord hath not sent me.’ So thought Elijah, when he said, ‘Lord God of Abraham, Isaac, and of Israel, let it be known this day that thou art God in Israel, and that I am thy servant;’—and the people, before whom he spake, were of the same opinion; for, when the fire of the Lord fell and consumed the burnt-sacrifice, they said—‘The Lord he is the God.’ So thought our Saviour when he said—‘The works that I do in my Father's name, they bear witness of me;’ and, ‘If I do not the works of my Father, believe me not.’ What reason have we to believe Jesus speaking in the Gospel, and to disbelieve Mahomet speaking in the Koran? Both of them lay claim to a divine commission; and yet we receive the words of the one as a revelation from God, and we reject the words of the other as an imposture of man. The reason is evident; Jesus established his pretensions, not by alleging any secret communication with the Deity, but by working numerous and indubitable miracles in the presence of thousands, and which the most bitter and watchful of his enemies could not disallow; but Mahomet wrought no miracles at all. Nor is a miracle the only criterion by which we may judge of the truth of a revelation. If a series of prophets should, through a course of many centuries, predict the appearance of a certain person, whom God would, at a particular time, send into the world for a particular end; and at length a person should appear, in whom all the predictions were minutely accomplished: such a completion of prophecy would be a criterion of the truth of that revelation, which that person should deliver to mankind. Or if a person should now say (as many false prophets have said, and are daily saying) that he had a commission to declare the will of God; and, as a proof of his veracity, should predict that, after his death, he would rise from the dead on the third day; the completion of such a prophecy would, I presume, be a sufficient criterion of the truth of what this man might have said concerning the will of God. Now I tell you (says Jesus to his disciples, concerning Judas, who was to betray him), before it come, that when it is come to pass, ye may believe that I am he. In various parts of the Gospels our Saviour, with the utmost propriety, claims to be received as the messenger of God, not only from the miracles which he wrought, but from the prophecies which were fulfilled in his person, and from the predictions which he himself delivered. Hence, instead of there being no criterion by which we may judge of the truth of the Christian revelation, there are clearly three. It is an easy matter to use an indecorous flippancy of language in speaking of the Christian religion, and, with a supercilious negligence, to class Christ and his apostles amongst the impostors who have

figured in the world; but it is not, I think, an easy matter for any man, of good sense and sound erudition, to make an impartial examination into any one of the three grounds of Christianity which I have here mentioned, and to reject it.

Dr. Olinthus Gregory has ably collected the more general arguments for the inspiration of Scripture, and in particular of the New Testament, in the following portion of his Letters on the Evidences of Christianity:—

‘A firm and cordial belief of the inspiration of the Bible is, indeed, of the highest moment; for, unless you are persuaded that those who were employed in the composition of the respective books were entirely preserved from error, a conviction of their honesty and integrity will be but of little avail. Honest men may err, may point out the wrong track, however unwilling they may be to deceive; and, if those who have penned what we receive as revelation are thus open to mistakes, we are still left to make the voyage of life in the midst of rocks, and shelves, and quicksands, with a compass vacillating and useless, and our pole-star enveloped in mists and obscurity. But some of these writers assure us that ‘all Scripture is given us by inspiration of God’ (*b*); meaning, at least, the Jewish Scriptures; a declaration which deserves attention on the score of the general veracity by which we have already shown their assertions are always marked. Still, as a like claim is made by writers who, it has been ascertained, were wicked and designing, let us enquire on what grounds and to what extent the divine inspiration of the Bible ought to be admitted.

‘Theologians have enumerated several kinds of inspiration: such as an inspiration of superintendency, in which God so influences and directs the mind of any person as to keep him more secure from error in some complex discourse, than he would have been merely by the use of his natural faculties:—plenary superintendent inspiration, which excludes any mixture of error whatever from the performance so superintended:—inspiration of elevation, where the faculties act in a regular, and, as it should seem, in a common manner, yet are raised to an extraordinary degree, so that the composition shall, upon the whole, have more of the true sublime, or pathetic, than natural genius could have given:—and inspiration of suggestion, in which the use of the faculties is superseded, and God does, as it were, speak directly to the mind, making such discoveries to it as it could not otherwise have obtained, and dictating the very words in which such discoveries are to be communicated, if they are designed as a message to others. It is not my purpose to enter into any enquiry how far different portions of Scripture were composed under one or other of these kinds of inspiration. I have enumerated them merely to show you that those who contend that Scripture is inspired have not arrived at their decision by a gross and careless process, but by sedulous, critical, and discriminating investigation. I mean, however, to affirm, and I trust the references I

have thrown at the foot of the page, together with a few particular arguments I shall advance, will prove to you the reasonableness of admitting that, while the authors employed in the composition of the Bible exercised generally their own reason and judgment (*c*), the spirit of God effectually stirred them up to write (*d*); appointed to each his proper portion and topic, corresponding with his natural talents, and the necessities of the church in his time (*e*); enlightened their minds and gave them a distinct view of the truths they were to deliver (*f*); strengthened and refreshed their memories to recollect whatever they had seen or heard, the insertion of which in their writings would be beneficial (*g*); directed them to select from a multitude of facts what was proper for the edification of the church, and neither more nor less (*h*); excited afresh in their minds such images and ideas as had been laid up in their memories, and directed them to other ends and purposes than themselves would ever have done of their own accord (*i*); suggested and imprinted upon their minds such matters as could not have been discovered or known by reason, observation, or information, but were subjects of pure revelation (*k*); superintended every particular writer, so as to render him infallible in his matter, words, and order, especially whenever they related to facts, discourses, or doctrines, the communication of which is the great object of Scripture; thus rendering the whole canon, at any given period, an infallible guide to true holiness and everlasting happiness (*l*).

Now that the Scriptures were actually dictated by an inspiration of this kind may, I think, be inferred both from the reasonableness and from the necessity of the thing. It is reasonable that the sentiments and doctrines developed in the Scriptures should be suggested to the minds of the writers by the Supreme Being himself. They relate principally to matters concerning which the communicating information to men is worthy of God: and the more important the information communicated, the more it is calculated to impress mankind, to preserve from moral error, to stimulate to holiness, to guide to happiness, the more reasonable is it to expect that God should make the communication in a manner free from every admixture or risque of error. Indeed the notion of inspiration enters

(*b*) 2 Tim. iii. 16.

essentially into our ideas of a revelation from God; so that to deny inspiration is tantamount to affirming there is no revelation. And why should it be denied? Is man out of the reach of him who created him? Has he, who gave man his intellect, no means of enlarging or illuminating that intellect? And is it beyond his power to illuminate and inform in an especial manner the intellects of some chosen individuals; or contrary to his wisdom to preserve them from error when they communicate to others, either orally or by writing, the knowledge he imparted to them, not merely for their own benefit, but for that of the world at large?

‘But, farther, inspiration is *necessary*. The necessity of revelation I have shown in a former letter; and the same reasoning, in connexion with what I have just remarked, establishes the necessity of inspiration. Besides this, the subjects of Scripture render inspiration necessary. Some past facts recorded in the Bible could not possibly have been known had not God revealed them. Many things are recorded there as future, that is, are predicted, which God alone could foreknow and foretell, which notwithstanding came to pass, and which, therefore, were foretold under divine inspiration. Others, again, are far above human capacity, and could never have been discovered by men: these, therefore, must have been delivered by divine inspiration. The authoritative language of Scripture, too, argues the necessity of inspiration, admitting the veracity of the writers. They propose things not as matters for consideration, but for adoption: they do not leave us the alternative of receiving or rejecting; do not present us with their own thoughts; but exclaim, ‘Thus saith the Lord,’ and on that ground demand our assent. They must of necessity therefore speak and write as they ‘were inspired by the Holy Ghost,’ or be impostors: and the last supposition is precluded by reasonings which I have again and again brought forward in these letters. Very striking proofs of the inspiration of the Scriptures might be deduced from a consideration of their sublimity, their union of perspicuity with profundity, their piety, their pure and holy tendency, their efficacy, their harmony, and their miraculous preservation. But I shall leave you to reflect upon these at your leisure, and proceed to lay before you, as an argument of no small weight, the testimony of those who lived nearest the apostolic times on this point. They may naturally be expected, so far I mean as is independent of the written word, to know more of the mind of those who, in regard to religious topics, had the ‘mind of Christ,’ than any Christians in subsequent ages.’

Our author then establishes by quotations from these writers (which we have not room to transcribe) that nearly all the Christian writers in the first three centuries, whose performances have wholly or partly reached us, speak of the Scriptures as divine, call them the Holy Scriptures, the sacred fountain, the divine fountains of salvation, &c., evidently implying their inspiration: and that in those early ages the whole church agreed in sentiment that no book should be received into the canon of Scripture of whose inspiration there was any doubt. The curious

reader may consult farther the testimonies collected by Dr. Whitby, vol. i. Pref., by Dr. Lardner in the second part of his *Credibility*, Dr. Doddridge in his *Lectures on Divinity*, and in his *Family Expositor*, vol. iii.

‘Thus, then, we see,’ he adds, ‘that in the primitive ages the universal opinion was in favor of the inspiration of the Scriptures. Let us next enquire how far this opinion grows naturally out of an examination of the Scriptures themselves. Considered in relation to the present subject, the books of Scripture fall under three classes: the prophetic books; the historical books of the Old Testament; and the New Testament, being in part historical, in part doctrinal.

‘Now, as to the prophetic books, their divine authority and their inspiration follow at once from the completion of several of the predictions they contain: the entire fulfilment of the whole is not essential to the argument. The inspiration of the New Testament may be inferred from the language of our Lord, and that of the apostles. Thus, Jesus Christ promised extraordinary assistance to his apostles. He promised them ‘the Comforter,’ ‘the Holy Spirit,’ ‘the Spirit of Truth,’ who should ‘testify of him,’ should ‘teach them all things, bring all things to their remembrance whatsoever Christ had said unto them, should guide them into all truth, should abide with them for ever, and show them things to come (m).’ Again, he says, ‘when the Comforter is come, whom I will send to you from the Father, even the Spirit of Truth, which proceedeth from the Father, he shall testify of me; and ye also (being so assisted) shall bear witness (n).’ From these passages it is but fair and reasonable to conclude that the aid of this Heavenly Guide was to be vouchsafed them on all suitable occasions; and surely no occasions could render it more expedient than when they were engaged in delivering written instructions, whether in the form of Gospels or of Epistles, which were intended for the edification of the Christian church till ‘time should be no longer.’ In fact, the Spirit could not abide with them for ever, in relation to the church, in any other way than by preserving the word they delivered from such human or diabolical depreciation and corruption as might render it injurious instead of being salutary. It will also be worth our while to notice the remarkable language in which Jesus Christ promises his apostles the extraordinary assistance of the Spirit while they are defending his cause before magistrates. ‘Settle it therefore in your hearts not to meditate before what ye shall answer; for I will give you a mouth and wisdom which all your adversaries shall not be able to gainsay or resist. Take no thought how or what ye shall speak; for it shall be given you in that same hour what ye shall speak; for it is not you that speak, but the Spirit of your Father that speaketh in you (o).’ If this were to be the case when they pleaded before magistrates, how much more reason is there to conclude that, when they

(m) John xiv. 16—26. xvi. 13.

(n) John xv. 26, 27.

(o) Luke xxi. 14, 15. Matt. x. 19, 20. Mark xiii. 11.

were writing for the use of all future generations, it was not so much they who wrote as the Spirit of the Father who dictated to them, and thus wrote by them. For the occasion is evidently much more important in the latter instance than in the former: an error in their writings would have a much more extensive, permanent, and injurious influence, than any error that could occur in a pleading or argument, necessarily of transient impression, before a magistrate.

‘In estimating the authority claimed by the eight writers of the New Testament, we must not only consider their unbroken, unimpeachable integrity, but that five of them were of the number of the apostles to whom the promises just cited were made. Of the other three, one, namely Luke, is generally admitted to have been of the seventy disciples sent out by Christ, and who received the promise of divine superintendence and inspiration recorded in his Gospel (*p*). With regard to Mark, if his own immediate inspiration cannot be established, that of his Gospel can, since it has never been questioned that he wrote under the superintendence of Peter, an inspired apostle. There then remains only Paul, who repeatedly and solemnly asserts his own inspiration, and his equality in every respect with all the other apostles; appealing to miracles publicly wrought by himself in proof of his divine commission. That the apostles themselves had a full persuasion that they wrote under Divine inspiration is evident from a great variety of texts; to some of the most important of which I shall refer you (*q*), that you may consult them carefully, and allow them their full impression upon your mind. You will find, too, that the apostles considered themselves as communicating to the world a perpetual rule of faith and practice, which would be comprehended by all except the finally impenitent. If, say they, ‘if our gospel be under a veil, it is veiled to those that are perishing (*r*).’ On these accounts, as it should seem, they preferred themselves before the prophets, saying (*s*) ‘God hath set in the church, first, apostles; secondly, prophets; thirdly, teachers:’ language which could not properly have been employed had the apostles been inspired only to preach, and not to write; for in that case they would manifestly be inferior to the prophets, who in their writings, as well as their oral denunciations, ‘spoke as they were moved by the Holy Ghost.’

Dr. Doddridge, in his valuable Dissertation on the Inspiration of the Scriptures, well observes:—‘The inspiration, and consequently the genuineness and credibility, of the Old Testament, may be certainly inferred from that of the New, because our Lord and his apostles were so

far from charging the Scribes and Pharisees (who on all proper occasions are censured so freely) with having introduced into the sacred volume any merely human compositions; that, on the contrary, they not only recommend a diligent and constant perusal of these Scriptures, as of the greatest importance to men’s eternal happiness, but speak of them as divine oracles, and as written by the extraordinary influence of the Holy Spirit upon the minds of the authors.

‘I desire that the following list of Scriptures may be attentively consulted and reflected on in this view. I might have added a great many more, indeed several hundreds, in which the sacred writers of the New Testament argue from those of the Old in such a manner as nothing could have justified but a firm persuasion that they were divinely inspired. Now, as the Jews always allowed that ‘the testimony of an approved prophet was sufficient to confirm the mission of one who was supported by it,’ so I think every reasonable man will readily conclude that no inspired person can erroneously attest another to be inspired; and indeed the very definition of plenary inspiration absolutely excludes any room for cavilling on so plain a head. I throw the particular passages which I choose to mention into the margin below (*t*); and he must be a very indolent inquirer into a question of so much importance, who does not think it worth his while to turn carefully to them; unless he have already such a conviction of the argument that it should need no farther to be illustrated or confirmed.’

Of late, objections to the evidence from miracles for the inspiration of Scripture having been revived in one of our most popular literary journals, bishop Gleir, of the Scottish Episcopal Church, has inserted a valuable Supplementary Dissertation on the Miracles of our Lord and his Apostles in his new edition of Stackhouse’s History of the Bible. The following is an abstract of the most material part of this excellent essay:—

‘A miracle has been defined—‘An effect or event contrary to the established constitution or course of things,’ or ‘a sensible deviation from the known laws of nature.’ To this definition I am not aware that any objection has ever been made, or indeed can be made. That the visible world is governed by stated general rules or laws; or that there is an order of physical causes and effects established in every part of the system of nature, which falls under our observation, is a fact, which is not, and cannot be, controverted. Effects which are produced by the regular operation of these laws or physical causes, or which are conformable to the established

course of events, are said to be natural; and every palpable deviation from this constitution of the natural system, and the correspondent course of events in it, is called a miracle.

'If this definition of a miracle be accurate, no event can be justly deemed miraculous merely because it is strange, or even to us unaccountable; for it may be nothing more than the regular effect of some physical cause operating according to an established though unknown law of nature. In this country earthquakes happen but rarely, and at no stated periods of time; and for monstrous births perhaps no particular and satisfactory account can be given: yet an earthquake is as regular an effect of the established laws of nature as the bursting of a bomb-shell, or the movements of a steam engine; and no man doubts but that, under particular circumstances unknown to him, the monster is nature's genuine issue. It is therefore necessary, before we can pronounce an event to be a true miracle, that the circumstances under which it was produced be known, and that the common course of nature be in some degree understood; for, in all those cases in which we are totally ignorant of nature, it is impossible to determine what is, or what is not, a deviation from her course. Miracles, therefore, are not, as some have represented them, appeals to our ignorance. They suppose some antecedent knowledge of the course of nature, without which no proper judgment can be formed concerning them; though with it their reality may be so apparent as to leave no room for doubt or disputation. Thus, were a physician to give instantly sight to a blind man, by anointing his eyes with a chemical preparation, which we had never before seen, and to the nature and qualities of which we were absolute strangers, the cure would to us undoubtedly be wonderful, but we could not pronounce it miraculous, because it might be the physical effect of the operation of the uuguent on the eye. But were he to give sight to his patient merely by commanding him to receive it, or by anointing his eyes with spittle, we should with the utmost confidence pronounce the cure to be a miracle; because we know perfectly that neither the human voice, nor human spittle has, by the established constitution of things, any such power over the diseases of the eye. No one is now ignorant that persons apparently dead are often restored to their families and friends, by being treated, during suspended animation, in the manner recommended by the Humane Society. To the vulgar, and sometimes even to men of science, these resuscitations appear very wonderful; but, as they are known to be effected by physical agency, they can never be considered as miraculous deviations from the laws of nature, though they may suggest to different minds very different notions of the state of death. On the other hand, no one could doubt of his having witnessed a real miracle who had seen a person, that had been four days dead, come alive out of the grave at the call of another, or who had even beheld a person exhibiting all the common evidences of death instantly resuscitated merely by being desired to live. Thus easy is it to distinguish between such miracles as those of our

blessed Saviour and the most wonderful phenomena produced by physical causes, operating according to the established laws of nature. Yet it seems difficult to admit, on any occasion, a suspension of these laws; and we may safely pronounce that they have never been suspended but for some important purpose, which could not otherwise have been accomplished. 'Events,' says an able writer, 'may be so extraordinary that they can hardly be established by any testimony;' and the instance which he gives is of an event, in which I am not aware that any law of nature would be suspended. 'We would not give credit to a man who should affirm that he saw 100 dice thrown in the air, and that they all fell on the same faces.' To such an affirmation I certainly would give no credit; for, though I think that 100 dice might all fall on the same faces without the suspension of any known law of nature, such an event is so extremely improbable, and of so very little importance in itself, that it would require the evidence of more than one witness to establish its credibility. The author however considers it as the violation of some unknown law of nature, and immediately infers, from its not being admitted on the report of one man, 'that the probability of the continuance of the laws of nature is superior to every other evidence, and to that of historical facts the best established.' In this inference I cannot acquiesce; but, before entering into any discussion on the subject, it will be necessary to ascertain with some precision what is meant by the laws of nature, and whence those laws had their origin.

'If this profound mathematician (Laplace is here referred to) be, as his countrymen in general were some years ago, convinced, either that there is no God; or that, if there be a God, he is not the moral governor of the world; or that the present laws of nature, or the established course of things, have existed from all eternity independent of him and of every intellectual being, he is perfectly consistent when he says that no weight of testimony could prove the miraculous suspension of these laws. It would indeed be ridiculous to talk of miracles to the atheist or fatalist; for if there were no God, or if God were not the moral as well as physical governor of the world, the very notion of miracles, as it is entertained by Christians, would involve in it a contradiction and absurdity. It is only with theists, therefore, and such theists as, admitting the moral attributes of God, believe that the established course of things, or the laws of nature, were established by him for the accomplishment of some great and good purpose, that any discussion can be carried on respecting the evidence necessary to prove the temporary suspension of any one of these laws; for if they be all necessary, and have been from eternity, it is as impossible to suspend them by any power, or for any purpose, as it is to render a geometrical axiom false.'

Let us now suppose that, when the Creator of the world was about to establish that course of events which we call the laws of nature, in such order as he knew would produce the greatest quantity of happiness to the whole sentient and intelligent creation, he foresaw that man, for whose accommodation chiefly we must suppose

this earth to have been fitted up, would bring himself into such circumstances that his happiness would become impossible, unless some one of these laws should for a time be suspended; may we not suppose that a Being of infinite power and wisdom might make provision for such an event in the very establishment of those laws? To control by force the freedom of the human will would be to destroy that very nature on which depends the greatest happiness of which man is capable; but might not some portion of inanimate matter be diverted for a short time from its regular course without the smallest injury to any sentient or intelligent being in the universe? In the journal to which I have already referred, it is confidently affirmed that it could not. 'Suppose a man,' says this critic, 'not at all versed in astronomy, who considers the moon merely as a luminous circle that, with certain irregularities, goes round the earth from east to west nearly in twenty-four hours, rising once and setting once in that interval. Let this man be told, from some authority that he is accustomed to respect, that on a certain day it had been observed at London that the moon did not set at all, but was visible above the horizon for twenty-four hours:—there is little doubt that, after making some difficulty about it, he would come at last to be convinced of the truth of the assertion. In this he could not be accused of any extraordinary or irrational credulity. The experience he had of the uniform setting and rising of the moon was but very limited; and the fact alleged might not appear to him more extraordinary than many of the irregularities to which that luminary is subject. Let the same thing be told to an astronomer, in whose mind the rising and setting of the moon were necessarily connected with a vast number of other appearances; who knew, for example, that the supposed fact could not have happened, unless the moon had exceedingly deviated from that orbit in which it has always moved; or the position of the earth's axis had been suddenly changed; or that the atmospherical refraction had been increased to an extent that was never known. Any of all these events must have affected such a vast number of others, that, as no such thing was ever before perceived, an incredible body of evidence is brought to ascertain the continuance of the moon in her regular course. The barrier that generalization and the explanation of causes thus raises against credulity and superstition,—the way in which it multiplies the evidence of experience, is highly deserving of attention, and is likely to have a great influence on the future fortunes of the human race. Against the uniformity, therefore, of such laws, it is impossible for testimony to prevail.' Certainly, it is impossible for such testimony as that supposed, to prevail against the uniformity of any law of nature; for, as I have already observed, if those laws be necessary and eternal, their uniformity can never be interrupted for any purpose or by any power, and, if they have been established by a God of perfect wisdom and goodness, we may be assured that they will never be suspended for so unworthy a purpose as only to make the citizens of London stare, and enable

one of them to try the credulity of some clown, who believes the moon to consist, according to the Scotch expression, of green cheese! What such a ridiculous tale as this, supposing it ever to have been seriously told, would have to do with superstition, it is not easy to conceive; but the ingenious critic might as well have told us, in plain terms, that it is impossible for testimony to render credible what is said of the sun and moon standing still at the call of Joshua; for even his friend, who believes the moon to be a mere luminous circle of cheese, if at all conversant with his Bible, must perceive that this is what he intended to say under the cover of a clumsy apology.

'If the laws of nature be the work of fate, I readily agree with him that the story of the sun and moon standing still cannot be rendered credible by any testimony. If those laws be, as I believe them to be, the constitution of an Almighty and infinitely wise and good God, I likewise readily agree with him that no testimony could render credible the phenomena of the sun and moon's standing still, but for some important purpose that could not have been otherwise so well accomplished. What the purpose was for which the children of Israel were separated from the idolatrous nations around them, and established in the land of Canaan, has been fully stated elsewhere; and the theist, with whom I am now arguing, will admit that, whether it was real or not, that purpose was of great importance. Great, however, as that purpose was, for the reasons elsewhere assigned, no testimony could prevail with me to believe, that, for the sake of it, the rotation of the earth on its axis, and the course of the moon in her orbit, were literally arrested, unless the same Almighty power wrought another miracle at the same instant to prevent the natural consequences of the sudden cessation of motions so rapid. Without this second miracle, I am as fully aware as our critic, that those events produced by the first must have not only affected a vast number of others, but been also productive of mischief—such as the reducing of the earth to a state of chaos—more than sufficient to balance the good expected from the miracle;—nay, that they would have rendered the miracle itself useless, by destroying those for whose instruction it was meant to be wrought. I confess, however, that I do not perceive what injury could have been done to any sentient or intelligent being in the solar system, or how the different planets, of which that system is composed, could have been disturbed in their courses, by an extraordinary atmospherical refraction of part of the solar rays, by which I believe the miracle in question to have been affected. It is very true that my knowledge of the sciences of astronomy and optics is very limited when compared with that of Laplace and his friend; but I may surely be allowed to know more of them than the man, who, without displaying any irrational credulity, believes that on a certain day the moon had at London forgotten to set. I have likewise conversed often, on the subject of miracles in general, and of that of Joshua in particular, with philosophical laymen, some of whom, with re-

spect to their knowledge of optics and astronomy, might, without presumption, have been brought into comparison even with Laplace; and they saw as little danger as I do, to any part of the creation, from a temporary increase of the refractive power of the atmosphere to any extent. Indeed all philosophical theists, with whom I have conversed freely on such subjects, have held the will of God to be the immediate cause (I mean efficient cause) of every law of inanimate nature, as well as of every deviation from those laws, which deviations were foreseen and provided for from the beginning, when 'the world first rose out of chaos.' I confess likewise that I see not how the restoration of a dead man to life, or any other miracle recorded of our Lord in the Gospels, could affect such a vast number of others as to bring what our critic calls an incredible body of evidence against the reality of those miracles. The most astonishing of them all has long appeared to me to be the multiplication of the loaves and fishes, because it seems to imply the power of creation; and we certainly have the evidence of uniform experience, as far as experience can be had in such a case, that not an atom of matter has been either created or annihilated since the beginning of the world. The quantity, however, of new matter added, on those two occasions, to the old, supposing such to have been the case, was comparatively so small, that the philosophers, who 'weigh not only the mountains of the earth,' but even the earth itself and all the planetary system, 'in a pair of scales,' and who hope, by the aid of 'a calculus sufficiently powerful, to make near approaches to omniscience,' will admit that it could not have greatly disturbed the motions of the earth and moon, or any other planet.

'On the principles of pure theism, therefore, though certainly not on those of atheism or fatalism, the possibility of miracles—and even of such miracles as those of our Lord,—will surely be admitted: but the great question is, what evidence is sufficient to render them credible? The Christians say that the evidence of testimony is sufficient for this purpose, and indeed that no other evidence can be had. That the truth of the gospel miracles admits, in the present age, of no other evidence than that of testimony, will be readily admitted; but our critic contends, as Hume had done before him, that the improbability of the violation of the order of those events, of which the course is known from experience to be perfectly uniform, is so strong, that no testimony can prevail against it. 'It will always be more wonderful,' he says, 'that the violation of such order should have taken place, than that any number of witnesses should have been deceived themselves, or should be disposed to deceive others.' If this doctrine be true, how many facts have taken place in nature, or have been said by philosophers to take place in nature, which not one man of 10,000, or even 10,000,000, can rationally believe to have happened! 'That testimony derives all its force from experience,' says the critic, 'seems very certain;' and Hume, as he acknowledges, had said the same thing before him. But, if this be true, upon what evidence can I and hundreds of millions beside me

believe, that showers of meteoric stones have, in different ages and distant nations, fallen from the atmosphere on the earth? I never saw one such stone fall, and I have the evidence of uniform experience that the atmosphere does not regularly generate metallic stones. Every man who is in the same predicament with me has the same immense weight of experience to place in the balance against the testimony of the comparatively very small number who say that they had witnessed such stones fall from the heavens; and, if it be very certain that testimony derives all its force from experience, how can it be possible for hundreds of millions of men, possessing common sense, to admit, in opposition to their own uniform experience, the testimony of some dozens of people who may have been deceived themselves, or disposed, like the London citizen with his moon of cheese, to deceive others? It is vain to say that we have the experience of ages, and of numbers of chemists who have examined the stones, in corroboration of the testimony that they fell from the heavens; for in this argument, where experience of the uniformity of the laws of nature is opposed to testimony bearing witness that those laws have been occasionally suspended, no experience can be admitted but individual personal experience. The experience of ages and of distant nations—indeed the experience of every individual but myself—is known to me only by testimony; and is it possible that any philosopher can seriously contend that testimony derives all its force from that experience, of which we never could have known any thing—of which, indeed, we never could have heard—but through the medium of testimony? This is surely not possible, and therefore it must be by every man's individual personal experience, by which, on the principles of Hume and his followers, the truth of testimony is to be tried. If so, I ought not to believe that there has ever been an earthquake; for I never felt the shock of one, though I have heard of many, and of some which were said to have been felt by numbers in the very town where I then was! I ought not to believe that a monstrous child was ever born of a woman; for I never saw a human being, who could with any propriety be called a monster, whilst I know, by uniform personal experience, that every monstrous birth, if there have been any such births, has been a deviation from the regular course of nature. In vain shall I be told that earthquakes may be accounted for in certain circumstances, and shown to be produced by the operation of the laws of nature; for those circumstances are probably assumed for the purpose, and, whether they be or not, they are made known to me only by testimony, which I ought to disregard, because directly contrary to my uniform experience.

'But even this mode of converting testimony into experience cannot be had recourse to in the case of the meteoric stones; for, according to one of the most scientific chemists of the age, 'it would be absurd, in the present state of our knowledge, to attempt any explanation of the manner in which they are formed; for not even a conjectural cause for them in the smallest degree probable can be assigned.' We are told in-

deed that the testimony produced in support of the origin of those stones, 'has been confirmed by a scrupulous examination into the natural history of the facts (the stones) themselves. When the stones which were said to have fallen from the heavens came to be chemically analyzed, they were found to have every where the same characters, and to consist of the same ingredients, nearly in the same proportions;' whilst no other stones have any where been found of precisely the same character. 'Here, therefore,' says the reviewer of Laplace, 'we have a testimony confirmed, and rendered quite independent of our previous knowledge of the veracity of the witnesses.' This inference I cannot admit; nor can I conceive by what rule of logic it is drawn from the premises. Not to insist on the unquestionable fact that the result of the chemical analysis of the stones can be known, to those myriads who were not present when it was made, only by testimony, all that seems to me to have been proved by that analysis is that the stones in question are of one and the same species, and that the species itself is very uncommon. These two facts I admit to have been completely proved; for I have no hesitation to receive the testimony of the chemist by whom they were ascertained; but why stones of a singular character, found in different regions of the earth, should therefore be inferred to have fallen from the heavens, I confess that I am yet to learn. That a stone of two or three tons weight, as some of those meteoric stones have been, should be generated in the higher regions of the atmosphere, and float in a horizontal direction over various countries, at the distance of sixty miles from the earth, is directly contrary not only to all my experience, but likewise to all that I know of the constitution of the atmosphere, as well as of the law of gravitation—the best ascertained, perhaps, of all the laws of corporeal nature! Am I then to reject with scorn all that I have been told of ignited stones falling from the heavens? Undoubtedly I ought to do so, if testimony derives all its force from experience; for though those stones have been chemically analysed, and their composition ascertained by experiments, not an individual of the human race can believe that they fell from the atmosphere on any other evidence than the unsupported testimony of those very few persons who have said that they saw them fall. 'But it will always be more wonderful that masses of iron, pyrites, and earth, of the weight of two or three tons, should be formed in the higher regions of the atmosphere, and even float horizontally in that rare medium, as a log of wood floats in water, than that any number of witnesses, who affirm that they say them fall, should have been deceived themselves, or disposed to deceive others.' They may have had their origin in the heart of the earth, and been forced upwards by subterranean fire; and this may seem the more probable, that the principal ingredient in them is iron in the metallic state; that they have been generally found hot and buried to a considerable depth in the earth; and that such eruptions from the bowels of the earth, through the craters of volcanoes, have frequently been accompanied by appearances in the air which might easily be

mistaken by a few individuals—almost stupified with astonishment—for meteors descending from the heavens.

'In a word, it appears to me that there is not one objection urged by Hume, Laplace, or any of their pupils, against the sufficiency of testimony to prove the reality of the gospel miracles, which does not hold with at least equal force against the reality of those showers of meteoric stones which are said to have fallen in all the quarters of the globe. The truth, however, is, that these objections are in both cases founded on a palpable mistake. Testimony is so far from deriving all its force from experience, that as was justly observed long ago (by Dr. Campbell in his admirable Dissertation on Miracles), it is the sole foundation of by far the greater part of what the opponents of the gospel call firm, unalterable, and universal experience; and that if we did not, in certain circumstances, repose implicit confidence in testimony, every man's knowledge of events would be confined to those which had fallen under the immediate observation of his own senses. Hume seems to have been perfectly aware of this, when he supposed a case, in which, were it ever to occur, testimony would be sufficient to establish the credibility even of a miracle. 'No testimony,' says he, 'is sufficient to establish a miracle, unless the testimony be of such a kind that its falsehood would be more miraculous than the fact which it endeavours to establish.—When any one tells me, that he saw a dead man restored to life, I immediately consider with myself, whether it be more probable that this person should either deceive or be deceived, or that the fact, which he relates, should really have happened. I weigh the one miracle against the other, and, according to the superiority which I discover, I pronounce my decision, and always reject the greater miracle. If the falsehood of his testimony would be more miraculous than the event which he relates; then, and not till then, can he pretend to command my belief or opinion.'

'There is some inaccuracy of language in talking of greater and less miracles when omnipotence is supposed to have performed them all; but it is no more than justice to acknowledge that the author admitted, in a note, that all real miracles are equally easy to the Almighty, by observing 'that the raising of a feather, when the wind wants ever so little force requisite for that purpose is as real a miracle as the raising of a house or ship into the air.' By greater and less miracles therefore, and by always rejecting the greater, it is evident that he meant nothing more than that of two or more deviations from the known laws of nature, one might in itself, when contemplated with all its circumstances, appear less probable than the others; and that, if he could not reject them all, his principles would compel him to reject that which should appear least probable when viewed in all its bearings. This seems to be a just maxim; and therefore, if it can be shown that the testimony given by the apostles and other first preachers of the gospel to the miracles of their Lord, would, on the supposition that those miracles were not really performed, have been as great a deviation from the

known laws of nature as the miracles themselves, the balance must be considered as evenly poised by opposite miracles; and, whilst it shall continue so, the judgment must remain in a state of suspense. But if it shall appear that, in this case, the false testimony would have been a deviation from the laws of nature much less probable in itself than the miracles recorded in the gospels, the balance will be instantly destroyed; and, by Mr. Hume's maxim, we must reject the supposition of falsehood in the testimony of the apostles, and admit the miracles of Christ to have been really performed.

‘In this argument it is needless to waste time in proving that those miracles, as they are represented in the writings of the New Testament, were of such a nature, and performed before so many witnesses, that no imposition could possibly be practised on the senses of those who affirm that they were present. From every page of the gospels this is so evident that the philosophical adversaries of the Christian faith never suppose the apostles to have been themselves deceived, but boldly accuse them of bearing false witness. But, if this accusation be well founded, their testimony itself is as great a miracle, or, in other words, as real a deviation from the laws of nature, as any which they record of themselves or of their master. That testimony does not derive all its force from experience has been already proved; and is indeed little less than self-evident from the unquestionable fact that the earliest assent, which is given to testimony by children who have no experience, is unlimited, whilst the experience of age renders men distrustful. Exactly the reverse would be the case, were our belief in testimony the result of experience. It has therefore been thought that the beneficent Author of nature, who intended man to be a social creature, hath implanted in every human breast an instinctive propensity to speak truth, and likewise a disposition to confide implicitly in the veracity of others; and it cannot be denied that children believe whatever is told them, and that the greatest liar on earth speaks a hundred truths for one falsehood. That truth is indeed always at the door of the lips; that it requires no effort to bring it forth; that in ordinary cases men speak truth uninfluenced by any motive moral or political; and that lying is never practised by the worst of men without some effort to accomplish some end, are positions which daily experience renders it impossible to question. But, notwithstanding all this, I do not think that truth is spoken by an original and instinctive principle; because men appear not to be impelled by instinct to speak any articulate language at all; and it is surely inconceivable that instinct should teach the use of arbitrary and artificial signs, such as the words of every language undoubtedly are, or that between such signs and ideas any natural relation should ever be formed.’—In human testimony the ideas in the mind of the speaker are the things signified, and the words of the language spoken are the signs by which they are expressed; and, when these things and signs are in conformity to each other, the words uttered express so much truth. Now, though in this case there is no na-

tural connexion between the signs and the things signified—between ideas or notions in the mind and articulate vocal sounds—yet it is obvious that, without a violent effort of the speaker to the contrary, they must always be in conformity with each other, because, in every language, there are words appropriated to the purpose of denoting every idea, and every relation of ideas, which can be expressed by that language; and in the mind of every man those ideas, relations of ideas, and their appropriate words, have been constantly associated or linked together from the time that he first learned to speak. So intimate is this association, and so impossible to be broken, that whoever will pay sufficient attention to the operations of his own mind, will find that he thinks as well as speaks in some language; and that in cogitation he runs over, silently and habitually, those sounds which in speaking he actually utters. Hence it is that hardly any man has written in perfect purity a language in which he has not been accustomed to think; and hence too, I believe, it is, that so many men of deep thinking have been remarked for the practice of speaking to themselves. If this be so, it is impossible that a man, without some effort, should ever speak any thing but truth; for the ideas of what he has seen or heard, &c., are not of his manufacture; they are generated in his mind by external objects, according to the established laws of nature; and, till they be effaced from his memory, they must always, by the law of association, which is one of those laws, make their appearance there with all their mutual relations, and in their appropriate dress. In the very act of learning to speak, we necessarily learn to speak the truth; for what I have called mental truth is impressed upon our minds by him who cannot err, and, were we not to employ words for the expression of that truth exactly as they are employed by those with whom we converse, our language (if language it could be called) would be unintelligible jargon; and we could neither declare our wants, nor ask relief with any hope of success. Children beginning to speak may indeed often utter untruths or nonsense without any motive, and merely from mistake; and this indeed they often do, because the ideas and words of children have neither been long nor closely linked together; but it is impossible that a man, however wicked, should habitually, and without motives, lie on ordinary occasions, unless the constituent principles of his nature have been totally altered; unless his brain has been disordered by disease; unless his ideas and notions have been disarranged; and all the associations which have taken place among them from his infancy have been dissolved, and quite contrary associations formed in their stead. We know indeed, by woeful experience, that immoral men occasionally utter falsehoods with a view to deceive. But in these cases they are influenced by some motive either of hope or of terror; the falsehood is always uttered with an effort; and so very strong is the association between words and ideas that the truth will at times break out in spite of all their endeavours to conceal it; so that the end or middle of a false narrative, if it be of any length, and include

a number of particular events or incidents, is commonly inconsistent with the beginning. We entertain a suspicion of falsehood, when those who relate the same tale either palpably contradict each other, or agree in every minute circumstance, and speak throughout the very same language—when they are but few in number and of a doubtful character—when they have an interest in what they affirm or deny—when they deliver their testimony either with hesitation, or with superfluous and violent asseverations of its truth; because all these are circumstances which have been generally observed to accompany false witness. It is likewise with reluctance that we admit a narrative of events entirely different from every thing that we have hitherto seen or heard; because we may not be certain that the narrator is not under some influence to deceive us in matters concerning which we have nothing but his testimony on which to ground our judgment. But in every case, where the fact recorded is in itself possible, and attributed to a cause which we know to be adequate; where a competent number of witnesses had sufficient means of information, and were certainly under no inducement to deceive, testimony is complete evidence, however extraordinary the fact may be; because no fact, which is known to have had an adequate cause, can be so incredible, as that a number of men of sound understanding should act in a manner inconsistent with the fundamental principles of human nature, or be able, if so disposed, to dissolve every association which had been formed in the mind of each of them from his infancy, and form new ones, all agreeing exactly with one another, and yet all contrary to the truth.

‘If this reasoning be just, and if the testimony of the apostles to their own and their Master’s miracles be false, it follows undeniably, either that they concerted a consistent scheme of falsehood, and agreed to publish it at every hazard; or that God had dissolved all the associations, which had been formed in their minds, of ideas of sense with the words of language, and arbitrarily formed new associations all in exact conformity with each other, but all in direct contradiction to truth. One or other of these events must have taken place; because, upon the supposition of falsehood, there is no other alternative. But such dissolution and formation of associations of ideas with words, as is supposed in the latter event, is as great a deviation from the established laws of nature, or, in other words, as real a miracle, as the resurrection of a man from the dead; and, all real miracles being acknowledged to be equally great, either of these could have been performed only by a power equal to the performance of the other. Nor would the supposed voluntary agreement of the apostles, in such a scheme of falsehood as they are said to have published to the world, be an event less miraculous than the Divine interposition for the unworthy purpose implied in the former hypothesis. When they sat down to fabricate their pretended revelation, and to contrive a series of miracles, to which they were all to appeal for its truth, it is plain, since they proved successful in their daring enterprise, that they must have

clearly foreseen every possible circumstance in which they could be placed, and have prepared consistent answers to every question that could be put to them by their most inveterate and most enlightened enemies; by the statesman, the lawyer, the philosopher, and the priest. That such foreknowledge as this would have been miraculous will not surely be denied; since it forms the very attribute which we find it most difficult to allow even to God himself. It is not, however, the only miracle, which this supposition would compel us to admit. The very resolution of the apostles to propagate the belief of false miracles, in support of such a religion as that which is taught in the New Testament, would have been as wide a deviation from the laws of nature, and therefore as great a miracle, as the mind of man has ever conceived.

‘When they formed this design, either they must have hoped to succeed, or they must have been convinced that they should fail in their undertaking; and, in either case, they chose evil, and what they knew to be unmixed evil, for its own sake! They could not, if they foresaw that they should fail, look for any thing but that contempt, disgrace, and persecution, which were then the inevitable consequences of an unsuccessful endeavour to overthrow the established religion. Nor would their prospects be brighter on the supposition of their success. As they knew themselves to be false witnesses, and impious deceivers, they could have no hope beyond the grave; and, by determining to oppose all the religious systems, superstitions, and prejudices of the age in which they lived, they wilfully exposed themselves to inevitable misery in the present life, to insult and imprisonment, to stripes and death. Nor can it be alleged that they might look forward to power and affluence, when they should through sufferings have converted their countrymen; for, so desirous were they of obtaining nothing but misery as the end of their mission, that they made their own persecution a test of the truth of their doctrines. They introduced the Master, from whom they professed to have received those doctrines, as telling them that they were ‘sent forth as sheep in the midst of wolves; that they should be delivered up to councils, and scourged in synagogues; that they should be hated of all men for his name’s sake;’ that ‘the brother should deliver up the brother to death, and the father the child;’ and that ‘he who took not up his cross and followed him was not worthy of him.’ The very system of religion, therefore, which they invented and resolved to impose upon mankind, was so contrived that the worldly prosperity of its first preachers, and even their exemption from persecution, was incompatible with its success. Had these clear predictions of the author of that religion, under whom the apostles and evangelists acted only as ministers, not been verified, all mankind must have instantly perceived that their claim to inspiration was groundless, and that Christianity was a scandalous and impudent imposture. All this the apostles could not but foresee when they formed their plan for deluding the world. Whence it follows that, when they resolved to support their pretended revelation by an appeal!

to forged miracles, they wilfully, and with their eyes open, exposed themselves to inevitable misery, whether they should succeed or fail in their enterprise; and that they concerted their measures in such a manner as not to admit a possibility of recompense to themselves, either in this life or in that which is to come. But if there be a law of nature, for the reality of which we have better evidence than we have for others, it is, 'that no man can choose misery for its own sake,' or make the acquisition of it the ultimate end of all his pursuits. The existence of other laws of nature we know by testimony and our own observation of the regularity of their effects. The existence of this law is made known to us not only by these means, but also by the still clearer and more conclusive evidence of every man's own consciousness. Thus, then, do miracles force themselves upon our assent in every possible view which we can take of this interesting subject.'

1. *Of the Pentateuch.*—The Pentateuch consists of the five books of Moses. Some of the strongest arguments in support of the authenticity of the Pentateuch, and inspiration of the writer, have been already given. But we shall present two arguments of a different kind, which would be sufficient to prove at least the former of these conclusions, from the language and contents of the Mosaic writings, and from the testimony of the other books of Scripture.

From the contents and language of the Pentateuch there arises a very strong presumption that Moses was its author. The very mode of writing in the last four books discovers an author contemporary with the events which he relates; every description, both religious and political, is a proof that the writer was present at each scene; and the legislative and historical parts are so interwoven with each other that neither of them could have been written by a man who lived in a later age. Dr. Marsh justly observes, that the account given in the book of Exodus of the conduct of Pharaoh towards the children of Israel, is such as might be expected from a writer who was not only acquainted with the country at large, but had frequent access to the court of its sovereign; and the minute geographical description of the passage through Arabia is such as could have been given only by a man like Moses, who had spent forty years in the land of Midian. The language itself is a proof of its high antiquity, which appears partly from the great simplicity of the style, and partly from the use of archaisms or antiquated expressions, which in the days even of David and Solomon were obsolete. For instance *הוּא* ille, and *נִפְרָה* puer, which are used in both genders by no other writer than Moses. See Gen. xiv. 14. 16. 28. 55. 57; xxxviii. 21. 25. But a strong argument, to show that the Pentateuch was written by a man born and educated in Egypt, is the use of Egyptian words; words which never were, nor ever could have been, used by a native of Palestine; and it is a remarkable circumstance that the very same thing which Moses had expressed by a word that is pure Egyptian, Isaiah, as might be expected from his birth and education, has expressed by a word that is purely Hebrew. For instance, *לִבְיָנִי*, written by the Seventy

ἡγεῖ or *αγεῖ*, Gen. xli. 2, and *לִבְיָנִי*, written by the Seventy *ἐγὼ* or *ἐγὼ*. See La Croze Lexicon Egyptiacum, art. AXI and OHBI. The same thing which Moses expressed by *לִבְיָנִי*, Gen. xli. 2; Isaiah (xix. 7) expresses by *עִירָה*, for the Seventy have translated both of these words by *αγεῖ*.

That Moses was the author of the Pentateuch is proved also from the evidence of testimony. We shall seek no authority but that of the succeeding sacred books themselves, which bear internal evidence that they were written in different ages, and therefore could not be forged, unless we were to adopt the monstrous opinion that there was a succession of impostors among the Jews who united together in the same fraud. The Jews were certainly best qualified to judge of the authenticity of their own books. They could judge of the truth of the facts recorded, and they could have no interest in adopting a forgery. Indeed, to suppose a whole nation combined in committing a forgery, and that this combination should continue for many hundred years, would be the most chimerical supposition that ever entered into the mind of man. Yet we must make this supposition, if we reject the historical facts of the Old Testament. No one will deny that the Pentateuch existed in the time of Christ and his apostles; for they not only mention it, but quote it. 'This we admit,' reply the advocates for the hypothesis which we are now combating; 'but you cannot therefore conclude that Moses was the author; for there is reason to believe it was composed by Ezra.' But, unfortunately for men of this opinion, both Ezra and Nehemiah ascribe the book of the law to Moses. See Ezra iii. 2; viii. 14; Neh. xiii. 1. 2. The Pentateuch was in the possession of the Samaritans before the time of Ezra. 3. It existed in the reign of Amaziah king of Judah, A. C. 839 years. 4. It was in public use in the reign of Jehosaphat, A. C. 912; for that virtuous prince appointed Levites and priests who taught in Judah, and had the book of the law of the Lord with them, and went about throughout all the cities of Judah and taught the people. 5. It is referred to by David in his dying admonitions to Solomon. He also makes many allusions to it in the Psalms, and sometimes quotes it. There remains therefore only one resource to those who contend that Moses was not the author, viz. that it was written in the period which elapsed between the age of Joshua and that of David. But the whole history of the Jews from their settlement in Canaan to the building of the temple pre-supposes that the book of the law was written by Moses. 6. We have satisfactory evidence that it existed in the time of Joshua. One passage may be quoted where this fact is stated. The Divine Being makes use of these words to Joshua: 'Only be thou strong, and very courageous, that thou mayest observe to do all according to the law which Moses my servant commanded thee. This book of the law shall not depart out of thy mouth,' &c. See Josh. i. 7, 8; viii. 31; xxiii. 6. To the foregoing demonstration objections may be stated. We will admit the force of your arguments, and grant that Moses actually wrote a work

called the book of the law; but how can we be certain that it was the very work which is now current under his name! And, unless you can show this to be at least probable, your whole evidence is of no value.' To illustrate the force or weakness of this objection, let us apply it to some ancient Greek author, and see whether a classical scholar would allow it to be of weight.

It is true that the Greek writers speak of Homer as an ancient and celebrated poet; it is true also that they have quoted from the works which they ascribe to him various passages that we find at present in the *Iliad* and *Odyssey*; yet still there is a possibility that the poems which were written by Homer, and those which we call the *Iliad* and *Odyssey*, were totally distinct productions.' Now an advocate for Greek literature would reply to this objection, not with a serious answer, but with a smile of contempt; and would think it beneath him to silence an opponent who appeared to be deaf to the clearest conviction. But still more may be said in defence of Moses than in defence of Homer; for the writings of the latter were not deposited in any temple or sacred archive, to secure them from the devastations of time; whereas the copy of the book of the law, as written by Moses, was intrusted to the priests and the elders, preserved in the ark of the covenant, and read to the people every seventh year. Deut. xxxi. 9—11; 14—26. Sufficient care therefore was taken not only for the preservation of the original record, but that no spurious production should be substituted in its stead. And that no spurious production ever has been substituted in the stead of the original composition of Moses, appears from the evidence both of the Greek and the Samaritan Pentateuch. For as these agree with the Hebrew, except in some trifling variations (see London Polyglot, vol. vi. p. 19), to which every work is exposed by length of time, it is absolutely certain that the five books which we now ascribe to Moses are one and the same work with that which was translated into Greek in the time of the Ptolemies, and, what is of still greater importance, with that which existed in the time of Solomon. And as the Jews could have had no motive whatsoever, during that period which elapsed between the age of Joshua and that of Solomon, for substituting a spurious production instead of the original as written by Moses, and, even had they been inclined to attempt the imposture, would have been prevented by the care which had been taken by their lawgiver, we must conclude that our present Pentateuch is the very identical work that was delivered by Moses.

II. *Of the historical books of the Old Testament.*—The positive evidence being now produced, we shall endeavour to answer some particular objections that have been urged. Most of these occur in the book of *GENESIS*: we shall reserve them, therefore, for separate examination, and here only consider the objections peculiar to the four last books. They may be comprised under one head, viz. expressions and passages in these books which could not have been written by Moses. 1. The account of the death of Moses, in the last chapter of

Deuteronomy, we allow must have been added by some succeeding writer; but this can never prove that the book of Deuteronomy is spurious. What is more common among ourselves than to see an account of the life and death of an author subjoined to his works, without informing us by whom the narrative was written? 2. It has been objected that Moses always speaks of himself in the third person. This is the objection of foolish ignorance, and therefore scarcely deserves an answer. Such persons have never read Cæsar's Commentaries, where the author uniformly speaks of himself in the third person, as writers of the most correct taste will often do; who reflects on the absurdity of employing the pronoun of the first person in a work intended to be read long after his death. 3. As to the objection that in some places the text is defective, as in Exodus xv. 8, it is not directed against the author, but against some transcriber; for what is wanting in the Hebrew is inserted in the Samaritan text. 4. The only other objection that deserves notice is made from two passages. It is said in one place that the bed of Og is at Ramah to this day; and in another (Deut. iii. 14) 'Jair the son of Manasseh took all the country of Argob into the coasts of Geshuri and Maacathi, and called them after his own name, Bashan-havoth-jair, unto this day.' The last clause in both these passages could not have been written by Moses; but it was probably placed in the margin by some transcriber by way of explanation, and was afterwards by mistake inserted in the text. Whoever doubts the truth of this assertion may have recourse to the MSS. of the Greek Testament, and he will find that the spurious additions in the texts of some MSS. are actually written in the margin of others.

That the Pentateuch, therefore, at least the four last books of it, was written by Moses, we have very satisfactory evidence; which, indeed, at the distance of 3000 years, is wonderful, and which cannot be affirmed of any profane history written at a much later period. But the book of *Genesis* was evidently not written by a person who was contemporary with the facts which he records; for it contains the history of 2369 years, a period comprehending almost twice as many years as all the rest of the historical books of the Old Testament put together. Moses has been acknowledged as the author of this book by all the ancient Jews and Christians; but it has been a matter of dispute from what source he derived his materials; some affirming that all the facts were revealed by inspiration, and others maintaining that he procured them from tradition.

Some, who pretend to be profound philosophers, have rejected many parts of the book of *Genesis* as fabulous and absurd; but it cannot be the wisdom of philosophy, but the vanity of ignorance, that could lead to such an opinion. In fact, the book of *Genesis* affords a key to many difficulties in philosophy, which cannot otherwise be explained. It has been supposed that the diversities among mankind prove that they are not descended from one pair; but it has been fully shown that all these diversities may be accounted for by natural causes. It has

been reckoned a great difficulty to explain how fossil shells were introduced into the bowels of the earth; but the deluge explains this fact better than all the romantic theories of philosophers. See DELUGE. It is impossible to account for the origin of such a variety of language in a more satisfactory manner than is done in the account of the confusion of tongues which took place at Babel. It would be no easy matter to show why the sea of Sodom is so different from every other sea on the globe which has yet been explored, if we had not possessed the scriptural account of the miraculous destruction of Sodom and Gomorrah. It is saturated with bitumen and salt, and contains few or no fishes. These are very singular facts, which have been fully established by late travellers. The book of Genesis, too, has been treated with contempt, because it makes the world less ancient than is necessary to support the theories of modern philosophers, and because it is difficult to reconcile the chronologies of several nations with the opinion that the world is not above 6000 or 7000 years old. The Chaldeans, in the time of Cicero, reckoned up 470,000 years. The Egyptians pretend that they have records extending 50,000 years back; and the Hindoos go beyond all bounds of probability, carrying back their chronology, according to Halhed, more than 7,000,000 of years.

An attempt was formerly made by M. Bailly, mayor of Paris, to reconcile these magnified calculations with the chronology of the Septuagint, which is justly preferred to the Hebrew. See SEPTUAGINT. He affirms that the Hindoos, as well as the Chaldeans and Egyptians, had years of arbitrary determination; as for instance months of fifteen days, and years of sixty days, or two months. A month is a night and a day of the patriarchs; a year is a night and a day of the gods; 4000 years of the gods are as many hundred years of men. By attention to such modes of computation, the age of the world will be found very nearly the same in the writings of Moses and in the calculations and traditions of the Brahmins. With these also we have a remarkable coincidence with the Persian chronology. Bailly has established these remarkable epochs from the creation to the deluge. The Septuagint gives 2256 years; the Chaldeans 2222; the Egyptians 2340; the Persians 2000; the Hindoos 2000; the Chinese 2300. The same author attempts to show the singular coincidence of the age of the world as given by four distinct and distantly situated people. The ancient Egyptians make it 5544 years; the Hindoos 5502; the Persians 5501; the Jews, according to Josephus, 5555.

Having made these remarks, to show that the facts recorded in Genesis are not inconsistent with truth, we shall now, by a few observations, confirm the evidence, from testimony, that Moses was the author, and answer the objections that seem strongest. There arises a great probability, from the book of Genesis itself, that the author lived near the time of Joseph; for, as we advance towards the end of that book, the facts gradually become more minute. The materials of the antediluvian history are very scanty. The

account of Abraham is more complete; but the history of Jacob and his family is still more fully detailed. This is indeed the case with every history. In the early part the relation is very short and general; but, when the historian approaches his own time, his materials accumulate. It is certain too that the book of Genesis must have been written before the rest of the Pentateuch; for the allusions in the last four books to the history of Abraham, of Isaac, and of Jacob, are very frequent. The simplicity of the style shows it to be one of the most ancient of the sacred books; and perhaps its similarity to the style of Moses would determine a critic to ascribe it to him. It will be allowed that no man was better qualified than Moses to compose the history of his ancestors. He was learned in all the wisdom of the Egyptians, the most enlightened nation of his time, and he had the best opportunities of obtaining accurate information. The short account of the antediluvian world could easily be remembered by Abraham, who might obtain it from Shem, who was his contemporary. To Shem it might be conveyed by Methuselah, who was 340 years old when Adam died. From Abraham to Moses, the interval was less than 400 years. The splendid promises made to that patriarch would certainly be carefully communicated to each generation, with the concomitant facts; and thus the history might be conveyed to Moses by the most distinguished persons, and through very few hands. The accounts respecting Jacob and his son Joseph might be given to Moses by his grandfather Kohath, who must have been born long before the descent to Egypt; and Kohath might have heard all the facts respecting Abraham and Isaac from Jacob himself. Thus we can easily point out how Moses might derive the materials of the book of Genesis, and especially of the last thirty-eight chapters, from the most authentic source.

But 1. It is objected that the author of the two first chapters of Genesis must have lived in Mesopotamia, as he discovers a knowledge of the rivers that watered paradise, of the cities of Babylon, Erech, Resen, and Calneh; of the gold of Pison; of the bdellium and onyx stone. But if he could not derive this knowledge from the wisdom of the Egyptians, which is far from being improbable, he might surely obtain it by tradition from Abraham, who was born and brought up beyond the Euphrates. 2. In Genesis xiv. 14 it is said, Abraham pursued the four confederate kings to Dan, yet that name was not given till after the conquest of Palestine. (Judges xviii. 22.) We answer this might be inserted by a transcriber: but such a supposition is not necessary; for, though we are told in the book of Judges that a city originally called Laish received then the name of Dan, this does not prove that Laish was the same city with the Dan which is mentioned in Genesis. The same answer may be given to the objection which is brought from Genesis xxxv. 21, where the tower of Edar is mentioned, which the objectors say was the name of a tower over one of the gates of Jerusalem. But the tower of Edar signifies the tower of the flocks, which in the

pastoral country of Canaan might be a very common name. 3. The most formidable objection perhaps is derived from these two passages, Gen. xii. 6 :—' And the Canaanite was then in the land.' Gen. xxxvi. 31 :—' These are the kings that reigned over the land of Edom, before there reigned any king over the children of Israel.' Now it is certain that neither of these passages could be written by Moses. We allow they were added by a later writer; but this circumstance cannot invalidate the evidence which has been already produced. It does not prove that Moses was not the author of the book of Genesis, but only that this book has received two additions or interpolations since his death. According to Rivet, our Saviour and his apostles have cited twenty-seven passages verbatim from the book of Genesis, and have made thirty-eight allusions to the sense.

The book of Exodus contains the history of the Israelites for about 145 years. It gives an account of the slavery of the Israelites in Egypt; of the miracles by which they were delivered, of their passage through the Red Sea, and journey through the wilderness; of the solemn promulgation of the decalogue on Mount Sinai, and of the building and furniture of the Tabernacle. This book is cited by David, by Daniel, and other sacred writers. Twenty-five passages are quoted by our Saviour and his apostles in express words, and they make up nineteen allusions to the sense.

The book of LEVITICUS contains the history of the Israelites for one month. It consists chiefly of laws. Indeed, properly speaking, it is the code of the Jewish ceremonial and political laws. It describes the consecration of Aaron and his sons, the daring impiety and exemplary punishment of Nadab and Abihu. It contains also some predictions respecting the punishment of the Israelites in case of apostasy; and contains an assurance that every sixth year should produce abundance to support them during the seventh or sabbatical year. This book is quoted as the production of Moses in several books of Scripture.

The book of NUMBERS comprehends the history of the Israelites for about thirty-eight years, reckoning from the first day of the second month after their departure from Egypt. It contains an account of two numberings of the people; the first in the beginning of the second year of their emigration, the second in the plains of Moab towards the conclusion of their journey in the wilderness. It describes the ceremonies employed at the consecration of the tabernacle; gives an exact journal of the marches and encampments of the Israelites; relates the appointment of the seventy elders, the miraculous cure performed by the brazen serpent, and the misconduct of Moses when he was commanded to bring water from the rock. There is also added an account of the death of Aaron, of the conquest of Sihon and Og, and the story of Balaam, with his celebrated prophecy concerning the Messiah. The book of Numbers is quoted as the work of Moses in several parts of Scripture.

The book of DEUTERONOMY comprehends a period of about two months. It consists of an

interesting address to the Israelites, in which Moses recalls to their remembrance the many instances of divine favor which they had experienced, and reproaches them for their ingratitude. He lays before them, in a compendious form, the laws which he had formerly delivered, and makes some explanatory additions. This was the more necessary, because the Israelites, to whom they had been originally promulgated, and who had seen the miracles in Egypt, at the Red Sea, and Mount Sinai, had died in the wilderness. The divine origin of these laws, and the miracles by which they were sanctioned, must already have been well known to them; yet a solemn recapitulation of these by the man who had miraculously fed the then present generation from their infancy, who, by the lifting up of his hands, had procured them victory in the day of battle, and who was going to leave the world to give an account of his conduct to the God of Israel, could not but make a deep and lasting impression on the minds of all who heard him. He inculcates these laws by the most powerful motives. He presents before them the most animating rewards, and denounces the severest punishments to the rebellious. The prophecies of Moses towards the end of this book, concerning the fate of the Jews, their dispersions and calamities, the conquest of Jerusalem by the Romans, the miseries of the besieged, and the present state of the Jewish nation, cannot be read without astonishment. They are perspicuous and minute, and have been literally accomplished. This book is cited as the production of Moses by Christ and his apostles, Matt. iv. 4, John i. 45, &c.

The other historical books of the Old Testament are twelve in number, Joshua, Judges, Ruth, I. and II. Samuel, I. and II. Kings, I. and II. Chronicles, Ezra, Nehemiah, Esther. These, if considered distinctly from the Pentateuch, and the writings more properly styled prophetical, contain a compendium of the Jewish history from the death of Moses, A. M. 2552, to the reformation established by Nehemiah after the return from the captivity, A. M. 3595, comprehending a period of 1043 years.

To enable us to discover the authors of these books, we have no guide but conjecture, internal evidence, or the authority of the modern Jews. From the frequent references in Scripture, and from the testimony of Josephus, it appears that the Jews were in possession of many historical records which might have thrown much light upon this subject if they had been preserved. But during the calamities which befel that infatuated nation in their wars with the Romans, and the dispersion which followed, these writings have perished. But though we can produce no testimony more ancient than the age of our Saviour to authenticate the historical books, yet there are some facts respecting the mode of their preservation which entitle them to credit. The very circumstance itself, that the Jews have preserved them in the sacred volume to this day, while their other ancient books have been lost, is a proof that they considered them as the genuine records of their nation. Josephus, whose authority is of great importance, informs

us, in his treatise against Apion, that it was the peculiar province of the prophets and priests to commit to writing the annals of the nation, and to preserve them to posterity. That these might be faithfully preserved, the sacerdotal function was made hereditary, and the greatest care was observed to prevent intermarriages either with foreigners or with the other tribes. No man could officiate as a priest who could not prove his descent in a right line by unquestionable evidence. Ezra ii. 61, 62. Registers were kept in Jerusalem, which at the end of every war were regularly revised by the surviving priests; and new ones were then composed. As a proof that this has been faithfully performed, Josephus adds that the names of all the Jewish priests, in an uninterrupted succession from father to son, had been registered for 2000 years; that is, from the time of Aaron to the age of Josephus. The national records were not allowed to be written by any man who might think himself fit for the office; and if the priest falsified them, he was excluded from the altar and deposed from his office. Thus, we are assured, the Jewish records were committed to the charge of the priests; and, as they may be considered as the same family from Aaron to the Babylonish captivity and downwards, the same credit is due to them that would be due to family records, which by antiquarians are esteemed the most authentic sources of information.

Of the twenty-two books which Josephus reckoned himself bound to believe, the historical books from the death of Moses to the reign of Artaxerxes, he informs us, were written by contemporary prophets. It appears, then, that the prophets were the composers, and the priests the hereditary keepers of the national records. Thus, the best provision possible was made that they should be written accurately, and be preserved uncorrupted. The principal office of these prophets was to instruct the people in their duty to God, and occasionally to communicate the predictions of future events. For this purpose they were educated in the schools of the prophets, or in academies where sacred learning was taught. The prophets were therefore the learned men of their time, and consequently were best qualified for the office of historians. It may be objected that the prophets, in concert with the priests, might have forged any writings they pleased. But, before we suspect that they have done so in the historical books of the Old Testament, we must find out some motive which could induce them to commit so daring a crime. But this is impossible. No encomiums are made either upon the prophets or the priests; no adulation to the reigning monarch appears, nor is the favor of the populace courted. The faults of all ranks are delineated without reserve. Indeed there is no history extant that has more the appearance of impartiality. We are presented with a simple detail of facts, and are left to discover the motives and intentions of the several characters; and, when a character is drawn, it is done in a few words, without exaggerating the vices or amplifying the virtues of the person.

It is of no real consequence, therefore, whether we can ascertain the authors of the different

books or not. From Josephus we know that they existed in his time; and, from his account of the manner in which they were preserved, we are assured they were not in danger of being corrupted. They existed also when the Septuagint translation was made. Frequent references are made to them in the writings of later prophets; sometimes the same facts are related in detail. In short, there is such a coincidence between the historical books and the writings of those prophets who were contemporary, that it is impossible to suppose the latter true without receiving the former. Indeed, to suppose that the Jews could have received and preserved with such care for so many hundred years false records, which it must have been in the power of every person to disprove, and which at the same time do so little credit to the character of their nation, is to suppose one of the greatest absurdities in the world: it is to suppose that a whole nation could act contrary to all those principles which have always predominated in the human mind, and which must always predominate till human nature undergo a total revolution.

The book which immediately follows the Pentateuch has been generally ascribed to Joshua, the successor of Moses. It contains, however, some things which must have been inserted after the death of Joshua. There is some accidental derangement in the order of the chapters of this book which was probably occasioned by the ancient mode of fixing together a number of rolls. If chronologically placed, they should be read thus, first chapter to the tenth verse; then the second chapter; then from the tenth verse to the end of the first chapter; afterwards should follow the sixth, seventh, eighth, ninth, tenth, and eleventh chapters; then the twenty-second; and lastly the twelfth and thirteenth chapters to the twenty-fourth verse of the latter. The facts mentioned in this book are referred to by many of the sacred writers. See 1 Chron. ii. 7, xii. 15; Psal. cxiv. 3; Isa. xxviii. 22; Acts vii. 45; Heb. xi. 31, xiii. 5; James ii. 25. 28. In the book of Kings, xvi. 34, the words of Joshua are said to be the words of God. See JOSHUA.

By whom the book of Judges was written is uncertain; but, as it contains the history of the Jewish republic for 317 years, the materials must have been furnished by different persons. The book, however, seems to be the composition of one individual who lived in the reign of Saul, and before the accession of David: for it is said, in chap. i. ver. 21, that the Jebusites were still in Jerusalem; who, we know, were dispossessed of that city early in the reign of David, 2 Sam. v. 6. 8. We have reason, therefore, to ascribe this book to Samuel. The history of this book may be divided into two parts; the first contains an account of the Judges from Othniel to Sampson, ending at the sixteenth chapter. The second part relates several remarkable transactions which occurred soon after the death of Joshua; but are thrown to the end of the book, that they might not interrupt the course of the history. See JUDGES.

The book of RUTH is a kind of supplement to the book of Judges, and an introduction to

the history of David, as it is related in the books of Samuel. Since the genealogy which it contains descends to David, it must have been written after the birth of that prince, but not at any considerable time after it; for the history of Boaz and Ruth, the great-grandfather and great-grandmother of David, could not be remembered above two or three generations. As the elder brothers of David and their sons are omitted, and none of his own children are mentioned in the genealogy, it is evident that the book was composed in honor of the Hebrew monarch, after he was anointed king by Samuel, and before any of his children were born; and consequently in the reign of Saul. The Jews ascribe it to Samuel; and indeed there is no person of that age to whom it may be attributed with more propriety. See SAMUEL. We are informed (1 Sam. x. 25) that Samuel was a writer, and are assured that no person in the reign of Saul was so well acquainted with the splendid prospects of David as the prophet Samuel.

The Greeks denominate the books of SAMUEL, which follow next in order, The books of Kingdoms; and the Latins, The books of Kings I. and II. Anciently there were but two books of Kings; the first was the two books of Samuel, and the second was what we now call the two books of Kings. According to the present division, these two books are four, viz. the first and second books of Samuel, and the first and second books of Kings. Concerning the author of the two books of Samuel there are different opinions. Some think that Samuel wrote only twenty or twenty-four chapters of the first book, and that the history was continued by Nathan and Gad. This opinion they ground on the following passage in 1 Chron. xxix. 29: 'Now the acts of David the king, first and last, behold they are written in the book of Samuel the seer, and in the book of Nathan the prophet, and Gad the seer.' Others think they were compiled by Ezra from ancient records; but it is evident that the books of Samuel were written before the books of Kings and Chronicles; for in the latter many circumstances are taken from the former. The first book carries down the history of the Israelites from the birth of Samuel to the fatal battle of Gilboa, comprehending a period of about eighty years. The second relates the history of David, from his succession to the throne of Israel, till within a year or two of his death, containing forty years. There are two beautiful passages in these books, which every man of sentiment and taste must feel and admire, the lamentation or elegy on Saul and Jonathan, and the parable of Nathan. The impartiality of the historian is fully attested, by the candor and freedom with which the actions of Saul and David are related. There are some remarks interspersed, which were probably added by Ezra.

When the two books of KINGS were written, or by whom they were compiled, is uncertain. Some have supposed that David, Solomon, and Hezekiah, wrote the history of their own times. But this seems not probable, as their crimes and vices are so particularly recorded. Others have been of opinion that the prophets, viz. Gad, Nathan, Isaiah, and Jeremiah, wrote each the his-

tory of the reign in which he lived, which appears much more probable. But it is generally believed that Ezra wrote these two books, and published them in the form in which we have them at present. There can be no doubt but the prophets drew up the lives of the kings who reigned in their times; for the names and writings of those prophets are frequently mentioned, and cited. Still, however, it is evident that the two books of Kings are but an abridgment of a larger work, the substance of which is contained in the books before us. In support of the opinion that Ezra is the author of these books, it is said that in the time of the penman, the ten tribes were captives in Assyria, whither they had been carried as a punishment for their sins: That in the second of these books the author makes some reflections on the calamities of Israel and Judah, which demonstrate that he lived after that event. But to this it is objected that the author of these books expresses himself throughout as a contemporary, and as one would have done who had been an eye and ear witness of what he related. To this objection it is answered that Ezra compiled these books from the prophetic writings which he had in his possession; that he copied them exactly, narrating the facts in order as they happened, and interspersed in his history some reflections and remarks arising from the subjects which he handled. The first book comprises a period of 126 years, from the death of David to that of Jehoshaphat. The second book records the transactions of the succeeding kings of Judah and Israel for about 300 years, from the death of Jehoshaphat to the destruction of Jerusalem and the temple, A. M. 3416, A. C. 588.

The Hebrews style the two books of CHRONICLES, Deberi Imim, i. e. Words of days, journals or diaries, in allusion to those ancient journals which appear to have been kept among the Jews. The Greeks call them *Παραλειπομένα*, Paralipomena, which signifies things omitted; as if these two books were a kind of supplement, to inform us of what had been omitted or too much abridged in the books of Kings. The two books of Chronicles contain indeed several particulars which are not to be met with in the other books of Scripture: but it is not therefore to be supposed that they are the records of the kings of Judah and Israel, so often referred to in the books of Kings. Those ancient registers were apparently much more copious than these books; and the compiler of the books of Chronicles often refers to them, and makes extracts from them.

Some suppose that the author of these two books was the same with that of the two books of Kings. The Jews say that they were written by Ezra, after the return from the captivity, assisted by Zechariah and Haggai, who were then alive. But events are mentioned in them of so late a date as to show that he could not have written them in their present form; and there is another objection to his being their author, which is little less forcible: between the books of Kings and Chronicles there is a great number of variations both in dates and facts, which could not have happened if Ezra had been the author

of them, or indeed if they had been the work of any one person. The books of Chronicles are not to be considered merely as an abridgment of former histories with some useful additions, but as books written with a particular view; which seems to have been to furnish a genealogical register of the twelve tribes, deduced from the earliest times; to point out those distinctions which were necessary to discriminate the mixed multitude that returned from Babylon; to ascertain the lineage of Judah; and to re-establish on their ancient footing the pretensions and functions of each individual tribe.

The books of EZRA and NEHEMIAH are attributed by the ancients to the former of these prophets; and they called them the first and second books of Esdras; which title is still kept up by the Latin church. It is indeed highly probable that the former of these books, which comprises the history of the Jews, from the time that Cyrus made the decree for their return until the twentieth year of Artaxerxes Longimanus (which was about 100 years, or as others think seventy-nine years), was all composed by Ezra, except the first six chapters, which contain an account of the first return of the Jews upon the decree of Cyrus; whereas Ezra did not return till the time of Artaxerxes. It is of this second return therefore that he writes the account; and adding it to the other, which he found ready composed to his hand, he made it a complete history of the Jewish restoration. This book is written in Chaldee from chap. iv. 8 to chap. vii. 27. As this part of the work chiefly contains letters, conversations, and decrees expressed in that language, the fidelity of the historian has probably induced him to take down the very words which were used. The people, too, had been accustomed to the Chaldee during the captivity, and probably understood it better than Hebrew; for

it appears from Nehemiah's account, chap. viii. 2. 8, that all could not understand the law.

The book of NEHEMIAH bears, in the Latin bibles, the title of the second book of Esdras; the ancient canons likewise gave it the same name, because, perhaps, it was considered as a sequel to the book of Ezra. In the Hebrew Bibles it has the name of Nehemiah prefixed to it; which name is retained in the English Bible. But, though that chief is by the writer of the second book of Maccabees affirmed to have been the author of it, there cannot, we think, be a doubt, but that either it was written at a later period, or had additions made to it after Nehemiah's death. With the books of Nehemiah and Esther the history of the Old Testament concludes. This is supposed to have taken place about A. M. 3574. A. C. 434. But Prideaux with more probability has fixed it at A. M. 3595. See NEHEMIAH.

It is uncertain who was the author of the book of ESTHER. Clement of Alexandria, and many commentators, have ascribed it to Mordecai; and the book itself seems to favor this opinion; for we are told, in chap. ix. 20, that 'Mordecai wrote these things.' Others have supposed that Ezra was the author; but the more probable opinion of the Talmudists is that the great synagogue (See SYNAGOGUE), to perpetuate the memory of the deliverance of the Jews from the conspiracy of Haman, and to account for the origin of the feast of Purim, ordered this book to be composed very likely of materials left by Mordecai, and afterwards approved and admitted it into the sacred canon. The time when the events which it relates happened, is supposed by some to have been in the reign of Artaxerxes Longimanus, and by others in that of Darius the son of Hystaspes, called by the sacred penman Ahasuerus. See AHASUERUS.

The following TABLE exhibits the Contemporary Reigns of the respective Kings of JUDAH and ISRAEL, and will assist in reading the Historical Books.

III.—Of the *Hagiographa*.—The third general division of the books of the Old Testament, among the Jews, according to Josephus, was the *Hagiographa*, or Holy Writings; which, however, are generally ranked second in order in all modern bibles. This comprehends the books of Job, Psalms, Proverbs, Ecclesiastes, and the Song of Solomon.

Concerning the author of the book of Job, there are many different opinions. Some have supposed that Job himself wrote it in Syriac or Arabic, and that it was afterwards translated by Moses. Others have thought that Elihu wrote it; and by others it is ascribed to Moses, to Solomon, to Isaiah, and to Ezra. To give even an abridgment of the arguments brought in support of these various opinions would fill a volume, and at last leave the reader in uncertainty. The most able summary of these opinions is to be found in the work of Dr. M. Good on Job. The writer of this article is decidedly of opinion, that Elihu was the author. He is the only one of Job's four friends who incurred no reproof. He listened with attention to them all, and at last delivered his opinion; and it is therefore highly probable, that he drew up the narrative of the whole. See ELIHU; and Job, xxxii. 15, 16, where he seems to speak of himself as the writer.

The book of Job, by whomsoever it was written, has been always esteemed a portion of canonical scripture, and is one of the most sublime compositions in the sacred volume. It appears to stand single and unparalleled in the sacred volume, having apparently little connexion with the other writings of the Hebrews, and no relation whatever to the affairs of the Israelites. The scene is laid in Idumea; the history of an inhabitant of that country is the basis of the narrative; the characters who speak are Idumeans, or at least Arabians of the adjacent country, all originally of the race of Abraham. The language is pure Hebrew, although the author appears to be an Idumean; for it is not improbable that all the posterity of Abraham, Israelites, Idumeans, and Arabians, whether of the family of Sarah, Keturah, or Ishmael, spoke for a considerable length of time one common language. That the Idumeans, however, and the Temanites in

particular, were eminent for the reputation of wisdom, appears by the testimony of the prophets Jeremiah and Obadiah. (Jer. xlix. 7, Ob. 8.) Baruch also particularly mentions them among 'the authors (or expounders) of fables, and searchers out of understanding.' Chap. iii. 22, 23.

The principal personage in this poem is Job; and in his character is meant to be exhibited (as far as is consistent with human infirmity) an example of perfect virtue. This is intimated in the introduction, but is still more eminently displayed in his actions and sentiments. He is holy, devout, and most piously and reverently impressed with the sacred awe of his divine Creator; he is also upright, and conscious of his own integrity; he is patient of evil, and yet very remote from that insensibility, or rather stupidity, to which the Stoics pretended. Oppressed, therefore, with unparalleled misfortunes, he laments his misery, and even wishes a release by death; in other words, he obeys, and gives place to the dictates of nature. Irritated, however, by the unjust insinuations and the severe reproaches of his pretended friends, he is more vehemently exasperated, and his too great confidence in his own righteousness leads him to expostulate with God in terms scarcely consistent with piety and strict decorum.

The first speech of Job, though it bursts forth with all the vehemence of passion, consists wholly of complaint, 'the words and sentiments of a despairing person empty as the wind;' which is indeed the apology that he immediately makes for his conduct; intimating that he is far from presuming to plead with God, far from daring to call in question the divine decrees, or even to mention his own innocence in the presence of his all-just Creator; nor is there any good reason for the censure which has been passed by some commentators upon this passage. The poet seems, with great judgment and ingenuity, to have performed in this what the nature of his work required. He has depicted the affliction and anguish of Job, as flowing from his wounded heart in a manner so agreeable to human nature (and certainly so far venial) that it may be truly said, 'in all this Job sinned not with his lips.' It is, nevertheless, embellished by such affecting ima-

gery, and inspired with such a warmth and force of sentiment, that we find it afforded ample scope for calumny; nor did the unkind witnesses of his sufferings permit so fair an opportunity to escape. The occasion is eagerly embraced by Eliphaz to rebuke the impatience of Job; and, not satisfied with this, he proceeds to accuse him in direct terms of wanting fortitude, and obliquely to insinuate something of a deeper dye. Though deeply hurt with the coarse reproaches of Eliphaz; still, however, when Job afterwards complains of the severity of God, he cautiously refrains from violent expostulations with his Creator, and, contented with the simple expression of affliction, he humbly confesses himself a sinner. Hence it is evident that those vehement attestations of his innocence, those murmurs against the divine Providence, which his tottering virtue afterwards permits, are to be considered merely as the consequences of momentary passion, and not as the ordinary effects of his settled character or manner.

The three friends are exactly such characters as the nature of the poem required. They are severe, irritable, malignant censors, readily, and with apparent satisfaction, deviating from the purposes of consolation into reproof and contumely. Even from the very first they manifest this evil propensity, and indicate what is to be expected from them.

The lenity and moderation of Elihu afford a beautiful contrast to the intemperance and asperity of the other three. He is pious, mild, and equitable; equally free from adulation and severity; and endued with singular wisdom, which he attributes entirely to the inspiration of God; and his modesty, moderation, and wisdom, are the more entitled to commendation when we consider his youth. As the characters of his detractors were in all respects calculated to inflame the mind of Job, that of this arbitrator is admirably adapted to sooth and compose it: to this point the whole drift of the argument tends, and on this the very purport of it seems to depend.

Another circumstance deserving particular attention, in a poem of this kind, is the sentiment; which must be agreeable to the subject, and embellished with proper expression. It is by Aristotle enumerated among the essentials of a dramatic poem; not indeed as peculiar to that species of poetry, but as common, and of the greatest importance to all. Manners or character are essential only to that poetry in which living persons are introduced; and all such poems must afford an exact representation of human manners; but sentiment is essential to every poem, indeed to every composition whatever. It respects both persons and things. As far as it regards persons, it is particularly concerned in the delineation of the manners and passions; and those instances to which we have just been adverting are sentiments expressive of manners.

The poem of Job abounds chiefly in the more vehement passions, grief and anger, indignation and violent contention. It is adapted in every respect to the incitement of terror; and is universally animated with the true spirit of sublimity. It is, however, not wanting in the gentler affec-

tions. The whole abounds with the most beautiful imagery, and is a most perfect specimen of the elegiac. His grief becomes fervent; but is at the same time soft and querimonious. It is unnecessary to quote instances. The book is in every body's hands.

The dignity of the style is answerable to that of the subject; its force and energy to the greatness of those passions which it describes; and, as this production excels all the other remains of the Hebrew poetry in economy and arrangement, so it yields to none in sublimity of style, and in every grace and excellence of composition. Among the principal of these, may be accounted the accurate and perfectly poetical conformation of the sentences, which is indeed generally most observable in the most ancient of the poetical compositions of the Hebrews. Here, however, as is natural and proper in a poem of so great length and sublimity, the writer's skill is displayed in the proper adjustment of the period, and in the accurate distribution of the members, rather than in the antithesis of words, or in any labored adaptation of the parallelisms.

The chief doctrines of the patriarchal religion, collected from different parts of this poem by Drs. Hales and Good, are as follow:—

1. The creation of the world by one Supreme and Eternal Intelligence. See c. xxxviii.—xli.

2. Its regulation by his perpetual and superintending providence. See c. i. 9—21; ii. 10; v. 8—27; ix. 4—13.

3. The intentions of his providence carried into effect by the ministrations of a heavenly hierarchy. See c. i. 6, 7; iii. 18, 19; v. 1.; xxxiii. 22, 23.

4. The heavenly hierarchy, composed of various ranks and orders, possessing different names, dignities, and offices. As obelim, servants; malachim, angels; melizim, intercessors; nemitim, destinies or destroyers; alep, the chiliad or thousand; kedoshim, sancti, the heavenly saints or hosts generally. See c. iv. 18; xxxiii. 22, 23; v. 2; xv. 15.

5. An apostasy, or defection, in some rank or order of these powers (c. iv. 18; xv. 15), of which Satan seems to have been one, and perhaps chief, c. i. 6—12; ii. 2—7.

6. The good and evil powers or principles equally formed by the Creator, and hence equally denominated 'Sons of God;' both of them employed by him in the administration of his providence; and both amenable to him at stated courts, held for the purpose of receiving an account of their respective missions. See c. i. 6, 7; ii. 1.

7. A day of future resurrection, judgment, and retribution to all mankind. See c. xiv. 13—15; xix. 25—29; xxi. 30; xxxi. 14.

8. The propitiation of the Creator, in the case of human transgressions, by sacrifices (c. i. 5, xlii. 8), and the mediation and intercession of a righteous person. See c. xlii. 8, 9.

9. The idolatrous worship of the heavenly bodies, a judicial offence, to be punished by the judge. See c. xxxi. 26—28.

10. The innate corruption of man; or what is generally termed 'original sin.' See c. xiv. 4, xv. 14—16; xxxv. 4.

Mr. Good has remarked that nothing can be more unfortunate for this most excellent composition than its division into chapters, and especially such a division as that in common use; in which, not only the unity of the general subject, but in many instances that of a single paragraph, or even of a single clause, is completely broken in upon and destroyed. Various are the divisions which have been adopted. Dr. Hales, who excludes the exordium and conclusion, divides it into five parts; but Dr. Good, who justly remarks that these are requisite to the unity of the composition, divides it into six. We have then

1. History of Job's character and trials (c. i.—iii.). 2. First series of conversations or controversy—Eliphaz's address (c. iv. v.); Job's answer (c. vi. vii.); Bildad's address (c. viii.); Job's answer (c. ix. x.); Zophar's address (c. xi.); Job's answer (c. xii.—xiv.). 3. Second series of controversy—Eliphaz's address (c. xv.); Job's answer (c. xvi. xvii.); Bildad's address (c. xviii.); Job's answer (c. xix.); Zophar's address (c. xx.); Job's answer (c. xxi.). 4. Third series of controversy—Eliphaz's address (c. xxii.); Job's answer (c. xxiii. xxiv.); Bildad's address (c. xxv.); Job's answer (c. xxvi.—xxxi.). 5. Elihu's four speeches to Job (c. xxxii.—xxxvii.). 6. Jehovah's first and second address to Job, his humiliation, and final prosperity, c. xxxviii.—xlii.

The word **PSALMS** is a Greek term, and signifies songs. The Hebrews call it ספר תהלים, *Seper Tehellim*, that is, the Book of Praises; and in the Gospel it is styled the Book of Psalms.

et veneration has always been paid to this collection of divine songs. The Christian church has, from the beginning, made them a principal part of her holy services; and in the primitive times it was almost a general rule that every bishop, presbyter, and religious person, should have the psalter by heart.

Many learned fathers, and modern writers, have maintained that David was the author of them all. Several are of a different opinion, and insist that David only wrote seventy-two of them, and that those without titles are to be ascribed to the authors of the preceding psalms, whose names are affixed to them. (See **DAVID**, **ASAPH**, &c.) Those who suppose that David alone was the author, contend that in the New Testament, and in the language of the church universal, they are expressly called the *Psalms of David*. That David was the principal author of these hymns, is universally acknowledged, and therefore the whole collection may properly enough go under his name; but that he wrote them all is a palpable mistake. Nothing certain can be gathered from the titles of the psalms; for, although unquestionably very ancient, yet authors are not agreed as to their authority, and they differ as much about their signification. The Hebrew doctors generally agree that the ninety-second psalm was composed by Adam: an opinion which, for many reasons, we are not inclined to adopt. There seems, however, to be no doubt but that

some of them were written by Moses; that Solomon was the author of the forty-ninth; and that others were occasioned by events long posterior to the flourishing era of the kingdom of Judah. The 137th particularly is one of those which mentions the captivity of Babylon.

Josephus, and most of the ancient writers, assert that the Psalms were composed in numbers: little, however, respecting the nature and principles of the Hebrew versification is known. There existed a certain kind of poetry among the Hebrews, principally intended, it should seem, for the assistance of the memory; in which, when there was little connexion between the sentiments, a sort of order or method was preserved, by the initial letters of each line or stanza following the order of the alphabet. Of this there are several examples extant among the sacred poems (Psalms xxv., xxxiv., xxxvii., cxl., cxli., cxlv.; Prov. xxxi., from the tenth verse to the end; the whole of the Lamentations of Jeremiah except the last chapter); and in these examples the verses are so exactly marked and defined that it is impossible to mistake them for prose; and particularly if we attentively consider the verses, and compare them with one another, since they are in general so regularly accommodated, that word answers to word, and almost syllable to syllable. The Hebrew poetry has likewise another property altogether peculiar to metrical composition. It admits foreign words, and certain particles which seldom occur in prose composition, and thus forms a distinct poetical dialect. One or two of the peculiarities also of the Hebrew versification are very observable in those poems in which the verses are defined by the initial letters. The first is that the verses are very unequal in length; the shortest consisting of six or seven syllables; the longest extending to about twice that number: the same poem is, however, generally continued throughout in verses not very unequal to each other. The close of the verse generally falls where the members of the sentences are divided. The ingenious Dr. Lowth has, however, with great acuteness, examined the peculiarities of Hebrew poetry, and has arranged them under general divisions. The correspondence of one verse or line with another he calls parallelism. When a proposition is delivered, and a second is subjoined to it, equivalent or contrasted with it in sense, or similar to it in the form of grammatical construction, these he calls parallel lines; and the words or phrases answering one to another in the corresponding lines, parallel terms. Parallel lines he reduces to three sorts; parallels synonymous, parallels antithetic, and parallels synthetic. For examples we refer to his work. The following arrangement of the Book of Psalms will be found useful in reading them. It is from the *Scripture Magazine*, vol. iii., but chiefly extracted from Mr. Townsend, the able author of a *Chronological Arrangement of the Old Testament*.

The book of PROVERBS has always been accounted canonical. The Hebrew title of it is מִשְׁלֵי, *Mishli*, which signifies similitudes. It has always been ascribed to Solomon, whose name it bears, though some have doubted whether he really was the author of every one of the maxims which it contains. Those in chapter xxx. are indeed called the words of Agur, the son of Jakeh, and the title of the thirty-first or last chapter is the words of king Lemuel. It seems certain that the collection called the Proverbs of Solomon was digested in the order in which we now have it by different hands; but it is not, therefore, to be concluded that they are not the work of Solomon. Several persons might have made collections of them: Hezekiah, among others, is mentioned c. xxv. Agur and Ezra might have done the same. From these several collections the work was compiled which we have now in our hands.

The book of Proverbs may be considered under five divisions. 1. The first, which is a kind of preface, extends to the tenth chapter. This contains general cautions and exhortations for a teacher to his pupil, expressed in elegant language, duly connected in its parts, illustrated with beautiful description, and well contrived to engage and interest the attention. 2. The second part extends from the beginning of c. x. to c. xxii. 17, and consists of what may strictly and properly be called proverbs, viz. unconnected sentences, expressed with much neatness and simplicity. They are truly, to use the language of their sage author, 'apples of gold in pictures of silver.' 3. In the third part, which is included between c. xxii. 16, and c. xxv., the tutor drops the sententious style, addresses his pupil as present, and delivers his advices in a connected manner. 4. The Proverbs which are included between c. xxv. and c. xxx. are supposed to have been selected by the men of Hezekiah from some larger collections of Solomon, that is, by the prophets whom he employed to restore the service and writings of the church. Some of the proverbs which Solomon had introduced into the former part of the book are here repeated. 5. The prudent admonitions which Agur delivered to his pupils Ithiel and Ucal are contained in the thirtieth chapter, and in the thirty-first are recorded the precepts which the mother of Lemuel delivered to her son. Several references are evidently made to the book of Proverbs by the writers of the New Testament. Rom. ix. 16. 20; 1 Peter iv. 8, v. 5; James iv.

The Proverbs of Solomon afford specimens of the didactic poetry of the Hebrews. They abound with antithetic parallels; for this form is peculiarly adapted to that kind of writing, to adages, aphorisms, and detached sentences. Indeed, the elegance, acuteness, and force of a great number of Solomon's wise sayings arise in a great measure from the antithetic form, the opposition of diction and sentiment.

The Hebrew title of the book called ECCLESIASTES is *Keleth*, that is, the gatherer or collector; and it is so called, either because the work itself is a collection of maxims, or because it was delivered to an assembly gathered together to hear them. The Greek term *Ecclesiastes* is of

the same import, signifying one who gathers together a congregation, or who discourses or preaches to an assembly convened. That Solomon was the author of this book is beyond all doubt; the beautiful description of the phenomena in the natural world, and their causes; of the circulation of the blood, as some think (see Horsley's Sermon before the Humane Society), and the economy of the human frame, shows it to be the work of a philosopher. At what period of his life it was written may be easily found out. The affecting account of the infirmities of old age which it contains is a strong indication that the author knew by experience what they were; and his complete conviction of the vanity of all earthly enjoyments proves it to have been the work of a penitent. Some passages in it seem, indeed, to express an epicurean notion of Providence. But it is to be observed that the author, in an academic way, disputes on both sides of the question; and at last concludes properly, that to 'fear God and keep his commandments is the whole duty of man; for God will bring every work to judgment.'

The general tenor and style of Ecclesiastes is very different from the book of Proverbs, though there are many detached sentiments and proverbs interspersed. For the whole work is uniform, and confined to one subject, namely, the vanity of the world exemplified by the experience of Solomon, who is introduced in the character of a person investigating a very difficult question, examining the arguments on either side, and at length disengaging himself from an anxious and doubtful disputation. The style of this work is singular; the language is generally low; it is frequently loose, unconnected, approaching to the incorrectness of conversation, and possesses very little of the poetical character, even in the composition and structure of the periods; which peculiarity may possibly be accounted for from the nature of the subject. Contrary to the opinion of the rabbies, Ecclesiastes has been classed among the poetical books; though authority and opinions might perhaps on this occasion deserve some attention.

THE SONG OF SONGS, or CANTICLES OF SOLOMON, forms one of the books of canonical Scripture mentioned by Josephus, and one book in the Jewish divisions of Scripture adopted by our Saviour and his apostles. The mystical meaning of this poem seems to afford the only reason for its insertion in the Jewish canon. Under the figure of a marriage is typified the intimate relation subsisting between Christ and his church; and the same figures found in this allegory have been transferred into the New Testament. See Matt. ix. 15, xxii. 2, xxv. 1—11; John iii. 29; 2 Cor. xi. 2; Eph. v. 23. 27; Rev. xix. 7. 9; xxii. 17. Dr. Good, whose excellent translation of this book of Scripture will afford much valuable aid in its perusal, considers it as a series of idyls, like the *cassides* of the poets of Arabia. Its style, as remarked by bishop Lowth, is of the pastoral kind, the two principal personages being represented in the character of shepherds. The manner in which the Song of Solomon has been interpreted by most expositors has had the effect of exposing it to unmerited

contempt. Not entering into the style and spirit of oriental poesy, they have given to some passages a coarse and indelicate appearance; and, not distinguishing between the literal and allegorical senses, they have destroyed the consistency and beauty of the poem, and bewildered the mind of the reader. To understand this part of Scripture requires not only a renewed heart and an enlightened mind, but a sober and cautious judgment. The spiritual senses must be exercised to discern clearly spiritual truths, and the imagination must be curbed by a reverential apprehension of the majesty and condescension of God. Among the Jews, it is said, they were not allowed to read it until they had attained the sacerdotal age of thirty years.

IV. *Of the prophetic writings of the Old Testament.*—The second of those great divisions under which the Jews classed the books of the Old Testament was that of the PROPHETS, which formerly comprehended sixteen books; and which we now consider last in order, according to their modern arrangement in our bibles. Although the greater part of the Psalms are prophetic, and the Song of Solomon is esteemed a prophetic allegory, yet, these writings being already taken notice of, we mean to restrict the subject of this section to the writings of the prophets, properly so called. The prophets were sixteen in number: Isaiah, Jeremiah, Ezekiel, Daniel, Hosea, Joel, Amos, Obadiah, Jonah, Micah, Nahum, Habakkuk, Zephaniah, Haggai, Zechariah, Malachi. The first four are called the greater prophets; the other twelve are denominated the minor prophets. The writings of the prophets are to Christians the most interesting part of the Old Testament; for they afford one of the most powerful arguments for the divine origin of the Christian religion. If we can only prove, therefore, that these prophecies were uttered a single century before the events took place to which they relate, their claim to inspiration is unquestionable. But we can do more; we can prove that the interval between their enunciation and accomplishment extended much farther, even to 500 or 1000 years, and in some cases much more.

The books of the prophets are mentioned by Josephus, and therefore surely existed in his time; they are also quoted by our Saviour under the general denomination of the prophets. We are informed by Tacitus and Suetonius that about sixty years before the birth of our Saviour there was a universal expectation in the east of a great personage who was to arise; and the source of this expectation is traced by the same writers to the sacred books of the Jews. They existed also in the time of Antiochus Epiphanes, A. C. 166; for when that tyrant prohibited the reading of the law, the books of the prophets were substituted in its place, and were continued as a part of the daily service after the interdict against the law of Moses was taken off. We remarked that references are made by the author of Ecclesiasticus, A. C. 200, to the writings of Isaiah, Jeremiah, and Ezekiel, and that he mentions the twelve prophets. We can ascend still higher, and assert, from the language of the prophets, that all their writings must have been com-

posed before the Babylonish captivity, or within a century after it; for all of them, except Daniel and Ezra, are composed in Hebrew, and even in them long passages are found in that language; but it is a well known fact that all the books written by Jews about two centuries after that era are composed in the Syriac or Chaldaic, or Greek language. 'Let any man,' says Michaelis, 'compare what was written in Hebrew after the Babylonish exile, and I apprehend he will perceive no less evident marks of decay than in the Latin language.' Even in the time of Ezra, the common people, from their long residence in Babylonia, had forgotten the Hebrew, and it was necessary for the learned to interpret the law of Moses to them. We can therefore ascertain with very considerable precision the date of the prophetic writings; which indeed is the only important point to be determined: for, if we can only establish their ancient date, we shall be fully entitled to draw this conclusion, that the predictions of the prophets are inspired.

Much has been written to explain the nature of inspiration, and to show by what methods God imparted to the prophets that divine knowledge which they were commanded to publish to their countrymen. But on this subject we shall not attempt to be wise above what is written. The manner in which the all-wise and unseen God may think proper to operate upon the minds of his creatures, we might expect a priori to be mysterious and inexplicable. The business of philosophy is not to enquire how almighty power produced the frame of nature, and bestowed upon it that beauty and grandeur which is every where conspicuous, but to discover those marks of intelligence and design, and the various purposes to which the works of nature are subservient. Philosophy has of late been directed to theology and the study of the Scriptures with the happiest effects; but it is not permitted to enter within the veil which the Lord of nature has thrown over his councils. Its province, which is sufficiently extensive, is to examine the language of the prophecies, and to discover their application.

The character of the prophetic style varies according to the genius, the education, and mode of living of the respective authors; but there are some peculiarities which run through the whole prophetic books. A plain unadorned style would not have suited those men who were to wrap the mysteries of futurity in a veil, which was not to be penetrated till the events themselves should be accomplished. For it was never the intention of prophecy to unfold futurity to our view, as many of the rash interpreters of prophecy fondly imagine; for this would be inconsistent with the free agency of man. It was therefore agreeable to the wisdom of God that prophecies should be couched in language which would render them unintelligible till the period of their completion; yet such a language as is distinct, regular, and would be easily explained when the events themselves should have taken place. This is precisely the character of the prophetic language. It is partly derived from the hieroglyphical symbols of Egypt, to which the Israelites during their servitude were fami-

liarized, and partly from that analogy which subsists between natural objects and those which are moral and political.

The prophets borrowed their imagery from the most splendid and sublime natural objects, from the host of heaven, from seas and mountains, from storms and earthquakes, and from the most striking revolutions in nature. The celestial bodies they used as symbols to express thrones and dignities, and those who enjoyed them. Earth was the symbol for men of low estate. Hades represents the miserable. Ascending to heaven, and descending to earth, are phrases which express rising to power, or falling from it. Great earthquakes, the shaking of heaven and earth, denote the commotions and overthrow of the kingdoms. The sun represents the whole race of kings shining with regal power and glory. The moon is the symbol of the common people. The stars are subordinate princes and great men. Light denotes glory, truth, or knowledge. Darkness expresses obscurity of condition, error, and ignorance. The darkening of the sun, the turning of the moon into blood, and the falling of the stars, signify the destruction or desolation of a kingdom. New moons, the returning of a nation from a dispersed state. Conflagration of the earth is the symbol for destruction by war. The ascent of smoke from any thing burning denotes the continuance of a people under slavery. Riding in the clouds signifies reigning over many subjects. Tempestuous winds, or motion of the clouds, denotes wars. Thunder denotes the noise of multitudes. Fountains of water express cities. Mountains and islands, cities with the territories belonging to them. Houses and ships stand for families, assemblies, and towns. A forest is put for a kingdom. A wilderness for a nation much diminished in its numbers. Animals, as a lion, bear, leopard, goat, are put for kingdoms or political communities corresponding to their respective characters. When a man or beast is put for a kingdom, the head represents those who govern, the tail those who are governed; the horns denote the number of military powers or states that rise from the head. Seeing signifies understanding; eyes, men of understanding; the mouth denotes a lawgiver; the arm of a man is put for power, or for the people by whose strength his power is exercised; feet represent the lowest of the people.

Such is the precision and regularity of the prophetic language, which we learn to interpret by comparing prophecies which are accomplished with the facts to which they correspond. So far is the study of it carried already that a dictionary has been composed to explain it; and it is probable that in a short time it may be so fully understood that we shall find little difficulty in explaining any prophecy. But let us not from this expect that the prophecies will enable us to penetrate the dark clouds of futurity: No! The difficulty of applying prophecies to their

corresponding events, before completion, will still remain insurmountable. Those men, therefore, however pious and well-meaning they may be, who attempt to explain and apply prophecies which are not yet accomplished, and who delude the credulous multitude by their own romantic conjectures, cannot be acquitted of rashness and presumption.

The predictions of the prophets, according to the opinion of Dr. Lowth, are written in a poetic style. They possess indeed all the characteristics of Hebrew poetry, with the single exception that none of them are alphabetical or acrostic, which is an artificial arrangement utterly repugnant to the nature of prophecy. The other arguments, however, ought to be particularly adverted to upon this subject; the poetic dialect for instance, the diction so totally different from the language of common life, and other similar circumstances, which an attentive reader will easily discover, but which cannot be explained by a few examples; for circumstances which, when taken separately, appear but of small account, are in a united view frequently of the greatest importance. To these we may add the artificial conformation of the sentences; which is a necessary concomitant of metrical composition, the only one indeed which is now apparent, as it has always appeared to us.

The order in which the books of the minor prophets are placed is not the same in the Septuagint as in the Hebrew. According to the latter, they stand as in our translation; but in the Greek the series is altered, as to the first six, to the following arrangement:—Hosea, Amos, Micah, Joel, Obadiah, Jonah. This change, however, is of no consequence, since, neither in the original nor in the Septuagint, are they placed with exact regard to the time in which their sacred authors respectively flourished. The order in which they should stand, if chronologically arranged, is by Blair and others supposed to be as follows:—Jonah, Amos, Hosea, Micah, Nahum, Joel, Zephaniah, Habakkuk, Obadiah, Haggai, Zechariah, Malachi. And this order will be found to be generally consistent with the periods to which the prophets will be respectively assigned in the following pages, except in the instance of Joel, who probably flourished rather earlier than he is placed by these chronologers. The precise period of this prophet, however, cannot be ascertained; and some disputes might be maintained concerning the priority of others also, when they were nearly contemporaries, as Amos and Hosea; and when the first prophecies of a latter prophet were delivered at the same time with, or previous to those of a prophet who was called earlier to the sacred office. The following scheme, however, in which also the greater prophets will be introduced, may enable the reader more accurately to comprehend the actual and relative periods in which they severally prophesied:—

THE PROPHETS in their supposed CHRONOLOGICAL ORDER, according to Blair's Tables, with some variations.

Prophets.	Years B. C.	Kings of Israel, Judah, Babylon, and Persia.
		Jehu and Jehoahaz.
		<i>Lloyd.</i>
Jonah	Between 856 and 784	Joash and Jeroboam II.
		<i>Blair.</i>
Amos	810 — 785	Uzziah and Jeroboam II.
Hosea	810 — 725	Uzziah and Jeroboam II., Jotham, and Ahaz, to the third year of Hezekiah.
Isaiah	810 — 638	Uzziah, Jotham, Ahaz, Hezekiah, and Manasseh.
Joel	810 — 660	Uzziah to Manasseh.
Micah	758 — 690	Jotham, Ahaz, Hezekiah, Pekah, and Hosea.
Nahum	720 — 698	Hezekiah.
Zephaniah	640 — 609	Josiah.
Jeremiah	628 — 586	Josiah, Jehoahaz, Jehoiakim, Jeconiah, Zedekiah, and Gedaliah.
Habakkuk	612 — 598	Jehoiakim.
Daniel	606 — 534	Nebuchadnezzar, Evilmerodach, Belshazzar, Cyaxares II. or Darius the Mede, Cyrus the Great.
Obadiah	588 — 583	Nebuchadnezzar.
Ezekiel	595 — 536	Nebuchadnezzar.
Haggai	520 — 518	Darius Hystaspis.
Zechariah	520 — 516	Darius Hystaspis.
Malachi	436 — 397	Ahasuerus or Artaxerxes.

ISAIAH is supposed to have entered upon the prophetic office in the last year of the reign of Uzziah, about 758 years A. C., and it is certain that he lived to the fifteenth or sixteenth year of Hezekiah. This makes the least possible term of the duration of his prophetic office about forty-eight years. The Jews say that Isaiah was put death in the reign of Manasseh, being sawn asunder with a wooden saw by the command of that tyrant, and this seems to be confirmed by St. Paul in Heb. xi. 37 (see ISAIAH). The time of the delivery of some of his prophecies is either expressly marked, or sufficiently clear from the history to which they relate. The date of a few others may be deduced from internal marks; from expressions, descriptions, and circumstances interwoven.

Isaiah, the first of the prophets both in order and dignity, abounds in such transcendent excellencies that he may be properly said to afford the most perfect mode of the prophetic poetry. He is at once elegant and sublime, forcible and ornamented; he unites energy with copiousness, and dignity with variety. In his sentiments there is uncommon elevation and majesty; in his imagery the utmost propriety, elegance, dignity, and diversity; in his language uncommon beauty and energy; and, notwithstanding the obscurity of his subjects, a surprising degree of clearness and simplicity. There is such sweetness in the poetical composition of his sentences that the native grace and harmony of the Hebrew poetry is chiefly to be found in the writings of Isaiah.

He greatly excels too in all the graces of method, order, connexion, and arrangement; though in asserting this we must not forget the nature of the prophetic impulse, which bears away the mind with irresistible violence, and frequently in rapid transitions from near to remote objects, from human to divine; we must also remark limits of particular predictions, since, as they are now extant, they are often improperly connected, without any marks of discrimination; which injudicious arrangement, on some occasions, creates almost insuperable difficulties. It is, in fact, a collection of different prophecies, nearly allied to each other as to the subject, which, for that reason, having a sort of connexion are not to be separated but with the utmost difficulty. The general subject is the restoration of the church. Its deliverance from captivity, the destruction of idolatry, the vindication of the divine power and truth, the consolation of the Israelites, the divine invitation to them, their incredulity, impiety, and rejection, the calling in of the Gentiles, the restoration of the chosen people, the glory and felicity of the church in its perfect state, and the ultimate destruction of the wicked—are all set forth with a sufficient respect to order and method. If we read these passages with attention, and duly regard the nature and genius of the mystical allegory, at the same time remembering that all these points have been frequently touched upon in other prophecies promulgated at different times, we shall neither find any irregularity in the arrangement of the whole, nor any want of order and connexion as to matter or sentiment in the different parts. Dr. Lowth esteems the whole book of Isaiah to be poetical, a few passages excepted, which would not exceed the bulk of five or six chapters. The fourteenth chapter of Isaiah is one of the most sublime odes in the Scripture, and contains one of the noblest personifications to be found in the records of poetry.

The prophet, after predicting the liberation of the Jews from their severe captivity in Babylon, and their restoration to their own country, introduces them as reciting a kind of triumphal song upon the fall of the Babylonish monarch, replete with imagery, and with the most elegant and animated personifications. A sudden exclamation, expressive of their joy and admiration on the unexpected revolution in their affairs and the destruction of their tyrants, forms the exordium of the poem. The earth itself triumphs with the inhabitants thereof; the fir-trees and the cedars of Lebanon (under which images the parabolic style frequently delineates the kings and princes of the Gentiles) exult with joy, and persecute with contemptuous reproaches the humbled power of a ferocious enemy.

How forcible is this imagery, how diversified, how sublime! how elevated the diction, the figures, the sentiments! The Jewish nation, the cedars of Lebanon, the ghosts of departed kings, the Babylonish monarch, the travellers who find his corpse, and, last of all, Jehovah himself, are the characters which support this beautiful lyric drama. One continued action is kept up, or rather a series of interesting actions are connected together in an incomparable whole. This

indeed is the principal and distinguished excellence of the sublimer ode, and is displayed in its utmost perfection in this poem of Isaiah, which may be considered as one of the most ancient, and certainly the most finished specimens of that species of composition which has been transmitted to us. The personifications here are frequent, yet not confused; bold, yet not improbable; a free, elevated, and truly divine spirit, pervades the whole: nor is there any thing wanting in this ode to defeat its claim to the character of perfect beauty and sublimity. 'If,' says Dr. Lowth, 'I may be indulged in the free declaration of my own sentiments, I do not know a single instance, in the whole compass of Greek and Roman poetry, which, in every excellence of composition, can be said to equal, or even approach it.' But though we cordially agree with Dr. Lowth, in the encomiums he bestows on the poetical beauties of this inspired prophet, we must observe that his chief merit lies in something of much superior value. The great, the infinite value of Isaiah's writings to the Christian consists in this, that his prophecies abound with the clearest and most accurate descriptions of the birth, life, and humiliations, preaching, miracles, propitiatory sufferings, death, resurrection, and divine character of our Saviour, of any of the whole inspired writings; insomuch that this prophet has been justly styled the evangelical prophet. Without this pre-eminent merit, all the beauties of his style and imagery would be of no more importance to mankind than those in Homer, Virgil, or Milton.

JEREMIAH was called to the prophetic office in the thirteenth year of the reign of Josiah the son of Amon, A. M. 3376, A. C. 628, and continued to prophecy upwards of forty years, during the reigns of the degenerate princes of Judah, to whom he boldly threatened those marks of the divine vengeance which their rebellious conduct drew on themselves and their country. After the destruction of Jerusalem by the Chaldeans, he was suffered by Nebuchadnezzar to remain in the desolate land of Judea to lament the calamities of his infatuated countrymen. He was afterwards, as he informs us, carried with his disciple Baruch into Egypt, by Johanan the son of Kareah. It appears from several passages that Jeremiah committed his prophecies to writing. In the thirty-sixth chapter we are informed that the prophet was commanded to write upon a roll all the prophecies which he had uttered; and, when the roll was destroyed by Jehoiakim the king, Jeremiah dictated the same prophecies to Baruch, who wrote them, together with many additional circumstances. The works of Jeremiah extend to the last verse of the fifty-first chapter, in which we have these words:—'Thus far are the words of Jeremiah.' The fifty-second chapter was therefore added by some other writer. It is, however, a very important supplement, as it illustrates the accomplishment of Jeremiah's prophecies respecting the fate of Zedekiah.

The prophecies of Jeremiah are not arranged in the chronological order in which they were delivered. What has occasioned this transposi-

tion cannot now be determined. It is generally maintained that, if we consult their dates, they ought to be thus placed:—In the reign of Josiah, the first twelve chapters. In the reign of Jehoiakim, chapters xiii., xx., xxi., xiv. 11, 14, xxii., xxiii., xxv., xxvi., xxxv., xxxvi., xlv.—xlix. 1—33. In the reign of Zedekiah, chap. xxi. 1—10, xxiv., xxxvii., xxxiv., xxxviii., xxxix., xlix., 34—39, l. and li. Under the government of Gedaliah, chapters xl. xlv. The prophecies which related to the Gentiles were contained in the forty-sixth and five following chapters, being placed at the end, as in some measure unconnected with the rest. But in some copies of the Septuagint these six chapters follow immediately after the thirteenth verse of the twenty-fifth chapter.

Jeremiah, though deficient neither in elegance nor sublimity, must give place in both to Isaiah. Jerome seems to object against him a sort of rusticity of language, no vestige of which Dr Lowth was able to discover. His sentiments indeed, are not always the most elevated; nor are his periods always neat and compact; but these are faults common to those writers whose principal aim is to excite the gentler affections, and to call forth the tear of sympathy or sorrow. This observation is strongly exemplified in the Lamentations, where these are the prevailing passions; it is, however, frequently instanced in the prophecies of this author, and most of all in the beginning of the book, which is chiefly poetical. The middle of it is almost entirely historical. The latter part, again, consisting of the last six chapters, is altogether poetical; it contains several different predictions, which are distinctly marked; and in these the prophet approaches very near the sublimity of Isaiah. On the whole, however, not above half the book of Jeremiah is poetical.

The book of LAMENTATIONS, as we are informed in the title, was composed by Jeremiah. We shall present to our reader an account of this elegiac poem from the elegant pen of Dr. Lowth. 'The Lamentations of Jeremiah (for the title is properly and significantly plural) consist of a number of plaintive effusions, composed upon the plan of the funeral dirges, all upon the same subject, and uttered without connexion as they rose in the mind, in a long course of separate stanzas. These have afterwards been put together, and formed into a collection or correspondent whole. If any reader, however, should expect to find in them an artificial and methodical arrangement of the general subject, a regular disposition of the parts, a perfect connexion and orderly succession in the matter, and with all this an uninterrupted series of elegance and correctness, he will really expect what was foreign to the prophet's design. In the character of a mourner, he celebrates, in plaintive strains, the obsequies of his ruined country; whatever presented itself to his mind in the midst of desolation and misery, whatever struck him as particularly wretched and calamitous, whatever the instant sentiment of sorrow dictated, he pours forth in a kind of spontaneous effusion. He frequently pauses, and, as it were, ruminates upon the same object; frequently varies and

illustrates the same, though with different imagery, and a different choice of language; so that the whole bears rather the appearance of an accumulation of corresponding sentiments, than an accurate and connected series of different ideas, arranged in the form of a regular treatise. There is, however, no wild incoherency in the poem; the transitions are easy and elegant.

The work is divided into five parts; in the first, second, and fourth chapters, the prophet addresses the people in his own person, or introduces Jerusalem as speaking. In the third a chorus of the Jews is represented. In the fifth the whole captive Jews pour forth their united complaints to Almighty God. Each of these five parts is distributed into twenty-two stanzas, according to the number of the letters of the alphabet. In the first three chapters these stanzas consist of three lines. In the first four chapters the initial letter of each period follows the order of the alphabet; and in the third chapter each verse of the same stanza begins with the same letter. In the fourth chapter all the stanzas are evidently distichs, as also in the fifth, which is not acrostic. The intention of the acrostic was to assist the memory to retain sentences not much connected. It deserves to be remarked that the verses of the first four chapters are longer by almost one-half than Hebrew verses generally are: the length of them seems to be on an average about twelve syllables. The prophet appears to have chosen this measure as being solemn and melancholy.

That the subject of the Lamentations is the destruction of the holy city and temple, the overthrow of the state, the extermination of the people; and that these events are described as actually accomplished, and not in the style of prediction merely, must be evident to every reader; though some authors of considerable reputation (Josephus, Jerome, Usher, &c.) have imagined this poem to have been composed on the death of king Josiah. The prophet, indeed, has so copiously, so tenderly, and poetically bewailed the misfortunes of his country, that he seems completely to have fulfilled the office and duty of a mourner. In my opinion, there is not extant any poem which displays such a happy and splendid selection of imagery in so concentrated a state. What can be more elegant and poetical than the description of that once flourishing city, lately chief among the nations, sitting in the character of a female, solitary, afflicted, in a state of widowhood, deserted by her friends, betrayed by her dearest connexions, imploring relief, and seeking consolation in vain? What a beautiful personification is that of the 'ways of Sion, mourning because none are come to her solemn feasts!' How tender and pathetic are the complaints! See chap. i. 12—16.

EZEKIEL was carried to Babylon as a captive, and received the first revelations from heaven, in the fifth year of Jehoiakim's captivity, A. C. 595. The book of Ezekiel is sometimes distributed under different heads. In the first three chapters the commission of the prophet is described. From the fourth to the thirty-second, inclusive, the calamities that befel the enemies of the Jews are predicted, viz. the Ammonites, the Moabites,

and Philistines. The ruin of Tyre and of Sidon, and the fall of Egypt, are particularly foretold; prophecies which have been fulfilled in the most literal and astonishing manner, as we have been often assured by the relation of historians and travellers. From the thirty-second chapter to the fortieth, he inveighs against the hypocrisy and murmuring spirit of his countrymen, admonishing them to resignation by promises of deliverance. In the thirty-eighth and thirty-ninth chapters he undoubtedly predicts the final return of the Jews from their dispersion in the latter days, but in a language so obscure that it cannot be understood till the event take place. The last nine chapters of this book furnish the descriptions of a very remarkable vision of a new temple and city, of a new religion and polity.

Ezekiel is much inferior to Jeremiah in elegance; in sublimity he is not even excelled by Isaiah; but his sublimity is of a totally different kind. He is deep, vehement, tragical; the only sensation he affects to excite is the terrible; his sentiments are elevated, fervid, full of fire, indignant; his imagery is crowded, magnificent, terrific; his language is pompous, solemn, austere, rough, and at times unpolished; he employs frequent repetitions, not for the sake of grace or elegance, but from the vehemence of passion or indignation. Whatever subject he treats of, that he sedulously pursues, from that he rarely departs, but cleaves as it were to it; whence the connexion is in general evident and well preserved. In many respects he is perhaps excelled by the other prophets; but in that species of composition to which he seems by nature adapted, the forcible, the impetuous, the great and solemn, not one of the sacred writers is superior to him. His diction is sufficiently perspicuous; all his obscurity consists in the nature of the subject. Visions (as for instance, among others, those of Hosea, Amos, and Jeremiah) are necessarily dark and confused. The greater part of Ezekiel, towards the middle of the book especially, is poetical, whether we regard the matter or the diction. His periods, however, are frequently rude and incompact. Isaiah, Jeremiah, and Ezekiel, as far as relates to style, may be said to hold the same rank among the Hebrews as Homer, Simonides, and Æschyles, among the Greeks.

A pretty full account of DANIEL and his writings has been already given under that article. Daniel flourished during the reign of five Babylonish kings from Nebuchadnezzar to Belshazzar, until the conquest of Babylon by Cyrus. The events recorded in the sixth chapter were contemporary with Darius the Mede; but in the seventh and eighth chapters Daniel returns to an earlier period, to relate the visions which he beheld in the first three years of Belshazzar's reign; and those which follow in the last four chapters were revealed to him in the reign of Darius; except the tenth, which is expressly dated in the third year of Cyrus, and records his glorious vision of the Messiah, who therein styles him 'a man greatly beloved.' But the last six chapters are all connected as parts of one great scheme. They extend through many ages, and furnish the most striking description of the fall of successive

kingdoms, which were to be introductory to the establishment of the Messiah's reign. They characterise in descriptive terms the four great monarchies of the world to be succeeded by 'that kingdom which shall never be destroyed.' See Dan. ii. 44, and MONARCHY.

The whole book of Daniel being a plain relation of facts, partly past and partly future, admits not of poetical beauties. Much indeed of the parabolic imagery is introduced in that book; but the author introduces it as a prophet only; as visionary and allegorical symbols of objects and events, totally untinctured with the true poetical coloring. The Jews, indeed, refuse to Daniel even the character of a prophet; but their arguments for this opinion are futile, trifling, absurd, and totally destitute of scriptural authority.

The prophecies of Daniel appear so plain and intelligible, after their accomplishment, that Porphyry, who wrote in the third century, affirms that they were written after the events to which they refer took place. A little reflection will show the absurdity of this supposition. Some of the prophecies of Daniel clearly refer to Antiochus Epiphanes, with whose oppressions the Jews were too well acquainted. Had the book of Daniel not made its appearance till after the death of Epiphanes, every Jew who read it must have discovered the forgery. And what motive could have induced them to receive it among their sacred books? It is impossible to conceive one. Their character was quite the reverse; their respect for the Scriptures had degenerated into superstition. But we are not left to determine this important point from the character of the Jews; we have access to more decisive evidence; we are sure that the book of Daniel contains prophecies, for some of them have been accomplished since the time of Porphyry; particularly those respecting Antichrist; some of them seem to be at present fulfilling; and others will evidently not be fulfilled till near the final consummation of all sublunary things; of which, indeed, his concluding verses seem to point out the period. Dan. xii. 11, 12.

The language in which the book of Daniel is composed proves that it was written about the time of the Babylonish captivity. Part of it is pure Hebrew; a language in which none of the Jewish books were composed after the age of Epiphanes. These are arguments to a deist. To a Christian the internal marks of the book itself will show the time in which it was written, and the testimony of Ezekiel will prove Daniel to have been at least his contemporary. See Ezek. xiv. 14, xxviii. 3.

The *twelve minor prophets* were so called, not from any supposed inferiority in their writings, but on account of the small size of their works. Perhaps it was for this reason that the Jews joined them together, and considered them as one volume. These twelve prophets present in scattered hints a lively sketch of many particulars relative to the history of Judah and of Israel, as well as of other kingdoms; they prophesy with historical exactness the fate of Babylon, of Nineveh, of Tyre, of Sidon, and of Damascus. The last three prophets especially illustrate many cir-

cumstances at a period when the historical pages of Scripture are closed, and when profane writers are entirely wanting. At first the Jewish prophets appeared only as single lights, and followed each other in individual succession; but they became more numerous about the time of the captivity. The light of inspiration was collected into one blaze, previous to its suspension; and it served to keep alive the faith and hopes of the Jews during the awful interval which prevailed between the expiration of prophecy and its grand completion in the advent of Christ.

Hosea has been supposed the most ancient of the twelve minor prophets. He flourished in the reign of Jeroboam II. king of Israel, and during the successive reigns of Uzziah, Jotham, Ahaz, and Hezekiah, kings of Judah. He was therefore nearly contemporary with Isaiah, Amos, and Jonah. Hosea is the first in order of the minor prophets, and is perhaps, Jonah excepted, the most ancient of them all. His style exhibits the appearance of very remote antiquity; it is pointed, energetic, and concise. It bears a distinguished mark of poetical composition, in that pristine brevity and condensation which is observable in the sentences, and which latter writers have in some measure neglected. This peculiarity has not escaped the observation of Jerome: 'He is altogether,' says he, 'laconic and sententious.' But this very circumstance, which anciently was supposed no doubt to impart uncommon force and elegance, in the present ruinous state of the Hebrew literature, is productive of so much obscurity, that, although the general subject of this writer be sufficiently obvious, he is the most difficult and perplexed of all the prophets. There is, however, another reason for the obscurity of his style: Hosea prophesied during the reigns of the four kings of Judah, Uzziah, Jotham, Ahaz, and Hezekiah. The duration of his ministry, therefore, in whatever manner we calculate, must include a very considerable space of time. We have now only a small volume of his remaining, which seems to contain his prophecies; and these are extant in a continued series, with no marks of distinction as to the times in which they were published, or the subjects of which they treat.

Concerning the date of the prophecy of JOEL there are various conjectures. The book itself affords nothing by which we can discover when the author lived, or upon what occasion it was written. Joel speaks of a great famine, and of mischiefs that happened in consequence of an inundation of locusts; but nothing can be gathered from such general observations to enable us to fix the period of his prophecy. St. Jerome thinks (and it is the general opinion) that Joel was contemporary with Hosea. Calmet places him under the reign of Josiah, at the same time with Jeremiah, and thinks it probable that the famine to which Joel alludes is the same with that which Jeremiah predicted, chap. viii. 13.

The style of Joel is essentially different from that of Hosea; but the general character of his diction, though of a different kind, is not less poetical. He is elegant, perspicuous, copious, and fluent; he is also sublime, animated, and energetic. In the first and second chapters he

displays the full force of the prophetic poetry, in metaphors, allegories, and comparisons. Nor is the connexion of the matter less clear and evident than the complexion of the style; this is exemplified in the display of the impending evils which gave rise to the prophecy; the exhortation to repentance; the promises of happiness and success, both terrestrial and eternal, to those who become truly penitent; the restoration of the Israelites; and the vengeance to be taken of their adversaries. But, while we allow this just commendation to his perspicuity, we must not deny that there is sometimes great obscurity in his subjects. His prophecy of the plague of locusts is described with great sublimity of expression. See chap. i. 6, 7, 10, &c.

Amos was contemporary with Hosea. They both began to prophesy during the reigns of Uzziah over Judah, and of Jeroboam II. over Israel. Amos saw his first vision two years before the earthquake, which Zechariah informs us happened in the days of Uzziah. See Amos.

Amos was no prophet (as he informed Amaziah), neither was he a prophet's son, that is, he had no regular education in the schools of the prophets. The prophecies of Amos consist of several distinct discourses, which chiefly respect the kingdom of Israel; yet sometimes the prophet inveighs against Judah, and threatens the adjacent nations, the Syrians, Philistines, Tyrians, Edomites, Ammonites, and Moabites. Mr. Locke has observed that the comparisons of this prophet are chiefly drawn from lions and other animals with which he was most accustomed; but the finest images and allusions are drawn from scenes of nature. There are many beautiful passages in the writings of Amos.

The writings of OBADIAH, which consist of one chapter, are composed with much beauty, and unfold a very interesting scene of prophecy. Of this prophet little can be said, as the specimen of his genius is so short, and the greater part of it included in one of the prophecies of Jeremiah. Compare Ob. 1—9 with Jer. xlix. 14, 15, 16. See OBADIAH.

Though JONAH be placed the sixth in order of the minor prophets, both in the Hebrew and Septuagint, he is generally considered as the most ancient of all the prophets, not excepting Hosea. He lived in the kingdom of Israel, and prophesied to the ten tribes under Joash and Jeroboam. The book of Jonah is chiefly historical, and contains nothing of poetry but the prayer of the prophet. The sacred writers, and our Lord himself, speak of Jonah as a prophet of considerable eminence. See JONAH, and Matt. xii. 39, 41, xvi. 4, and Luke xi. 29.

MICAH began to prophesy soon after Isaiah, Hosea, Joel, and Amos; and he prophesied between A. M. 3246, when Jotham began to reign, and A. M. 3305, when Hezekiah died. One of his predictions saved the life of Jeremiah, who under the reign of Jehoiakim would have been put to death for prophesying the destruction of the temple, had it not appeared that Micah had foretold the same thing under Hezekiah about 100 years before. Joseph. Antiq. lib. x. c. 7, Mic. iii. 12. Micah is mentioned as a prophet in the book of Jeremiah and in Matt. ii. 5;

John vii. 42. He is imitated by succeeding prophets, as he himself had borrowed expressions from his predecessors. Our Saviour himself spoke in the language of this prophet. See Micah, vii. 6, and Matt. x. 33, 36. The style of Micah is for the most part close, forcible, pointed, and concise; sometimes approaching the obscurity of Hosea; in many parts animated and sublime; and in general truly poetical. In his prophecies there is an elegant poem, which Dr. Lowth thinks is a citation from the answer of Balaam to the king of the Moabites. See chap. vi. 6—8.

Josephus asserts that NABUM lived in the time of Jotham king of Judah; in which case he may be supposed to have prophesied against Nineveh when Tiglath-Pileser king of Assyria carried captive the natives of Galilee and other parts, about A. M. 3264. It is however probable that his prophecies were delivered in the reign of Hezekiah; for he appears to speak of the taking of No-Ammon, a city of Egypt, and of the insolent messengers of Sennacherib, as of things past; and he describes the people of Judah as still in their own country, and desirous of celebrating their festivals. While Jerusalem was threatened by Sennacherib, Nahum promised deliverance to Hezekiah, and predicted that Judah would soon celebrate her solemn feasts secure from invasion, as her enemy would no more disturb her peace. In the second and third chapters Nahum foretells the downfall of the Assyrian empire and the final destruction of Nineveh, which was probably accomplished by the Medes and Babylonians, whose combined forces overpowered the Assyrians by surprise, 'while they were folded together as thorns, and while they were drunken as drunkards,' when the gates of the river were opened, the palace demolished, and an 'over-running flood' assisted the conquerors in their devastation; who took an endless store of spoil of gold and silver, making an utter end of Nineveh, that vast and populous city, whose walls were 100 feet high, and so broad that three chariots could pass abreast. Yet, so completely was this celebrated city destroyed, that even in the second century the spot on which it stood could not be ascertained, every vestige of it being gone. It is impossible to read of the exact accomplishment of the prophetic denunciations against the enemies of the Jews, without reflecting on the astonishing proofs which that nation enjoyed of the divine origin of their religion. From the Babylonish captivity to the time of Christ they had numberless instances of the fulfilment of their prophecies. 'None of the minor prophets,' says Dr. Lowth, 'seem to equal Nahum in boldness, ardor, and sublimity. His prophecy, too, forms a regular and perfect poem; the exordium is not merely magnificent, it is truly majestic; the preparation for the destruction of Nineveh, and the description of its downfall and desolation, are expressed in the most vivid colors, and are bold and luminous in the highest degree.'

As the prophet HABAKKUK makes no mention of the Assyrians, and speaks of the Chaldean invasions as near at hand, he probably lived after the destruction of the Assyrian empire in the

fall of Nineveh, A. M. 3392, and not long before the devastation of Judea by Nebuchadnezzar. Habakkuk then was nearly contemporary with Jeremiah, and predicted the same events. A general account of Habakkuk's prophecies have already been given under the article HABAKKUK. The prayer in the third chapter is a most beautiful and perfect ode, possessing all the fire of poetry, and the profound reverence of religion. The prophet illustrates his subject throughout with great sublimity; selecting an assemblage of miraculous incidents the most noble and important, displaying them in the most splendid colors, and embellishing them with the sublimest imagery, figures, and diction, the dignity of which is heightened and recommended by the superior elegance of the conclusion. Habakkuk is imitated by succeeding prophets, and his words are borrowed by the evangelical writers. Heb. x. 37, 38; Rom. i. 17; Gal. iii. 2; Acts xiii. 41; compare with Hab. i. 5.

ZEPHANIAH, who was contemporary with Jeremiah, prophesied in the reign of Josiah king of Judah; and, from the idolatry which he describes as prevailing at that time, it is probable that his prophecies were delivered before the last reformation made by that pious prince, A. M. 3381. The account which Zephaniah and Jeremiah give of the idolatries of their age is so similar that St. Isidore asserts that Zephaniah abridged the descriptions of Jeremiah. But it is more probable that the prophecies of Zephaniah were written some years before those of his contemporary; for Jeremiah seems to represent the abuses as partly removed which Zephaniah describes as flagrant and excessive. In the first chapter Zephaniah denounces the wrath of God against the idolaters who worshipped Baal and the host of heaven, and against the violent and deceitful. In the second he threatens destruction to the Philistines, the Moabites, the Ammonites, and Ethiopians; and describes the fate of Nineveh in emphatic terms. In the third he inveighs against the pollutions and oppressions of the Jews; and concludes with the promise, 'That a remnant would be saved, and that multiplied blessings would be bestowed upon the penitent.' The style of Zephaniah is poetical, but is not distinguished by any peculiar elegance or beauty, though generally animated and impressive.

HAGGAI was the first who flourished among the Jews after the Babylonish captivity. He began to prophesy in the second year of Darius Hystaspis, about 520 years B. C. The intention of his prophecy was to encourage the dispersed Jews to proceed with the building of the temple. The only prediction mentioned refers to the Messiah, who, the prophet assures his countrymen, would fill the new temple with glory. So well was this prediction understood by the Jews that they looked with earnest expectation for the Messiah's appearing in this temple till it was destroyed by the Romans. But, as the victorious Messiah whom they expected did not appear, they have since applied the prophecy to a third temple, which they hope to see reared in some future period. The style of Haggai, in the opinion of Dr. Lowth, is prosaic. Dr. Newcome thinks that a great part of it is poetical.

ZECHARIAH was undoubtedly a contemporary of Haggai, and began to prophesy two months after him, in the eighth month of the second year of Darius Hystaspis, A. M. 3484, being also commissioned to exhort the Jews to proceed in the building of the temple, after the interruption which the work had suffered. We are informed by Ezra (vi. 14) that the Jews prospered through the prophesying of Zechariah and Haggai.

Zechariah begins with general exhortations to his countrymen, exciting them to repent from the evil ways of their fathers, whom the prophets had admonished in vain. He describes angels of the Lord interceding for mercy on Jerusalem and the desolate cities of Judah, which had experienced the indignation of the Most High for seventy years, while the neighbouring nations were at peace. He declares that the house of the Lord should be built in Jerusalem, and that Zion should be comforted. The prophet then represents the increase and prosperity of the Jews under several typical figures. He describes the establishment of the Jewish government, and the coming of the Messiah. He admonishes those who observed solemn fasts without due contrition, to execute justice, mercy, and compassion, every man to his brother; not to oppress the widow nor the fatherless, the stranger nor the poor. He promises that God would again show favor to Jerusalem; that their mournful fasts should be turned into cheerful feasts; and that the church of the Lord should be enlarged by the accession of many nations. The twelfth verse of the eleventh chapter of this book, which exhibits a prophetic description of some circumstances afterwards fulfilled in our Saviour, appears to be cited by St. Matthew (xxvii. 9, 10) as spoken by Jeremiah; and as the eleventh, twelfth, and thirteenth chapters have been thought to contain some particulars more suitable to the age of Jeremiah than to that of Zechariah, some learned writers are of opinion that they were written by the former prophet, and have been, from similarity of subject, joined by mistake to those of Zechariah. But others are of opinion that St. Matthew might allude to some traditional prophecy of Jeremiah, or, what is more probable, that the name of Jeremiah was substituted, by mistake, in place of Zechariah. The twelfth, thirteenth, and fourteenth chapters, contain prophecies which refer entirely to the Christian dispensation; the circumstances attending which he describes with a clearness which indicated their near approach. The style of Zechariah is so similar to that of Jeremiah that the Jews were accustomed to remark that the spirit of Jeremiah had passed into him. He is generally prosaic till towards the conclusion of his work, when he becomes more elevated and poetical. The whole is beautifully connected by easy transitions, and present and future scenes are blended with the greatest delicacy.

MALACHI was the last prophet that flourished under the Jewish dispensation; but neither the time in which he lived, nor any particulars of his history, can now be ascertained. It is even uncertain whether the word מלאכי, Malachi, be a proper name, or denote, as the Septuagint have rendered it, his angel, that is, 'the angel of the

Lord.' Origen supposed that Malachi was an angel incarnate, and not a man. As it appears, from the concurring testimony of all the ancient Jewish and Christian writers, that the light of prophecy expired in Malachi, we may suppose that the termination of his ministry coincided with the accomplishment of the first seven weeks of Daniel's prophecy, which was the period appointed for sealing the vision and prophecy. This, according to Prideaux, took place in A. M. 3595; but, according to bishop Lloyd, in A. M. 3607, twelve years later. Whatever reckoning we prefer, it must be allowed that Malachi completed the canon of the Old Testament 400 years B. C. It appears certain that Malachi prophesied under Nehemiah, and after Haggai and Zechariah, at a time when great disorders remained among the priests and people of Judah, which are reproved by Malachi. He inveighs against the priests (i. 6, &c.; ii. 1, 2, &c.); he reproaches the people with having taken strange wives (ii. 11); he reproves them for their inhumanity towards their brethren (ii. 10, iii. 5); their too frequently divorcing their wives; their neglect of paying their tithes and first fruits (Mal. iii. 13). He seems to allude to the covenant that Nehemiah renewed with the Lord (iii. 10, and ii. 4, 5, &c.), assisted by the priests and the chief of the nation. He speaks of the sacrifice of the new law, and of the abolition of those of the old, in chap. i. 10—13. He declares that the Lord was weary with the impiety of Israel; and assures them that the Lord whom they sought should suddenly come to his temple, preceded by the messenger of the covenant, who was to prepare his way; that the Lord, when he appeared, should purify the sons of Levi from their unrighteousness, and refine them as metal from the dross; and that then the offering of Judah, the spiritual sacrifice of the heart, should be pleasant to the Lord. The prophet, like one who was delivering a last message, denounces destruction against the impenitent in emphatic and alarming words. He encourages those who feared the name of the Lord with the animating promise, that the 'Sun of Righteousness should arise with salvation in his rays,' and render them triumphant over the wicked. And now that prophecy was to cease, and miracles were no more to be performed till the coming of the Messiah—now that the Jews were to be left to the guidance of their own reason, and the written instructions of their prophets—Malachi exhorts them to remember the law of Moses, which the Lord had revealed from Horeb for the sake of all Israel. At length he seals up the prophecies of the Old Testament, by predicting the commencement of the new dispensation, which should be ushered in by John the Baptist, with the power and spirit of Elijah; who should turn the hearts of fathers and children to repentance; but, if his admonitions should be rejected, that the Lord would smite the land with a curse.

PART II.

OF THE NEW TESTAMENT.

INTRODUCTION.—*Of the authenticity and inspiration of the Scriptures of the New Testament.*—The collection of writings composed after the

ascension of Christ, and acknowledged by his followers to be divine, is known in general by the name of *Καὴν Διαθήκη*. This title, though neither given by divine command nor applied to these writings by the apostles, was adopted in a very early age, though the precise time of its introduction is uncertain, it being justified by several passages in Scripture, and warranted by the authority of St. Paul in particular, who calls the sacred books before the time of Christ *παλαια διαθήκη*. Even long before that period, either the whole of the Old Testament, or the five books of Moses, were entitled *βιβλιον διαθηκης*, or book of the covenant; 1 Mac. i. 57.

As the word *διαθήκη* admits of a two-fold interpretation, we may translate this title either the New Covenant or the New Testament. The former translation must be adopted, if respect be had to the texts of Scripture from which the name is borrowed, since those passages evidently convey the idea of a covenant; and, besides, a being capable of death can neither have made an old, nor make a new testament. It is likewise probable that the earliest Greek disciples, who made use of this expression, had no other notion in view than that of covenant. We, on the contrary, are accustomed to give this sacred collection the name of Testament; and since it would be not only improper, but even absurd, to speak of the Testament of God, we commonly understand the Testament of Christ; an explanation which removes but half the difficulty, since the new only, and not the old, had Christ for its testator.

In stating the evidence for the truth of Christianity, there is nothing more worthy of consideration than the authenticity of the books of the New Testament. This is the foundation on which all other arguments rest; and, if it is solid, the Christian religion is fully established. The proofs for the authenticity of the New Testament have this peculiar advantage that they are plain and simple, and involve no metaphysical subtleties. Every man who can distinguish truth from falsehood must see their force; and if there are any so blinded by prejudice, or corrupted by licentiousness, as to attempt by sophistry to elude them, their sophistry will be easily detected by every man of common understanding who has read the historical evidence with candor and attention. Instead, therefore, of declaiming against the infidel, we solicit his attention to this subject, convinced that, where truth resides, it will shine with so constant and clear a light that the combined ingenuity of all the deists since the beginning of the world will never be able to extinguish or to obscure it. If the books of the New Testament are really genuine, opposition will incite the Christian to bring forward the evidence; and thus, by the united efforts of the deist and the Christian, the arguments will be stated with all the clearness and accuracy of which they are susceptible in so remarkable a degree. It is surprising that the enemies of Christianity have not always made their first attacks in this quarter; for if they admit that the writings of the New Testament are as ancient as we affirm, and composed by the persons to

whom they are ascribed, they must allow, if they reason fairly, that the Christian religion is true.

The apostles allude frequently in their epistles to the gift of miracles, which they had communicated to the Christian converts by the imposition of hands, in confirmation of the doctrine delivered in their speeches and writings, and sometimes to miracles which they themselves had performed. Now, if these epistles are really genuine, it is hardly possible to deny those miracles to be true. The case is here entirely different from that of an historian, who relates extraordinary events in the course of his narrative, since either credulity or an actual intention to deceive may induce him to describe as true a series of falsehoods respecting a foreign land or distant period. Even to the evangelists might an adversary of the Christian religion make this objection: but to write to persons with whom we stand in the nearest connexion, 'I have not only performed miracles in your presence, but have likewise communicated to you the same extraordinary endowments,' to write in this manner, if nothing of the kind had ever happened, would require such an incredible degree of effrontery that he who possessed it would not only expose himself to the utmost ridicule, but, by giving his adversaries the fairest opportunity to detect his imposture, would ruin the cause which he attempted to support.

St. Paul's First Epistle to the Thessalonians is addressed to a community, to which he had preached the gospel only three Sabbath days, when he was forced to quit it by the persecution of the populace. In this epistle he appeals to the miracles which he had performed, and to the gifts of the Holy Spirit which he had communicated. Now is it possible, without forfeiting all pretensions to common sense, that, in writing to a community which he had lately established, he could speak of miracles performed, and gifts of the Holy Ghost communicated, if no member of the society had seen the one, or received the other? To suppose that an impostor could write to the converts or adversaries of the new religion such epistles as these, with a degree of triumph over his opponents, and yet maintain his authority, implies ignorance and stupidity hardly to be believed. Credulous as the Christians have been in later ages, and even so early as the third century, no less severe were they in their enquiries, and guarded against deception, at the introduction of Christianity. This character is given them even by Lucian, a writer of the second century, who vented his satire not only against certain Christians, who had supplied Peregrinus with the means of subsistence, but also against heathen oracles and pretended wonders. He relates of his impostor (Pseudomantis) that he attempted nothing supernatural in the presence of the Christians and Epicureans. This Pseudomantis exclaims before the whole assembly, 'away with the Christians, away with the Epicureans, and let those only remain who believe in the Deity (*πιστευαντες τω Θεω*)!' upon which the populace took up stones to drive away the suspicious; while the other philosophers, Pythagoreans, Platonists, and Stoics, as credu-

lous friends and protectors of the cause, were permitted to remain.

It is readily acknowledged that the arguments drawn from the authenticity of the New Testament only establish the truth of the miracles performed by the apostles, and are not applicable to the miracles of our Saviour; yet, if we admit the three first gospels to be genuine, the truth of the Christian religion will be proved from the prophecies of Jesus. For if these gospels were composed by Matthew, Mark, and Luke, at the time in which all the primitive Christians affirm, that is, previous to the destruction of Jerusalem, they must be inspired; for they contain a circumstantial prophecy of the destruction of Jerusalem, and determine the period at which it was accomplished. Now it was impossible that human sagacity could foresee that event; for when it was predicted nothing was more improbable. The Jews were resolved to avoid an open rebellion, well knowing the greatness of their danger, and submitted to the oppressions of their governors in the hope of obtaining redress from the court of Rome. The circumstance which gave birth to these misfortunes is so trifling in itself, that, independent of its consequences, it would not deserve to be recorded. In the narrow entrance to a synagogue in Cæsarea some person had made an offering of birds, merely with a view to irritate the Jews. The insult excited their indignation, and occasioned the shedding of blood. This seemingly trifling circumstance, ordained by Him without whose permission a sparrow cannot fall to the ground, gave rise to a bloody war, which ended in the fulfilment of our Saviour's prophecy, by the total destruction of Jerusalem, and the dreadful massacre of its inhabitants. See JEWS. Florus, who was then procurator of Judea, converted this private quarrel into public hostilities, and compelled the Jewish nation to rebel, contrary to its wish and resolution, to avoid what the Jews had threatened, an impeachment before the Roman emperor, for his excessive cruelties. But, even after this rebellion had broken out, the destruction of the temple was a very improbable event. It was not the practice of the Romans to destroy the magnificent edifices of the nations which they subdued; and, of all the Roman generals, none was more unlikely to demolish so ancient and august a building as Titus Vespasian. So important then is the question, whether the books of the New Testament be genuine? that the arguments which prove their authenticity prove also the truth of the Christian religion. Let us now consider the evidence which proves the authenticity of the New Testament.

We receive the books of the New Testament as the genuine works of Matthew, Mark, Luke, John, and Paul, for the same reason that we receive the writings of Xenophon, Polybius, Plutarch, Cæsar, and Livy. We have the uninterrupted testimony of all ages, and we have no reason to suspect imposition. This argument is much stronger when applied to the books of the New Testament than when applied to any other writings; for they were addressed to large societies, were often read in their presence, and acknowledged by them to be the writings of the

apostles. Whereas, the most eminent profane writings which still remain were addressed only to individuals, or to no persons at all : and we have the authority to affirm that they were read in public ; on the contrary, we know that a liberal education was uncommon ; books were scarce, and the knowledge of them was confined to a few individuals in every nation.

The New Testament was read over three quarters of the world, while profane writers were limited to one nation or to one country. An uninterrupted succession of writers from the apostolic ages to the present time quote the sacred writings, or make allusions to them ; and these quotations and allusions are made not only by friends but by enemies. This cannot be asserted of even the best classic authors. And it is highly probable that the translations of the New Testament were made so early as the second century ; and in a century or two after they became very numerous. After this period it was impossible to forge new writings, or to corrupt the sacred text, unless we can suppose that men of different nations, of different sentiments, and different languages, and often exceedingly hostile to one another, should all agree in one forgery. This is so strong that, if we deny the authenticity of the New Testament, we may with a thousand times more propriety reject all the other writings in the word ; we may even throw aside human testimony itself. But, as this subject is of great importance, we shall consider it at more length ; and, to enable our readers to judge with greater accuracy, we shall state, from the valuable work of Michaelis, as translated by the learned bishop Marsh, the reasons which may induce a critic to suspect a work to be spurious :—

1. When doubts have been made, from its first appearance in the world, whether it proceeded from the author to whom it is ascribed.
2. When the immediate friends of the pretended author, who were able to decide upon the subject, have denied it to be his production.
3. When a long series of years has elapsed after his death, in which the book was unknown, and in which it must unavoidably have been mentioned and quoted, had it really existed.
4. When the style is different from that of his other writings, or, in case no other remain, different from that which might reasonably be expected.
5. When events are recorded which happen later than the time of the pretended author.
6. When opinions are advanced which contradict those he is known to maintain in his other writings : though this latter argument alone leads to no positive conclusion, since every man is liable to change his opinion, or through forgetfulness to vary in the circumstances of the same relation, of which Josephus, in his *Antiquities* and *Wars of the Jews*, affords a striking example.

1. But it cannot be shown that any one doubted of the authenticity of the New Testament in the period in which it first appeared.
2. No ancient accounts are on record whence we may conclude it to be spurious.
3. No considerable period elapsed after the death of the apostles, in which the New Testament was unknown ; but,

on the contrary, it is mentioned by their very contemporaries, and the accounts of it in the second century are still more numerous.

4. No argument can be brought in its disfavor from the nature of the style, it being exactly such as might be expected from the apostles, not Attic but Jewish Greek.
5. No facts are recorded which happened after their death.
6. No doctrines are maintained which contradict the known tenets of the authors, since, beside the New Testament, no writings of the apostles exist. But, to the honor of the New Testament be it spoken, it contains numerous contradictions to the tenets and doctrines of the fathers in the second and third century, whose morality was different from that of the gospel, which recommends fortitude and submission to unavoidable evils, but not that enthusiastic ardor for martyrdom for which these centuries are distinguished ; it alludes to ceremonies which in the following ages were either in disuse or totally unknown ; all which circumstances infallibly demonstrate that the New Testament is not a production of either of those centuries. We shall now consider the positive evidences for the authenticity of the New Testament. These may be arranged under the three following heads : i. The impossibility of a forgery, arising from the nature of the thing itself. ii. The ancient Christian, Jewish, and Heathen testimony in its favor. iii. Its own internal evidence.

- i. *The impossibility of a forgery, arising from the nature of the thing itself*, is evident. It is impossible to establish forged writings as authentic in any place where there are persons strongly inclined and well qualified to detect the fraud. Now the Jews were the most violent enemies of Christianity. They put the founder of it to death ; they persecuted his disciples with implacable fury ; and they were anxious to stifle the new religion in its birth. If the writings of the New Testament had been forged, would not the Jews have detected the imposture ? Is there a single instance on record where a few individuals have imposed a history upon the world against the testimony of a whole nation ? Would the inhabitants of Palestine have received the gospels, if they had not had sufficient evidence that Jesus Christ really appeared among them, and performed the miracles ascribed to him ? Or would the churches of Rome or of Corinth have acknowledged the epistles addressed to them as the genuine works of Paul, if Paul had never preached among them ? We might as well think to prove that the history of the Reformation is the invention of historians ; and that no revolution happened in Great Britain during the seventeenth century.

- ii. The second kind of evidence which we produce, to prove the authenticity of the New Testament, is *the testimony of ancient writers, Christians, Jews, and Heathens*. In reviewing the evidence of testimony, it will not be expected that we should begin at the present age, and trace backwards the authors who have written on this subject to the first ages of Christianity. This indeed, though a laborious task, could be performed in the most complete manner ; the whole series of authors, numerous in

every age, who have quoted from the books of the New Testament, written commentaries upon them, translated them into different languages, or who have drawn up a list of them, could be exhibited so as to form such a perfect body of evidence that we imagine even a jury of deists would find it impossible, upon a deliberate and candid examination, to reject or disbelieve it. We do not, however, suppose that scepticism has yet arrived at so great a height as to render such a tedious and circumstantial evidence necessary. Passing over the intermediate space, therefore, we shall ascend at once to the fourth century, when the evidence for the authenticity of the New Testament was fully established, and trace it back from that period to the age of the apostles. This method of stating the evidence will appear more natural, and will afford more satisfaction, than that which has been usually adopted.

It is surely more natural, when we investigate the truth of any fact which depends on a series of testimony, to begin with those witnesses who lived nearest the present age, and whose characters are best established. In this way we shall learn from themselves the foundation of their belief, and the characters of those from whom they derived it; and thus we ascend till we arrive at its origin. This mode of investigation will give more satisfaction to the deist than the usual way; and we believe no Christian, who is confident of the goodness of his cause, will be unwilling to grant any proper concessions. The deist will thus have an opportunity of examining, separately, what he will consider as the weakest parts of the evidence, those which are exhibited by the earliest Christian writers, consisting of expressions, and not quotations, taken from the New Testament. The Christian, on the other hand, ought to wish that these apparently weak parts of the evidence were distinctly examined, for they will afford an irrefragable proof that the New Testament was not forged; and, should the deist reject the evidence of those early writers, it will be incumbent on him to account for the origin of the Christian religion, which he will find more difficult than to admit the common hypothesis.

In the fourth century we could produce the testimonies of numerous witnesses to prove that the books of the New Testament existed at that time; but it will be sufficient to mention their names, the time in which they wrote, and the substance of their evidence. This we shall present in a concise form in the following table, taken from Jones's New and Full Method of establishing the canon of the New Testament; but condensed to save room.

It exhibits, 1. The names of the writers. 2. The times in which they lived. 3. The variation or agreement of their catalogues with ours now received: and, 4. The books in which these catalogues are.

I. Athanasius, bishop of Alexandria. A. D. 315. The same perfectly with ours now received. Fragment. Epist. Testal. tom. 2, et in Synops. tom. 1.

II. Cyril, bishop of Jerusalem, A. D. 340. The same with ours, only the Revelation is omitted. Catech. IV. sect. ult. p. 101.

III. The bishops assembled in the council of Laodicea. A. D. 364. The Revelation is omitted. Canon. LIX. N. B. The canons of this council were not long afterwards received into the body of the canons of the universal church.

IV. Epiphanius, bishop of Salamis in Cyprus. A. D. 370. The same with ours now received. Hæres. 76. cont. Anom. p. 399.

V. Gregory Nazianzen, bishop of Constantinople, A. D. 375. Omits the Revelation. Carm. de veris et genuin. Scriptur.

VI. Philastrius, bishop of Brixia in Venice. A. D. 380. The same with ours now received; except that he mentions only thirteen of St. Paul's epistles (omitting very probably the Epistle to the Hebrews), and leaves out the Revelations. Lib. de Hæres. Numb. 87.

VII. Jerome. A. D. 382. The same with ours, except that he speaks dubiously of the Epistle to the Hebrews; though in other parts of his writings he receives it as canonical. Ep. ad Paulin. 83. Tract. 6. p. 2. Also commonly prefixed to the Latin vulgar.

VIII. Ruffin, presbyter of Aquilegium. A. D. 390. It perfectly agrees with ours. Expos. in Symb. Apostol. sect. 36. int. Ep. Hieron. Par. 1. Trac. 3, p. 110, et inter. Op. Cypr. p. 575.

IX. Austin, bishop of Hippo in Africa. A. D. 394. It perfectly agrees with ours. De Doctrin. Christ. 1, 2, c. 8. Tom. Op. 3. p. 25.

X. The XLIV. bishops assembled in the third council of Carthage. St. Austin was present at it. It perfectly agrees with ours. Vid. Canon. XLVII. et cap. ult.

We now go back to Eusebius, who wrote about the year 315, and whose catalogue of the books of the New Testament we shall mention at more length. 'Let us observe,' says he, 'the writings of the apostle John, which are uncontradicted; and, first of all, must be mentioned, as acknowledged of all, the gospel according to him, well known to all the churches under heaven.' The author then proceeds to relate the occasions of writing the gospels, and the reasons for placing St. John's the last, manifestly speaking of all the four as equal in their authority, and the certainty of their original. The second passage is taken from a chapter, the title of which is 'Of the Scriptures universally acknowledged, and of those that are not such.' Eusebius begins his enumeration in the following manner: 'In the first place are to be ranked the sacred four Gospels, then the book of the Acts of the Apostles; after that are to be reckoned the Epistles of St. Paul; in the next place, that called the first Epistle of John and the Epistle of Peter are to be esteemed authentic: after this is to be placed, if it be thought fit, the Revelation of St. John; about which we shall observe the different opinions at proper seasons. Of the controverted, but yet well known or approved by the most, are that called the Epistle of James and that of Jude, the second of Peter, and the second and third of John, whether they were written by the evan

gelist, or by another of the same name.' He then proceeds to reckon up five others, not in our canon, which he calls in one place spurious, in another controverted; evidently meaning the same thing by these two words. He uses still stronger terms with respect to the pretended gospels of Peter, and Thomas, and Matthias, and some others, which he says are altogether absurd and impious.

A. D. 290, Victorin bishop of Pettaw in Germany, in a commentary upon this text of the revelation, 'The first was like a lion, the second was like a calf, the third like a man, and the fourth like a flying eagle,' makes out that by the four creatures are intended the four gospels; and, to show the propriety of the symbols, he recites the subject with which the evangelist opens his history. The explication is fanciful, but the testimony positive. He also expressly cites the Acts of the Apostles.

A. D. 230, Cyprian bishop of Carthage gives the following testimony: 'The church,' says this father, 'is watered like Paradise by four rivers, that is, by four gospels.' The Acts of the Apostles are also frequently quoted by Cyprian under that name, and under the name of the Divine Scriptures. In his various writings are such frequent and copious citations of Scripture as to place this part of the testimony beyond controversy. Nor is there, in the works of this eminent African bishop, one quotation of a spurious or apocryphal Christian writing.

A. D. 210, Origen is a most important evidence. Nothing can be more peremptory upon the subject now under consideration, and, from a writer of his learning and information, nothing more satisfactory, than the declaration of Origen, preserved in an extract of his works by Eusebius: 'That the four gospels alone are received without dispute by the whole church of God under heaven:' to which declaration is immediately subjoined a brief history of the respective authors, to whom they were then, as they are now, ascribed. The sentiments expressed concerning the gospels in all the works of Origen which remain entirely correspond with the testimony here cited. His attestation to the Acts of the Apostles is no less positive; 'And Luke also once more sounds the trumpet relating the Acts of the Apostles.' That the Scriptures were then universally read is plainly affirmed by this writer in a passage in which he is repelling the objections of Celsus, 'That it is not in private books, or such as are read by few only, and those studious persons, but in books read by every body, that it is written the invisible things of God, from the creation of the world are clearly seen, being understood by things that are made.' It is to no purpose to single out quotations of Scripture from such a writer as this. We might as well make a selection of the quotations of Scripture in Dr. Clarke's sermons. They are so thickly sown in the works of Origen, that Dr. Mill says, 'If we had all his works remaining, we should have before us almost the whole text of the Bible.'

A. D. 194, Tertullian exhibits the number of the gospels then received, the names of the evangelists, and their proper designations, in one short sentence. 'Among the apostles, John and

Matthew teach us the faith; among apostolical men, Luke and Mark refresh it.' The next passage to be taken from Tertullian affords as complete an attestation to the authenticity of the gospels as can be well imagined. After enumerating the churches which had been founded by Paul at Corinth, in Galatia, at Philippi, Thessalonica, and Ephesus, the church of Rome established by Peter and Paul, and other churches derived from John, he proceeds thus: 'I say then that with them, but not with them only which are apostolical, but with all who have fellowship with them in the same faith, is that gospel of Luke received from its first publication, which we so zealously maintain;' and presently afterwards adds, 'The same authority of the apostolical churches will support the other gospels, which we have from them, and according to them, I mean John's and Matthew's, although that likewise which Mark published may be said to be Peter's, whose interpreter Mark was.' In another place Tertullian affirms that the three other gospels, as well as St. Luke's, were in the hands of the churches from the beginning. This noble testimony proves incontestably the antiquity of the gospels, and that they were universally received; that they were in the hands of all, and had been so from the first. And this evidence appears not more than 150 years after the publication of the books. Dr. Lardner observes 'that there are more and larger quotations of the small volume of the New Testament, in this one Christian author, than there are of all the works of Cicero, in writers of all characters, for several ages.'

A. D. 178, Irenæus was bishop of Lyons, and is mentioned by Tertullian, Eusebius, Jerome, and Photius. In his youth he had been a disciple of Polycarp, who was a disciple of John. He asserts, of himself and his contemporaries, that they were able to reckon up in all the principal churches the succession of bishops to their first institution. His testimony to the four gospels and Acts of the Apostles is express and positive. 'We have not received,' says Irenæus, 'the knowledge of the way of our salvation by any others than those by whom the gospel has been brought to us. Which gospel they first preached, and afterwards, by the will of God, committed to writing, that it might be for time to come the foundation and pillar of our faith. For after that our Lord rose from the dead, and they (the apostles) were endowed from above with the power of the Holy Ghost coming down upon them, they received a perfect knowledge of all things. They then went forth to all the ends of the earth, declaring to men the blessing of heavenly peace, having all of them, and every one alike, the gospel of God. Matthew then, among the Jews, wrote a gospel in their own language, while Peter and Paul were preaching the gospel at Rome, and founding a church there. And, after their exit, Mark also, the disciple and interpreter of Peter, delivered to us in writing the things that had been preached by Peter. And Luke, the companion of Paul, put down in a book the gospel preached by him (Paul). Afterwards John, the disciple of the Lord, who also leaned upon his breast, likewise published a gospel while he dwelt at Ephesus in

Asia.' Irenæus then relates how Matthew begins his gospel, how Mark begins and ends his; and gives the supposed reasons for doing so. He enumerates at length all the passages of Christ's history in Luke, which are not found in any of the other evangelists. He states the particular design with which St. John composed his gospel, and accounts for the doctrinal declarations which precede the narrative. If any modern divine should write a book upon the genuineness of the gospels, he could not assert it more expressly, or state their original more distinctly, than Irenæus hath done within little more than 100 years after they were published.

Respecting the book of the Acts of the Apostles, and its author, the testimony of Irenæus is no less explicit. Referring to the account of St. Paul's conversion and vocation, in the ninth chapter of that book, 'Nor can they,' says he, meaning the parties with whom he argues, 'show that he is not to be credited, who has related to us the truth with the greatest exactness.' In another place, he has actually collected the several texts, in which the writer of the history is represented as accompanying St. Paul, which led him to exhibit a summary of almost the whole of the last twelve chapters of the book.

According to Lardner, Irenæus quotes twelve of Paul's epistles, naming their author; also the first epistle of Peter, the two first epistles of John, and the Revelation. The epistles of Paul which he omits are those addressed to Philemon and the Hebrews. Eusebius says that he quotes the epistle to the Hebrews, though he does not ascribe it to Paul. The work, however, is lost.

A. D. 172, Tatian, who is spoken of by Clements Alexandrinus, Origen, Eusebius, and Jerome, composed a harmony of the four gospels, which he called *Diatessaron*, of the four. This title, as well as the work, is remarkable, because it shows that then as well as now there were four and only four, gospels in general use among Christians.

A. D. 170, the churches of Lyons and Vienne in France sent an account of the sufferings of their martyrs to the churches of Asia and Phrygia, which has been preserved entire by Eusebius. And what carries in some measure the testimony of these churches to a higher age is, that they had now for their bishop Pothinus, who was ninety years old, and whose early life consequently must have immediately followed the times of the apostles. In this epistle are exact reference to the gospels of Luke and John, and to the Acts of the Apostles. The form of references is the same as in all the preceding articles. That from St. John is in these words: 'Then was fulfilled that which was spoken by the Lord, that whosoever killeth you, will think that he doth God service.' Distinct references are also made to other books, viz. Acts, Romans, Ephesians, Philippians, 1 Timothy, 1 Peter, 1 John, Revelation.

A. D. 140, Justin Martyr composed several books; which are mentioned by his disciple Tatian, by Tertullian, Methodius, Eusebius, Jerome, Epiphanius, and Photius. In his writings between twenty and thirty quotations from the gospels and Acts of the Apostles are reckoned

up, which are clear, distinct, and copious; if each verse be counted separately, a much greater number; if each expression still more. Jones, in his book on the Canon of the New Testament, ventures to affirm that he cites the books of which it consists, particularly of the four gospels, above 200 times. We meet with quotations of three of the gospels within the compass of half a page, viz. from Matthew xxv. 41, Luke x. 19, and Mark viii. 31. But all the references in Justin are made without mentioning the author; which proves that these books were perfectly well known, and that there were no other accounts of Christ then extant, or at least no others so received and credited as to make it necessary to add any marks of distinction. But, although Justin mentions not the author's names, he calls the books *Memoirs* composed by the Apostles; *Memoirs* composed by the Apostles and their Companions; which descriptions, the latter especially, exactly suit the titles which the Gospels and Acts of the Apostles now bear.

He informs us, in his first apology, that the *Memoirs* of the Apostles, or the writings of the prophets, are read according as the time allows; and, when the reader has ended, the president makes a discourse, exhorting to the imitation of such excellent things. A few short observations will show the value of this testimony. 1. The *Memoirs* of the Apostles, Justin in another place expressly tells us, are what are called gospels. And that they were the gospels which we now use is made certain by Justin's numerous quotations of them, and his silence about any others. 2. He describes the general usage of the Christian church. 3. He does not speak of it as recent or newly instituted, but in the terms in which men speak of established customs. Justin also makes such allusions to the following books as shows that he had read them: Romans, 1 Corinthians, Galatians, Ephesians, Philippians, Colossians, 2 Thessalonians, Hebrews, 2 Peter; and he ascribes the Revelation to John, the apostle of Christ.

A. D. 116, Papias, a hearer of John, and companion of Polycarp, as Irenæus attests, and of the apostolical age, as all agree, in a passage quoted by Eusebius from a work now lost, expressly ascribes the two first gospels to Matthew and Mark; and in a manner which proves that these gospels must have publicly borne the names of these authors at that time, and probably long before; for Papias does not say that one gospel was written by Matthew, and another by Mark; but, assuming this as perfectly well known, he tells us from what materials Mark collected his account, viz. from Peter's preaching, and in what language Matthew wrote, viz. in Hebrew. Whether Papias was well informed in this statement or not, to the point for which this testimony is produced, namely, that these books bore these names at this time, his authority is complete. Papias himself declares that he received his accounts of Christianity from those who were acquainted with the apostles, and that those accounts which he thus received from the older Christians, and had committed to memory, he inserted in his books. He farther adds that he was very solicitous to obtain

every possible information, especially to learn what the apostles said and preached, valuing such information more than what was written in books.

A. D. 103, Polycarp was bishop of Smyrna, and disciple of John the Apostle. This testimony concerning Polycarp is given by Irenæus, who in his youth had seen him. 'I can tell the place,' saith Irenæus, 'in which the blessed Polycarp sat and taught, and his going out and coming in, and the manner of his life, and the form of his person, and the discourses he made to the people, and how he related his conversation with John and others who had seen the Lord, and how he related their sayings, and what he had heard concerning the Lord, both concerning his miracles and his doctrines, as he had received them from the eye-witnesses of the word of life; all which Polycarp related agreeable to the Scriptures.'

Of Polycarp, whose proximity to the age and country and persons of the apostles is thus attested, we have one undoubted epistle remaining; which, though a short performance, contains nearly forty clear allusions to the books of the New Testament. See POLYCARP. This is strong evidence of the respect which was paid to them by Christians of that age. Among these, although the writings of St. Paul are more frequently used by Polycarp than other parts of Scripture, there are copious allusions to the gospel of St. Matthew, some passages in the gospels both of Matthew and Luke, and some which more nearly resemble the words in Luke. He thus fixes the authority of the Lord's prayer, and the use of it among Christians. If, therefore, we pray the Lord to forgive us, we ought also to forgive. And again, With supplication beseeching the all-seeing God, not to lead us into temptation.

In another place he quotes the words of our Lord: 'But remember what the Lord said, teaching, Judge not, that ye be not judged. Forgive, and ye shall be forgiven; be ye merciful, that ye may obtain mercy; with what measure ye mete, it shall be measured to you again.' Supposing Polycarp to have had these words from the books in which we now find them, it is manifest that these books were considered by him, and by his readers, as he thought, as authentic accounts of Christ's discourses, and that this point was incontestable. He quotes also the following books, the first of which he ascribes to St. Paul: 1 Corinthians, Ephesians, Philippians, 1 and 2 Thessalonians; and makes evident references to others, particularly to Acts, Romans, 2 Corinthians, Galatians, 1 Timothy, 2 Timothy, 1 Peter, 1 John.

Ignatius, as it is testified by ancient Christian writers, became bishop of Antioch about thirty-seven years after Christ's ascension: and therefore, from his time and place, and station, it is probable that he had known and conversed with many of the apostles. See IGNATIUS. Epistles of Ignatius are referred to by Polycarp his contemporary. Passages found in the epistles now extant under his name are quoted by Irenæus, A. D. 178, by Origen, A. D. 230; and the occasion of writing them is fully explained by Eusebius and Jerome. What are called the smaller

epistles of Ignatius are generally reckoned the same which were read by Irenæus, Origen, and Eusebius. They are admitted as genuine by Vossius, and have been proved to be so by bishop Pearson, with a force of argument which seems to admit of no reply. In these epistles are undoubted allusions to Matt. iii. 15, xi. 16; to John iii. 8; and their venerable author, who often speaks of St. Paul in terms of the highest respect, once quotes his epistle to the Ephesians by name.

Near the conclusion of the epistle to the Romans, St. Paul, amongst others, sends the following salutation: 'Salute Asyncretus, Phlegon, Hermas, Patrobas, Hermes, and the brethren which are with them.' Of Hermas, who appears in this catalogue of Roman Christians as contemporary with St. Paul, there is a book still remaining, the authenticity of which cannot be disputed. See HERMAS. It is called the Shepherd or Pastor of Hermas. Its antiquity is incontestable from the quotations of it in Irenæus, A. D. 178, Clement of Alexandria, A. D. 194, Tertullian, A. D. 200, Origen, A. D. 230. The notes of time extant in the epistle itself agree with its title, and with the testimonies concerning it, which intimate that it was written during the lifetime of Clement. In this piece are tacit allusions to St. Matthew's, St. Luke's, and St. John's gospels; that is to say, there are applications of thoughts and expressions found in these gospels, without citing the place or writer from which they were taken. In this form appear in Hermas the confessing and denying of Christ; the parable of the seed sown; the comparison of Christ's disciples to little children; the saying 'he that putteth away his wife, and marieth another, committeth adultery;' the singular expression, 'having received all power from his Father,' is probably an allusion to Matt. xxviii. 18, and Christ being the gate, or only way of coming 'to God,' is a plain allusion to John xiv. 6, x. 9. There is also a probable allusion to Acts v. 32. The Shepherd of Hermas has been considered as a fanciful performance. This, however, is of no importance in the present case. We only adduce it as an evidence that the books to which it frequently alludes existed in the first century; and for this purpose it is satisfactory, as its authenticity has never been questioned.

A. D. 96, we have an epistle written by Clement, the fourth bishop of Rome, whom ancient writers, without any doubt, assert to have been the Clement whom St. Paul mentions, Philip. iv. 3, 'with Clement also, and other my fellow laborers, whose names are in the book of life.' This epistle is spoken of by the ancients as an epistle acknowledged by all; and, as Irenæus well represents its value, 'written by Clement, who had seen the blessed apostles and conversed with them, who had the preaching of the apostles still sounding in his ears, and their traditions before his eyes.' It is addressed to the church of Corinth; and, what alone may seem a decisive proof of its authenticity, Dionysius bishop of Corinth, about the year 170, i. e. about eighty or ninety years after the epistle was written, bears witness, 'that it had been usually read in that church from ancient times.' This

epistle affords, amongst others, the following valuable passages: 'especially remembering the words of the Lord Jesus, which he spake, teaching gentleness and long suffering;' for thus he said, 'Be ye merciful, that ye may obtain mercy; forgive, that it may be forgiven unto you,' &c. Again, 'Remember the words of the Lord Jesus; for he said, wo to that man by whom offences come; it were better for him that he had not been born,' &c. He ascribes the first epistle to the Corinthians to Paul, and makes such allusion to the following books as is sufficient to show that he had seen and read them: Acts, Romans, 2 Corinthians, Galatians, Ephesians, Philippians, Colossians, 1 Thessalonians, 1 Timothy, 2 Timothy, Titus, 1 Peter, 2 Peter. It may be said, as Clement has not mentioned the books by name, from which we assert these allusions or references are made, it is uncertain whether he refers to any books, or whether he received these expressions from the discourses and conversation of the apostles. Mr. Paley has given a very satisfactory answer to this objection: 1st. That Clement, in the very same manner, namely, without any mark of reference, uses a passage now found in the epistle to the Romans (chap. i. 29); which passage, from the peculiarity of the words that compose it, and from their order, it is manifest that he must have taken from the epistle. 2dly, That there are many sentences of St. Paul's first epistle to the Corinthians to be found in Clement's epistle, without any sign of quotation, which yet certainly are quotations; because it appears that Clement had St. Paul's epistle before him; for in one place he mentions it in terms too express to leave us in any doubt. 'Take into your hands the epistle of the blessed apostle Paul.' 3dly, That this method of adopting words of Scripture, without reference or acknowledgment, was a method in general use amongst the most ancient Christian writers. St. Paul himself quotes the heathen poet, Aratus, without naming him. See ARATUS. These analogies not only repel the objection, but cast the presumption on the other side; and afford a considerable degree of positive proof that the words in question have been borrowed from the places of Scripture in which we now find them. But take it the other way, that Clement had heard these words from the apostles or first teachers of Christianity; with respect to the precise point of our argument, viz. that the Scriptures contain what the apostles taught, this supposition may serve almost as well.

We have now traced the evidence to the times of the apostles; but we have not been anxious to draw it out to a great length, by introducing every thing. On the contrary, we have been careful to render it as concise as possible, that its force might be discerned at a glance. The evidence which has been stated is of two kinds. Till the time of Justin Martyr and Irenæus it consists chiefly of allusions, references, and expressions, borrowed from the books of the New Testament, without mentioning them by name. After the time of Irenæus it became usual to cite the sacred books, and mention the authors from which the citations were taken.

The only point of importance to be determined is, whether these references are a sufficient proof of the existence of the books to which they allude. This, we presume, will not be denied; especially in the present age, when it is so common to charge an author with plagiarism, if he happen to fall upon the same train of ideas, or express himself in a similar manner with authors who have written before him. We may farther affirm, that these tacit references afford a complete proof that those ancient writers had no intention of imposing a forgery upon the world. They prove the existence of the Christian religion, and of the apostolical writings, without showing any suspicious earnestness that men should believe them. Had these books been forged, those who wished to pass them upon the world would have been at more pains than the first Christians were to prove their authenticity. They acted the part of honest men; they believed them themselves, and they never imagined that others would suspect their truth.

It is a consideration of great importance, in reviewing the evidence which has been now stated, that the witnesses lived in different countries; Clemens flourished at Rome, Polycarp at Smyrna, Justin Martyr in Syria, Irenæus in France, Tertullian at Carthage, Origen at Alexandria, and Eusebius at Cæsarea. This proves that the books of the New Testament were equally well known in distant countries by men who had no intercourse with one another. The same thing is proved by testimonies, if possible, less exceptionable. The ancient heretics, whose opinions were sometimes grosser and more impious than those which any modern sectary has ventured to broach, and whose zeal in the propagation of them equalled that of the most flaming enthusiast of the seventeenth century, never called in question the authenticity of the books of the New Testament. When they met with any passage in the gospels or epistles which they could not reconcile to their own heretical notions, they either erased it, or denied that the author was inspired; but they nowhere contend that the book in which it stood was not written by the apostle or evangelist whose name it bore. Eusebius relates that the Ebionites rejected all the epistles of Paul, and called him an apostate, because he departed from the Levitical law; and they adopted as their rule of faith the Gospel of St. Matthew, though indeed they greatly corrupted it. This proves, therefore, that the Gospel according to Matthew was then published, and that St. Paul's epistles were then known.

Of the heretics who erased or altered passages to make the Scriptures agree with their doctrines, we may produce Marcion as an instance, who lived in the beginning of the second century. He lived in an age when he could have easily discovered if the writings of the New Testament had been forged; and as he was much incensed against the orthodox party, if such a forgery had been committed unquestionably he would not have failed to make the discovery, as it would have afforded the most ample means of revenge and triumph, and enabled him to establish his own opinions with less difficulty. But

his whole conduct shows clearly that he believed the writings of the New Testament to be authentic. He said that the Gospel according to St. Matthew, the Epistle to the Hebrews, with those of St. Peter and St. James, as well as the Old Testament in general, were writings not for Christians but for Jews. He published a new edition of the Gospel according to Luke, and the first ten epistles of Paul; in which it has been affirmed by Epiphanius that he altered every passage that contradicted his own opinions: but as many of these alterations are what modern critics call various readings, though we receive the testimony of Epiphanius, we must not rely upon his opinion. Dr. Loeffler wrote a dissertation vindicating Marcion from this charge. Hence it is evident that the books of the New Testament above-mentioned did then exist, and were acknowledged to be the works of the authors whose names they bear.

Dr. Lardner, in his General Review, sums up this head of evidence in the following words: 'Noetus, Paul of Samosata, Sabellius, Marcellus, Photinus, the Novatians, Donatists, Manicheans, Priscillianists, beside Artemon, the Audians, the Arians, and divers others, all received most or all the same books of the New Testament which the Catholics received; and agreed in a like respect for them as written by apostles or their disciples and companions.'

Celsus and Porphyry, both enemies of the Christian religion, are powerful witnesses for the antiquity of the New Testament. Celsus, who lived towards the end of the second century, not only mentions by name, but quotes passages from the books of the New Testament: and that the books to which he refers were no other than our present gospels is evident from the allusions to various passages still found in them. Celsus takes notice of the genealogies, which fixes two of these gospels; of the precepts, resist not him that injures you, and, if a man strike thee on the one cheek, offer to him the other also; of the woes denounced by Christ; of his predictions; of his saying that it is impossible to serve two masters; of the purple robe, the crown of thorns, and the reed which was put into the hand of Jesus; of the blood that flowed from his body upon the cross, a circumstance which is recorded only by John; and (what is *instar omnium* for the purpose for which we produce it) of the difference in the accounts given of the resurrection by the evangelists, some mentioning two angels at the sepulchre, others only one. It is extremely material to remark that Celsus not only perpetually referred to the accounts of Christ contained in the four gospels, but that he referred to no other accounts; that he founded none of his objections to Christianity upon any thing delivered in spurious gospels.

The testimony of Porphyry is still more important than that of Celsus. See PORPHYRIUS. He was born in 233, and died in 304, aged seventy-one. Unfortunately for the present age, says Michaelis, the mistaken zeal of the Christian emperors has banished his writings from the world; and every real friend of our religion would gladly give the works of one of the pious fathers to rescue those of Porphyry from the

flames. But Mr. Marsh, the learned and judicious translator of Michaelis, relates that, according to the accounts of Isaac Vossius, a MS. of the works of Porphyry is preserved in the Medicean library at Florence, but kept so secret that no one is permitted to see it. It is universally allowed that Porphyry is the most sensible, as well as the most severe adversary of the Christian religion that antiquity can produce. He was versed not only in history, but also in philosophy and politics. His acquaintance with the Christians was not confined to a single country; for he had conversed with them in Tyre, in Sicily, and in Rome. Enabled by his birth to study the Syriac, as well as the Greek authors, he was of all the adversaries to the Christian religion the best qualified to enquire into the authenticity of the sacred writings. He possessed therefore every advantage which natural abilities or a scientific education could afford, to discover whether the New Testament was a genuine work of the apostles and evangelists, or whether it was imposed upon the world after the decease of its pretended authors. But no trace of this suspicion is any where to be found in his writings. In the fragments, which still remain, mention is made of the gospels of St. Matthew, St. Mark, and St. John, the Acts of the Apostles, and the Epistle to the Galatians; and it clearly appears, from the very objections of Porphyry, that the books to which he alludes were the same which we possess at present. Thus he objects to the repetition of a generation in St. Matthew's genealogy; to Matthew's call; to the quotation of a text from Isaiah, which is found in a psalm ascribed to Asaph; to the calling of the lake of Tiberias a sea; to the expression in St. Matthew, 'the abomination of desolation;' to the variation in Matthew and Mark upon the text 'the voice of one crying in the wilderness.' Matthew citing it from Isaiah, Mark from the prophets; to John's application of the term Word; to Christ's change of intention about going up to the feast of tabernacles (John vii. 8); and to the judgment denounced by St. Peter upon Ananias and Sapphira, which he calls an imprecation of death.

The instances herealleged serve in some measure to show the nature of Porphyry's objections, and prove that Porphyry had read the gospels with that sort of attention which a writer would employ who regarded them as the depositories of the religion which he attacked. Besides these specifications, there exists in the writings of ancient Christians general evidence that the places of Scripture, upon which Porphyry had made remarks, were very numerous.

iii. The *internal evidence* of the authenticity of the New Testament consists of two parts:—The nature of the style, and the coincidence of the New Testament with the history of the times.

1. The *STYLE* of the New Testament is singular, and differs very widely from the style of classical authors. It is full of Hebraisms and Syriasms; a circumstance which pious ignorance has considered as a fault, and which, even so late as the present century, it has attempted to remove; not knowing that these very deviations from Grecian purity afford the strongest pre-

sumption in its favor; for they prove that the New Testament was written by men of Hebrew origin, and is therefore a production of the first century. After the death of the first Jewish converts, few of the Jews turned preachers of the gospel; the Christians were generally ignorant of the Hebrew, and consequently could not write in the style of the New Testament. After the destruction of Jerusalem, and the dispersion of the Jews, their language must have been blended with that of other nations, and their vernacular phraseology almost entirely lost. The language of the early fathers, though not always the purest classic Greek, has no resemblance to that of the New Testament, not even excepting the works of the few who had a knowledge of the Hebrew; as Origen, Epiphanius, and Justin Martyr, who, being a native of Palestine, might have written in a style similar to that of the New Testament, had such a style then prevailed. He that suspects the New Testament to be the forgery of a more recent period ought to produce some person who has employed a similar diction; but those who are conversant with eastern writings know well that a foreigner, who has not been inured to eastern manners and modes of thinking from his infancy, can never imitate with success the oriental style, much less forge a history or an epistle, which contains a thousand incidental allusions which nothing but truth could suggest. To imitate closely the style of the New Testament is even more difficult than to imitate that of any other oriental book; for there is not a single author, even among the Jews themselves, since the destruction of Jerusalem, that has composed in a style in the least degree like it. The style of Clemens Romanus may perhaps be an exception. By many eminent critics it has been thought so like to that of the Epistle to the Hebrews as to give room for the opinion that Clement either was the author of that epistle, or was the person who translated it from the Syro-Chaldaic language, in which it was originally composed.

But, though the books of the New Testament bear so close a resemblance in idiom, there is a diversity of style which shows them to be the work of different persons. Whoever reads with attention the epistles of Paul must be convinced that they were all written by the same author. An equal degree of similarity is to be found between the gospel and first epistle of John. The writings of St. John and St. Paul exhibit marks of an original genius which no imitation can ever attain. The character of Paul as a writer is drawn with great judgment by Michaelis:—‘His mind overflows with sentiment, yet he never loses sight of his principal object, but, hurried on by the rapidity of thought, discloses frequently in the middle a conclusion to be made only at the end. To a profound knowledge of the Old Testament he joins the acuteness of philosophical wisdom, which he displays in applying and expounding the sacred writings; and his explanations are therefore sometimes so new and unexpected that superficial observers might be tempted to suppose them erroneous. The fire of his genius, and his inattention to style, occasion frequently a twofold obscurity, he

being often too concise to be understood except by those to whom he immediately wrote, and not seldom on the other hand so full of his subject as to produce long and difficult parentheses, and a repetition of the same word even in different senses. With a talent for irony and satire, he unites the most refined sensibility, and tempers the severity of his censures by expressions of tenderness and affection; nor does he ever forget in the vehemence of his zeal the rules of modesty and decorum. He is a writer, in short, of so singular and wonderful a composition that it would be difficult to find a rival. The truly sensible and sagacious Mr. Locke was of the same opinion, and contended that St. Paul was without an equal.’

2. Poems have been forged and ascribed to former ages with some success. Philosophical treatises might be invented which it would be difficult to detect; but there is not a single instance on record, where an attempt has been made to forge a history or a long epistle, where the fraud has not been either fully proved, or rendered so suspicious that few are weak enough to believe it. Whoever attempts to forge a history or an epistle in the name of an ancient author, will be in great danger of contradicting the history or the manners of that age, especially if he relate events which are not mentioned in general history, but such as refer to a single city, sect, religion, or school. The difficulty of forging such histories as the gospels, and such epistles as those of Paul, cannot be overcome by all the genius, learning, and industry, of any individual or society of men that ever lived. They contain a purer system of ethics than all the ancient philosophers could invent: they discover a candor and modesty unexampled: they exhibit an originality in the character of Jesus, and yet such a consistency as the imagination of our best poets has ever reached. Now it is a very remarkable circumstance that histories, written by four different men, should preserve such dignity and consistency, though frequently relating different actions of Jesus, and descending to the most minute circumstances in his life. The scene of action is too extensive, and the agreement of facts with the state of the times as represented by other historians is too close, to admit the possibility of forgery.

The scene of action is not confined to one country, it is successively laid in the greatest cities of the Roman empire; in Rome, in Antioch, in Corinth, in Athens, as well as in Jerusalem and the land of Palestine. Innumerable allusions are made to the manners and opinions of the Greeks, the Romans, and the Jews; and, respecting the Jews, they extend even to the trifles and follies of their schools. Yet, after the strictest examination, the New Testament will be found to have a wonderful coincidence and harmony with Josephus, the principal historian of these times, and an enemy of Christianity. It has been a question who the soldiers were who are said in the gospel of Luke to have addressed John the Baptist in these words, What shall we do? An answer to this question may be found in Josephus: *Antiq. lib. 58. c. 5. § 1, 2.* Herod the tetrarch of Galilee was engaged in a war

with his father-in-law Aretas, a petty king in Arabia Petrea, at the very time that John was preaching in the wilderness; and, the road from Galilee to Arabia running through that wilderness, the soldiers on their march had this interview with the Baptist. A coincidence like this, which has been overlooked by all the commentators, would not probably be attended to in a forgery.

Another instance of an agreement no less remarkable we shall quote from the valuable work of Michaelis. It has been a question of some difficulty among the learned, who was the Ananias who commanded St. Paul to be smitten on the mouth when he was making his defence before the council in Jerusalem: Acts xviii. 2—5. Krebs, in his remarks taken from Josephus, has shown him to have been the son of Nebedeni. But, if so, how can it be reconciled with chronology, that Ananias was, at that time, called high priest, when it is certain from Josephus that the time of his holding that office was much earlier! And how comes it to pass that St. Paul says, 'I wist not, brethren, that he was the high priest?' The sacerdotal garb must have discovered who he was; a jest would have ill-suited the gravity of a tribunal; and a falsehood is inconsistent with the character of St. Paul. All these difficulties vanish as soon as we examine the special history of that period:—Ananias the son of Nebedeni was high priest at the time that Helena queen of Adiabene supplied the Jews with corn from Egypt, during the famine which took place in the fourth year of Claudius, mentioned in the eleventh chapter of the Acts. St. Paul, therefore, who took a journey to Jerusalem at that period, could not have been ignorant of the elevation of Ananias to that dignity. Soon after the holding of the first council, as it is called, at Jerusalem, Ananias was dispossessed of his office, in consequence of certain acts of violence between the Samaritans and the Jews, and sent prisoner to Rome; but, being afterwards released, he returned to Jerusalem. Now from that period he could not be called high priest in the proper sense of the word, though Josephus has sometimes given him the title of *ἀρχιερεὺς*, taken in the more extensive meaning of a priest who had a seat and voice in the Sanhedrim; and Jonathan, though we are not acquainted with the circumstances of his elevation, had been raised in the mean time to the supreme dignity in the Jewish church. Between the death of Jonathan, who was murdered by order of Felix, and the high priesthood of Ismael, who was invested with that dignity by Agrippa, elapsed an interval during which the sacerdotal office was vacant. Now it happened precisely in this interval that St. Paul was apprehended in Jerusalem; and, the Sanhedrim being destitute of a president, he undertook of his own authority the discharge of that office, which he executed with the greatest tyranny. It is possible therefore that St. Paul, who had been only a few days in Jerusalem, might be ignorant that Ananias, who had been dispossessed of the priesthood, had taken upon himself a trust to which he was not entitled; he might therefore very naturally exclaim, 'I wist not, brethren, that he was the high priest!' Admitting him on the other hand to have been ac-

quainted with the fact, the expression must be considered as an indirect reproof, and a tacit refusal to recognise usurped authority.' Could such a correspondence as this subsist between truth and falsehood, between a forgery and an authentic history? or is it credible that these events could be related by any person but a contemporary?

Impressed with the love of truth, and feeling contempt as well as detestation at pious frauds, we hesitate not to acknowledge that in some particular facts there is a difference either real or apparent between Josephus and the writers of the New Testament. The objections arising from these differences are of two kinds; 1. Such as would prove a book not to have been written by the author to whom it is ascribed. 2. Such as would prove that the author was mistaken, and therefore not divinely inspired. To the first class belongs the following objection:—St. Paul says (2 Cor. xi. 32) that the governor of Damascus was under Aretas the king; but if we are to judge from the eighteenth book of the Jewish Antiquities, which corresponds with the period of St. Paul's journey to Damascus, this city must have belonged at that time to the Romans; and what authority could Aretas, a petty king in Arabia Petrea, have in such a city? In answer to this question, J. G. Ayne, in a dissertation published in 1755, has shown it to be highly probable that Aretas, against whom the Romans, not long before the death of Tiberius, made a declaration of war, which they neglected to put in execution, took the opportunity of seizing Damascus, which had once belonged to his ancestors; an event omitted by Josephus, as forming no part of the Jewish history, and by the Roman historians, as being a matter not flattering in itself, and belonging only to a distant province. 2dly, That Aretas was by religion a Jew; a circumstance the more credible, when we reflect that Judaism had been widely propagated in that country, and that even kings in Arabia Felix had recognised the law of Moses. The difficulty then is so far removed that it ceases to create suspicion against an epistle which has so many evident marks of authenticity; and it is only to be regretted that, in order to place the subject in the clearest point of view, we are not sufficiently acquainted with the particular history of Damascus.

Examples of the second kind are such as, if allowed their full force, might indeed prove a writer not divinely inspired, but could afford no reason to conclude that he was not the author of the writings which bear his name, since mistakes may be committed by the most accurate historian. The chief difficulties of this nature are found in the Gospel according to St. Luke, and do not apply to the writings of Matthew, John, Paul, and Peter. Laying aside the idea of inspiration altogether, let us enquire whether Luke or Josephus be most entitled to credit in those passages where they differ: which of them is most accurate, and which of them had the best opportunities of exploring the truth of the facts which they relate. Now Josephus relates the same story differently in different parts of his works, and is sometimes equally mistaken in

them all. We do not recollect to have seen such inconsistencies in the writings of St. Luke. Luke knew the characters, and witnessed many of the facts, of which he speaks, and he could receive the best information respecting those facts which were transacted in his absence. Josephus was born A. D. 37, some years after our Saviour's ascension. Now it is a very important observation of Michaelis that the period of history with which mankind are least acquainted is that which includes the time of their childhood and youth, together with the twenty or thirty years immediately preceding their birth. Concerning the affairs transacted during that period we are much more liable to fall into mistakes than concerning those of a remoter age. The reason is, that authentic history never comes down to the period of our birth; our knowledge of the period immediately preceding depends on hearsay; and the events which pass within the first eighteen or twenty years of our lives we are too young and heedless to observe with attention. This must have been more remarkably the case in the time of Josephus than at present, when there were neither daily papers nor periodical journals to supply the want of regular annals. There was no historian from whom Josephus could derive any knowledge of the times that immediately preceded his birth. There is a period then of forty or fifty years, in which, even with the most diligent enquiry, he was exposed to error.

When we find, therefore, the relations of Luke and Josephus so different as not to be reconciled, it would be very unfair to determine, without any further enquiry, in favor of Josephus. Let their character, works, and situation, be strictly examined; let their testimony be duly weighed and compared; and then let the preference be given to that author who, according to the strictest rules of equity and justice, seems entitled to the highest degree of credit. The decision of a jury, we shall venture to say, would in every instance turn out in favor of Luke.

Having thus ascertained the authenticity of the books of the New Testament, the next thing to be considered is their *inspiration*. It is certainly of some importance to know how far the apostles and evangelists were guided in their writings by the immediate influence of the Spirit of God; though this knowledge, if attainable, is not equally important with that of the authenticity of these writings. Michaelis indeed asserts that the divinity of the New Testament may be proved whether we can evince it to be written by immediate inspiration or not. 'The question,' says he, 'whether the books of the New Testament are inspired, is not so important as the question whether they are genuine! The truth of our religion depends upon the latter, not absolutely on the former. Had the Deity inspired not a single book of the New Testament, but left the apostles and evangelists without any other aid than that of natural abilities to commit what they knew to writing, admitting their works to be authentic, and possessed of a sufficient degree of credibility, the Christian religion would still be well founded. The miracles by which

it is confirmed would equally demonstrate its truth, even if the persons who attested them were not inspired, but simply human witnesses; and their divine authority is never presupposed, when we discuss the question of miracles, but merely their credibility as human evidence. If the miracles are true which the evangelists relate, the doctrines of Christ, recorded in the gospels, are proved to be the infallible oracles of God; and even if we admit the apostles to be mistaken in certain not essential circumstances, yet, as the main points of the religion which Christ commissioned them to preach are so frequently repeated, their epistles would instruct us as well in the tenets of the Christian system as the works of Maclaurin in the philosophy of Newton. It is possible, therefore, to doubt, and even to deny, the inspiration of the New Testament, and yet be fully persuaded of the truth of the Christian religion; and many really entertain these sentiments either publicly or in private, to whom we should render great injustice, if we ranked them in the class of unbelievers. Yet the Christian religion would be attended with difficulty, if our principium cognoscendi rested not on firmer ground; and it might be objected that sufficient care had not been taken for those whose consciences were tender, and who were anxiously fearful of mistaking the smallest of the divine commands. The chief articles, indeed, of Christianity are so frequently repeated, both by Christ and his apostles, that even were the New Testament not inspired we could entertain no doubt of the following doctrines: 'Jesus was the Messiah of the Jews, and an infallible messenger of God: he died for our iniquity; and by the satisfaction made by his death we obtain remission of sins, if on our part be faith and amendment of life; the Levitical law is abolished, and moral precepts with the ceremonies of baptism and the Supper of the Lord, are appointed in its stead; after the present follows an everlasting life, in which the virtuous shall be rewarded and the wicked punished, and where Christ himself shall be the judge.'

'To the epistles indeed,' says Michaelis, 'inspiration is of real consequence; but with respect to the historical books, viz. the gospels and Acts of the Apostles, we should really be no losers if we abandoned the system of inspiration, and in some respects have a real advantage. We should be no losers, if we considered the apostles in historical facts as merely human witnesses, as Christ himself has done in saying, 'Ye also shall bear witness, because ye have been with me from the beginning,' John xv. 27. And no one that attempts to convince an unbeliever of the truth of Christianity, would begin his demonstration by presupposing a doctrine which his adversary denies, but would ground his arguments on the credibility of the evangelists as human historians, for the truth of the miracles, the death, and the resurrection of Christ. Even those who examine the grounds of their faith for their own private conviction must treat the evangelists as human evidence; since it would be arguing in a circle to conclude that the facts recorded in the gospels are true because they are inspired, when we conclude the Scriptures to be inspired, in

consequence of their contents. In these cases, then, we are obliged to consider the evangelists as human evidence; and it would be no detriment to the Christian cause to consider them at all times as such in matters of historical fact. We find it nowhere expressly recorded that the public transactions which the apostles knew by their own experience, and of which St. Luke informed himself by diligent enquiry, should be particular objects of divine inspiration. We should even be considerable gainers, in adjusting the harmony of the gospels, if we were permitted to suppose that some one of the evangelists had committed an immaterial error, and that St. John has rectified some trifling mistakes in the preceding gospels. The most dangerous objections which can be made to the truth of our religion, and such as are most difficult to answer, are those drawn from the different relations of the four evangelists.

Before any enquiry is made respecting the inspiration of the books of the New Testament, it is necessary to determine the reading of the term; for theologians have given to it a variety of significations. Most of the German divines make it to consist in an infusion of words as well as ideas. Luther, Beza, and Salmasius, restrict it to ideas alone. Doddridge understands by it an intervention of the Deity, by which the natural faculties of the mind were directed to the discovery of truth. Warburton and Law think it was a negative intervention to preserve the sacred writers from essential errors. Some believe every circumstance was dictated by the Holy Ghost; others suppose that no supernatural assistance was granted except in the epistolary writings. See *INSPIRATION*.

As there is an evident distinction between inspiration and revelation, and as the origin of the Christian religion may be still proved divine, even though it were denied that those who record its facts and doctrines were inspired in the act of writing, it will be most judicious and safe to employ the word inspiration in that sense which can be most easily defended and supported. By doing this, much may be gained and nothing lost. It is difficult to prove to a deist that the words of Scripture are divine, because he sees that every writer has words and phrases peculiar to himself. It is difficult also to prove that the ideas were infused into the mind of the authors while they were engaged in the act of writing; because, concerning facts, they appeal not to divine inspiration, but declare what they have seen and heard. In reasoning, they add their own sentiments to what they had received from the Lord, and subjoin, especially in their epistles, things not connected with religion. The definition which Doddridge gives seems applicable to ordinary gifts, or the usual endowments of rational creatures, rather than to the extraordinary gifts of the Holy Spirit, which were bestowed on the apostles. Those who maintain that every fact or circumstance was suggested by divine inspiration will find it no easy matter to prove their position. The opinion of Warburton and Law, with proper explanations, seems most probable. The opinion of Grotius, that only the epistles were inspired, may be easily refuted.

The proof of the authenticity of the New Testament depends on human testimony. the proof of its inspiration is derived from the declaration of inspired persons. In proving that the New Testament is inspired, we presuppose its authenticity; that the sacred books were written by the apostles whose names they bear; and that they have been conveyed to us pure and uncorrupted. This we have already attempted to prove, and we hope with success. The evidence of inspiration is the testimony of Christ and his apostles, which we receive as credible, because they confirmed their doctrines by miracles. From the important mission of Christ and his apostles, we infer that every power was bestowed which divine wisdom thought expedient; and from their conduct we conclude that it is morally impossible that they could lay claim to any powers which they did not possess. It is proper, therefore, to enquire into the declarations of Christ and his apostles concerning the nature, degree, and extent of the inspiration bestowed upon the writers of the sacred books.

If we consider Christ's more immediate promises of inspiration to the apostles, we shall find that he has given them, in the most proper sense of the word, at three several periods, 1st, When he sent the apostles to preach the gospel; 2dly, In holding a public discourse relating to the gospel, at which were present a considerable multitude; 3dly, In this prophecy of the destruction of Jerusalem. When he sent the apostles to preach the gospel, he thus addressed them: 'When they deliver you up, take no thought how or what ye shall speak; for it shall be given you in that same hour what ye shall speak; for it is not you that speak, but the spirit of your Father that speaketh in you.' The same promise was made almost in the same words in the presence of an immense multitude: Luke xii. 11, 12. From these passages it has been urged that, if the apostles were to be inspired in the presence of magistrates in delivering speeches, which were soon to be forgotten, it is surely reasonable to conclude that they would be inspired when they came to compose a standard of faith for the use of all future generations of Christians. If this conclusion be fairly deduced, it would follow that the writings of the New Testament are the dictates of inspiration, not only in the doctrines and precepts, but in the very words. But it is a conclusion to which sincere Christians have made objections; for, say they, though Christ promises to assist his apostles in cases of great emergency, where their own prudence and fortitude could not be sufficient, it does not follow that he would dictate to them those facts which they knew already, or those reasonings which their own calm reflection might supply. Besides, say they, if the New Testament was dictated by the Holy Spirit, and only penned by the apostles, what reason can be given for the care with which Christ instructed them both during his ministry and after his crucifixion in those things pertaining to the kingdom of God?

In answer to this we may observe that though it be difficult to prove that the identical words of the New Testament were dictated by the Holy

'Spirit, or the train of ideas infused into the minds of the sacred writers, there is one species of inspiration to which the New Testament has an undoubted claim. It is this, that the memories of the apostles were strengthened, and their understandings preserved from falling into essential errors. This we prove from these words of our Saviour, 'and I will pray the Father, and he will give you another Comforter, that he may abide with you for ever. He shall teach you all things, and bring all things to your remembrance whatsoever I have said unto you.' John xiv. 16, 26. This promise was surely not restrained to the day of Pentecost; it must have been a permanent gift, enabling the apostles at all times to remember with accuracy the discourses of our Saviour. When the apostles therefore (Matthew and John) relate those precepts of Christ which they themselves had heard, they write indeed from memory, but under the protection of the Spirit, who secures them from the danger of mistake: and we must of course conclude that their gospels are inspired.

Were we called upon more particularly to declare what parts of the New Testament we believe to be inspired, we would answer, The doctrines, the precepts, and the prophecies, every thing essential to the Christian religion. From these the idea of inspiration is inseparable. As to the events, the memory of the apostles was sufficient to retain them. If this opinion be just, it will enable us to account for the discrepancies between the sacred writers, which are chiefly confined to the relation of facts and events.

I. *Of the language of the New Testament Scriptures.*—All the books of the New Testament were originally written in Greek, except the Gospel according to Matthew and the Epistle to the Hebrews, which there is reason to believe were composed in the Syro-Chaldaic language, which in the New Testament is called Hebrew.

Various reasons have been assigned why the greatest part of the New Testament was written in Greek; but the true reason is this: it was the language best understood both by writers and readers. Had St. Paul written to a community in the Roman province of Africa, he might have written perhaps in Latin; but epistles to the inhabitants of Corinth, Galatia, Ephesus, Philippi, and Thessalonica, to Timothy, Titus, and Philemon, from a native of Tarsus, could hardly be expected in any other language than Greek. The same may be said of the epistles of St. Peter, which are addressed to the Christians of different countries, who had no other language in common than the Greek; and likewise of the epistles of St. James, who wrote to the Jews that lived at a distance from Palestine, and were ignorant of Hebrew. The native language of St. Luke, as well as of Theophilus, to whom he addressed his gospel and Acts of the Apostles, appears to have been Greek, and that St. John wrote his gospel in that language, and not in Hebrew, is by no means a matter of surprise, since he wrote at Ephesus.

With respect to the Epistle to the Romans, it may be asked indeed why St. Paul did not write in Latin? Now, whoever proposes this question, must presuppose that St. Paul was master of the

Latin language in such a degree as to find no difficulty in writing it; a matter which remains to be proved. It is very probable that St. Paul was acquainted with the Latin; but, between understanding a language and being able to write it, there is a very material difference. As St. Paul was a native of Tarsus, his native language was Greek; he had travelled during several years through countries in which no other language was spoken, and when he addressed the Roman centurion at Jerusalem, he spoke not Latin, but Greek. Is it extraordinary, then, that in writing to the inhabitants of Rome he should have used a language which was there so generally understood? It has been long remarked that Greek was at that time as well known in Rome as French in any court of modern Europe: that according to Juvenal even the female sex made use of Greek as the language of familiarity and passion; and that, in letters of friendship, Greek words and phrases were introduced with greater freedom than French expressions in German letters, as appears from Cicero's epistles to Atticus, and from those of Augustus preserved in the works of Suetonius. To this must be added a material circumstance, that a great part of the Roman Christians consisted of native Jews, who were better acquainted with Greek than with Latin, as either they themselves or their ancestors had come from Greece, Asia Minor, or Egypt, in which Greek was the language of the country. At least they read the Bible in that language, as no Latin translation of the Old Testament at that time existed; and, the Christian church at that period consisting chiefly of Jews, the heathen converts in Rome were of course under the necessity of accustoming themselves to the Greek language. In short, St. Paul in his Epistle to the Romans made use of a language, in which alone those who were ignorant of Hebrew could read the Bible. What has been here advanced respecting the Epistle to the Romans is equally applicable to the Greek of St. Mark, on the supposition that it was written at Rome.

To the above arguments may be added the example of Josephus, who, as well as the apostles, was by birth a Jew. He even lived in Rome, which is more than can be said of St. Paul and St. Mark, who resided there only a certain time: he was likewise younger than either; he came to Italy at an age which is highly suitable to the learning of a language, and previous to that period had spent several years in the Roman camp. The Jewish antiquities, the history of the Jewish war, and the account of his own life, he wrote undoubtedly with a view of their being read by the Romans; and yet he composed all these writings in Greek. He expresses his motive for writing his Greek account of the Jewish war in the following terms: 'That having written in his native language (i. e. the Hebrew dialect at that time spoken) a history of the war, in order that Parthians, Babylonians, Arabians, Adiabenes, and the Jews beyond the Euphrates might be informed of those events, he was now resolved to write for the Greeks and Romans, who had not been engaged in the campaigns, a more certain

account than had hitherto been given.' The motives which induced Josephus to write in Greek are fully as applicable to St. Paul and St. Mark.

Michaelis has thus characterised the style of the New Testament. 'The New Testament,' says he, 'was written in a language at that time common among the Jews, which may be named Hebraic Greek; the first traces of which we find in the translation of the LXX. Every man acquainted with the Greek language, who had never heard of the New Testament, must immediately perceive, on reading only a few lines, that the style is widely different from that of the classic authors. We find this character in all the books of the New Testament, in a greater or less degree, but we must not therefore conclude that they possess a uniformity of style. The harshest Hebraisms, which extend even to grammatical errors in the government of cases, are the distinguishing marks of the book of Revelation; but they are accompanied with tokens of genius and poetical enthusiasm of which every reader must be sensible who has taste and feeling. There is no translation of it which is not read with pleasure even in the days of childhood; and the very faults of grammar are so happily placed as to produce an agreeable effect. The gospels of St. Matthew and St. Mark have strong marks of this Hebraic style; the former has harsher Hebraisms than the latter, the fault of which may be ascribed to the Greek translator, who has made too literal a version, and yet the Gospel of St. Mark is written in worse language, and in a manner that is less agreeable. The epistles of St. James and St. Jude are somewhat better, but even these are full of Hebraisms, and betray in other respects a certain Hebrew tone. St. Luke has in several passages written pure and classic Greek, of which the first four verses of his gospel may be given as an instance; in the sequel, where he describes the actions of Christ, he has very harsh Hebraisms, yet the style is more agreeable than that of St. Matthew or St. Mark. In the Acts of the Apostles he is not free from Hebraisms, which he seems to have never studiously avoided; but his periods are more classically turned, and sometimes possess beauty devoid of art. St. John has numerous, though not uncouth, Hebraisms both in his gospel and epistles; but he has written in a smooth and flowing language, and surpasses all the Jewish writers in the excellence of narrative. St. Paul again is entirely different from them all; his style is indeed neglected and full of Hebraisms, but he has avoided the concise and verse-like construction of the Hebrew language, and has upon the whole a considerable share of the roundness of Grecian composition. It is evident that he was as perfectly acquainted with the Greek manner of expression as with the Hebrew, and he has introduced them alternately, as either the one or the other suggested itself the first, or was the best approved.'

Michaelis has shown that the New Testament not only contains Hebraisms, but Rabinisms, Syriasm, Chaldaisms, Arabisms, Latinisms, and Persian words, of which he has exhibited many specimens. To theologians, whose duty it cer-

tainly is to study the language of the New Testament with attention, we would strenuously recommend the perusal of this work, which in the English translation is one of the most valuable accessions to scriptural criticism that has yet appeared. We speak of the English translation, which the large and judicious notes of Mr. Marsh has rendered infinitely superior to the original.

We shall here add a few remarks on the peculiarities of the style and manner of the sacred writers, particularly the historians. These remarks extend to the Old Testament as well as to the New. 1. The first quality, for which the sacred history is remarkable, is simplicity in the structure of the sentences. The first five verses of Genesis furnish an example, which consist of eleven sentences. The substantives are not attended by adjectives, nor the verbs by adverbs, no synonymes, no superlatives, no effort at expressing things in a bold, emphatical, or uncommon manner. 2. The second quality is simplicity of sentiment, particularly in the Pentateuch, arising from the very nature of the early and uncultivated state of society about which that book is conversant. 3. Simplicity of design. The subject of the narrative so engrosses the attention of the writer, that he himself is as nobody. He introduces nothing as from himself, no remarks, doubts, conjectures, or reasonings. Our Lord's biographers particularly excel in this quality. This quality of style we meet with in Xenophon and Cæsar.

The evangelists may be ranked next to Genesis for simplicity of composition in the sentences. John and Matthew are distinguished for it more than Mark and Luke. But the sentiment is not so remarkable for simplicity in the evangelists as in the Pentateuch. The reasons of this difference are, the state of the Jews was totally changed; their manners, customs, &c., split into factions both in religion and politics. 2. The object of our Lord's ministry, which is the great subject of the gospels, was to inculcate a doctrine and morality with which none of their systems perfectly coincided; besides, being constantly opposed by all the great men, the greater part of his history consists of instructions and disputes. 3. As it is occupied with what our Saviour said, and what he did, this makes two distinctions of style and manner; that of our Saviour and the sacred penman's. In their own character, they neither explain nor command, promise nor threaten, praise nor blame. They generally omit the names of our Lord's enemies; thus directing our hatred at the vices they committed, not at the persons. They never mention such persons without necessity; which is the case with the high-priest, Pilate, Herod, and Judas: the first three for the chronology, the fourth to do justice to the eleven.

Herodias is indeed mentioned with dishonor, but her crime was a public one. On the other hand, all persons distinguished for any thing virtuous are carefully mentioned, Joseph of Arimathea, Nicodemus, Zaccheus, Bartimeus, Jairus, Lazarus, Mary, and Martha. They record their own faults (Peter's, Thomas's), nor do they make any merit of their confession. In one uniform

strain they relate the most signal miracles and most ordinary facts.

From the narrative is excluded that quality of style which is called animation. Nothing that discovers passion in the writer, or is calculated to excite the passions of the readers. Every thing is directed to mend the heart. But, in the discourses and dialogues of our Saviour, the expression, without losing any of its simplicity, is often remarkable for spirit and energy. Respecting harmony and smoothness, qualities which only add an external polish to language, they had not the least solicitude.

As to elegance, there is an elegance which results from the use of such words as are most in use with those who are accounted fine writers, and from such arrangements in the words and clauses as have generally obtained their approbation. This is disclaimed by the sacred authors. But there is an elegance of a superior order more nearly connected with the sentiment; and in this sort of elegance they are not deficient. In all the oriental languages great use is made of tropes, especially metaphors. When the metaphors employed bear a strong resemblance, they confer vivacity; if they be borrowed from objects which are naturally agreeable, beautiful, or attractive, they add also elegance. The evangelists furnish us with many examples of this kind of vivacity and elegance. Our Lord borrows tropes from corn-fields, vineyards, gardens, &c.

As a valuable appendage to this part of our subject, we subjoin Dr. Campbell's method of studying the books of the New Testament. This we offer to our readers as a beautiful instance of the judicious application of philosophy to sacred studies. It is the same method of discovering truth, by analysis and induction, which was pursued by Sir Isaac Newton with such astonishing success, which since his time has been uniformly practised in natural philosophy, and has been also applied to chemistry, to medicine, to natural history, and to the philosophy of the mind, by the ingenious Dr. Reid. This is the path of sound philosophy, which can alone lead to the discovery of truth. In following it, our progress may be slow, but it will be sure. If all the theologians would steadily adhere to it, we might then entertain the pleasant hope of discarding for ever those absurd systems of religion which are founded on single passages and detached fragments of Scripture, and of establishing opinions and doctrines on a solid foundation.

1. To get acquainted with each writer's style; to observe his manner of composition, both in sentences and paragraphs; to remark the words and phrases peculiar to him, and the peculiar application that he may sometimes make of ordinary words; for there are few of those writers who have not their peculiarities in all the respects now mentioned. This acquaintance with each can be obtained only by the frequent and attentive reading of his works in his own language.

2. To enquire into the character, the situation, and the office of the writer, the time, the place, and the occasion of his writing, and the people for whose immediate use he originally intended his work. Every one of these particu-

lars will sometimes serve to elucidate expressions otherwise obscure or doubtful. This knowledge may in part be learned from a diligent and reiterated perusal of the book itself, and in part be gathered from authentic, or at least probable accounts that have been transmitted to us concerning the compilement of the canon.

3. The next general direction is, to consider the principal scope of the book, and the particulars chiefly observable in the method by which the writer has purposed to execute his design. This direction is particularly applicable to the epistolary writings, especially those of Paul.

4. If a particular word or phrase occur, which appears obscure, perhaps unintelligible, the first thing we ought to do, if satisfied that the reading is genuine, is to consult the context, to attend to the manner wherein the term is introduced, whether in a chain of reasoning or in a historical narration, in a description, or included in an exhortation or command. As the conclusion is inferred from the premises, or as from two or more known truths a third unknown or unobserved before may fairly be deduced; so from such attention to the sentence in connexion, the import of an expression, in itself obscure or ambiguous, will sometimes, with moral certainty be discovered. This, however, will not always answer.

5. If it do not, let the second consideration be, whether the term or phrase be one of the writer's peculiarities. If so, it comes naturally to be enquired, what is the acceptance in which he employs it in other places? If the sense cannot be precisely the same in the passage under review, perhaps, by an easy and natural metaphor or other trope, the common acceptance may give rise to one which perfectly suits the passage in question. Recourse to the other places wherein the word or phrase occurs in the same author is of considerable use, though the term should not be peculiar to him.

6. But 3dly, If there should be nothing in the same writer that can enlighten the place, let recourse be had to the parallel passages, if there be any such, in the other sacred writers. By parallel passages, I mean those places, if the difficulty occur in history, wherein the same or a similar story, miracle, or event, is related; if in teaching or reasoning, those parts wherein the same argument or doctrine is treated, or the same parable propounded; and, in moral lessons, those wherein the same class of duties is recommended; or, if the difficulty be found in a quotation from the Old Testament, let the parallel passage in the book referred to, both in the original Hebrew, and in the Greek version, be consulted.

7. But if, in these, there be found nothing that can throw light on the expression of which we are in doubt, the fourth recourse is to all the places wherein the word or phrase occurs in the New Testament, and in the Septuagint version of the Old, adding to these the consideration of the import of the Hebrew or Chaldaic word, whose place it occupies, and the extent of signification, of which in different occurrences such Hebrew or Chaldaic term is susceptible.

8. Perhaps the term in question is one of those which very rarely occur in the New Testament, or those called *απαξ λεγόμενα*, only once read in Scripture, and not found at all in the translation of the LXX. Several such words there are. There is then a necessity, in the fifth place, for recurring to the ordinary acceptation of the term in classical authors. This is one of those cases wherein the interpretation given by the earliest Greek fathers deserves particular notice. In this, however, I limit myself to those comments wherein they give a literal exposition of the sacred text, and do not run into vision and allegory.' See ALLEGORY.

II. *Of the ancient MSS. and early editions of the New Testament.*—The MSS. of the New Testament are the natural source, from which the genuine readings of the Greek Testament are to be drawn. The printed editions are either copies of more ancient editions, or of MSS., and they have no further authority than as they correspond to the MSS. from which they were originally taken. By MSS. of the New Testament we mean those only which were written before the invention of printing. The most ancient of these are lost, and there is no MS. now extant older than the sixth century. Few contain the whole New Testament; some contain the four gospels; some the Acts of the Apostles and epistles; and others the book of Revelation. The greatest number are those which contain the first part; those which have the second, or the first and second together, are likewise numerous; but those of the third are extremely few. It must be added, also, that in many MSS. those epistles are omitted whose divine authority was formerly doubted.

Wetstein, in collating many MSS. anew, made discoveries which had entirely escaped the notice of his predecessors. The fourth class consists of such as have been completely and accurately collated more than once. The fifth class, which is by far the most valuable, consists of such as have been printed word for word, and therefore form an original edition of the Greek Testament. We can boast but of a very few MSS. of this kind. Hearne printed at Oxford, in 1715, the Acts of the Apostles in Greek and Latin from the Codex Laudianus 3; Knittel has annexed to his edition of Ulpilas, p. 53—118, a copy of two very ancient fragments preserved in the library of Wolfenbüttele; the one of the four gospels in general, the other of St. Luke and St. John. Woide printed in 1786 the Codex Alexandrinus, a MS. of great antiquity; and the University of Cambridge has resolved to publish, in a similar manner, the Cod. Cant. I., or, as it is sometimes called, the Codex Bezae, the care of which is entrusted to Dr. Kipling, a publication which will be thankfully received by every friend to sacred criticism. It was the intention of the abbé Spoletti, a few years ago, to publish the whole of the celebrated Codex Vaticanus; which would likewise have been a most valuable accession, since a more important MS. is hardly to be found in all Europe. He delivered for this purpose a memorial to the pope; but the design was not put into execution, either because the pope refused his assent, or the abbé aban-

doned it himself. See the Oriental Bible, vol. xxii. No. 333, and vol. xxiii. No. 348.

'A very valuable library,' says Michaelis, 'might be composed of the impressions of ancient MSS. which, though too expensive for a private person, should be admitted into every university collection, especially the Alexandrine and Cambridge MSS., to which I would add, if it were now possible to procure it, Hearne's edition of the Codex Laudianus 3. A plan of this sort could be executed only in England, by a private subscription, where a zeal is frequently displayed in literary undertakings that is unknown in other countries; and it were to be wished that the project were begun before length of time has rendered the MSS. illegible, and the attempt fruitless. £10,000 would go a great way towards the fulfilling of this request, if the learned did not augment the difficulty of the undertaking, by adding their own critical remarks, and endeavouring thereby to recommend their publication rather than by presenting to the public a faithful copy of the original. Should posterity be put in possession of faithful impressions of important MSS., an acquisition which would render the highest service to sacred criticism, all these editions of the New Testament should be regulated on the same plan as Hearne's edition of the Acts of the Apostles.' It must be highly flattering, to the patriotic spirit of an Englishman, to hear the encomiums which learned foreigners have so profusely bestowed on our liberality in supporting works of genius and learning and public utility. The plan which Michaelis proposed to us, in preference to all other nations in Europe, is noble and magnificent, and would certainly confer immortality on those men who would give it their patronage and assistance. There are many ancient MSS., especially in Italy, which have never been collated, but lie still unexplored. Here is a field where much remains to be done. See Marsh's Notes on Michaelis, vol. ii. p. 643, and Lectures on Lady Margaret's professor of divinity in the university of Cambridge, published in two parts. Michaelis has given a catalogue of ancient MSS., amounting in number to 292, to which he has added a short account of each. We shall confine our observations to the two most celebrated, the Alexandrine and Vatican MSS., which we have chiefly extracted from Michaelis.

The *Alexandrine manuscript* consists of four volumes; the first three of which contain the Old Testament, the fourth the New Testament, together with the first epistle of Clement to the Corinthians, and a fragment of the second. In the New Testament, which alone is the object of our present enquiry, is wanting the beginning as far as Matthew xxv. 6, *ὁ πρῶτος πορεύεται*, likewise from John vi. 50 to viii. 52, and from 2 Cor. iv. 13 to xii. 7. The Psalms are preceded by the epistle of Athanasius to Marcellinus, and followed by a catalogue, containing those which are to be used in prayer for each hour, both of the day and of the night; also by fourteen hymns, partly apocryphal, partly biblical, the eleventh of which is a hymn in praise of the Virgin Mary, entitled *προσευχη Μαρίας της ζωοτοκου*: further the Hy-

potheses Eusebii are annexed to the psalms, and his Canones to the gospels. It is true that this has no immediate reference to the New Testament, but may have influence in determining the antiquity of the MS. itself. It has neither accents nor marks of aspiration; it is written with capital, or, as they are called, uncial letters, and has very few abbreviations. There are no intervals between the words; but the sense of a passage is sometimes terminated by a point, and sometimes by a vacant space. Here arises a suspicion that the copyist did not understand Greek, because these marks are sometimes found even in the middle of a word; for instance, Levit. v. 4, *ανομος* : η for *ανομοση*, and Num. xiii. 29, *μω* *Υαηε*. This MS. was presented to Charles I. in 1628, by Cyrillus Lucaris, patriarch of Constantinople. Cyrillus has given the following account:—We know so much of this MS. of the holy writings of the Old and New Testament that Thecla, an Egyptian lady of distinction (nobilis femina Ægyptia), wrote it with her own hand 1300 years ago. She lived soon after the council of Nicæa. Her name was formerly at the end of the book; but when Christianity was subverted in Egypt, by the errors of Mahomet, the books of the Christians suffered the same fate, and the name of Thecla was expunged. But oral tradition of no very ancient date (memoria et traditio recens) has preserved the remembrance of it.' After all, its antiquity cannot be determined with certainty, though it appears from the formation of the letters, which resemble those of the fourth and fifth centuries, and the want of accents, that it was not written so late as the tenth. In this century it was placed by Oudin, while Grabe and Schulze have referred it to the fourth, which is the very utmost period that can be allowed, because it contains the epistles of Athanasius. Wetstein, with more probability, has chosen a mean between these two extremes, and referred it to the fifth century.

The public is now in possession of a perfect impression of this MS., accompanied with a complete and critical collection of various readings. Dr. Woide published it in 1786, with types cast for that purpose, without intervals between the words. The copy is so perfect a resemblance of the original that it may supply its place. Its title is *Novum Testamentum Græcum e codice MSS. Alexandrino, qui Londini in Bibliotheca Musæi Britannici asservatur, descriptum*. The preface of the learned editor contains an accurate description of the MS., with an exact list of all its various readings, that takes up no less than eighty-nine pages; and each reading is accompanied with a remark, in which is given an account of what his predecessors Juninus, Walton, Fell, Mill, Grabe, and Wetstein, had performed or neglected. See ALEXANDRINE COPY.

The *Vatican manuscript* contained originally the whole Greek Bible, including both the Old and New Testament; and in this respect, as well as in regard to its antiquity, it resembles none so much as the Codex Alexandrinus, but no two MSS. are more dissimilar in their readings, in the New Testament as well as in the Old. After the gospels, which are placed in the usual order,

come the Acts of the Apostles, which are immediately followed by the seven catholic epistles. Professor Hwiid, in a letter dated Rome, April 12th, 1781, assured Michaelis that he had seen them with his own eyes, and that the second Epistle of St. Peter is placed folio 1434, the second of St. John folio 1442, the third folio 1443: then follow the epistles of St. Paul, but not in the usual order; for the Epistle to the Hebrews is placed immediately after those to the Thessalonians. The epistles of St. Paul are divided into ninety-three sections by figures written in the margin with red ink; but the Epistle to the Galatians ends with 59, and that to the Ephesians begins with 70; the Epistle to the Hebrews, on the contrary, begins with 60, and ends with 69. With the words *αμωμοντω δευ*, Heb. ix. 4, the MS. ceases, the remaining leaves being lost. There is wanting, therefore, not only the latter part of this epistle, but the epistles to Timothy, Titus, and Philemon, with the Revelation of St. John; but this last book, as well as the latter part of the Epistle to the Hebrews, has been supplied by a modern hand in the fifteenth century. In many places the faded letters have been also retouched by a modern but careful hand; and when the person who made these amendments, who appears to have been a man of learning, found a reading in his own MS. which differed from that of the Codex Vaticanus, he has noted it in the margin, and has generally left the text itself untouched, though in some few examples he has ventured to erase it. It is certain that this MS. is of very high antiquity, though it has been disputed which of the two in this respect is entitled to the preference, the Vaticanus or Alexandrinus. The editors of the Roman edition of the Septuagint, in 1587, referred the date of the Vatican MS. to the fourth century, the period to which the advocates for its great rival refer the Codex Alexandrinus. More moderate are the sentiments of that great judge of antiquity Montfauçon, who, in his *Bibliotheca Bibliothecarum*, p. 3, refers it to the fifth or sixth century; and adds that, though he had seen other MSS. of equal antiquity, he had found none at the same time so complete.

The *Codex Vaticanus* has a great resemblance to the MSS. noted by Wetstein, C. D. . . 1. 13. 33. 69. 102, and to the Latin, Coptic, and Ethiopic versions; but it is preferable to most of them in being almost entirely free from those undeniable interpolations, and arbitrary corrections, which are very frequently found in the above-mentioned MSS., especially in D. 1. and 62. It may be applied, therefore, as a mean not only of confirming their genuine readings, but of detecting and correcting those that are spurious. It is written with great accuracy, and is evidently a faithful copy of the more ancient from which it was transcribed. But this MS. has not throughout the whole New Testament the same uniform text.

As we have now a beautiful printed edition of the Alexandrine manuscript, by Dr. Woide, it is much to be wished that we had also an exact impression of the Vatican manuscript. From the superstitious fears and intolerant spirit of the inquisition at Rome, all access to this MS. was

refused to the abbe Spoletti, who presented a memorial for that purpose. Unless the pope interpose his authority, we must therefore despair of having our wishes gratified.

The most valuable editions of the Greek New Testament are those of Mill, Bengel, and Wetstein. The edition of Mill, which was only finished fourteen days before his death, occupied the attention of the author for thirty years. The collections of various readings which had been made before the time of Mill, the Valesian, the Barberini, those of Stephens, the London Polyglot, and Fell's edition, with those which the bishop had left in manuscript, and whatever he was able to procure elsewhere, he brought together into one large collection. He made likewise very considerable additions to it. He collated several original editions more accurately than had been done before: he procured extracts from Greek manuscripts, which had never been collated; and of such as had been before collated, but not with sufficient attention, he obtained more complete extracts. It is said that he has collected from MSS. fathers, and versions, not fewer than 30,000 various readings. This collection, notwithstanding its many imperfections, and the superiority of that of Wetstein, is still absolutely necessary to every critic: for Wetstein has omitted a great number of readings which are to be found in Mill, especially those which are either taken from the Vulgate, or confirm its readings. Mill was indeed too much attached to this version; yet he cannot be accused of partiality in producing its evidence. Wetstein, by too frequently neglecting the evidence in favor of the Vulgate, has rendered his collection less perfect than it would otherwise have been. He likewise added, as far as he was able, readings from the ancient versions; and is much to be commended for the great attention which he paid to the quotations of the fathers; the importance of which he had sagacity enough to discern. It cannot, however, be denied, that Mill's Greek Testament has many imperfections, and some of real importance. His extracts from MSS. are often not only incomplete, but erroneous; and it is frequently necessary to correct his mistakes from the edition of Wetstein. His extracts from the oriental versions are also imperfect, because he was unacquainted with these languages. The great diligence which Mill had shown, in collecting so many various readings, alarmed the clergy as if the Christian religion had been in danger of subversion. It gave occasion for a time to the triumphs of the deist, and exposed the author to many attacks. But it is now universally known that not a single article of the Christian religion would be altered, though a deist were allowed to select out of Mill's 30,000 readings whatever he should think most inimical to the Christian cause.

In 1734 Bengel, abbot of Alpirspach, in the duchy of Wirtemberg, published a new edition of the Greek Testament. The fears which Mill had excited began to subside upon this new publication; for Bengel was universally esteemed a man of piety. Bengel was not only diligent in the examination of various readings, but in the strictest sense of the word conscientious; for he

considered it as an offence against the Deity, if, through his own levity or carelessness, he introduced a false reading into the sacred text. His object was not merely to make a collection of readings, and leave the choice of them to the judgment of the reader, but to examine the evidence on both sides, and draw the inference: yet he has not given his own opinion so frequently as Mill, whom he resembled in his reverence for the Latin version, and in the preference which he gave to harsh and difficult readings before those which were smooth and flowing. He was a man of profound learning; and had a cool and sound judgment, though it did not prevent him from thinking too highly of the Latin readings, and of the Codex Alexandrinus; with other Latinising MSS. The imperfections of Bengel's edition arise chiefly from his diffidence and caution. He did not venture to insert into the text any reading which had not already appeared in some printed edition, even though he believed it to be the genuine reading. In the book of Revelation indeed he took the liberty to insert readings which had never been printed; because few MSS. had been used in the printing of that book.

The celebrated edition of John James Wetstein, which is the most important of all, and the most necessary to those engaged in sacred criticism, was published at Amsterdam in 1751 and 1752, in two volumes folio. No man will deny that Wetstein's *Prolegomena* discover profound erudition, critical penetration, and an intimate acquaintance with the Greek MSS. It is a work which, in many respects, has given a new turn to sacred criticism, and no man engaged in that study can dispense with it. Wherever Wetstein has delivered his sentiments respecting a Greek MS., which he has done less frequently than Mill, he shows himself an experienced and sagacious critic. He is likewise more concise than Mill in delivering his opinion, and does not support it by producing so great a number of readings. But the critical rules which he has delivered are perfectly just; and in this respect there is a remarkable agreement between him and his eminent predecessors Mill and Bengel. In regard to the Latin version alone they appear to differ; in Mill and Bengel it has powerful, and perhaps partial advocates, but in Wetstein a severe and sagacious judge, who sometimes condemns it without a cause. But, in consequence of this antipathy to the Vulgate, his collection of various readings is less perfect than it might have been.

Wetstein, in his character of a critic, is perfectly honest. With respect to his diligence and accuracy, Michaelis does not pronounce him faultless. But Mr. Marsh has examined the examples on which Michaelis founds his assertion, and declares that Michaelis is mistaken in every one of them. The diligence of Wetstein can scarcely be questioned by any who are acquainted with his history. He travelled into different countries, and examined with his own eyes a much greater number of MSS. than any of his predecessors. His collection of various readings amount to above a million; and he has not only produced a much greater quantity of

matter than his predecessors, but has likewise corrected their mistakes. The extracts from MS. versions, and printed editions of the Greek Testament, which had been quoted by Mill, are generally quoted by Wetstein. Whenever Wetstein had no new extracts from the MSS. quoted by Mill, or had no opportunity of examining them himself, he copied literally from Mill; but wherever Mill has quoted from printed editions, as from the margin of Robert Stephen's for instance, or from the London Polyglot, Wetstein did not copy from Mill, but went to the original source, as appears from his having corrected many mistakes in Mill's quotations. On the whole it is surprising, when we consider the difficulties and labor which Wetstein had to encounter, that his errors and imperfections are so few.

The proposal of Michaelis, however, of a new collation of MSS., to form a complete collection of various readings, is worthy the attention of the learned. In mentioning this proposal Michaelis says, Britain is the only country which possesses the will and the means to execute the task. Should a resolution, he adds, be formed in this island, so happily situated for promoting the purposes of general knowledge; to make the undertaking a public concern, to enter into a subscription, and to employ men of abilities in collating MSS. both at home and abroad, they would be able to do more in ten years than could otherwise be done in a century. And could this nation direct its attention to any object more glorious or more useful than in ascertaining the text of the sacred Scriptures, and giving to posterity an accurate edition?

As the sense of Scripture, as well as all other books, is affected by the punctuation, it is of importance to determine whether the stops or points which we find in the sacred books were used by the sacred writers, or have been inserted by modern transcribers. We are told by Montfaucon, in his *Palæographia Græca*, p. 31, that the person who first distinguished the several parts of a period in Greek writing, by the introduction of a point, was Aristophanes of Byzantium, who lived under Ptolemæus Epiphanes, in the 145th Olympiad. But, though points were not used in books before this period, they were employed in inscriptions above 400 years B. C. See Mont. Pal. Græc. p. 135. As the fact has not been generally known that the ancients pointed their MSS., and as it is an important and interesting fact, we refer our readers to the first six lines of St. John's Gospel, as they are pointed in the Alexandrine MS. exhibited in vol. I. p. 563.

Whether any points for making the sense were used by the apostles, cannot be determined; but the points now in use have been invented since. In the fourth century Jerome began to add the comma and colon to the Latin version; and they were then inserted in many more ancient MSS. In the fifth century Euthalius, a deacon of Alexandria, divided the New Testament into lines. This division was regulated by the sense, so that each line ended where some pause was to be made in speaking. And when a copyist was disposed to contract his space, and therefore

crowded the lines into each other, he placed a point where Euthalius had terminated the line. In the eighth century the stroke was invented which we call a comma. In the Latin MSS. Jerome's points were introduced by Paul Warnfried and Alcuin, at the command of Charlemagne. In the ninth century the Greek note of interrogation (;) was first used. At the invention of printing the editors placed the points arbitrarily, probably without bestowing the necessary attention; and Stephens, in particular, varied his points in every edition. The meaning of many passages in the Scripture has been altered by false pointing.

The ancients divided the New Testament into two kinds of chapters, some longer and some shorter. This method appears to be more ancient than St. Jerome; for he expunged a passage from the New Testament which makes an entire chapter. The longer kind of chapters were called breves, the shorter capitula. St. Matthew contained, according to St. Jerome, sixty-eight breves; Mark contained forty-eight; Luke eighty-three; and John eighteen. All the evangelists together consisted of 217 breves and 1126 capitula. The inventor of our modern division into chapters was Hugo de S. Caro, a French Dominican friar who lived in the thirteenth century.

The ancients had two kinds of verses, one of which they called *στίχοι*, and the other *ῥήματα*. The *remata* were lines which contained a certain number of letters like our printed books, and therefore often broke off in the middle of a word. Josephus's twenty books of antiquities contained 60,000 of them, though in Ittiquis's edition there are only 40,000 broken lines. *Stichi* were lines measured by the sense; according to an ancient written list, mentioned by Father Simon, there were in the New Testament 18,612 of these.

The verses into which the New Testament is now divided are more modern, and an imitation of the division of the Old Testament. Robert Stephens, the first inventor, introduced them in his edition in 1551. He made this division on a journey from Lyons to Paris; and, as his son Henry tells us in his preface to the Concordance of the New Testament, he made it inter equitandum; i. e. when he was weary of riding he amused himself with this work at his inn.

This invention of the learned printer was soon introduced into all the editions of the New Testament; and, it must be confessed that in consulting and quoting the Scriptures, and in framing concordances for them, a subdivision into minute parts is of the greatest utility. But all the purposes of utility could surely have been gained, without adopting the hasty and indigested division of Stephens, which often breaks the sense in pieces, renders plain passages obscure, and difficult passages unintelligible. To the injudicious division of Stephens we may ascribe a part of the difficulties which attend the interpretation of the New Testament, and many of those absurd opinions which have disgraced the ages of the Reformation. For as separate verses appear to the eyes of the learned, and to the minds of the unlearned, as so many detached sentences, they have been supposed to contain complete sense, and they have accordingly been ex-

plained without any regard to the context, and often in direct opposition to it. Were any modern history divided into fragments, with as little regard to the sense, we should soon find that as many opposite meanings could be forced upon them as have been forced upon the books of the New Testament. The division into verses has been still more injurious to the epistles than to the gospels, for there is a close connexion between the different parts of the epistles, which the verses entirely dissolve. It is therefore to be wished that this division into verses were laid aside. The Scriptures ought to be divided into paragraphs, according to the sense; and the figures ought to be thrown into the margin. In

this way, the figures will retain their utility without their disadvantages. Dr. Campbell, in his beautiful translation of the gospels, has adopted this method with great judgment and success; and he who will read that translation will perceive that this single alteration renders the gospels much more intelligible, and, we may add, more entertaining.

Respecting the chronological order of the books of the New Testament critics are by no means agreed. The following table is from Mr. Townsend's Chronological Arrangement, where the conflicting opinions of chronologists have been considered and decided upon with great care:—

Book.	Author.	Place at which it was written.	For whose use primarily intended.	A. D.
Gospel of Matthew	Matthew	Judea	Jews in Judea	37
Gospel of Mark	Mark	Rome and Jerusalem.	Gentile Christians.	44
Acts of the Apostles	Luke	—	—	—
Epistle to the Galatians	Paul	Thessalonica	—	51
First to the Thessalonians	—	Corinth	—	—
Second to the Thessalonians	—	—	—	52
Epistle to Titus	—	Nicopolis	—	53
First to the Corinthians	—	Ephesus	—	56
First Epistle to Timothy	—	Macedonia	—	56 or 57
Second Epistle to the Corinthians	—	Philippi	—	58
Epistle to the Romans	—	Corinth	—	—
Epistle to the Ephesians	—	Rome	—	61
Epistle to the Philippians	—	—	—	62
Epistle to the Colossians	—	—	—	—
Epistle to Philemon	—	—	—	—
Epistle of James	James	Jerusalem	Jewish Christians	—
Epistle to the Hebrews	Paul	Italy	Jews	—
Gospel of St. Luke	Luke	Achaia	Gentile converts	64
Second Epistle to Timothy	Paul	—	—	65 or 66
First Epistle of Peter	Peter	—	Jews and Gentile converts	—
Second Epistle of Peter	—	Italy or Rome	Jewish and Gentile Christians of the Dispersion	—
Epistle of Jude	Jude	Probably Syria	General	66
Book of Revelation	John	Asia Minor	—	96
Three Epistles of John	—	—	—	96 to 106
Gospel according to John	—	—	—	—

III.—*Of the historical books of the New Testament.*—The word ΕΥΑΓΓΕΛΙΟΝ signifies any joyful tidings, and exactly corresponds to our English word Gospel. In the New Testament this term is confined to 'The glad tidings of the coming of the Messiah.' Thus, in Mat. xi. 5, our Lord says, 'The poor have the gospel preached;' that is, 'The coming of the Messiah is preached to the poor. Hence the name of Gospel was given to the histories of Christ, in which the good news of the coming of the Messiah, with all its joyful circumstances, are recorded.

That the Gospel according to MATTHEW was composed, says Dr. Campbell, by one born a Jew, familiarly acquainted with the opinions, ceremonies, and customs of his countrymen; that it was composed by one conversant in the sacred writings, and habituated to their idiom;

a man of plain sense, but of little or no learning, except what he derived from the Scriptures of the Old Testament; and finally, that it was the production of a man who wrote from conviction, and had attended closely to the facts and speeches which he related, but who in writing entertained not the most distant view of setting off himself—we have as strong internal evidence as the nature of the thing will admit, and much stronger than that wherein the mind in ninety-nine cases out of 100 acquiesces.

That the author of this history of our blessed Saviour was Matthew, appears from the testimony of the early Christians. It is attested by Jerome, Augustine, Epiphanius, and Chrysostom, and in such a manner as shows that they knew the fact to be uncontroverted, and judged it to be incontrovertible. Origen, who flourished in

the former part of the third century, is also respectable authority. He is quoted by Eusebius (Hist. lib. 6. c. 25), wherein he specially treats of Origen's account of the sacred canon. 'As I have learned,' says Origen, 'by tradition concerning the four Gospels, which alone are received without dispute by the whole church of God under heaven; the first was written by Matthew, once a publican, afterwards an apostle of Jesus Christ, who delivered it to the Jewish believers, composed in the Hebrew language.' In another place he says, 'Matthew writing for the Hebrews who expected him who was to descend from Abraham and David, says, the lineage of Jesus Christ, son of David, the son of Abraham.' The next authority is that of Irenæus, bishop of Lyons, who had been a disciple of Polycarp. He says in the only book of his extant, that 'Matthew, among the Hebrews, wrote a gospel in their own language, whilst Peter and Paul were preaching the Gospel at Rome, and founding the church there.'

Irenæus had the best opportunities of information, having been well acquainted in his youth with Polycarp, the disciple of John; no objection can therefore be made to his evidence. But we can quote an authority still nearer the times of the apostles. Papias, bishop of Hierapolis, in Cæsarea, who flourished about 116, affirms that Matthew wrote his gospel in the Hebrew tongue, which every one interpreted as he was able. Papias was the companion of Polycarp, and besides must have been acquainted with many persons who lived in the times of the apostles. The fact, therefore, is fully established, that Matthew, the apostle of our Saviour, was the author of that gospel which is placed first in our edition of the New Testament.

The next subject of enquiry respects the language in which it was written. This we are assured by Papias, by Irenæus, and Origen, was the Hebrew; but this fact has been disputed by Erasmus, Whithy, and others. But though we are forced to acknowledge that the Gospel according to Matthew which we possess is a translation, it is evidently a close one; and the very circumstance that it has superseded the original, is a clear proof that it was thought equally valuable by the ancient Christians. The language in which the Gospel according to Matthew was originally composed, and which is called Hebrew by Papias, Irenæus, and Origen, is not the same with the Hebrew of the Old Testament; it was what Jerome very properly terms Syro-Chaldaic, having an affinity to both languages, but much more to the Chaldean than to the Syrian.

The time when this gospel was composed has not been precisely ascertained. Irenæus says that 'Matthew published his gospel when Peter and Paul were preaching at Rome.' Now Paul arrived at Rome A. D. 60 or 61, and probably suffered martyrdom in A. D. 65. This may be justly concluded from comparing the relation of Tacitus with that of Orosius, a writer of the fifth century. Orosius having given an account of Nero's persecution of the Christians, and of the death of the two apostles in it, adds, that it was followed by a pestilence in the city, and other disasters. And Tacitus relates that a pestilence prevailed in

the city, and violent storms took place in Italy A. D. 65. Matthew's gospel was therefore written between the year 60 and 65.

That this history was primarily intended for the use of the Jews, we have, besides historical evidence, very strong presumption from the book itself. Every circumstance is carefully pointed out which might conciliate the faith of that nation; every unnecessary expression is avoided, which might in any way serve to obstruct it. There was no sentiment relating to the Messiah with which the Jews were more strongly possessed, than that he must be of the race of Abraham, and of the family of David. Matthew, therefore, with great propriety, begins his narrative with the genealogy of Jesus. That he should be born at Bethlehem in Judea, is another circumstance in which the learned among the Jews were universally agreed. His birth in that city, with some very memorable circumstances that attended it, this historian has also mentioned. Those passages in the prophets, or other sacred books, which either foretel any thing that should happen to him, or admit an allusive appellation, or were in that age generally understood to be applicable to events which respect the Messiah, are never passed over by the evangelist in silence. The fulfilment of prophecy was always to the Jews, who were convinced of the inspiration of their sacred writings, strong evidence. Accordingly none of the evangelists has been more careful than Matthew, that nothing of this kind should be overlooked.

That which chiefly distinguishes Matthew's writings from those of the other evangelists, is the minute and distinct manner in which he has related many of our Lord's discourses and moral instructions. Of these his sermon on the mount, his charge to the apostles, his illustrations of the nature of his kingdom, and his prophecy on Mount Olivet, are examples. He has also wonderfully united simplicity and energy in relating the replies of his master to the cavils of his adversaries. Being early called to the apostleship, he was an eye and ear witness of most of the things which he relates. And Dr. Campbell thinks, that Matthew has approached as near the precise order of time in which the events happened as any of the evangelists. See MATTHEW. The Gospel according to Matthew is cited seven times in the epistle of Barnabas, twice in the first epistle of Clemens Romanus to the Corinthians, eight times in the Shepherd of Hermas, six times in Polycarp's epistle to the Philippians, and seven times in the smaller epistles of Ignatius. These citations may be seen at full length in Jones's New and Full Method of Settling the Canon, with the parallel passages in the Gospel according to Matthew.

That MARK was the author of the gospel which bears his name, and that it was the second in the order of time, is proved by the unanimous testimony of the ancient Christians. Many authorities are therefore unnecessary: we shall only mention those of Papias and Irenæus. Eusebius has preserved the following passage of Papias:— 'This is what is related by the elder (that is John, not the apostle, but a disciple of Jesus). Mark being Peter's interpreter, wrote exactly whatever he remembered, not indeed in the or-

der wherein things were spoken and done by the Lord ; for he was not himself a hearer or follower of our Lord ; but he afterwards, as I said, followed Peter, who gave instructions as suited the occasions, but not as a regular history of our Lord's teaching. Mark, however, committed no mistake in writing such things as occurred to his memory ; for of this one thing he was careful, to omit nothing which he had heard, and to insert no falsehood in his narrative.' Such is the testimony of Papias, which is the more to be regarded, as he assigns his authority. He spake not from hearsay, but from the information which he had received from a most credible witness, John the elder, or presbyter, a disciple of Jesus, and a companion of the apostles.

Irenæus adds :—' After the departure (ἔξοδος) of Peter and Paul, Mark also, the disciple and interpreter of Peter, delivered to us in writing the things which had been preached by Peter.' Mark's gospel was published in Peter's lifetime, and had his approbation. It is supposed to be but two years posterior in date to that of Matthew.

Mark has generally been supposed to be the same person who is mentioned in the Acts and some of Paul's epistles, who is called John, and was the nephew of Barnabas. But as this person was the attendant of Paul and Barnabas, and is nowhere in Scripture said to have accompanied Peter in his apostolical mission, which ancient writers inform us the author of the gospel did, Dr. Campbell has concluded that these were different persons. The author of the gospel is certainly meant by Peter, when he says, ' Marcus my son saluteth you.'—1 Pet. v. 13.

That Mark wrote his gospel in Greek, is conformable to the testimony of antiquity. From the Hebraisms in the style, we should readily conclude that the author was by birth and education a Jew. There are also expressions which show, that he had lived for some time among the Latins, as *κεντυριον*, centurion, and *σπεκλασιωρ*, sentinel ; words which do not occur in the other gospels. There are other internal evidences that this gospel was written beyond the confines of Judea. The first time the Jordan is mentioned, *ποταμος*, river, is added to the name for explanation ; for though no person in Judea needed to be informed that Jordan was a river, the case was different in distant countries. The word *Gehenna*, which is translated hell in the New Testament, originally signified the Valley of Hinnom, where infants had been sacrificed by fire to Moloch, and where a continual fire was afterwards kept up to consume the filth of Jerusalem. As the words could not have been understood by a foreigner, the evangelist adds, by way of explanation, *πυρ το ασβεστον*, the unquenchable fire. Instead of the word *mammon*, he uses the common term *χρηματα*, riches. When he employs the oriental word *corban*, he subjoins the interpretation *ο επι ζωων*, that is, a gift. These peculiarities corroborate the historical evidence, that Mark intended his gospel for the Gentiles. See *CORBAN*.

It has been affirmed that this evangelist has been the abridger of Matthew. It is true that Mark sometimes copies the expressions used by Matthew ; but he is not to be considered as a mere

abridger, for he omits altogether several things related by Matthew, viz. our Lord's pedigree, his birth, the visit of the magians, Joseph's flight into Egypt, and the cruelty of Herod. Dr. Lardner has given a list of thirty-three passages, wherein circumstances are related, which are omitted by the other evangelists. There is one parable and an account of two miracles, peculiar to Mark. The parable is mentioned in ch. iv. 26. One of these miracles was the curing of a deaf and dumb man, ch. vii. 31—37. The other was the giving sight to a blind man at Bethsaida, ch. viii. 22, 26. The style of Mark, instead of being more concise than that of Matthew, is more diffuse. That he had read Matthew's gospel cannot be doubted ; but that he abridged it, is a mistake.

According to the testimony above quoted, Mark derived his information from the apostle Peter. Yet this evangelist has omitted many things tending to Peter's honor, which are related in the other gospels, and has given the most particular account of Peter's fall. This gospel is seven times cited by Irenæus, and nine times by Tertullian.

That the author of the gospel, which is the third in order, was *LUKE*, the companion of the apostle Paul, is evident from the testimonies of Irenæus, Clemens of Alexandria, Origen, Tertullian, and many succeeding writers. But it has been disputed whether he was a Jew or a Gentile. That Luke was a Jew by birth, or at least by religion, may be argued from his being a constant companion of Paul. If he had been an uncircumcised Gentile, exceptions would have been made to him, especially at Jerusalem. It is also rendered highly probable, from his mode of computing time by the Jewish festivals, and from his frequent use of the Hebrew idiom. It has been supposed that Luke was one of the seventy disciples ; but he does not pretend to have been a witness of our Lord's miracles and teaching ; on the contrary, he tells us in his introduction, that he received his information from others. The design of Luke in writing his gospel was to supersede some imperfect and inaccurate histories of our Saviour, which had then been published.

It has been supposed that Luke chiefly derived his information from the apostle Paul, whom he faithfully attended in his travels ; but from Luke's own words, we may conclude, that the principal source of his intelligence, as to the facts related in the gospel, was from those who had been eye and ear witnesses of what our Lord both did and taught. It was from conversing with some of the apostles or disciples of our Lord, who heard his discourses and saw his miracles, that he obtained his information. The time when this gospel was written is not ascertained. But as Origen, Eusebius, and Jerome, have ranged it after those of Matthew and Mark, we have no reason to doubt but they were written in the same order. The gospel by Luke has supplied us with many interesting particulars which had been omitted both by Matthew and Mark. It has given a distinct narration of the circumstances attending the birth of John the Baptist and the nativity of our Saviour. It has given an account of several memorable incidents and cures which had been overlooked

by the rest; the conversion of Zaccheus the publican; the cure of the woman who had been bowed down for eighteen years; the cure of the dropsical man; the cleansing of the ten lepers; the inhospitable treatment of our Saviour by the Samaritans, and the instructive rebuke which he gave on that occasion to two of his disciples for their intemperate zeal; also the affecting interview which he had after his resurrection with two of his disciples. Luke has also added many edifying parables to those which the other evangelists had recorded. Most of these Irenæus has specified as particularly belonging to this gospel, and has thereby shown that the Gospel of Luke was the same in his time that it is at present.

The style of St. Luke abounds almost as much with Hebraisms as any of the sacred writings; but it contains more of the Grecian idiom than any of them. It is also distinguished by greater variety and copiousness; qualities which may be justly ascribed to the superior learning of the author. His occupation as a physician would induce him to employ some time in reading, and give him easier access to the company of the great, than any of the other evangelists. As an instance of Luke's copiousness, Dr. Campbell has remarked that each of the evangelists has a number of words which are used by none of the rest; but in Luke's gospel the number of such peculiarities or words used in none of the other gospels, is greater than that of the peculiar words found in all the other gospels put together; and that the terms peculiar to Luke are for the most part long and compound words. He has also observed that there is more of composition in Luke's sentences than in the other three, and consequently less simplicity. Of this the very first sentence is an example, which occupies no less than four verses. Luke, too, has a great resemblance to other historians, in giving what may be called his own opinion in the narrative part of this work, a freedom which the other evangelists have seldom or never used. He calls the Pharisees lovers of money; in distinguishing Judas Iscariot from the other Judas, he uses the phrase, *he who proved a traitor*. (*ὁς καὶ ἐγένετο προδότης*). Matthew and Mark express the same sentiment in milder language, 'he who delivered him up.' In recording the moral instructions of our Lord, especially in parables, Luke has united an affecting sweetness of manner with genuine simplicity. This gospel is frequently cited by Clemens Romanus, the contemporary of the apostles, by Ignatius, and Justin Martyr. Irenæus has made above 100 citations from it. In his lib. iii. adv. Hæres. c. 14. he vindicates the authority and perfection of Luke's gospel, and has produced a collection of those facts which are recorded only by this evangelist. See LUKE.

That the gospel which is placed last in our editions of the New Testament was written by JOHN, our Saviour's beloved disciple, is confirmed by the unanimous testimony of the ancient Christians. See JOHN. He possessed a high degree of intrepidity and zeal, a warm and affectionate heart, and was strongly attached to his master. He and his brother James were honored with the title of Boanerges, or Sons of Thunder. He was anxious to restrain whatever

he considered as a mark of disrespect against his Master, and to punish his enemies with severity. He was incensed against some persons for attempting to cast out demons in the name of Jesus; and required them to desist because they were not his disciples. James and he proposed to our Saviour to call down fire from heaven to punish the inhospitable Samaritans. But these instances of bigotry were reprov'd by our Lord. Nor was the courage of John less ardent than his zeal. When Peter had disowned his Lord, and all the other disciples had fled, John continued to attend his master. He was present at his trial, and followed him to the cross, where he was a spectator of his sufferings and death. The interview between Jesus and his disciple at Calvary, though concisely related, is an event which will strongly affect every man of feeling, while it convinces him of the unalterable affection of Jesus for his beloved disciple, as well as discovers his respectful tenderness for his mother. See JOHN.

The ancients inform us that there were two motives which induced John to write his gospel; the one that he might refute the heresies of Cerinthus and the Nicolaitans, who had attempted to corrupt the Christian doctrine; the other that he might supply those important events in the life of our Saviour which the other evangelists had omitted. Of the former of these motives Irenæus gives an account; but it seems very improbable that an apostle should write a history of our Lord on purpose to confute the wild opinions of Cerinthus or any other heretic. The intention of John in writing his gospel was far more extensive and important. It was evidently, according to Clemens of Alexandria, to supply the omissions of the other evangelists: It was to exhibit the evidences of the Christian religion in a distinct and perspicuous manner: It was, as he himself in the conclusion of his gospel assures us, to convince his readers, 'that Jesus is the Messiah, the Son of God, and that believing they might have life through his name.'—John xx. 31. He has executed his plan with astonishing ability, and has given the most circumstantial and satisfactory evidence that Jesus was the Messiah the Son of God. After declaring the pre-existence of Jesus, he gives the testimony of John the Baptist, and selects some of the greatest miracles of Jesus to prove his divine mission. In the fifth chapter he presents us with a discourse which our Saviour delivered in the temple in the presence of the Jews, wherein he states in a very distinct manner the proofs of his mission, from 1. The testimony of John; 2. His own miracles; 3. The declaration of the Father at his baptism; 4. The Jewish Scripture. Indeed the conclusion that Jesus was the Messiah, the Son of God, naturally arises from almost every miracle which our Saviour is said to have performed, and from every discourse that he delivered. This declaration is very often made by our Saviour himself; particularly to the woman of Samaria, to Nicodemus, and to the blind man whom he had cured.

John studiously passes over those passages in our Lord's history and teaching which had been treated at large by the other evangelists, or, if he mentions them at all, he mentions them slightly. This confirms the testimony of ancient writers,

that the first three gospels were written and published before John composed his gospel. Except the relation of our Saviour's trial, death, and resurrection, almost every thing which occurs in this book is new. The account of our Saviour's nativity, of his baptism, and of his temptation in the wilderness, is omitted; nor is any notice taken of the calling of the twelve apostles, or of their mission during our Saviour's life. Not one parable is mentioned, nor any of the predictions relating to the destruction of Jerusalem. All the miracles recorded by the other evangelists are passed over, except the miraculous supply of provisions, by which 5000 were fed. The other miracles which are mentioned are few in number, but they are minutely detailed. They are these: the turning of water into wine at Cana; the cure of the diseased man at the pool of Bethesda; the cure of the man blind from his birth; the restoring of Lazarus to life; and the healing of the servant's ear which Peter had cut off. But valuable would this gospel be though it had only recorded the consolation of Jesus to his disciples previous to his departure, which exhibits a most admirable view of our Saviour's character,—of his care and tender regard for his disciples. Having opened every source of comfort to their desponding minds, exhorted them to mutual love, and to the obedience of his Father's precepts; having warned them of the impending dangers and sorrows—our Saviour concludes with a prayer, in the true spirit of piety and benevolence; ardent without enthusiasm; sober and rational without lukewarmness.

The time in which this gospel was written has not been ascertained. Irenæus informs us that

it was written at Ephesus, but does not say whether before or after John's return from Patmos. He was banished to Patmos by Domitian, and died at Ephesus A. D. 100. The persecution which occasioned the exile of John commenced in the fourteenth year of Domitian's reign. John wrote his gospel after his return to Ephesus, as is affirmed by Epiphanius, about the year 97. This gospel is evidently the production of an illiterate Jew, and its style is remarkable for simplicity. It abounds perhaps with Hebraisms more than any of the other gospels; and contains some strong oriental figures which are not readily understood by any European. This gospel is cited once by Clemens Romanus, by Barnabas three times, by Ignatius five times, by Justin Martyr six times, by Irenæus often, and above forty times by Clemens Alexandrinus.

The following harmonised Table of the contents of the four Gospels is taken from Marsh's Translation of Michaelis's Introduction to the New Testament, vol. iii. p. 40, &c., to which we are so much in this paper indebted. The arrangement of facts as they occur in St. Matthew is here generally followed; and the other evangelists are collated with his account. The author observes, 'I would not have the reader suppose that the several facts here delivered are arranged, without exception, according to the order in which they really happened; for it is my intention to give rather a general index to the four Gospels than to draw up a chronological table.' The numbers prefixed to the several sections point out the consecutive order of the facts as well as it can be ascertained.

ST. MATTHEW.	ST. MARK.	ST. LUKE.
2. Genealogy of Christ, I. 1—17.		1. Preface, I. 1—4. III. 23—38. 3. Birth of John, I. 5—25. 4. Birth of Christ announced to Mary, I. 26—38. 5. Mary's visit to Elizabeth, I. 39—55. 7. Birth of John I. 56—80. II. 1—20. 9. Circumcision of Christ, II. 21. 10. Presentation of Christ in the temple, II. 22—40. 12. 144. Christ shows himself in Galilee to all his disciples, on a mountain, where he had appointed them, XXVIII. 16—20.

The book entitled the Acts of the Apostles connects the gospels and the epistles. It is evidently a continuation of Luke's gospel, which appears both from the introduction and from the attestations of ancient Christians. Both are dedicated to Theophilus; and in the beginning of the Acts a reference is made to his gospel, which he calls 'a former treatise,' recording the actions and discourses of Jesus till his ascension to heaven. Luke is mentioned as the author of the Acts of the Apostles by Irenæus, Tertullian, Origen, and Eusebius. From the frequent use of the first person plural it is manifest that Luke was present at many of the transactions which he relates. He appears to have accompanied Paul from Troas to Philippi. He attended him also to Jerusalem, and afterwards to Rome, where he remained for two years. He is mentioned by Paul in several of those epistles which were written from Rome, particularly in the second epistle to Timothy, and in the epistle to Philemon.

This book contains the history of the Christian church for about twenty-eight or thirty years, from our Saviour's ascension to Paul's arrival at Rome in 60 or 61. As it informs us that Paul resided two years in Rome, it must have been written after the year 63; and, as the death of Paul is not mentioned, it is probable it was composed before that event, which happened A. D. 65. It may be divided into seven parts:—1. The account of our Saviour's ascension, and of the occurrences which happened on the first pentecost after that event, contained in c. i. ii. 2.

The transactions of the Christians of the circumcision at Jerusalem; in Judea, and Samaria, c. iii.—ix., xi. 1—21; xii. 3. Transactions in Cæsarea, and the admission of the Gentiles, c. x. 4. The first circuit of Barnabas and Paul among the Gentiles, c. xi. 22, xiii., xiv. 5. Embassy to Jerusalem, and the first council held in that city, c. xv. 6. Paul's second journey, c. xvi.—xxi. 7. His arrestment, trial, appeal to Cæsar, and journey to Rome, c. xxi. to the end of the book. The Acts of the Apostles are cited by Clemens Romanus, by Polycarp, by Justin Martyr, thirty times by Irenæus, and seven times by Clemens Alexandrinus.

IV. *Of the epistolary writings of the New Testament.* All the essential doctrines and precepts of the Christian religion were certainly taught by our Saviour himself, and are contained in the gospels. The epistles may be considered as commentaries on the doctrines of the gospel, addressed to particular societies, accommodated to their respective situations; intended to refute the errors and false notions which prevailed among them, and to inculcate those virtues in which they were most deficient. The plan on which these letters are written is, first, to decide the controversy, or refute the erroneous notions which had arisen in the society to which the epistle was addressed: and, secondly, to recommend those duties which their false doctrines might induce them to neglect; at the same time inculcating, in general exhortations, the most important precepts of Christian morality.

Of the epistles, fourteen were written by St. Paul. These are not placed according to the order of time in which they were composed, but according to the supposed precedence of the societies or persons to whom they were addressed. The following is their chronological order according to Dr. Lardner:—

A TABLE of ST. PAUL'S EPISTLES, with the PLACES where, and TIMES when, written, according to Dr. Lardner.

Epistles.	Places.	A. D.
1 Thessalonians	Corinth	52
2 Thessalonians	Corinth	52
Galatians . . .	{ Corinth or } near the end of 52	
	{ Ephesus } or beginning of 53	
1 Corinthians . .	Ephesus . . the beginning of 53	
1 Timothy . . .	Macedonia	56
Titus	{ Macedonia } bef. the end of 56	
	{ or near it }	
2 Corinthians . .	Macedonia . . about October	57
Romans	Corinth . . about February	58
Ephesians	Rome . . about April	61
2 Timothy	Rome . . about May	61
Philippians . . .	Rome . . bef. the end of 62	
Colossians	Rome . . bef. the end of 62	
Philemon	Rome . . bef. the end of 62	
Hebrews	{ Rome or } in Spring of 63	
	{ Italy }	

A TABLE of the CATHOLIC EPISTLES, and the REVELATION, according to Dr. Lardner.

Epistles.	Places.	A. D.
James	Judea . . {	61
	{ or beg. of	62
The two Epistles } of Peter }	Rome	64
1 John	Ephesus . . about .	80
2d and 3d of } John }	Ephesus . . { between	80
	{ and }	90
Jude	Unknown	64 or 65
Revelation . . .	{ Patmos or }	95 or 96
	{ Ephesus }	

It is more difficult to understand the epistolary writings than the gospels; the cause of which is evident. Many things are omitted in a letter, or slightly mentioned, because supposed to be known by the person to whom it is addressed. To a stranger this will create much difficulty. These causes of obscurity are common to all the writers of the epistles; but there are some peculiar to St. Paul. 1. As he had an acute and fertile mind, he seems to have written with great rapidity, and without attending much to method and arrangement. To this cause we may ascribe his numerous and long parentheses. In the heat of argument he sometimes breaks off abruptly to follow out some new thought; and, when he has exhausted it, he returns from his digression without informing his readers; so that it requires great attention to retain the connexion. 2. His frequent change of person, too, creates ambiguity; by the pronoun I he sometimes means himself; sometimes any Christian; sometimes a Jew, and sometimes any man. In using the pronoun we, he sometimes intends himself, sometimes comprehends his companions, sometimes the apostles; at one time he alludes to the converted Jews, at another time to the

converted Gentiles. 3. There is a third cause of obscurity; he frequently proposes objections, and answers them without giving any formal intimation. There are other difficulties which arise from our uncertainty who are the persons he is addressing, and what are the particular opinions and practices to which he refers. To these we may add two external causes, which have increased the difficulty of understanding the epistles. 1. The dividing them into chapters and verses, which dissolves the connexion of the parts, and breaks them into fragments. If Cicero's epistles had been so disjointed, the reading of them would be attended with less pleasure and advantage, and with a great deal more labor. 2. We are accustomed to the phraseology of the epistles from our infancy; but we have either no idea at all when we use it, or our idea of it is derived from the articles or system which we have espoused. But, as different sects have arbitrary definitions for St. Paul's phrases, we shall never by following them discover the meaning of St. Paul, who certainly did not adjust his phraseology to any man's system.

The best plan of studying the epistles is that which was proposed and executed by Mr. Locke. That acute and judicious author says, 'After I had found by long experience that the reading of the text and comments in the ordinary way proved not so successful as I wished to the end proposed, I began to suspect that reading a chapter, as was usual, and thereupon sometimes consulting expositors upon some hard places of it, was not a right method to get into the true sense of these epistles. I saw plainly that if any one should write me a letter as long as St. Paul's to the Romans, concerning such a matter as that is, in a style as foreign, and expressions as dubious, as his seem to be, if I should divide it into fifteen or sixteen chapters, and read one of them to-day, and another to-morrow, &c., it is ten to one I should never come to a full and clear comprehension of it. The way to understand the mind of him that wrote it, every one would agree, was to read the whole letter through from one end to the other all at once, to see what was the main subject and tendency of it; or if it had several views and purposes in it, not dependent one on another, nor in a subordination to one chief aim and end, to discover what those different matters were, and where the author concluded one and began another; and, if there were any necessity of dividing the epistle into parts, to make these the boundaries of them. In the prosecution of this thought, I concluded it necessary, for the understanding of any one of St. Paul's epistles, to read it all through at one sitting, and to observe, as well as I could, the drift and design of his writing it. If the first reading gave me some light, the second gave me more; so I persisted on, reading constantly the whole epistle over at once, till I came to have a good general view of the apostle's main purpose in writing the epistle, the chief branches of his discourse wherein he prosecuted it, the arguments he used, and the disposition of the whole. This, I confess, is not to be obtained by one or two hasty readings; it must be repeated again and again with a close attention to the tenor of

the discourse, and a perfect neglect of the divisions into chapters and verses.

Mr. Locke tells us he continued to read the same epistle over and over again till he discovered the scope of the whole, and the different steps and arguments by which the writer accomplishes his purpose. For he was convinced that Paul was a man of learning, of sound sense, and knew all the doctrines of the gospel by revelation. The speeches recorded in the Acts of the Apostles convinced this judicious critic that Paul was a close and accurate reasoner; and therefore he concluded that his epistles would not be written in a loose, confused, incoherent style. Mr. Locke accordingly followed the chain of the apostle's discourse, observed his inferences, and carefully examined from what premises they were drawn, till he obtained a general outline of any particular epistle.

That the Epistle to the ROMANS was written at Corinth, by St. Paul, is ascertained by the testimony of the ancient Christians. It was composed A.D. 58, in the twenty-fourth year after Paul's conversion, and is the seventh epistle which he wrote. From the Acts of the Apostles we learn that it must have been written within three months; for that was the whole period of Paul's residence in Greece (Acts xx. 1, 2, 3). The following analysis of this epistle is from a valuable treatise, Dr. Percy's Key to the New Testament. It exhibits the intention and arguments of the apostle, in the most concise, distinct, and connected manner, and affords the best view of this epistle that we have seen.

'The Christian church at Rome appears not to have been planted by any apostle; wherefore St. Paul, lest it should be corrupted by the Jews, who then swarmed in Rome, and of whom many were converted to Christianity, sends them an abstract of the principal truths of the gospel, and endeavours to guard them against those erroneous notions which the Jews had of justification, and of the election of their own nation. Now the Jews assigned three grounds for justification. First, 'The extraordinary piety and merits of their ancestors, and the covenant made by God with these holy men.' They thought God could not hate the children of such meritorious parents; and, as he had made a covenant with the patriarchs to bless their posterity, he was obliged thereby to pardon their sins. Secondly, 'A perfect knowledge and diligent study of the law of Moses.' They made this a plea for the remission of all their sins and vices. Thirdly, 'The works of the Levitical law,' which were to expiate sin, especially circumcision and sacrifices. Hence they inferred that the Gentiles must receive the whole law of Moses, in order to be justified and saved. The doctrine of the Jews concerning election was, 'That as God had promised to Abraham to bless his seed, to give him not only spiritual blessings, but also the land of Canaan, to suffer him to dwell there in prosperity, and to consider him as his church upon earth: That therefore this blessing extended to their whole nation, and that God was bound to fulfil these promises to them, whether they were righteous or wicked, faithful or unbelieving. They even believed that a prophet ought

not to pronounce against their nation the prophecies with which he was inspired; but was rather to beg of God to expunge his name out of the book of the living. These remarks will serve as a key to unlock this difficult epistle, on which we shall now give a short analysis. See Michaelis's Lectures on the New Testament.

i. The epistle begins with the usual salutation with which the Greeks began their letters: chap. i. 1—7.

ii. St. Paul professes his joy at the flourishing state of the church at Rome, and his desire to come and preach the gospel (ver 8—19): then he insensibly introduces the capital point he intended to prove, viz.

iii. The subject of the gospel (ver. 16, 17); that it reveals a righteousness unknown before, derived solely from faith, and to which Jews and Gentiles have an equal claim.

iv. To prove this, he shows (chap. i. 18; iii. 20) that both Jews and Gentiles are 'under sin,' i. e. that God will impute their sins to Jews as well as to Gentiles. His arguments may be reduced to these syllogisms (chap. ii. 1. 17—24).

1. The wrath of God is revealed against those who hold the truth in unrighteousness; i. e. who acknowledge the truth and yet sin against it. 2. The Gentiles acknowledged truths; but partly by their idolatry, and partly by their other detestable vices, they sinned against the truth they acknowledged. 3. Therefore the wrath of God is revealed against the Gentiles, and punisheth them. 4. The Jews have acknowledged more truths than the Gentiles, and yet they sin. 5. Consequently the Jewish sinners are yet more exposed to the wrath of God: chap. ii. 1—12. Having thus proved his point, he answers certain objections to it. *Obj.* 1. 'The Jews were well grounded in their knowledge, and studied the law.' He answers, If the knowledge of the law, without observing it, could justify them, then God could not have condemned the Gentiles, who knew the law by nature: chap. ii. 13—16. *Obj.* 2. 'The Jews were circumcised.' *Ans.* That is, ye are admitted by an outward sign into the covenant with God. 'This sign will not avail you when ye violate that covenant: chap. ii. 25, to the end. *Obj.* 3. 'According to this doctrine of St. Paul, the Jews have no advantage before others.' *Ans.* Yes, they still have advantages; for unto them are committed the oracles of God. But their privileges do not extend to this, that God should overlook their sins: chap. iii. 1—19. *Obj.* 4. 'They had the Levitical law and sacrifices.' *Ans.* From hence is no remission, but only the knowledge of sin: chap. iii. 20.

v. From all this St. Paul concludes that Jews and Gentiles may be justified by the same means, without the Levitical law, through faith in Christ: And, in opposition to the imaginary advantages of the Jews, he states the declaration of Zechariah, that God is the God of the Gentiles as well as of the Jews: chap. iii. 21, to the end.

vi. As the whole blessing was promised to the faithful descendants of Abraham, whom both Scripture and the Jews call his children, he proves his former assertion from the example of Abraham; who was an idolater before his call.

but was declared just by God, on account of his faith, long before his circumcision. Hence he takes occasion to explain the nature and fruits of faith: chap. iv. 1, v. 11.

vii. He goes on to prove, from God's justice, that the Jews had no advantage over the Gentiles with respect to justification. Both Jews and Gentiles had forfeited life and immortality, by the means of one common father of their race, whom they themselves had not chosen. Now as God was willing to restore immortality by a new spiritual head of a covenant, viz. Christ, it was just that both Jews and Gentiles should share in this new representative of the whole race: chap. v. 12, to the end. Chap. v. ver. 15, 16, amounts to this negative question:—'Is it not fitting that the free gift should extend as far as the offence?'

viii. He shows that the doctrine of justification, as stated by him, lays us under the strongest obligations to holiness: chap. vi. 1, to the end.

ix. He shows that the law of Moses no longer concerns us at all; for our justification arises from our appearing, in God's sight, as if actually dead with Christ on account of our sins; but the law of Moses was not given to the dead. On this occasion he proves at large that the eternal power of God over us is not affected by this; and that, whilst we are under the law of Moses, we perpetually become subject to death, even by sins of inadvertency: chap. vii. 1, to the end.

x. Hence he concludes that all those, and those only, who are united with Christ, and for the sake of his union do not live according to the flesh, are free from all condemnation of the law, and have an undoubted share in eternal life: chap. viii. 1—17.

xi. Having described their blessedness, he is aware that the Jews, who expected a temporal happiness, would object to him, that Christians notwithstanding endure much suffering in this world. He answers this objection at large: chap. viii. 12, to the end.

xii. He shows that God is not the less true and faithful, because he doth not justify, but rather rejects and punishes, those Jews who would not believe the Messiah: chap. ix., x., xi. In discussing this point, we may observe the cautious manner in which, on account of the Jewish prejudices, he introduces it (chap. ix. 1—5), as well as in the discussion itself. He shows that the promises of God were never made to all the posterity of Abraham, and that God always reserved to himself the power of choosing those sons of Abraham, whom, for Abraham's sake, he intended to bless, and of punishing the wicked sons of Abraham; and that, with respect to temporal happiness or misery, he was not even determined in his choice by their works. Thus he rejected Ishmael, Esau, the Israelites in the time of Moses, and the greater part of that people in the time of Isaiah: chap. ix. 6—29. He then shows that God had reason to reject most of the Jews then living, because they would not believe in the Messiah, though the gospel had been preached to them: chap. ix. 30, x. to the end. However, that God had not rejected all his people, but was still fulfilling his

promise upon many thousand natural descendants of Abraham, who believed in the Messiah, and would in a future period fulfil them upon more; for that all Israel would be converted: chap. xi. 1—32. And he concludes with admiring the wise counsels of God: ver. 33, to the end.

xiii. From the doctrine hitherto laid down, and particularly from this, that God has in mercy accepted the Gentiles; he argues that the Romans should consecrate and offer themselves up wholly to God. This leads him to mention in particular some Christian duties (chap. xii.), viz.

xiv. He exhorts them to be subject to magistrates (chap. xiii. 1—7), the Jews at that time being given to sedition.

xv. To love one another heartily: ver. 2—10; And,

xvi. To abstain from those vices which were considered as things indifferent among the Gentiles: ver. 11, to the end.

xvii. He exhorts the Jews and Gentiles in the Christian church to brotherly unity: chap. xiv. 2; xv. 13.

xviii. He concludes his epistle with an excuse for having admonished the Romans, whom he had not converted; with an account of his journey to Jerusalem; and with some salutations to those persons whom he meant to recommend to the church at Rome. See Michaelis's Lectures.

CORINTH was a wealthy and luxurious city of Greece. In this city Paul had^s spent two years founding a Christian church, which consisted of a mixture of Jews and Gentiles, but the greater part Gentiles. About three years after the apostle had left Corinth he wrote this epistle from Ephesus, A. D. 56, in the beginning of Nero's reign. That it was written from Ephesus appears from the salutation with which the epistle closes: chap. xvi. 19. From these words it is evident, 1st, that the epistle was written in Asia. 2dly, from Acts xviii. 18, 19, that Aquila and Priscilla accompanied Paul from Corinth to Ephesus. St. Paul had certainly kept up a constant intercourse with the churches which he had founded; for he was evidently acquainted with all their revolutions. They seem to have applied to him for advice in those difficult cases which their own understanding could not solve; and he was ready on all occasions to correct their mistakes. This epistle consists of two parts. 1. A reproof for those vices to which they were most prone. 2. An answer to some queries which they had proposed to him.

The Corinthians, like the other Greeks, had been accustomed to see their philosophers divide themselves into different sects; and, as they brought along with them into the Christian church their former opinions and customs, they wished, as before, to arrange themselves under different leaders. In this epistle Paul condemns these divisions, as inconsistent with the spirit of Christianity, which inculcates benevolence and unanimity, and as opposite to the conduct of Christian teachers, who did not, like the philosophers, aspire after the praise of eloquence and wisdom. They laid no claim to these, nor to any honor that cometh from men. He de-

clares that the Christian truths were revealed from heaven; that they were taught with great plainness and simplicity, and proved by the evidence of miracles: chap. i. 1. He dissuades them from their divisions, by reminding them of the great trial which every man's work must undergo; of the guilt they incurred by polluting the church of God; of the vanity of human wisdom; and of glorying in men. He admonishes them to esteem the teachers of the gospel only as the servants of Christ; and to remember that every superior advantage which they enjoyed was to be ascribed to the goodness of God: chap. iii. 4.

2. In the fifth chapter the apostle considers the case of a notorious offender, who had married his step-mother; and tells them that he ought to be excommunicated. He also exhorts the Christians not to associate with any person who led such an openly profane life.

3. He censures the Corinthians for their litigious disposition, which caused them to prosecute their Christian brethren before the heathen courts. He expresses much surprise that they did not refer their differences to their brethren; and concludes his exhortations on this subject by assuring them that they ought rather to allow themselves to be defrauded than to seek redress from heathens: chap. v. 1—9.

4. He inveighs against those vices to which the Corinthians had been addicted before their conversion, and especially against fornication; the criminality of which they did not fully perceive, as this vice was generally overlooked in the systems of the philosophers: chap. vi. 9—20.

Having thus pointed out the public irregularities with which they were chargeable, he next replies to certain questions which the Corinthians had proposed to him by letter.

1. He determines some questions relating to the marriage state; as 1st, Whether it was good to marry under the existing circumstances of the church? And 2d, Whether they should withdraw from their partners if they continued unbelievers? chap. vii.

2. He instructs them how to act with respect to idol offerings. It could not be unlawful in itself to eat the food which had been offered to idols; for the consecration of flesh or wine to an idol did not make it the property of the idol, an idol being nothing, and therefore incapable of property. But some Corinthians thought it lawful to go to a feast in the idol temples, which were places of resort for lewdness, and to eat the sacrifices whilst praises were sung to the idols. This was publicly joining in the idolatry. He even advises to abstain from such participation as was lawful, rather than give offence to a weak brother, which he enforces by his own example, who had abstained from many lawful things, rather than prove a scandal to the gospel: chap. viii., ix., x.

3. He answers a third query concerning the manner in which women should deliver any thing in public, when called to it by a divine impulse. And here he censures the unusual dress of both sexes in prophesying, which exposed them to the contempt of the Greeks, among whom the men usually went uncovered, and the

women veiled. He goes on to censure the irregularities committed at their love-feasts, or the Lord's Supper. It was a common practice with the Greeks at their social suppers for every man to bring his own provisions along with him, not, however, to share them with the company, but to feast upon them in a solitary manner. Thus the rich ate and drank to excess, while the poor were totally neglected. The Corinthians introduced the same practice in the celebration of the Lord's Supper, thus confounding it with their ordinary meals, and without ever examining into the end of the institution. This gross abuse Paul reproveth in the eleventh chapter. He also shows them that all Christians ought to be united in mutual love; and that tenderness ought to be shown to the most inconsiderable member, as every one is subservient to the good of the whole: chap. xii. In the thirteenth chapter he gives a beautiful description of benevolence. He represents it as superior to the supernatural gifts of the Spirit, to the most exalted genius, to universal knowledge, and even to faith. In the fourteenth chapter he cautions the Corinthians against ostentation in the exercise of the gift of languages, and gives them proper advices.

4. He asserts the resurrection of the dead, founding it upon the resurrection of Jesus Christ, which he considers as one of the most essential doctrines of Christianity. He then answers some objections, drawn from our not being capable of understanding how it will be accomplished: chap. xv. He concludes with directions concerning alms; promises them a visit, and salutes some of the members.

The second epistle to the CORINTHIANS was written from Macedonia, A. D. 57. See 2 Cor. ix. 1—5; viii. and xiii. 1. St. Paul's first epistle had wrought different effects among the Corinthians; many of them examined their conduct: they excommunicated the incestuous man; requested St. Paul's return with tears; and vindicated him and his office against the false teacher and his adherents. Others of them still adhered to that adversary of St. Paul, denied his apostolic office, and furnished themselves with pretended arguments from that epistle. He had formerly promised to take a journey from Ephesus to Corinth, thence to visit the Macedonians, and return from them to Corinth: 2 Cor. i. 15, 16. But the unhappy state of the Corinthian church made him alter his intention (ver. 23), since he found he must have treated them with severity. Hence his adversaries argued, 1. That St. Paul was irresolute and unsteady, and therefore could not be a prophet. 2. The improbability of his ever coming to Corinth again, since he was afraid of them. Such was the state of the Corinthian church when St. Paul, after his departure from Ephesus, having visited Macedonia (Acts xx. 1), received an account of the above particulars from Titus (2 Cor. vii. 5, 6), and therefore wrote them his second epistle about the end of the same year, or the beginning of 58. But to give a more distinct view of the contents of this epistle:—

1. The apostle, after a general salutation, expresses his grateful sense of the divine goodness; professing his confidence in God, supported by a

sense of his own integrity; makes an apology for not having visited the Corinthians as he had intended, and vindicates himself from the charge of fickleness: chap. i.

2. He forgives the incestuous man, whose conduct had made so deep an impression on the apostle's mind, that one reason why he had deferred his journey to Corinth was that he might not meet them in grief, nor till he had received advice of the effect of his admonitions. He mentions his anxiety to meet Titus at Troas, to hear of their welfare; expresses his thankfulness to God for the success attending his ministry, and speaks of the Corinthians as his credentials, written by the finger of God: chap. ii. iii. 1—6.

3. He treats of the office committed to him of preaching the redemption; and prefers it to preaching the law, to which probably his adversaries had made great pretences. They had ridiculed his sufferings: which he shows to be no disgrace to the gospel or its ministers; and gives a short abstract of the doctrine he preaches: chap. iii. 6. v. to the end. He expiates on the temper with which, in the midst of afflictions and persecutions, he and his brethren executed their important embassy; and with great affection exhorts them to avoid idolatry: chap. vi. He tells them how much he rejoiced in their amendment, and how sorry he had been for the distress which his necessary reproofs had occasioned: chap. vii. He then exhorts them to make liberal contributions for the Christians in Judea. He recommends to them the example of the Macedonians, and reminds them of the benevolence of the Lord Jesus. He expresses his joy for the readiness of Titus to assist in making the collection: makes honorable mention of other Christian brethren (chap. viii.); and recommends them to the divine blessing: chap. ix.

4. Next he obviates some reflexions thrown upon him for the mildness of his conduct, as if it had proceeded from fear. He asserts his apostolical power and authority: chap. x. He vindicates himself against the insinuations of some for having declined pecuniary support from the church. To show his superiority over those designing men who had opposed his preaching, he enumerates his sufferings; gives a detail of some extraordinary revelation which he had received; and vindicates himself from the charge of boasting, by declaring that he had been forced to it: chap. xi. xii. He closes the epistle, by assuring them how much it would grieve him to demonstrate his divine commission by severer methods.

The GALATIANS were descended from those Gauls who had formerly invaded Greece, and afterwards settled in Lower Asia. St. Paul had preached the gospel among them A. D. 51, soon after the council at Jerusalem: Acts xvi. 6. Asia swarmed at that time with zealots for the law of Moses, who wanted to impose it upon the Gentiles: Acts xv. 1. Soon after St. Paul had left the Galatians, these false teachers had got among them, and wanted them to be circumcised, &c. This occasioned the epistle, which Michaelis thinks was written in the same year, before St. Paul left Thessalonica. Dr. Lardner dates it about the end of 52, or in the beginning

of 53, before St. Paul set out for Jerusalem by way of Ephesus. The subject of this epistle is much the same with that of the Epistle to the Romans; only this question is more fully considered here, 'Whether circumcision, and an observance of the Levitical law, be necessary to the salvation of a Christian convert?' These Judaizing Christians, whose indirect views St. Paul exposes (Acts xv. 1; Gal. v. 3, 9), at first only represented circumcision as necessary to salvation; but afterwards they insisted upon the Christians receiving the Jewish festivals: Gal. iv. 10.

As it appears from several passages of this epistle (chap. i. 7, 8, 10, and v. 11) that the Judaizing Christians had endeavoured to persuade the Galatians that Paul himself had changed his opinion, and now preached up the Levitical law; he denies that charge, and affirms that the doctrines which he had taught were true, for he had received them from God by immediate revelation. He relates his miraculous conversion; asserts his apostolical authority, which had been acknowledged by the disciples of Jesus; and, as a proof that he had never inculcated a compliance with the Mosaic law, he declares that he had opposed Peter at Antioch for yielding to the prejudices of the Jews.

He then argues that the Galatians ought not to submit to the law of Moses:—1. Because they had received the Holy Ghost and the gifts of miracles, not by the law, but by the gospel: chap. iii. 1—5. 2. Because the promises which God made to Abraham were not restricted to his circumcised descendants, but extended to all who are his children by faith: chap. iii. 6—18. In answer to the objection, 'To what then serveth the law?' he replies, That it was given because of transgression; that is, to preserve them from idolatry till the Messiah himself should come. 3. Because all men, whether Jews or Gentiles, are made the children of God by faith, or by receiving the Christian religion, and therefore do not stand in need of circumcision: chap. iii. 26—29. From the first verse of chap. iv. to the eleventh, he argues that the law was temporary, being only fitted for a state of infancy; but that the world having attained a state of manhood under the Messiah, the law was of no farther use. In the remaining part of chap. iv. he reminds them of their former affection for him, and assures them that he was still their sincere friend. He exhorts them to stand fast in the liberty with which Christ had made them free.

He next confutes the false report which had been spread abroad among the Galatians that Paul himself preached up circumcision. He had already indirectly refuted this calumny, but he now directly and openly contradicts it; 1. By assuring them that all who thought circumcision necessary to salvation could receive no benefit from the Christian religion: chap. v. 2—4. 2. By declaring that he expected justification only by faith: ver. 5, 6. 3. By testifying that they had once received the truth, and had never been taught such false doctrines by him: ver. 7, 8. 4. By insinuating that they should pass some censure on those who misled them (ver. 9, 10), by declaring that he was persecuted for opposing

the circumcision of the Christians: ver. 11. 5. By expressing a wish that those persons should be cut off who troubled them with this doctrine. This epistle affords a fine instance of Paul's skill in managing an argument.

He next cautions them against an idea which his arguments for Christian liberty might excite, that it consisted in licentiousness. He shows them it does not consist in gratifying vicious desires; for none are under stronger obligations to moral duties than the Christian. He recommends gentleness and meekness to the weak (chap. vi. 1—5), and exhorts them to be liberal to their teachers, and unto all men: ver. 6—10. He concludes with exposing the false pretences of the Judaizing teachers, and asserting the integrity of his own conduct.

EPHESUS was the chief city of all Asia on this side Mount Taurus. St. Paul had passed through it in the year 54, but without making any stay: Acts xviii. 19—21. In 55 he returned to Ephesus again, and staid there three years: chap. xix. During his abode there he completed a very flourishing church of Christians, the first foundations of which had been laid by some inferior teachers. As Ephesus was frequented by persons of distinction from all parts of Asia Minor, St. Paul took the opportunity of preaching in the ancient countries (ver. 10); and the other churches of Asia were considered as the daughters of the church of Ephesus; so that an epistle to the Ephesians was, in effect, an epistle to the other churches of Asia at the same time. Dr. Lardner shows it to be highly probable that this epistle was written A.D. 61, soon after Paul's arrival at Rome.

As Paul was in a peculiar manner the apostle of the Gentiles, and was now a prisoner at Rome in consequence of having provoked the Jews, by asserting that an observance of the Mosaic law was not necessary to obtain the favor of God, he was afraid lest an advantage should be taken of his confinement to unsettle the minds of those whom he had converted. Hearing that the Ephesians stood firm in the faith of Christ, without submitting to the law of Moses, he writes this epistle to give them more exalted views of the love of God, and of the excellence and dignity of Christ. This epistle is not composed in an argumentative or didactic style: The first three chapters consist almost entirely of thanksgivings and prayers, or glowing descriptions of the blessings of the Christian religion. The last three chapters contain practical exhortations to unity, love, and concord, from the consideration that all Christians are members of the same body, of which Christ is the head. He then advises them to forsake the vices to which they had been addicted while they remained heathens. He recommends justice and charity; and condemns lewdness, obscenity, and intemperance. In the sixth chapter he points out the duties of husbands and wives, parents and children, masters and servants, &c.

The church at PHILIPPI had been founded by Paul, Silas, and Timothy (Acts xvi.) in 51, and had continued to show a strong attachment to the Christian religion, and a tender affection for the apostle. Hearing of his imprisonment at

Rome, they sent Epaphroditus, one of their pastors, to supply him with money. It appears from this epistle that he was in great want of necessaries before this contribution arrived, for, as he had not converted the Romans, he did not consider himself as entitled to receive supplies from them. Being a prisoner, he could not work; and it was his maxim never to accept any pecuniary assistance from those churches where a faction had been raised against him. From the Philippians he was not averse to receive a present, as he considered it as a mark of their affection.

This letter was written while he was a prisoner at Rome (chap. i. 7, 13; iv. 22); and from the expectation which he discovers (chap. ii. 24) of being soon released and restored to them, compared with Philemon ver. 22, and Heb. xiii. 13, where he expresses a like expectation in stronger terms, it is probable that it was written towards the end of his first imprisonment in 62. His design in this epistle seems to be to comfort the Philippians under the concern they had expressed at his imprisonment; to check a party spirit that had broken out among them; to promote union and harmony; to guard them against being seduced by Judaizing teachers; to support them under their trials; and to inspire them with a desire to adorn their profession by the most eminent attainments. After some admonitions, in the beginning of the fourth chapter, he, in the eighth verse, recommends virtue in the most extensive sense. Towards the close, he makes his acknowledgments to the Philippians for the seasonable and liberal supply which they had sent him, as a proof of their affection for him, and their concern for the support of the gospel.

The Epistle to the COLOSSIANS was written while Paul was in prison (chap. iv. 3), about A.D. 62. The intention of it was to secure the Colossians from some erroneous doctrines, and to excite them to a behaviour worthy of their sacred character. A new sect had arisen, which had blended the oriental philosophy with the superstitious opinions of the Jews. See GNOSTICS.

Against these doctrines Paul argues with great skill and address. He describes the dignity of Jesus Christ; declares that he had created all things, whether thrones or dominions, principalities or powers; that he alone was the head of the church, and had reconciled men to the Father: that Jesus was superior to angels; that they were created beings, and ought not to be worshipped.

He ensures the observation of the Jewish Sabbath; rebukes those who required abstinence from certain kinds of food; and cautions them against persons who assume a great appearance of wisdom and virtue: chap. ii. In the third chapter he exhorts them, that, instead of external ceremonies, they ought to cultivate pure morality. He guards them against impurity, to which they had before their conversion been much addicted. He admonishes them against the irascible passions, and falsehood. He exhorts them to cultivate the benevolent affections, humility, patience, and all the relative duties, with prayer and thanksgiving: chap. iv. 2.

The First Epistle to the THESSALONIANS is addressed to the inhabitants of Thessalonica, the capital of Macedonia. It appears from the Acts (xvii. 1), that the Christian religion was introduced into this city by Paul and Silas, soon after they had left Philippi. At first they made many converts; but at length the Jews stirred up the rabble, which assaulted the house where the apostle and his friends lodged, so that Paul and Silas were obliged to flee to Berea. The apostle then withdrew to Athens; and Timothy, at his desire, returned to Thessalonica (1 Thess. iii. 2), to see what were the sentiments of the inhabitants after the persecution. Paul went to Corinth, where he stayed eighteen months; during which Timothy returned with the joyful tidings that the Thessalonians remained steadfast to the faith, and firmly attached to the apostle, notwithstanding his flight. Upon this he sent them this epistle, A.D. 52, in the twelfth year of Claudius.

The intention of Paul in writing this epistle was evidently to encourage the Thessalonians to adhere to the Christian religion. This church being still in its infancy, and oppressed by the Jews, required to be established in the faith. St. Paul, therefore, in the first three chapters, endeavours to convince the Thessalonians of the truth of his gospel, both by the miraculous gifts of the Holy Ghost which had been imparted, and by his own conduct when among them.

He expresses a strong affection for them; mentions it to their honor that they received the gospel as the word of God and not of man; expresses a strong desire to visit them; and concludes with various exhortations.

The Second Epistle to the THESSALONIANS appears to have been written soon after the first, and from the same place; for Silvanus, or Silas, and Timothy are joined with the apostle in the address of this epistle, as well as of the former. Paul begins with commending the faith and charity of the Thessalonians; expresses great joy on account of the patience with which they supported persecution; and observes that their persecution was a proof of a righteous judgment to come, where their persecutors would meet with a proper recompense, and the righteous be delivered out of all their afflictions.

From misunderstanding a passage in his former letter, the Thessalonians believed the day of judgment was at hand. To rectify this mistake, he informs them that the day of the Lord will not come till a great apostasy has overspread the Christian world, the nature of which he describes. Dr. Hurd explains this of the papal power, to which it applies with astonishing exactness. Symptoms of this mystery of iniquity had then appeared; but the apostle expresses his thankfulness to God that the Thessalonians had escaped this corruption. He then proceeds to correct some irregularities. Many of the Thessalonians seem to have led a disorderly life; these he severely reproofs, and commands the faithful to shun their company if they remained incorrigible.

When the First Epistle to TIMOTHY was written it is difficult to ascertain. Lardner dates it in 56; Mill, Whitby, and Macknight, place it

in 64. Timothy was the intimate friend and companion of Paul, and is always mentioned by that apostle with much affection and esteem. Having appointed him to superintend the church of Ephesus, during a journey which he made to Macedonia, he wrote this letter to direct him how to discharge the important trust. This was the more necessary as Timothy was young and inexperienced: 1 Tim. iv. 12.

In the second chapter he prescribes the manner in which the worship of God was to be performed in the church of Ephesus; and in the third explains the qualifications of the persons whom he was to ordain as bishops and deacons. In the fourth he foretels the great corruptions of the church which were to prevail in future times. In the fifth and sixth he teaches Timothy how to admonish both old and young; and gives rules respecting widows, elders, slaves, trifling controversies, and the excessive love of money.

That the Second Epistle to TIMOTHY was written from Rome is universally agreed; but the precise date is uncertain. Timothy was at Ephesus or in Asia Minor when this epistle was sent to him. The false teachers who had before thrown this church into confusion grew every day worse; insomuch that not only Hymenæus, but Philetus, another Ephesian heretic, now denied the resurrection. They were led into this error by a dispute about words. At first they only annexed various improper significations to the word resurrection, but at last they denied it altogether.

Neither the date of the Epistle to TITUS, whom Paul had appointed over the church of Crete, nor the place from which it was sent, is ascertained. The apostle reminds Titus of the reasons for which he had left him at Crete; and directs him how to act in ordaining Christian pastors: chap. i. He advises him to accommodate his exhortations to the respective ages, sexes, and circumstances of those whom it was his duty to instruct; and to give an example of what he taught c. ii.: He exhorts him also to teach obedience to the civil magistrate, because the Judaizing Christians affirmed that no obedience was due from the worshippers of the true God to magistrates who were idolaters. He cautions against censoriousness and contention; recommends meekness; and to avoid useless controversies; and concludes with directing him how to proceed with heretics.

The Epistle to PHILEMON was written from Rome at the same time with the epistles to the Colossians and Philippians and A.D. 62 or 63. The occasion of the letter was this: Onesimus, Philemon's slave, had robbed his master, and fled to Rome; where, happily, he met with the apostle, who was then a prisoner at large, and by his instructions was converted to Christianity, and reclaimed to a sense of his duty. St. Paul, when he had made a sufficient trial of him, and found that his behaviour was entirely agreeable to his profession, sent him back to his master, and, as a mark of his esteem, entrusted him, together with Tychicus, with the charge of delivering his epistle to the church at Colosse, and giving them a particular account of the state of things at Rome, recommending him to them, at the same

time, as a faithful and beloved brother: Col. iv. 9. And, as Philemon might well be supposed to be strongly prejudiced against one who had left his service in so infamous a manner, he sends him this letter, in which he employs all his influence to remove suspicions, and reconcile him to the taking Onesimus into his family again. See PHILEMON.

It is impossible to read over this admirable epistle without being touched with the delicacy of sentiment, and the masterly address that appear in every part of it. We see here, in a most striking light, how perfectly consistent true politeness is, not only with all the warmth and sincerity of the friend, but even with the dignity of the Christian and the apostle. And, if this letter were to be considered in no other view than as a mere human composition, it must be allowed a master-piece in its kind. As an illustration of this remark, it may not be improper to compare it with an epistle of Pliny, that seems to have been written upon a similar occasion (lib. ix. ep. 21); which, though it has many beauties, and was penned by one that is reckoned to excel in the epistolary style, yet must be acknowledged, by every impartial reader, vastly inferior to this animated composition of the apostle.

The Epistle to the HEBREWS has been generally ascribed to Paul; but the truth of this opinion has been suspected by others for three reasons:—1. The name of the writer is nowhere mentioned, neither in the beginning nor in any other part of the epistle. 2. The style is said to be more elegant than Paul's. 3. There are expressions in the epistle which have been thought unsuitable to an apostle's character. 1. In answer to the first objection, Clemens Alexandrinus has assigned a very good reason: 'Writing to the Hebrews,' says he, 'who had conceived a prejudice against him, and were suspicious of him, he wisely declined setting his name at the beginning, lest he should offend them.' 2. Origen and Jerome admitted the elegance of the style, and reckoned it superior to that which Paul has exhibited in his epistles; but, as ancient testimony had assigned it to Paul, they endeavoured to answer the objection, by supposing that the sentiments were the apostle's, but the language and composition the work of some other person. If the epistle, however, be a translation, which we believe it to be, the elegance of the language may belong to the translator. As to the composition and arrangement, there are many specimens in the writings of this apostle not inferior in these qualities to the epistle to the Hebrews. 3. It is objected that, in Heb. ii. 3, the writer of this epistle joins himself with those who had received the gospel from Christ's apostles. Now Paul had it from Christ himself. But Paul often appeals to the testimony of the apostles in support of those truths which he had received from revelation. See 1 Cor. xv. 5, 6, 7, 8; 2 Tim. ii. 2.

This epistle is not quoted till the end of the second century, and even then does not seem to have been universally received. This silence might be owing to the Hebrews themselves, who, supposing this letter had no relation to the Gentiles, might be at no pains to diffuse

copies of it. The authors, however, on whose testimony we receive it as authentic, are entitled to credit; for they lived so near the age of the apostles that they were in no danger of being imposed on; and, from the numerous list of books which they rejected as spurious, we are assured that they were very careful to guard against imposition. It is often quoted as Paul's by Clemens Alexandrinus, about A. D. 194. It is received and quoted as Paul's by Origen, about 230; by Dionysius, bishop of Alexandria, in 247; and by a numerous list of succeeding writers.

The Epistle to the Hebrews was originally written in Hebrew, or rather Syro-Chaldaic; a fact testified by Clemens Alexandrinus, Jerome, and Eusebius. To this it has been objected that, as these writers have not referred to any authority, we can only consider this as an opinion. But as they state no reasons for adopting this opinion, but only mention as a fact that Paul wrote to the Hebrews in their native language, we must allow that it is their testimony which they produce, and not their opinion. Eusebius informs us that some supposed Luke the evangelist, and others Clemens Romanus, to have been the translator. According to Clemens Alexandrinus, Jerome, and Euthalius, this epistle was addressed to the Jews in Palestine. The scope of the epistle confirms this opinion.—The time when it was written may be easily determined; for the salutation from the saints of Italy (c. iv. 24), together with the apostle's promise to see the Hebrews (v. 23), plainly intimate that his confinement was then either ended or on the eve of being ended. It must therefore have been written soon after the epistles to the Colossians, Ephesians, and Philemon, and not long before Paul left Italy, that is, A. D. 61 or 62.

As the zealous defenders of the Mosaic law would naturally insist on the divine authority of Moses, on the majesty and glory attending its promulgation by the ministry of angels, and the great privileges it afforded those who adhered to it; the apostle shows—

I. That in all these articles Christianity had an infinite superiority to the law. This topic he pursues from c. i. to xi., wherein he reminds the believing Hebrews of the extraordinary favor shown them by God, in sending them a revelation by his own Son, whose glory was far superior to that of angels (c. i.); very naturally inferring from hence the danger of despising Christ on account of his humiliation, which, in perfect consistence with his dominion over the world to come, was voluntarily submitted to by him for wise and important reasons; particularly to deliver us from the fear of death, and to encourage the freedom of our access to God: c. ii. With the same view he magnifies Christ as superior to Moses, their great legislator; and, from the punishment inflicted on those who rebelled against the authority of Moses, infers the danger of contemning the promises of the gospel: c. iii. 2—13. And, as it was an easy transition to call to mind on this occasion that rest in Canaan to which the authority invested in Moses was intended to lead them, the apostle hence cautions them against unbelief, as what would prevent their entering

into a superior state of rest to what the Jews ever enjoyed: c. iii. 14, iv. 11. This caution is still farther enforced by awful views of God's omniscience, and a lively representation of the high-priesthood of Christ (c. iv. and v. to the end). In the next place he intimates the very hopeless situation of those who apostatise from Christianity (c. vi. 1—9); and then, for the comfort and confirmation of sincere believers, displays to them the goodness of God, and his faithful adherence to his holy engagements; the performance of which is sealed by the entrance of Christ into heaven as our forerunner: c. vi. 9, to the end. Still farther to illustrate the character of our Lord, he enters into a parallel between him and Melchizedec as to their title and descent; and, from instances wherein the priesthood of Melchizedec excelled the Levitical, infers that the glory of the priesthood of Christ surpassed that under the law: c. vii. 1—17. From these premises the apostle argues that the Aaronical priesthood was not only excelled, but consumed by that of Christ, to which it was only introductory and subservient; and of course that the obligation of the law was henceforth dissolved: c. vii. 18, to the end. Then recapitulating what he had already demonstrated, concerning the superior dignity of Christ's priesthood, he thence illustrates the distinguished excellence of the new covenant, as not only foretold by Jeremiah, but evidently enriched with much better promises than the old (c. viii. throughout); explaining further the doctrine of the priesthood and intercession of Christ, by comparing it with what the Jewish high priest did on the great day of atonement: c. ix. 1—14. Afterwards he enlarges on the necessity of shedding Christ's blood, and the sufficiency of the atonement made by it (c. ix. 15, to the end); and proves that the legal ceremonies could not by any means purify the conscience; whence he infers the insufficiency of the Mosaic law, and the necessity of looking beyond it: c. x. 1—15. He then urges the Hebrews to improve the privileges which such a high priest and covenant conferred on them, to the purposes of approaching God with confidence, to a constant attendance on his worship, and most benevolent regards to each other: c. x. 15—25. The apostle having thus obviated the insinuations and objections of the Jews, for the satisfaction and establishment of the believing Hebrews, proceeds,

II. To prepare and fortify their minds against the storm of persecution which in part had already befallen them, and which was likely to continue and be often renewed, he reminds them of those extremities they had endured, and of the fatal effects which would attend their apostasy (chap. x. 26, to the end); calling to their remembrance the eminent examples of faith and fortitude exhibited by holy men, and recorded in the Old Testament, (chap. xi. 1—29). He concludes his discourse with glancing at many other illustrious worthies; and, besides those recorded in Scripture, refers to the case of several who suffered under the persecution of Antiochus Epiphanes: 2 Mac. chap. viii. &c., xi. 30, xii. 2. Having thus finished the argumentative part of the epis-

tle, the apostle proceeds to a general application in which he exhorts the Hebrew Christians to patience, peace, and holiness (chap. xii. 3—14); cautions them against secular views and sensual gratifications, by laying before them the incomparable excellence of the blessings introduced by the gospel, which even the Jewish economy, glorious and magnificent as it was, did by no means equal; exhorts them to brotherly affection, purity, compassion, dependence on the divine care, steadfastness in the profession of truth, a life of thankfulness to God, and benevolence to man; and concludes the whole with recommending their pious ministers to their particular regard, entreating their prayers, saluting and granting them his usual benediction.

The seven following epistles, one of James, two of Peter, three of John, and one of Jude, have been distinguished by the appellation of Catholic or general epistles, because most of them are inscribed, not to particular churches or persons, but to the body of Jewish or Gentile converts over the world. The authenticity of some of these has been questioned, viz. the Epistle of James, the second of Peter, the Epistle of Jude, and the second and third of John. The ancient Christians were very cautious in admitting any books into their canon whose authenticity they had any reason to suspect. They rejected all the writings forged by heretics in the name of the apostles, and certainly, therefore, would not receive any without first subjecting them to a severe scrutiny. Now, though these seven epistles were not immediately acknowledged as the writings of the apostles, this only shows that the persons who doubted had not received complete and incontestable evidence of their authenticity. But, as they were afterwards universally received, we have every reason to conclude, that upon a strict examination they were found to be the genuine productions of the apostles. The truth is, so good an opportunity had the ancient Christians of examining this matter, so careful were they to guard against imposition, and so well founded was their judgment concerning the books of the New Testament, that, as Dr. Lardner observes, no writing which they pronounced genuine has yet been proved spurious, nor have we at this day the least reason to believe any book genuine which they rejected.

That the Epistle of JAMES was written in the apostolical age is proved by the quotations of Clemens Romanus, Ignatius, and Origen. There are several reasons why it was not more generally quoted by the first Christian writers. Being written to correct the errors and vices which prevailed among the Jews, the Gentiles might think it of less importance to them, and therefore take no pains to procure copies of it. As the author was sometimes denominated James the Just, and often called bishop of Jerusalem, it might be doubted whether he was one of the apostles. But its authenticity does not seem to have been suspected on account of the doctrines which it contains. In modern times, indeed, Luther called it a strawy epistle (*epistola straminea*), and excluded it from the sacred writings, on account of its apparent opposition to the

apostle Paul concerning justification by faith. This epistle could not be written by James the elder, the son of Zebedee, and brother of John, who was beheaded by Herod, A. D. 44; for it contains passages which refer to a later period. It must, therefore, have been the composition of James the Less, the son of Alphaeus, who was called the Lord's brother, because he was the son of Mary, the sister of our Lord's mother. Lardner fixes the date in the year 61 or 62.

James the Less stately resided at Jerusalem, whence he was styled by some ancient fathers bishop of that city, though without sufficient foundation. Now James being one of the apostles of the circumcision, while he confined his personal labors to the inhabitants of Judea, it was natural for him to endeavour, by his writings, to extend his services to the Jewish Christians who were dispersed abroad in more distant regions. For this purpose there are two points which the apostle seems to have principally aimed at, though he did not pursue them in an orderly and logical method, but in the free epistolary manner, handling them jointly or distinctly as occasions naturally offered. And these were 'to correct those errors both in doctrine and practice into which the Jewish Christians had fallen, which might otherwise have produced fatal consequences; and then to establish the faith and animate the hope of sincere believers, both under their present and their approaching sufferings.' The opinions which he is most anxious to refute are these, that God is the author of sin (ch. i. 13); and that the belief of the doctrines of the gospel was sufficient to procure the favor of God for them, however deficient they were in good works: chap. ii. He dissuades the Jews in the third chapter from aspiring to the office of teachers, because their prejudices in favor of the law of Moses might induce them to pervert the doctrines of the gospel. He therefore guards them against the sins of the tongue, by representing their pernicious effects; and as they thought themselves wise and intelligent, and were ambitious of becoming teachers, he advises them to make good their pretensions, by showing themselves possessed of that wisdom which is from above: chap. iii.

The destruction of Jerusalem was now approaching; the Jews were split into factions, and often slaughtered one another; the apostle, therefore, in the fourth chapter admonishes them to purify themselves from those vices which produced tumults and bloodshed. To rouse them to repentance, he foretells the miseries that were coming upon them. Lastly, he checks an irreligious spirit that seems to have prevailed, and concludes the epistle with several exhortations.

The authenticity of the first Epistle of PETER has never been denied. It is referred to by Clemens Romanus, and Polycarp, and is quoted by Papias, Irenæus, Clemens Alexandrinus, and Tertullian. It is addressed to the strangers scattered through Pontus, &c., who are evidently Christians in general, as appears from chap. ii. 10. From Peter's sending the salutation of the church at Babylon to the Christians in Pontus, &c., it is generally believed that he wrote it in Babylon. There was a Babylon in Egypt and

another in Assyria. It could not be the former; for it was an obscure place, which seems to have had no church for the first four centuries. We have no authority to affirm that Peter was in Assyria. The most probable opinion is that of Grotius, Whitby, Lardner, as well as of Eusebius, Jerome, and others, that by Babylon Peter figuratively means Rome. Lardner dates it in 63, 64, or 65. St. Peter's chief design is to confirm the doctrine of St. Paul, which the false teachers pretended he was opposing, and to assure the proselytes that they stood in the true grace of God: chap. v. 12. With this view he calls them elect, and mentions that they had been declared such by the effusion of the Holy Ghost upon them: chap. i. 1, 2. He assures them that they were regenerate without circumcision, merely through the gospel and the resurrection of Christ (ver. 3, 4. 21—25); and that their sufferings were no argument of their being under the displeasure of God, as the Jews imagined: ver. 6—12. He recommends it to them to hope for grace to this end: ver. 13. He testifies that they were not redeemed by the paschal lamb, but through Christ, whom God had pre-ordained for this purpose before the foundation of the world: ver. 18—20.

The second Epistle of PETER is not mentioned by any ancient writer extant till the fourth century, from which time it has been received by all Christians, except the Syrians. Jerome acquaints us that its authenticity was disputed, on account of a remarkable difference between the style of it and the former epistle. But this remarkable difference in style is confined to the second chapter of the second epistle. No objections, however, can be drawn from this circumstance; for the subject of that chapter is different from the rest of Peter's writings, and nothing is so well known as that different subjects suggest different styles. Peter, in describing the character of some flagitious impostors, feels an indignation which he cannot suppress; it breaks out, therefore, in the bold and animated figures of an oriental writer. Such a diversity of style is not uncommon in the best writers, especially when warmed with their subject. This objection being removed, we contend that this epistle was written by Peter, from the inscription, Simon Peter, a servant and an apostle of Jesus Christ. It appears from chap. i. 16, 17, 18, that the writer was one of the disciples who saw the transfiguration of our Saviour. Since it has never been ascribed to James or John, it must therefore have been Peter. It is evident, from chap. iii. 1, that the author had written an epistle before to the same persons, which is another circumstance that proves Peter to be the author.

It is acknowledged, however, that all this evidence is merely internal; for there is no external evidence upon the subject. Some, therefore, have contended, that if the credit which we give to any fact is to be in proportion to the degree of evidence with which it is accompanied, we must allow more authority to the gospels than to the epistles; more to those epistles which have been generally acknowledged than to those which have been controverted, &c. To us it

seems that sufficient evidence of *inspiration* being obtained is the main point. Yet one way of determining the essential doctrines of Christianity would be to examine what are the doctrines which occur oftener in the gospels; for the gospels are the plainest parts of the New Testament, and their authenticity is most completely proved. Nor will it be denied that our Saviour taught all the doctrines of the Christian religion himself; that he repeated them on different occasions, and inculcated them with an earnestness proportionable to their importance. The epistles are to be considered as a commentary on the essential doctrines of the gospel, adapted to the situation and circumstances of particular churches, and perhaps sometimes explaining doctrines of inferior importance. 1. The essential doctrines are therefore first to be sought for in the gospels, and to be determined by the number of times they occur. 2. In the uncontroverted epistles, in the same manner. 3. No essential doctrine ought to be founded on a single passage, nor on the authority of a controverted passage.

That Peter was old, and near his end, when he wrote this epistle, may be inferred from chap. i. 14: 'Knowing that shortly I must put off this tabernacle, even as our Lord Jesus has shown me.' Lardner thinks it was written soon after the former. Others date it in 67. The general design of it is to confirm the doctrines and instructions delivered in the former; 'to excite the Christian converts to adorn, and steadfastly adhere to their holy religion, as a religion proceeding from God, notwithstanding the artifices of false teachers, whose character is described; or the persecution of their inveterate enemies.'

The first Epistle of *JOHN* is ascribed by the unanimous suffrage of the ancients to the beloved disciple of our Lord. It is referred to by Polycarp, is quoted by Papias, by Irenæus, and was received as genuine by Clemens Alexandrinus, by Dionysius of Alexandria, by Cyprian, Origen, and Eusebius. There is such a resemblance between the style and sentiments of this epistle and those of St. John's gospel, as to afford the highest degree of internal evidence that they are the compositions of the same author. In the style of this apostle there is a remarkable peculiarity, and especially in this epistle. His sentences, considered separately, are exceedingly clear and intelligible; but, when we search for their connexion, we frequently meet with greater difficulties than we do even in the epistles of St. Paul. The principal signature and characteristic of his manner is, an artless and amiable simplicity, and a singular modesty and candor, in conjunction with a wonderful sublimity of sentiment. His conceptions are apparently delivered to us in the order in which they arose to his own mind, and are not the product of artificial reasoning or labored investigation. It is impossible to fix with any precision the date of this epistle, nor can we determine to what persons it was addressed.

The leading design of the apostle is to show the insufficiency of faith, and the external profession of religion, separate from morality; to guard Christians against the delusive arts of the

corrupters of Christianity, whom he calls Antichrist; and to inculcate universal benevolence. His admonitions concerning the necessity of good morals, and the inefficacy of external professions, are scattered over the epistle, but are most frequent in the first, second, and third chapters. The enemies or corrupters of Christianity against whom he contends, seem to have denied that Jesus was the Messiah, the Son of God (chap. ii. 22, v. 1), and had actually come into the world in a human form: chap. iv. 2, 3. The earnestness and frequency with which this apostle recommends benevolence is remarkable. He makes it the distinguishing characteristic of the disciples of Jesus, the only sure pledge of our love to God, and the only assurance of eternal life: chap. iii. 14, 15. Benevolence was his favorite theme, which he affectionately pressed upon others, and constantly practised himself. It was conspicuous in his conduct to his great Master, and in the reciprocal affection which it inspired in his sacred breast. He continued to recommend it in his last words. When his extreme age and infirmities had so wasted his strength, that he was incapable to exercise the duties of his office, the venerable old man, anxious to exert in the service of his Master the little strength which still remained, caused himself to be carried to church, and in the midst of the congregation he repeated these words, 'Little children love one another.'

It has been observed by Dr. Mill that the second and third epistles of *JOHN* are so short, and resemble the first so much in sentiment and style, that it is needless to contend about them. The second epistle consists only of thirteen verses, and of these eight may be found in the first epistle, in which the sense or language is precisely the same. The second epistle is quoted by Irenæus, and was received by Clemens Alexandrinus. Both were admitted by Athanasius, by Cyril of Jerusalem, and by Jerome. The second is addressed to a woman of distinction, whose name is by some supposed to be Cyria (taking *κυρια* for a proper name), by others Electa. The third is inscribed to Gaius or Caius, according to the Latin orthography, who, in the opinion of Lardner, was an eminent Christian, that lived in some city of Asia not far from Ephesus, where St. John chiefly resided after his leaving Judea. Or he may be the Gaius whom Paul calls his host, in Rom. xvi. 23. The time of writing these two epistles cannot be determined with any certainty. They are so short that an analysis of them is not necessary.

The Epistle of *JUDAS* is cited by no ancient Christian writer extant before Clemens Alexandrinus about the year 194; but this author has transcribed eight or ten verses in his *Stromata* and *Pedagogue*. It is quoted once by Tertullian about the year 200; by Origen frequently about 230. It was not however received by many of the ancient Christians, on account of a supposed quotation from a book of Enoch. But it is not certain that Jude quotes any book. He only says that, 'Enoch prophesied, saying, the Lord cometh with ten thousand of his saints.' These might be words of a prophecy preserved by tradition, and inserted occasionally in different

writings. Nor is there any evidence that there was such a book as Enoch's Prophecies in the time of Jude, though a book of that name was extant in the second and third centuries. As to the date of this epistle, nothing beyond conjecture can be produced. The design of it is, by describing the character of the false teachers, and the punishments to which they were liable, to caution Christians against listening to their suggestions, and being thereby perverted from the faith and purity of the gospel.

V.—*Of the Revelation of St. John.*—The APOCALYPSE OR REVELATION has not always been unanimously received as the genuine production of the apostle John. Its authenticity is proved, however, by the testimony of many respectable authors of the first centuries. It is referred to by the martyrs of Lyons; it was admitted by Justin Martyr as the work of the apostle John. It is often quoted by Irenæus, by Theophilus bishop of Antioch, by Clement of Alexandria, Tertullian, Origen, and Cyprian of Carthage. It was also received by heretics, as Novatians and his followers, the Donatists, and the Arians. For the first two centuries no part of the New Testament was more universally acknowledged, or mentioned with higher respect. But, a dispute having arisen about the millennium, Caius, with some others, about 212, to end the controversy as speedily and effectually as possible, ventured to deny the authority of the book which had given occasion to it.

The book of Revelation, as we learn from ch. i. 9, was written in the Isle of Patmos. According to the general testimony of ancient authors, John was banished into Patmos in the reign of Domitian, and restored by his successor Nerva. But the book could not be published till after John's release, when he returned to Ephesus. As Domitian died in 96, and his persecution did not commence till near the end of his reign, the Revelation might therefore be published in 97.

As our readers may wish to be informed how the predictions revealed in this book of St. John have usually been interpreted and applied, we subjoin a key to the prophecies contained in the Revelation, extracted from the learned dissertations of Dr. Newton, bishop of Bristol, vol. iii., to which the reader is referred for a more full illustration of the several parts, as the conciseness of our plan only admits a short analysis of them.

Nothing of a prophetic nature occurs in the first three chapters, except, 1. What is said concerning the church of Ephesus, 'that her candlestick shall be removed out of its place,' which is now verified, not only in this, but in all the other Asiatic churches which existed at that time; the light of the Gospel having been taken from them, not only by their heresies and divisions from within, but by the arms of the Saracens from without; and, 2. Concerning the church of Smyrna, that she shall 'have tribulation ten days;' that is, in prophetic language, ten years, referring to the persecution of Dioclesian, which alone of all the general persecutions lasted so long.

The next five chapters relate to the opening of

the seven seals; and by these seals are intimated so many different periods of the prophecy. Six of these seals are opened in the sixth and seventh chapters.

The first seal or period is memorable for conquests. It commences with Vespasian, and terminates in Nerva; and during this time Judea was subjugated. The second seal is noted for war and slaughter. It commences with Trajan, and continues through his reign, and that of his successors. In this period the Jews were entirely routed and dispersed; and great was the slaughter and devastation occasioned by the contending parties. The third seal is characterised by a rigorous execution of justice, and an abundant provision of corn, wine, and oil. It commences with Septimius Severus. He and Alexander Severus were just and severe emperors, and at the same time highly celebrated for the regard they paid to the felicity of their people, by procuring them plenty of every thing, and particularly corn, wine, and oil. This period lasted during the reigns of the Septimian family. The fourth seal is distinguished by a concurrence of evils, such as war, famine, pestilence, and wild beasts; by all which the Roman empire was remarkably infested from the reign of Maximin to that of Dioclesian. The fifth seal begins at Dioclesian, and is signalised by the great persecution, from whence arose that memorable era, the era of martyrs. With Constantine begins the sixth seal, a period of revolutions, pictured forth by great commotions in earth and in heaven, alluding to the subversion of Paganism and the establishment of Christianity. This period lasted from the reign of Constantine the Great to that of Theodosius I. The seventh seal includes under it the remaining parts of the prophecy, and comprehends seven periods distinguished by the sounding of seven trumpets.

As the seals foretold the state of the Roman empire before and till it became Christian, so the trumpets foreshow the fate of it afterwards; each trumpet being an alarm to one nation or other, rousing them up to overthrow that empire. Four of these trumpets are sounded in the eighth chapter.

At the sounding of the first trumpet, Alaric and his Goths invade the Roman empire, besiege Rome twice, and set it on fire in several places. See *ROME*. At the sounding of the second, Attila and his Huns waste the Roman provinces, and compel the eastern emperor Theodosius II., and the western emperor Valentinian III., to submit to shameful terms. At the sounding of the third, Genseric and his Vandals arrive from Africa; spoil and plunder Rome, and set sail again with immense wealth and innumerable captives. See *ROME*. At the sounding of the fourth trumpet, Odoacer and the Heruli put an end to the very name of the western empire. See *ROME*. Theodoric founds the kingdom of the Ostrogoths in Italy; and at last Italy becomes a province of the eastern empire, Rome being governed by a duke under the exarch of Ravenna. See *ITALY*. As the foregoing trumpets relate chiefly to the downfall of the western empire, so do the two following to that of the eastern. They are sounded in the ninth, tenth, and part of the eleventh chap-

ters. At the sounding of the fifth trumpet, Mahomet, that blazing star, appears, opens the bottomless pit, and with his locusts, the Arabians, darkens the sun and air. At the sounding of the sixth, a period not yet finished, the four angels, that is, the four sultans, or leaders of the Turks and Othmans, are loosed from the river Euphrates. The Greek or Eastern empire was cruelly 'hurt and tormented' under the fifth trumpet; but under the sixth it was 'slain,' and utterly destroyed.

The Latin or Western church not being reclaimed by the ruin of the Greek or Eastern, but still persisting in their idolatry and wickedness; at the beginning of the tenth chapter, and under the sound of the sixth trumpet, is introduced a vision preparative to the prophecies respecting the Western church, wherein an angel is represented, having in his hand a little book, or codicil, describing the calamities that should overtake that church. The measuring of the temple shows, that during all this period there will be some true Christians, who will conform themselves to the rule of God's word, even whilst the outer court, that is, the external and more extensive part of this temple or church, is trodden under foot by Gentiles, i. e. such Christians as, in their idolatrous worship and persecuting practice, resemble and outdo the Gentiles themselves. Yet against these corrupters of religion there will be always some true witnesses to protest, who, however they may be overborne at times, and in appearance reduced to death, yet will arise again from time to time, till at last they triumph and gloriously ascend. The eleventh chapter concludes with the sounding of the seventh trumpet.

In the twelfth chapter, by the woman bearing a man-child is to be understood the Christian church; by the great red dragon, the heathen Roman empire; by the man-child whom the woman bore, Constantine the Great; and by the war in heaven, the contests between the Christian and Heathen religions.

In the thirteenth chapter, by the beast with seven heads and ten horns, unto whom the dragon gave his power, seat, and great authority, is to be understood not Pagan but Christian, not imperial but papal Rome; in submitting to whose religion, the world did in effect submit again to the religion of the dragon. The ten-horned beast, therefore, represents the Romish church and state in general; but the beast with two horns like a lamb is the Roman clergy; and that image of the ten-horned beast, which the two-horned beast caused to be made, and inspired with life, is the pope; whose number is 666, according to the numerical powers of the letters constituting the Roman name *Λατίνος*, Latinus, or its equivalent in Hebrew, רומיית Romiith.

Chap. xvi. By the lamb on Mount Sion is meant Jesus; by the 144,000 his church and followers; by the angel preaching his everlasting gospel, the first principal effort made towards a reformation by that public opposition formed against the worship of saints and images by emperors and bishops in the eighth and ninth centuries; by the angel crying, 'Babylon is fallen,' the Waldenses and Albigenses, who pronounced the church of Rome to be the Apocalyptic Babylon, and denounced her destruction; and by the third angel, Martin Luther, and his fellow reformers, who protested against all the corruptions of the church of Rome, as destructive to salvation.

The following very excellent canons of interpretation, in respect to this book, have been recently proposed by Dr. Woodhouse, who has himself, applied them with great success to its exposition:—

1. Compare the language, the symbols, and the predictions of the Apocalypse with those of former revelations; and admit only such interpretation as shall appear to have the sanction of this divine authority.

2. Unless the language and symbols of the Apocalypse should in particular passages direct, or evidently require, another mode of application, the predictions are to be applied to the progressive church of Christ.

3. The kingdom which is the subject of this prophetic book is not a temporal, but a spiritual kingdom;—'not a kingdom of this world;' not established by the means and apparatus of worldly pomp, not bearing the external ensigns of royalty; but governing the inward man, by possession of the ruling principles: 'the kingdom of God,' says our Lord, 'is within you.' Luke xvii. 21. The predictions relative to this kingdom, therefore, are to be spiritually interpreted. Wars, conquests, and revolutions, and vast extent and great political import, are not the object of the Apocalyptic prophecies, unless they appear to have promoted or retarded in a considerable degree the real progress of the religion of Jesus Christ, whose proper reign is in the hearts and consciences of his subjects. His reign is advanced when Christian principles, when faith, and righteousness, and charity abound. It is retarded when ignorance, impurity, idolatrous superstition, and wickedness prevail.

4. We are not to attempt the particular explanation of those prophecies which remain to be fulfilled.

For an account of the doctrines and precepts contained in the Scriptures, see THEOLOGY.

We cannot conclude this article more satisfactorily to our own minds, nor to that, we would hope, of a large majority of our readers, than in the admirable remarks of Dr. Chalmers on the *Supreme Authority* of the Scriptures.

'If the New Testament be a message from God, it behoves us to make an entire and unconditional surrender of our minds, to all the duty and to all the information which it sets before us. There is, perhaps, nothing more thoroughly beyond the cognizance of the human faculties than the truths of religion, and the ways of that

mighty and invisible Being who is the object of it; and yet nothing, we will venture to say, has been made the subject of more hardy and adventurous speculation. We make no allusion at present to Deists, who reject the authority of the New Testament because the plan and the dispensation of the Almighty, which is recorded there, is different from that plan and that dispensation which they have chosen to ascribe to him. We speak of Christians who profess to admit the authority of this record, but who have tainted the purity of their profession by not acting upon its exclusive authority; who have mingled their own thoughts and their own fancy with its information; who, instead of repairing in every question, and in every difficulty, to the principle of '*What readest thou?*' have abridged the sovereignty of this principle, by appealing to others, of which we undertake to make out the incompetency; who, in addition to the word of God, talk also of the reason of the thing, or the standard of orthodoxy; and have in fact brought down the Bible from the high place which belongs to it, as the only tribunal to which the appeal should be made, or from which the decision should be looked for.

'It is not merely among partizans or the advocates of a system that we meet with this indifference to the authority of what is written. It lies at the bottom of a great deal of that looseness, both in practice and speculation, which we meet with every day in society, and which we often hear expressed in familiar conversation. Whence that list of maxims which are so indolently conceived, but which, at the same time, are so faithfully proceeded upon? 'We have all our passions and infirmities; but we have honest hearts, and that will make up for them. Men are not all cast in the same mould. God will not call us to task too rigidly for our foibles; at least this is our opinion, and God can never be so unmerciful, or so unjust, as to bring us to a severe and unforgiving tribunal for the mistakes of the understanding.' Now, it is not licentiousness in general, which we are speaking against. It is against that sanction which it appears to derive from the self-formed maxims of him who is guilty of it. It is against the principle that either an error of doctrine, or an indulgence of passion, is to be exempted from condemnation, because it has an opinion of the mind to give it countenance and authority. What we complain of is, that a man no sooner sets himself forward and says, '*this is my sentiment*,' than he conceives that all culpability is taken away from the error, either of practice or speculation, into which he has fallen. The carelessness with which the opinion has been formed is of no account in the estimate. It is the mere existence of the opinion which is pleaded in vindication, and under the authority of our maxim, and our mode of thinking, every man conceives himself to have a right to his own way and his own peculiarity.

'Now this might be all very fair were there no Bible and no revelation in existence. But it is not fair that all this looseness, and all this variety, should be still floating in the world, in the face of an authoritative communication from God

himself. Had no message come to us from the fountain-head of truth, it were natural enough for every individual mind to betake itself to its own speculation. But a message has come to us, bearing on its forehead every character of authenticity; and is it right now, that the question of our faith, or of our duty, should be committed to the capricious variations of this man's taste, or of that man's fancy? Our maxim, and our sentiment! God has put an authoritative stop to all this. He has spoken, and the right or the liberty of speculation no longer remains to us. The question now is not '*What thinkest thou?*' In the days of Pagan antiquity no other question could be put; and the wretched delusions and idolatries of that period let us see what kind of answer the human mind is capable of making, when left to its own guidance, and its own authority. But we call ourselves Christians, and profess to receive the Bible as the directory of our faith; and the only question in which we are concerned is, '*What is written in the law? how readest thou?*'

'Instead of learning the designs and character of the Almighty from his own mouth, we sit in judgment upon them; and make our conjecture of what they should be take the precedency of his revelation of what they are. We do Him the same injustice that we do to an acquaintance, whose proceedings and whose intentions we venture to pronounce upon, while we refuse him a hearing, or turn away from the letter in which he explains himself. No wonder, then, at the want of unanimity among Christians, so long as the question of '*what thinkest thou?*' is made the principle of their creed, and, for the safe guidance of criticism, they have committed themselves to the endless caprices of the human intellect. Let the principle of '*what thinkest thou?*' be exploded; and that of '*what readest thou?*' be substituted in its place. Let us take our lesson as the Almighty places it before us, and, instead of being the judge of his conduct, be satisfied with the safer and humbler office of being the interpreter of his language.

'This principle is not exclusively applicable to the learned. The great bulk of Christians have no access to the Bible in its original languages; but they have access to the common translation, and they may be satisfied, by the concurrent testimony of the learned among the different sectaries of this country, that the translation is a good one. We do not confine the principle to critics and translators; we press it upon all. We call upon them not to form their divinity by independent thinking, but to receive it by obedient reading, to take the words as they stand, and submit to the plain English of the Scriptures which lie before them. It is the office of a translator to give a faithful representation of the original. Now that this faithful representation has been given, it is our part to peruse it with care, and to take a fair and a faithful impression of it. It is our part to purify our understanding of all its previous conceptions. We must bring a free and unoccupied mind to the exercise. It must not be the pride or the obstinacy of self-formed opinions, or the haughty independence of him who thinks he has reached

the manhood of his understanding. We must bring with us the docility of a child, if we want to gain the kingdom of heaven. It must not be a partial, but an entire and unexcepted obedience. There must be no garbling of that which is entire, no darkening of that which is luminous, no softening down of that which is authoritative or severe. The Bible will allow of no compromise. It professes to be the directory of our faith, and claims a total ascendancy over the souls and the understandings of men. It will enter into no composition with us or our principles. It challenges the whole mind as its due, and it appeals to the truth of heaven for the high authority of its sanctions. 'Whosoever addeth to, or taketh from, the words of this book, is accursed,' is the absolute language in which it delivers itself. This brings us to its terms. There is no way of escaping after this. We must bring every thought into the captivity of its obedience, and, as closely as ever lawyer stuck to his document or his extract, must we abide by the rule and the doctrine which this authentic memorial of God sets before us. Now we hazard the assertion, that with a number of professing Christians there is not this unexcepted submission of the understanding to the authority of the Bible; and that the authority of the Bible is often modified, and in some cases superseded, by the authority of other principles.

'But is not this an enlightened age? he afterwards asks, and, since the days of the gospel, has not the wisdom of 2000 years accumulated upon the present generation? has not science been enriched by discovery? and is not theology one of the sciences. Are the men of this advanced period to be restrained from the high exercise of their powers? and, because the men of a remote and barbarous antiquity lisped and drivelled in the infancy of their acquirements, is that any reason why we should be restricted like so many schoolboys to the lesson that is set before us? It is all true that this is a very enlightened age, but on what field has it acquired so flattering a distinction? On the field of experiment. The human mind owes all its progress to the confinement of its efforts within the safe and certain limits of observation, and to the severe restraint which it has imposed upon its speculative tendencies. Go beyond these limits, and the human mind has not advanced a single inch by its own independent exercises. All the philosophy which has been reared by the labor of successive ages is the philosophy of facts reduced to general laws, or brought under a general description from observed points of resemblance. A proud and a wonderful fabric we do allow; but we throw away the very instrument by which it was built the moment that we cease to observe, and begin to theorise and ex-cogitate. Tell us a single discovery which has thrown a particle of light on the details of the divine administration. Tell us a single truth, in

the whole field of experimental science, which can bring us to the moral government of the Almighty by any other road than *his own revelation*.

'We do all homage to modern science, nor do we dispute the loftiness of its pretensions. But we maintain that, however brilliant its career in those tracts of philosophy where it has the light of observation to conduct it, the philosophy of all that lies without the field of observation is as obscure and inaccessible as ever. We maintain that, to pass from the motions of the moon to an unauthorised speculation upon the chemistry of its materials, is a presumption disowned by philosophy. We ought to feel that it would be a still more glaring transgression of all her maxims, to pass from the brightest discovery in her catalogue, to the ways of that mysterious Being whom no eye hath seen, and whose mind is capacious as infinity. The splendor and the magnitude of what we do know can never authorise us to pronounce upon what we do not know; nor can we conceive a transition more violent, or more unwarrantable, than to pass from the truths of natural science to a speculation on the details of God's administration, or the economy of his moral government. We hear much of revelations from heaven. Let any one of these bear the evidence of an actual communication from God himself, and all the reasonings of all the theologians must vanish, and give place to the substance of this communication. Instead of theorising upon the nature and properties of that divine light which irradiates the throne of God, and exists at so immeasurable a distance from our faculties, let us point our eyes to that emanation which has actually come down to us. Instead of theorising upon the counsels of the divine mind, let us go to that volume which lighted upon our world nearly 2000 years ago, and which bears the most authentic evidence that it is the depository of part of these counsels. Let us apply the proper instrument to this examination. Let us never conceive it to be a work of speculation or fancy. It is a pure work of grammatical analysis. It is an unmixt question of language. The commentator who opens this book with the one hand, and carries *his system* in the other, has nothing to do with it. We admit of no other instrument than the vocabulary and the lexicon. The man whom we look to is the Scripture critic, who can appeal to his authorities for the import and significance of phrases, and, whatever be the strict result of his patient and profound philology, we submit to it. We call upon every enlightened disciple of lord Bacon to approve the steps of this process, and to acknowledge that the same habits of philosophising to which science is indebted for all her elevation in these latter days, will lead us to cast down all our lofty imaginations, and bring into captivity every thought to the obedience of Christ.

SCRIVENER, *n. s.* Fr. *escrivain*; Lat. *scri-vano*. One who draws contracts among brokers.

We'll pass the business privately and well ;
Send for your daughter by your servant here,
My boy shall fetch the scrivener.

Shakspeare. Taming of the Shrew.

Yet certain though it be, it hath flaws ; for that
the *scriveners* and brokers do value unsound men to
serve their own turn.

Bacon's Essays.

How happy in his low degree,
Who leads a quiet country life,
And from the griping scrivener free !

Dryden's Horace.

I am reduced to beg and borrow from *scriveners*
and usurers, that suck the heart and blood.

Arbuthnot's History of John Bull.

A SCRIVENER, if entrusted with a bond, may receive the interest : and, if he fails, the obligee shall bear the loss : and so it is if he receive the principal and deliver up the bond ; for, being entrusted with the security itself, it must be presumed that he is trusted with power to receive interest or principal ; and the giving up the bond on payment of the money shall be a discharge thereof. But, if a scrivener shall be entrusted with a mortgage-deed, he hath only authority to receive the interest, not the principal, and the giving up the deed in this case is not sufficient to restore the estate, but there must be a reconveyance, &c. It is held, where a scrivener puts out his client's money on a bad security, which upon enquiry might have been easily found so, yet he cannot in equity be charged to answer for the money ; for it is here said, no one would venture to put out money of another upon a security, if he were obliged to warrant and make it good in case a loss should happen, without any fraud in him.

SCRIVERIUS (Peter), a learned Dutch author, born at Haerlem, in 1590. He wrote 1. *Batavia Illustrata* ; 2. *Notes upon Aquilius's Chronicum Geldricum* ; 3. *Some other works upon the Antiquities of the United Provinces*. He also corrected a copy of Vegetius ; and died in 1653, aged sixty-three.

SCROFANELLO, in ichthyology, a name which some have given to a small fish of the Mediterranean more usually known by the name of *scorpena*.

SCROFULA, *n. s.* } Lat. *scrofa*, a sow, as
SCROFULOUS, *adj.* } Gr. *χοιρας*. A deprava-
tion of the humors of the body, which breaks
out in sores ; commonly called the king's evil :
the adjective corresponds.

Scrofulous persons can never be duly nourished ;
for such as have tumours in the parotides often have
them in the pancreas and mesentery.

Arbuthnot on Aliments.

English consumptions generally proceed from a
scrofulous disposition.

Arbuthnot.

If matter in the milk dispose to coagulation, it
produces a *scrofula*.

Wiseman of Tumours.

What would become of the race of men in the
next age, if we had nothing to trust to, beside the
scrofulous consumptive production furnished by our
men of wit and pleasure ?

Swift.

SCROFULA. See **MEDICINE**.

SCROLL, *n. s.* By Minshew supposed to be
corrupted from roll ; by Skinner from an *escroulle*
given by the heralds ; whence parchment,

VOL. XIX.

wrapped up in a similar form, has the same
name. A writing wrapped up.

His chamber all was hanged about with rolls,
And old records from ancient times deriv'd ;
Some made in books, some in long parchment *scrolls*,
That were all worm-eaten, and full of canker-holes.

Spenser.

A Numidian priest, bellowing out certain super-
stitious charms, cast divers *scrolls* of paper on each
side the way, wherein he cursed and banned the
Christians.

Knolles.

We'll add a royal number to the dead,
Gracing the *scroll* that tells of this war's loss,
With slaughter coupled to the name of kings.

Shakspeare.

Here is the *scroll* of every man's name, which is
thought fit through all Athens to play in our inter-
lude.

Id.

He drew forth a *scroll* of parchment, and delivered
it to our foremost man.

Bacon.

Such follow him as shall be registered ;
Part good, part bad : of bad the longer *scroll*.

Milton.

With this epistolary *scroll*,

Receive the partner of my inmost soul.

Prior.

SCROON, a lake of the state of New York,
United States. Twelve miles west of George
Lake, eight miles long, and one broad.

SCROON, a river of the United States, in New
York, the north-east branch of the Hudson. It
runs from Scroon Lake into the Hudson, and has
several falls.

SCROPIHULA. See **MEDICINE**.

SCROPIHULARIA, figwort, in botany, a
genus of the angiospermia order, and didynamia
class of plants ; natural order fortieth, per-
sonatæ : CAL. quinquefid : COR. almost globose,
and resupinated : CAPS. biloculated. There are
several species, of which the most remarkable
are these :—

1. *S. aquatica*, water figwort or betony. The
root is fibrous ; stem erect, square, about four
feet high. The leaves are opposite, elliptical,
pointed, slightly scalloped, on decurrent foot-
stalks. Flowers purple, in loose naked spikes.
It grows on the sides of rivulets and other wet
places, and has a fetid smell. The leaves are
used in medicine as a corrector of senna.

2. *S. nodosa*, or the common figwort, which
grows in woods and hedges. The root is tu-
brous ; the stalks are four or five feet high, and
branched towards the top ; the leaves are heart
shaped, serrated, and acute. The flowers are of
a dark red color, shaped like a cap or helmet ;
the lower lip greenish : they grow in loose
dichotomous spikes or racemi at the top of the
branches. The leaves have a fetid smell and
bitter taste. An ointment made of the root was
formerly used to cure scrofulous sores, but is
at present out of practice.

3. *S. scorodonia*, or balm-leaved figwort. The
stem is erect, square, about two feet high. The
leaves are opposite, doubly serrated. The
flowers are dusky purple, in composite bunches.
It grows on the banks of rivulets, &c., in Corn-
wall.

4. *S. vernalis*, or yellow figwort. The stalks
are square, hairy, brown, about two feet high.
The leaves are heart-shaped, roundish, hairy, in-
dentated, opposite. The flowers are yellow, on

single forked foot-stalks from the axæ of the leaves. It grows in hedges in Surry.

SCROYLE, *n. s.* Fr. *escrouelle*. A scrofulous swelling; a mean fellow; a rascal; a scabby wretch.

The *scroyles* of Angiers flout you kings,
And stand securely on their battlements,
As in a theatre. *Shakspeare. King John.*

SCRUB, *v. a. & n. s.* } Belgic *schrobben*;
SCRUBBED, } Swed. *skrubba*. To
SCRUBBY, *adj.* } rub hard with some-
thing coarse: a mean fellow; any thing mean:
the adjective corresponding.

I gave it to a youth,
A kind of boy, a little *scrubbed* boy,
No higher than thyself.

Shakspeare. Merchant of Venice.
Such wrinkles as a skillful hand would draw
For an old grandam ape, when with a grace
She sits at squat, and *scrubs* her leathern face.

Dryden.
She never would lay aside the use of brooms and
scrubbing brushes. *Arbutnot.*

Now Moll had whirled her mop with dexterous
airs,

Prepar'd to *scrub* the entry and the stairs. *Swift.*
With a dozen large vessels my vault shall be
stor'd;

No little *scrub* joint shall come on my board. *Id.*
The scene a wood, produced no more
Than a few *scrubby* trees before. *Id.*

SCRUB, one of the smaller Virgin Islands of
the West Indies, to the east of the north extre-
mity of Tortola, on which it depends. Long.
62° 57' E., lat. 18° 25' N.

SCRUPLE, *n. s. & v. n.* } French *scrup-*
SCRUPULOSITY, } *pule*; Lat. *scrupu-*
SCRUPULOUS, *adj.* } *lus*. Doubt; diffi-
SCRUPULOUSLY, *adv.* } culty of determina-
SCRUPULOUSNESS, *n. s.* } tion; perplexity:
the third part of a dram; any small quantity:
scrupulosity also means doubt, state of, or dispo-
sition to doubt; minute exactitude: the other
derivatives follow this sense.

The one sort they warned to take heed, that *scrupulosity* did not make them rigorous in giving unadvised sentence against their brethren which were free; the other, that they did not become scandalous by abusing their liberty and freedom, to the offence of their weak brethren, which were *scrupulous*.

Hooker.

Macduff, this noble passion,
Child of integrity, hath from my soul
Wiped the black *scruples*, reconciled my thoughts
To your good truth. *Shakspeare. Macbeth.*

Equality of two domestic powers
Breeds *scrupulous* faction. *Id. Antony and Cleopatra.*

Nothing did more fill foreign nations with admiration of his succession, than the consent of all estates of England for the receiving of the king without the least *scruple*, pause, or question. *Bacon.*

Milk, one ounce, oil of vitriol a *scruple*, doth coagulate the milk. *Id.*

As the cause of a war ought to be just, so the justice of that cause ought to be evident; not obscure nor *scrupulous*. *Id.*

The first sacrilege is looked on with horror: but, when they have made the breach, their *scrupulosity* soon retires. *Decay of Piety.*

For the matter of your confession, let it be severe and serious; but yet so as it may be without any inordinate anxiety, and unnecessary *scruples*, which only entangle the soul. *Taylor.*

He *scrupled* not to eat

Against his better knowledge; not deceived,
But fondly overcome with female charms.

Milton's Paradise Lost.

The *scruples* which many public ministers would make of the worthiness of parents to have their children baptized, forced such questioned parents, who did not believe the necessity of having their children baptized by such *scruplers*, to carry their children unto other ministers. *Graunt's Bills of Mortality.*

Men make no *scruple* to conclude that those propositions, of whose knowledge they can find in themselves no original, were certainly the impress of God and nature upon their minds, and not taught them by any one else. *Locke.*

Some birds, inhabitants of the waters, whose blood is cold as fishes, and their flesh is so like in taste, that the *scrupulous* are allowed them on fish days. *Id.*

No careful, even to *scrupulosity*, were they to keep their sabbath, that they must not have a time to prepare them for that, but a further time also to prepare them for their very preparations. *South.*

Henry V. manifestly derived his courage from his piety, and was *scrupulously* careful not to ascribe the success of it to himself. *Addison's Freeholder.*

I have been the more *scrupulous* and wary, in regard the inferences from these observations are of importance. *Woodward.*

Dubius is such a *scrupulous* good man,
Yes—you may catch him tripping, if you can,
He would not, with a peremptory tone,
Assert the nose upon his face his own. *Cowper.*

SCRUPLE, among goldsmiths, twenty-four grains.

SCRUPLE, in Chaldean chronology, is $\frac{1}{60}$ part of an hour, called by the Hebrews *helakin*. These scruples are much used by Arabs and other eastern nations, in computation of time.

SCRUPULUM, or **SCRUPULUS**, Latin, a scruple; the least of the weights used by the ancients, which, among the Romans, was the twenty-fourth part of an ounce, or the third part of a dram.

SCRUTABLE, *adj.* } Lat. *scrutor*. Disco-
SCRUTATOR, *n. s.* } verable by enquiry; an
enquirer or searcher.

Shall we think God so *scrutable*, or ourselves so penetrating, that none of his secrets can escape us?

Decay of Piety.

In process of time, from being a simple *scrutator*, an archdeacon became to have jurisdiction more amply. *Ayliffe.*

SCRUTINY, *n. s.* } Lat. *scrutinium*. En-
SCRUTINISE, *v. a.* } quiry; search; examina-
SCRUTINIOUS, *adj.* } tion with nicety: to
search; examine: captious; careful.

In the *scrutinies* for righteousness and judgment, when it is inquired whether such a person be a good man or no, the meaning is not, what does he believe or hope, but what he loves.

Taylor's Rule of Holy Living.

Age is froward, uneasy, *scrutinious*,
Hard to be pleased, and parsimonious. *Deuham.*

Their difference to measure, and to reach,
Reason well rectified must nature teach:
And these high *scrutinies* are subjects fit
For man's all-searching and enquiring wit. *Id.*

I thought thee worth my nearer view
And narrower *scrutiny*, that I might learn
In what degree or meaning thou art called
The Son of God. *Milton's Paradise Regained*

They that have designed exactness and deep *scrutiny*, have taken some one part of nature. *Hale.*

We are admonished of want of charity towards others, and want of a christian *scrutiny* and examination into ourselves. *L'Estrange.*

These, coming not within the *scrutiny* of human senses, cannot be examined by them, or attested by any body. *Locke.*

The compromissarii should chuse according to the votes of those whose votes they were obliged to *scrutinize*. *Ayliffe.*

When any argument of great importance is managed with that warmth which a serious conviction of it generally inspires, somewhat may easily escape, even from a wary pen, which will not bear the test of a severe *scrutiny*. *Atterbury.*

SCRUTINY (*scrutinium*), in the early ages of the church an examination or probation practised in the last week of Lent, on the catechumens, who were to receive baptism on the Easter-day. The scrutiny was performed with a great many ceremonies. Exorcisms and prayers were made over the heads of the catechumens; and, on Palm Sunday, the Lord's Prayer and Creed were given them, which they were afterwards made to rehearse. This custom was more in use in the church of Rome than any where else: though it appears by some missals, to have been likewise used, though much later, in the Gallican church. It is supposed to have ceased about A. D. 860.

SCRUTINY is also used, in the canon law, for a ticket, or little paper billet, wherein at elections the electors write their votes privately, so as it may be known for whom they vote. Among us the term scrutiny is chiefly used for a strict perusal and examination of the several votes hastily taken at an election; in order to find out any irregularities committed therein, by unqualified voters, &c.

SCRUTOIRE, *n. s.* Fr. *scritoire*, or *escritoire*. A case of drawers for writings.

I locked up these papers in my *scrutoire*, and my *scrutoire* came to be unlocked. *Prior.*

SCRUZE, *v. a.* Perhaps from screw. This word, says Johnson, though now disused by writers, is still preserved, in its corruption, to serouge, in the London jargon. To squeeze; compress.

Though up he caught him 'twixt his puissant hands,

And having *scrused* out of his carrion corse

The loathful life, now loosed from sinful bands,
Upon his shoulders carried him. *Faerie Queene.*

SCUD, *v. n.* Ital. *scultire*; Swed. *skutta*; Isl. *skictur*, swift; Goth. *skiota*. To fly; run away with precipitation.

The frighted satyrs, that in woods delight,
Now into plains with pricked-up ears take flight;
And *scudding* thence, while they their horn-feet ply,
About their sires the little sylvans cry. *Dryden.*

The vote was no sooner passed, but away they *scudded* to the next lake. *L'Estrange.*

Away the frighted spectre *scuds*,

And leaves ny lady in the suds. *Swift.*

SCUDDING, the movement by which a ship is carried precipitately before a tempest. As a ship flies with amazing rapidity through the water whenever this expedient is put in practice, it is never attempted in a contrary wind, unless when her condition renders her incapable of sustaining

the mutual efforts of the wind and waves any longer on her side. A ship either *scuds* with a sail extended on her fore-mast, or, if the storm is excessive, without any sail; which, in the sea-phrase, is called *scudding* under bare poles. In sloops and schooners, and other small vessels, the sail employed for this purpose is called the square sail. In large ships it is either the fore-sail at large reefed, or with its goose-wings extended, according to the degree of the tempest; or it is the fore-top-sail, close reefed, and lowered on the cap; which last is particularly used when the sea runs so high as to become the foresail occasionally, a circumstance which exposes the ship to the danger of *broaching-to*. The principal hazards incident to *scudding* are generally, a *pooping* sea; the difficulty of steering, which exposes the vessel perpetually to the risk of *broaching-to*; and the want of sufficient sea-room. A sea striking the snip violently on the stern may dash it inwards, by which she must inevitably founder. In *broaching-to* (that is, inclining suddenly to windward) she is threatened with being immediately overturned; and, for want of sea-room, she is endangered by shipwreck on a lee-shore, a circumstance, alas, of too frequent occurrence to require explanation.

SCUDERY (George), de, an eminent French writer, descended of an ancient and noble family in Provence, and born at Havre de Grace in 1603. He was educated at Apt, and afterwards settled at Paris. In 1638 he published *Observations on the Cid* of Corneil. He afterwards wrote several dramatic pieces, poems of various kinds, and some tracts in prose. He was appointed governor of the castle of Notre Dame de la Garde, near Marseilles; and, in 1650, was admitted a member of the Royal Academy. He died at Paris 1667.

SCUDERY (Magdalene), de, sister of George, was born at Havre de Grace, in 1607, and became eminent for her writings. She went early to Paris, and soon became a very voluminous writer; and published many romances which sold rapidly. Her abilities were reckoned superior to her brother's; the celebrated Academy of the Ricovrati at Padua admitted her an honorary member, and she succeeded the learned Helena Cornaro. She also received the first prize for eloquence given by the academy. She received many valuable presents from several great personages. She died in 1701, aged ninety-four, and two churches contended fiercely for the honor of receiving her remains; and it required no less authority than that of cardinal de Noailles to decide the dispute.

SCUFFLE, *n. s.* & *v. n.* Derived by Skinner from shuffle. But there is a Swed. *skuffa*, and Goth. *skinfa*. A confused quarrel; tumultuous broil; to fight in confusion.

His captain's heart,
In the *scuffle* of great fights, hath burst
The buckles on his breast.

Shakspeare. Antony and Cleopatra.

Avowed atheists, placing themselves in the seat of the scorner, take much pleasing diversion, by deriding our eager *scuffles* about that which they think nothing.

Deccau of Piety.

I must confess I've seen in former days
The best knights in the world, and *scuffled* in some
frays. *Drayton.*

A gallant man would rather fight to great disadvantages in the field, in an orderly way, than *scuffle* with an undisciplined rabble. *King Charles.*

The dog leaps upon the serpent, and tears it to pieces; but in the *scuffle* the cradle happened to be overturned. *L'Estrange.*

Popish missionaries mix themselves in these dark *scuffles*, and animate the mob to such outrages and insults. *Addison.*

SCULK, *v. n.* Dan. *sculcke*; Swed. *skulka*; Goth. *skiula*. To lurk in hiding-places; lie close.

Fearing to be seen, within a bed
Of colworts he concealed his wily head;
There *sculked* till afternoon, and watched his time. *Drayton.*

It has struck on a sudden into such a reputation, at it scorns any longer to *sculk*, but owns itself publicly. *Government of the Tongue.*

My prophets and my sophists finished here

Their civil efforts of the verbal war:
Not so my rabbins and logicians yield;
Retiring still they combat; from the field
Of open arms unwilling they depart,
And *sculk* behind the subterfuge of art. *Prior.*

No news of Phyl! the bridegroom came,
And thought his bride had *sculked* for shame;
Because her father used to say,
The girl had such a bashful way. *Swift.*

SCULL, *n. s.* Sax. *scpul*. Derived by Skinner from shell, and in some provinces called shull. Mr. Lye observes more satisfactorily that skola is in Islandic the skull of an animal.—Johnson. It is clearly derived from Goth. *skol*,

skal. The bone which incases and defends the brain.

Fractures of the *scull* are at all times very dangerous, as the brain becomes affected from the pressure. *Sharp.*

SCULL, *n. s.* Sax. *ƿceole*, an assembly. In Milton's style, a shoal or vast multitude of fish.

Each bay
With fry innumerable swarm, and shoals
Of fish, that with their fins and shining scales
Glide under the green wave, in *sculls* that oft
Bank the mid sea. *Milton.*

Like catiff vile, that for misdeed
Rides with his face to rump of steed;
Or rowing *scull*, he's fain to love,
Look one way and another move. *Hudibras.*

Her soul already was consigned to fate,
And shivering in the leaky *sculler* sate. *Dryden.*
They hire the *sculler*, and, when once abroad,
Grow sick, and damn the climate like a lord. *Pope.*

SCULL/CAP, *n. s.* Scull and cap. A head-piece; nightcap.

SCULL'ERY, *n. s.* Fr. *escueille*, a dish; Isl. *skiolo*, a vessel. The place where common utensils, as kettles or dishes, are cleaned and kept.

I must, like a whore, unpack my heart with words
And fall a-cursing like a very drab,
A *scullion*, fye upon 't! foh! about my brain.

Shakespeare. Hamlet.
Pyreicus was famous for counterfeiting base things, as pitchers, a *scullery*, and setting rogues together by the ears. *Peucham.*

If the gentleman hath lain there, get the cook, the stable-men, and the *scullion*, to stand in his way. *Swift.*

SCULPTURE.

SCULP, *v. a.* } Fr. *sculper*; Lat. *sculpo*. To carve;
SCULPTILE, *adj.* } engrave: sculptile
SCULPTOR, *n. s.* } is made by carving.

SCULPTURE, *n. s. & v. a.* }
Words not in use. A sculptor is a carver of wood or stone into images, busts, &c.: sculpture, his art, see below: the verb corresponds in meaning.

O that the tenor of my just complaint
Were *sculpt* with steel on rocks of adamant!

In a silver medal is upon one side Moses horned, and on the reverse the commandment against *sculptile* images. *Sandys.*

Nor did there want
Cornice or freeze with bossy *sculpture* graven. *Browne.*

There too, in living *sculpture*, might be seen
The mad affection of the Cretan queen. *Milton.*

Thy shape's in every part
So clean, as might instruct the *sculptor's* art. *Dryden.*
The Latin poets give the epithets of trifidum and trisulcum to the thunderbolt, from the *sculptors* and painters that lived before them, that had given it three forks. *Id.*

Then *sculpture* and her sister arts revive,
Stones leaped to form and rocks began to live. *Addison.*

Gold, silver, ivory vases *sculptured* high,
There are who have not. *Pope.*

HISTORY OF SCULPTURE.

SCULPTURE is an art of remote antiquity, being practised, as there is reason to believe, before the general deluge. We are induced to assign to it this early origin, by considering the expedients by which, in the first stages of society, men have every where supplied the place of alphabetical characters. These, it is universally known, have been picture writing, such as that of the Mexicans, which, in the progress of refinement and knowledge, was gradually improved into the hieroglyphics of the Egyptians and other ancient nations. See *HEROGLYPHICS*.

That mankind should have lived nearly 1700 years, from the creation of the world to the flood of Noah, without falling upon any method to make their conceptions permanent, or to communicate them to a distance, is extremely improbable: especially when we consider that such methods of writing have been found, in modern times, among people much less enlightened than those must have been, who were capable of building such a vessel as the ark. But, if the antediluvians were acquainted with any kind of writing, there can be little doubt of its having been hieroglyphical. Bryant has proved that the Chaldeans were possessed of that art before the Egyptians; and Berosus (Apud. Svnellum, p

37), informs us, that a delineation of all the monstrous forms which inhabited the chaos, when this earth was in that state, was to be seen in the temple of Belus in Babylon. This delineation, as he describes it, must have been a history in hieroglyphical characters; for it consisted of human figures with wings, with two heads, and some with the horns and legs of goats. This is exactly similar to the hieroglyphical writings of the Egyptians; and it was preserved, our author says, both in drawings and engravings in the temple of the god of Babylon. As Chaldea was the first peopled region of the earth after the flood, and as it appears from Pliny, as well as from Berosus, that the art of engraving upon bricks baked in the sun was there carried to a considerable degree of perfection at a very early period, the probability certainly is that the Chaldeans derived the art of hieroglyphical writing, and consequently the rudiments of the art of sculpture, from their antediluvian ancestors.

It is generally thought that sculpture had its origin from idolatry, as it was found necessary to place before the people the images of their gods to enliven the fervor of their devotion; but this is probably a mistake. The worship of the heavenly bodies, as the only gods of the heathen nations, prevailed so long before the deification of dead men was thought of (see POLYTHEISM) that we cannot suppose mankind to have been, during all that time, ignorant of the art of hieroglyphical writing. But the deification of departed heroes undoubtedly gave rise to the almost universal practice of representing the gods by images of a human form; and therefore we must conclude that the elements of sculpture were known before that art was employed to enliven the devotion of idolatrous worshippers. The pyramids and obelisks of Egypt, which were probably temples, or other altars, dedicated to the sun (see PYRAMID), were covered from top to bottom with hieroglyphical emblems of men, beasts, birds, fishes, and reptiles, at a period prior to that in which there is any unexceptionable evidence that mere statue worship prevailed even in that nursery of idolatry. Thus it appears evident that picture-writing was the first employment of the sculptor; and that idolatrous worship contributed to carry his art to that perfection which it attained in some of the nations of antiquity. Even in the dark ages of Europe, when the other fine arts were almost extinguished, the mummeries of the church of Rome, and the veneration which she taught for saints and martyrs, preserved among the Italians some vestiges of the sister arts of sculpture and printing; and therefore it is reasonable to believe that a similar veneration for heroes and demigods would, among the ancient nations have a similar effect. The presumption therefore is, that the Chaldeans were the first who invented the art of hewing blocks of wood and stone into the figures of men and other animals; for the Chaldeans were unquestionably the first idolaters, and their early progress in sculpture is confirmed by the united testimonies of Berosus, Alexander Polyhistor, Apollodorus, and Pliny; not to mention the eastern tradition that Terah the father of Abraham was a statuary.

Against this conclusion Bromley, in his History of the Fine Arts, has urged some plausible objections. In stating these he professes not to be original, or derive his information from the fountain head of antiquity. He adopts, he says, the theory of a French writer, who maintains that in the year of the world 1949, about 300 years after the Deluge, the Scythians under Brouma, a descendant of Magog the son of Japhet, extended their conquests over the greater part of Asia. According to this System, Brouma was not only the civiliser of India, and the author of the braminical doctrines, but also diffused the principles of the Scythian mythology over Egypt, Phœnicia, Greece, and the continent of Asia.

Of these principles Mr. Bromley has given us no distinct enumeration: the account which he gives of them is not to be found in one place, but to be collected from a variety of distant passages. In attempting, therefore, to present the substance of his scattered hints in one view, we will not be confident that we have omitted none of them. The ox, says he, was the Scythian emblem of the generator of animal life, and hence it became the principal divinity of the Arabians. The serpent was the symbol of the source of intelligent nature. These were the common points of union in all the first religions of the earth. From Egypt the Israelites carried with them a religious veneration for the ox and the serpent. Their veneration for the ox appeared soon after they marched into the wilderness, when, in the absence of Moses, they called upon Aaron to make them gods which should go before them. The idea of having an idol to go before them, says our author, was completely Scythian; for so the Scythians acted in all their progress through Asia, with this difference, that their idol was a living animal. The Israelites having gained their favorite god, which was an ox (not a calf, as it is rendered in the book of Exodus), next proceeded to hold a festival, which was to be accompanied with dancing; a species of gaiety common in the festivals which were held in adoration of the emblematic Urotal, or ox, in that very part of Arabia near Mount Sinai where this event took place. It is mentioned too, as a curious and important fact, that the ox, which was revered in Arabia was called Adonai. Accordingly Aaron, announcing the feast of the ox or golden calf, speaks thus, to-morrow is a feast to Adonai, which is in our translation rendered to the Lord. In the time of Jeroboam we read of the golden calves set up as objects of worship at Bethel and Dan. Nor was the reverence paid to the ox confined to Scythia, to Egypt, and to Asia; it extended much farther. The ancient Cimbri, as the Scythians did, carried an ox of bronze before them on all their expeditions. Mr. Bromley also informs us that as great respect was paid to the living ox among the Greeks as was offered to its symbol among other nations.

The emblem of the serpent, continues Mr. Bromley was marked yet more decidedly by the express direction of the Almighty. That animal had ever been considered as emblematic of the supreme generating power of intelligent life; nor was that idea, says he, discouraged so far as

it went to be a sign or symbol of life, when God said to Moses, 'Make thee a brazen serpent, and set it upon a pole, and it shall come to pass that every one who is bitten, when he looketh upon it, shall live.' The serpent made a distinguished figure in Grecian sculpture. The fable of Lelidna, the mother of the Scythians, gave her figure terminating as a serpent, to all the foundlers of states in Greece; from which their earliest sculptors represented in that form the Titan princes, Cecrops, Draco, and Erichthonius. Besides the spear of the image of Minerva, which Phidias made for the citadel of Athens, he placed a serpent, which was supposed to guard that goddess. The serpent was combined with many other figures. It sometimes, was coiled round an egg as an emblem of the creation; sometimes round a trident to show its power over the sea; sometimes it encircled a flambeau, to represent life and death.

In Egypt, as well as in Scythia and India, the divinity was represented on the leaves of the tamara lotus. Their sphinxes, and all their combined figures of animal creation, took their origin from the mother of the Scythians, who brought forth an offspring that was half a woman and half a serpent. Their pyramids and obelisks arose from the idea of flame; the first emblems of the supreme principle, introduced by the Scythians, and which even the influence of Zoroaster and the Magi could not remove.

The Bacchus of the Greeks is derived from the Brouma of the Indians; both are represented as seated on a swan swimming over the waves, to indicate that each was the god of humid nature, not the god of wine, but the god of waters. The mitre of Bacchus was shaped like half an egg; an emblem taken from this circumstance, that at the creation the egg, from which all things sprung, was divided in the middle. Pan also was revered among the Scythians; and from that people were derived all the emblems by which the Greeks represented this divinity.

It would be tedious to follow our author through the whole of this subject; and, were we to submit to that labor, we should still view his system with suspicion. It is drawn, he says, from the work of M. D'Ancarville, entitled *Recherches sur l'Origine, l'Esprit, et les Progrès, des Arts de la Grèce*.

To form conclusions concerning the origin of nations, the rise and progress of the arts and sciences, without the aid of historical evidence, by analogies which are sometimes accidental, and often fanciful, is a mode of reasoning which cannot be admitted. There may, indeed, be resemblances in the religion, language, manners, and customs of different nations, so striking and so numerous, that to doubt of their being descended from the same stock would savor of scepticism. But historical theories must not be adopted rashly. We must be certain that the evidence is credible and satisfactory before we proceed to deduce any conclusions. We must first know whether the Scythian history itself be authentic, before we make any comparison with the history of other nations. But what is called the Scythian history, every man of learning knows to be a collection of fables. Herodotus and Justin

are the two ancient writers from whom we have the fullest accounts of that warlike nation; but these two historians contradict each other, and both write what cannot be believed of the same people at the same period of their progress. Justin tells us that there was a long and violent contest between the Scythians and Egyptians about the antiquity of their respective nations; and after stating the arguments on each side of the question, which, as he gives them (lib. ii. c. 1.), are nothing to the purpose, he decides in favor of the claim of the Scythians. Herodotus was too partial to the Egyptians not to give them the palm of antiquity; and he was in the right, for Justin describes this most ancient of nations, even in the time of Darius Hystaspis, as ignorant of all the arts of civil life. 'They occupied their land in common,' says he, 'and cultivated none of it. They had no houses nor settled habitations, but wandered with their cattle from desert to desert. In these rambles they carried their wives and children in tumbrils covered with the skins of beasts, which served as houses to protect them from the storms of winter. They were without laws, but governed by the dictates of natural equity. They coveted not gold or silver like the rest of mankind, and lived upon milk and honey. Though they were exposed to extreme cold, and had abundance of flocks, they knew not how to make garments of wool, but clothed themselves in the skins of wild beasts.' This is the most favorable account which an ancient writer gives of the Scythians. By Strabo and Herodotus they are represented as the most savage of mortals, delighting in war and bloodshed, cutting the throats of all strangers who came among them, eating their flesh, and making cups and pots of their skulls. Is it conceivable that such savages could be sculptors; or that, even supposing their manners to have been such as Justin represents them, a people so simple and ignorant could have imposed their mythology upon the Chaldeans, Phœnicians, and Egyptians, whom we know by the most incontrovertible evidence to have been great and polished nations so early as in the days of Abraham? No! We could as soon admit other novelties, with which the French of the present age pretend to enlighten the world, as this origin assigned by Mr. Bromley to the art of sculpture.

The inference of our author from the name of the sacred ox in Arabia, and from the dancing and gaiety in the religious festivals of the Arabians, appears to be very hastily drawn. At the early period of the departure of the Israelites from Egypt, the language of the Hebrews, Egyptians, and Arabians, differed not more from each other than the different dialects of the Greek tongue which are found in the poems of Homer; and, for many years after the formation of the golden calf, the Hebrews were strangers to every species of idolatry but that which they had brought with them from their house of bondage. See REMPHAN. Taking it for granted, therefore, that the Scythians did not impose their mythology upon the eastern nations, and that the art of sculpture, as well as hieroglyphic writing and idolatrous worship, prevailed first among the Chaldeans, we shall trace the progress of this

art through some other nations of antiquity till we bring it to Greece, where it was carried to the highest perfection to which it has yet attained.

The first intimation that we have of the art of sculpture is in the book of Genesis, where we are informed that when Jacob, by his divine command, was returning to Canaan, his wife Rachel carried along with her the teraphim or idols of her father. These we are assured were small, since Rachel found it so easy to conceal them from her father, notwithstanding his anxious search. We are ignorant, however, how these images were made, or of what materials they were composed. The first person mentioned as an artist of eminence is Bezaleel, who formed the cherubim which covered the mercy-seat.

SECT. I.—OF THE ANCIENT EGYPTIAN SCULPTURE.

The Egyptians early cultivated the art of sculpture; but there were two circumstances that obstructed its progress. 1. The persons of the Egyptians were not possessed of the graces of form, elegance, or symmetry; and of consequence they had no perfect standard to model their taste. They resembled the Chinese in the cast of their face, in their great bellies, and in the clumsy rounding of their contours. 2. They were restrained by their laws to the principles and practices of their ancestors, and were not permitted to introduce any innovations. Their statues were always formed in the same stiff attitude, with the arms hanging perpendicularly down their sides. What perfection were they capable of who knew no other attitude than that of chairmen? So far were they from attempting any improvements, that in the time of Adrian the art continued in the same rude state as at first; and, when their slavish adoration of that emperor induced them to place the statue of his favorite Antinous among the objects of their worship, the same inanimate stiffness in the attitude of the body and position of the arms was observed. This Egyptian statue, therefore, was different from the celebrated statue of Antinous, of which so many moulds have been taken that imitations of it are now to be met with almost in every cabinet in Europe.

Notwithstanding the attachment of the Egyptians to ancient usages, Winkelman thinks he has discovered two different styles of sculpture which prevailed at different periods. The first of these ends with the conquest of Egypt by Cambyzes. The second begins at that time, and extends beyond the reign of Alexander the Great. In the first style, the lines which form the contour are straight, and projecting a little: the position is stiff and unnatural: in sitting figures the legs are parallel, the feet squeezed together, and the arms fixed to the sides; but in the figures of women the left arm is folded across the breast; the bones and muscles are faintly discernible; the eyes are flat and looking obliquely, and the eyebrows sunk; features which destroy entirely the beauty of the head; the cheek-bones are high, the chin small and piked; the ears are generally placed higher than in nature, and the feet are too large and flat. In short, if we are to look for

any model in the statues of Egypt, it is not for the model of beauty, but of deformity. The statues of men are naked, only they have a short apron, and a few folds of drapery surrounding their waist: the vestments of women are only distinguishable by the border, which rises a little above the surface of the statue. In this age it is evident the Egyptians knew little of drapery.

Of the second style of sculpture practised among the Egyptians, Winkelman thinks he has found specimens in the two figures of basaltes in the capitol, and in another figure at Villa Albani, the head of which has been renewed. The two first of these, he remarks, bear visible traces of the former style, which appear especially in the form of the mouth and shortness of the chin. The hands possess more elegance; and the feet are placed at a greater distance from one another. In the first and third figures the arms hang down close to the sides. In the second they hang more freely. Winkelman suspects that these three statues have been made after the conquest of Egypt by the Greeks. They are clothed with a tunic, a robe, and a mantle. Their tunic, which is puckered into many folds, descends from the neck to the ground. The robe in the first and third statues seems close to the body, and is only perceptible by some little folds. It is tied under the breast, and covered by the mantle, the two buttons of which are placed under the epaulet.

The Antinous of the capitol is composed of two pieces, which are joined under the haunches. But, as all the Egyptian statues which now remain have been hewn out of one block, we must believe that Diodorus, in saying the stone was divided, and each half finished by a separate artisan, spoke only of a colossus. He tells us that the Egyptians divided the human body into twenty-four parts and three-quarters: but it is to be regretted that he has not given a more minute detail of that division. The Egyptian statues were formed by the chisel, and polished with great care. Even those on the summit of an obelisk, which could only be viewed at a distance, were finished with as much labor as if they had admitted a close inspection. As they are generally executed in granite or basaltes, stones of a very hard texture, it is impossible not to admire the indefatigable patience of the artists.

The eye was often of different materials from the rest of the statue; sometimes it was composed of a precious stone or metal. We are assured that the valuable diamond of the empress of Russia, the largest and most beautiful hitherto known, formed one of the eyes of the famous statue of Scheringham in the temple of Brama. Those Egyptian statues which still remain are composed of wood or baked earth; and the statues of earth are covered with green enamel.

SECT. II.—OF THE PHENICIAN SCULPTURE.

The Phenicians possessed both a character and situation highly favorable to the cultivation of statuary. They had beautiful models in their own persons, and their industrious character qualified them to attain perfection in every art

for which they had a taste. Their situation raised a spirit of commerce, and commerce induced them to cultivate the arts. The temples shone with statues and columns of gold, and a profusion of emeralds was every where scattered. All the great works of the Phœnicians have been unfortunately destroyed; but many of the Carthaginian medals are still preserved, ten of which are deposited in the cabinet of the king of Etruria. But, though the Carthaginians were a colony of Phœnicians, we cannot from their works judge of the merit of their ancestors.

The Persians made no distinguished figure in the arts of design. They were indeed sensible to the charms of beauty, but they did not study to imitate them. Their dress, which consisted of long flowing robes, concealing the whole person, prevented them from attending to the beauties of form. Their religion, too, which taught them to worship the divinity in the emblem of fire, and that it was impious to represent him under a human form, seemed almost to prohibit the exercise of this art, by taking away those motives which alone could give it dignity and value; and, as it was not customary among them to raise statues to great men, it was impossible that statuary could flourish in Persia.

SECT. III.—OF THE ANCIENT ETRURIAN SCULPTURE.

The Etrurians, or ancient Tuscans, in the opinion of Winkelman, carried this art to some degree of perfection at an earlier period than the Greeks. It is said to have been introduced before the siege of Troy by Dædalus, who, to escape the resentment of Minos king of Crete, took refuge in Sicily, whence he passed into Italy, where he left many monuments of his art. Pausanias and Diodorus Siculus inform us that some works ascribed to him were to be seen when they wrote, and that these possessed that character of majesty which distinguished the labors of Etruria.

A character strongly marked forms the chief distinction in those productions of Etruria which have descended to us. Their style was indeed harsh and overcharged; a fault also committed by Michael Angelo the celebrated painter of modern Etruria; for it is not to be supposed that a people of such rude manners as the ancient Etrurians could communicate to their works that vividness and beauty which the elegance of Grecian manners inspired. On the other hand, there are many of the Tuscan statues which bear so close a resemblance to those of Greece, that antiquarians have thought it probable that they were conveyed from that country or Magna Græcia into Etruria about the time of the Roman conquest, when Italy was adorned with the spoils of Greece.

Among the monuments of Etrurian art two different styles have been observed. In the first the lines are straight, the attitude stiff, and no idea of beauty appears in the formation of the head. The contour is not well rounded, and the figure is too slender. The head is oval, the chin piked, the eyes flat, and looking asquint. These are the defects of an art in a state of infancy, which an accomplished master could

never fall into, and are equally conspicuous in Gothic statues as in the productions of the ancient natives of Florence. They resemble the style of the Egyptians so much that one is almost induced to suppose there had once been a communication between these two nations: but others think that this style was introduced by Dædalus.

Winkelman supposes that the second epoch of this art commenced in Etruria, about the time at which it had reached its greatest perfection in Greece, in the age of Phidias; but this conjecture is not supported by any proofs. To describe the second style of sculpture among the Etrurians is almost the same as to describe the style of Michael Angelo and his numerous imitators. The joints are strongly marked, the muscles raised, the bones distinguishable; but the whole mien harsh. In designing the bone of the leg, and the separation of the muscles of the calf, there is an elevation and strength above life. The statues of the gods are designed with more delicacy. In forming them, the artists were anxious to show that they could exercise their power without that violent distension of the muscles which is necessary in the exertions of beings merely human; but in general their attitudes are unnatural, and the actions strained. If a statue, for instance, hold any thing with its fore-fingers, the rest are stretched out in a stiff position.

SECT. IV.—OF THE GRECIAN SCULPTURE.

According to ancient history, the Greeks did not emerge from the savage state till a long time after the Egyptians, Chaldeans, and Indians, had arrived at a considerable degree of civilisation. The original rude inhabitants of Greece were civilised by colonies which arrived among them at different times from Egypt and Phœnicia. These brought along with them the religion, the letters, and the arts of their parent countries; and, if sculpture had its origin from the worship of idols, there is reason to believe that it was one of the arts which were thus imported; for that the gods of Greece were of Egyptian and Phœnician extraction is a fact incontrovertible: see MYSTERIES, MYTHOLOGY, PHILOSOPHY, and TITAN. The original statues of the gods, however, were very rude. The earliest objects of idolatrous worship have every where been the heavenly bodies; and the symbols consecrated to them were generally pillars of a conical or pyramidal figure. It was not till hero-worship was engrafted on the planetary, that the sculptor thought of giving to the sacred statue any part of the human form (see POLYTHEISM); and it appears to have been about the era of this revolution in idolatry, that the art of sculpture was introduced among the Greeks. The first representations of their gods were round stones placed upon cubes or pillars; and these stones they afterwards formed roughly, so as to give them something of the appearance of a head. Agreeable to this description was a Jupiter which Pausanias saw in Tegeum, in Arcadia. These representations were called *Hermes*; not that they represented Mercury, but from the word *herma*, which signified a rough stone. It is the

name which Homer gives to the stones which were used to fix vessels to the shore. Pausanias saw at Pheres thirty deities made of unformed blocks or cubical stones. The Lacedemonians represented Castor and Pollux by two parallel posts; and a transverse beam was added to express their mutual affection. If the Greeks derived from foreign nations the rudiments of the arts, it must redound much to their honor that in a few centuries they carried them to such wonderful perfection as entirely to eclipse the fame of their masters. It is by tracing the progress of sculpture among them that we are to study the history of this art; and we shall see its origin and successive improvements correspond with nature, which always operates slowly and gradually.

The great superiority of the Greeks in the art of sculpture may be ascribed to a variety of causes. The influence of climate over the human body is so striking that it must have fixed the attention of every thinking man who has reflected on the subject. The violent heats of the torrid zone, and the excessive cold of the polar regions, are unfavorable to beauty. It is only in the mild climates of the temperate regions that it appears in its most attractive charms. Perhaps no country in the world enjoys a more serene air, less tainted with mists and vapors, or possesses in a higher degree that mild and genial warmth which can unfold and expand the human body into all the symmetry of muscular strength, and all the delicacies of female beauty in greater perfection, than the happy climate of Greece; and never was there any people that had a greater taste for beauty, or were more anxious to improve it. Of the four wishes of Simonides, the second was to have a handsome figure. The love of beauty was so great among the Lacedemonian women, that they kept in their chambers the statues of Nereus, of Narcissus, of Hyacinthus, and of Castor and Pollux; hoping that by often contemplating them they might have beautiful children.

There were a variety of circumstances in the noble and virtuous freedom of the Grecian manners that rendered these models of beauty peculiarly subservient to the cultivation of the fine arts. There were no tyrannical laws, as among the Egyptians, to check their progress. They had the best opportunities to study them in the public places, where the youth, who needed no other veil than chastity and purity of manners, performed their various exercises quite naked. They had the strongest motives to cultivate sculpture, for a statue was the highest honor which public merit could attain. It was an honor ambitiously sought, and granted only to those who had distinguished themselves in the eyes of their fellow citizens. As the Greeks preferred natural qualities to acquired accomplishments, they decreed the first rewards to those who excelled in agility and strength of body. Statues were often raised to wrestlers. Even the most eminent men of Greece, in their youth, sought renown in gymnastic exercises. Chrysippus and Cleanthes distinguished themselves in the public games before they were known as philosophers. Plato appeared as a wrestler both at the Isthmian and

Pythian games; and Pythagoras carried off the prize at Elis. See *Pythagoras*. The passion by which they were inspired was the ambition of having their statues erected in the most sacred place of Greece, to be seen and admired by the whole people. The number of statues erected on different occasions was immense; of course the number of artists must have been great, their emulation ardent, and their progress rapid. As most of their statues were decreed for those who vanquished in the public games, the artists had the opportunity of seeing excellent models; for those who surpassed in running, boxing, and wrestling, must in general have been well formed, yet would exhibit different kinds of beauty.

The high estimation in which sculptors were held was very favorable to their art. Socrates declared the artists the only wise men. An artist could be a legislator, a commander of armies, and might hope to have his statue placed beside those of Miltiades and Themistocles, or of those of the gods themselves. Besides, the honor and success of an artist did not depend on the caprice of pride or of ignorance. The productions of art were estimated and rewarded by the greatest sages in the general assembly of Greece, and the sculptor who had executed his work with ability and taste was confident of obtaining immortality.

It was the opinion of Winkelman, that liberty was highly favorable to this art; but, though liberty is absolutely necessary to the advancement of science, it may be doubted whether the fine arts owe their improvement to it. Sculpture flourished most in Greece, when Pericles exercised the power of a king; and in the reign of Alexander, when Greece was conquered. It attained no perfection in Rome till Augustus had enslaved the Romans. It revived in Italy under the patronage of the family of Medici, and in France under the despotic rule of Louis XIV. It is the love of beauty, luxury, wealth, or by the patronage of a powerful individual, that promotes the progress of this art.

It will now be proper to give a particular account of the ideas which the Greeks entertained concerning the standard of beauty in the different parts of the human body. And with respect to the head, the profile which they chiefly admired is peculiar to dignified beauty. It consists in a line almost straight, or marked by such slight and gentle inflections as are scarcely distinguishable from a straight line. In the figures of women and young persons the forehead and nose form a line approaching to a perpendicular.

Ancient writers, as well as artists, assure us that the Greeks reckoned a small forehead a mark of beauty, and a high forehead a deformity. From the same idea, the Circassians wore their hair hanging down over their foreheads almost to their eyebrows. To give an oval form to the countenance, it is necessary that the hair should cover the forehead, and thus make a curve about the temples; otherwise the face, which terminates in an oval form in the inferior part, will be angular in the higher part, and the proportion will be destroyed. This rounding of the forehead may be seen in all handsome persons, in all the heads of ideal beauty in ancient statues, and

especially in those of youth. It has been overlooked, however, by modern statuary. Bernini, who modelled a statue of Louis XIV. in his youth, turned back the hair from the forehead.

It is generally agreed that large eyes are beautiful; but their size is of less importance in sculpture than their form, and the manner in which they are enched. In ideal beauty, the eyes are always sunk deeper than they are in nature, and consequently the eyebrows have a greater projection. But in large statues, placed at a certain distance, the eyes, which are of the same color with the rest of the head, would have little effect if they were not sunk. By deepening the cavity of the eye, the statuary increases the light and shade, and thus gives the head more life and expression. The same practice is used in small statues. The eye is a characteristic feature in the heads of the different deities. In the statues of Apollo, Jupiter, and Juno, the eye is large and round. In those of Pallas they are also large; but, by lowering the eyelids, the virgin air and expression of modesty are delicately marked. Venus has small eyes, and the lower eyelid being raised a little, gives them a languishing look and an enchanting sweetness. It is only necessary to see the Venus de Medicis to be convinced that large eyes are not essential to beauty, especially if we compare her small eyes with those which resemble them in nature. The beauty of the eyebrows consists in the fineness of the hair, and in the sharpness of the bone which covers them; and masters of the art considered the joining of the eyebrows as a deformity, though it is sometimes to be met with in ancient statues.

The beauty of the mouth is peculiarly necessary to constitute a fine face. The lower lip must be fuller than the upper, in order to give an elegant rounding to the chin. The teeth seldom appear, except in laughing satyrs. In human figures the lips are generally close, and a little opened in the figures of the gods. The lips of Venus are half open.

In figures of ideal beauty, the Grecian artists never interrupted the rounding of the chin by introducing a dimple; for this they considered not as a mark of beauty, and only to be admitted to distinguish individuals. The dimple indeed appears in some ancient statues, but antiquaries suspect it to be the work of a modern hand. It is suspected, also, that the dimple which is sometimes found on the cheeks of ancient statues is a modern innovation.

No part of the head was executed by the ancients with more care than the ears, though little attention has been given to them by modern artists. This character is so decisive, that if we observe in any statue that the ears are not highly finished, but only roughly marked, we may conclude with certainty that we are examining a modern production. The ancients were very attentive to copy the precise form of the ear in taking likenesses. Thus, where we meet with a head, the ears of which have a very large interior opening, we know it to be the head of Marcus Aurelius.

The manner in which the ancient artists formed the hair also enables us to distinguish

their works from those of the moderns. On hard and coarse stones the hair was short, and appeared as if it had been combed with a wide comb; for that kind of stone was difficult to work, and could not without immense labor be formed into curled and flowing hair. But the figures executed in marble in the most flourishing period of the art have the hair curled and flowing; at least where the head was not intended to be an exact resemblance, for then the artist conformed to his model. In the heads of women, the hair was thrown back, and tied behind in a waving manner, leaving considerable intervals; which gives the agreeable variety of light and shade, and produces the effects of the *claro-obscuro*. The hair of the Amazons is disposed in this manner. Apollo and Bacchus have their hair falling down their shoulders; and young persons, till they arrived at manhood, wore their hair long. The color of the hair which was reckoned most beautiful was fair; and this they gave without distinction to the most beautiful of their gods, Apollo and Bacchus, and likewise to their most illustrious heroes.

Although the ravages of time have preserved but few of the hands or feet of ancient statues, it is evident from what remains how anxious the Grecian artists were to give every perfection to these parts. The hands of young persons were moderately plump, with little cavities or dimples at the joints of the fingers. The fingers tapered very gently from the root to the point, like well proportioned columns, and the joints were scarcely perceptible. The terminating joint was not bent, as it commonly appears in modern statues.

In the figures of young men the joints of the knee are faintly marked. The knee unites the leg to the thigh without making any remarkable projections or cavities. The most beautiful legs, and best turned knees, according to Winkelman, are preserved in the Apollo Sauroctones, in the Villa Borghese; in the Apollo which has a swan at its feet; and in the Bacchus of Villa Medicis. The same able connoisseur remarks, it is rare to meet with beautiful knees in young persons, or in the elegant representations of art. As the ancients did not cover the feet as we do, they gave to them the most beautiful turning, and studied the form of them with the most scrupulous attention.

The breasts of men were large and elevated. The breasts of women did not possess much amplitude. The figures of the deities have always the breasts of a virgin, the beauty of which the ancients made to consist in a gentle elevation. So anxious were the women to resemble this standard, that they used several arts to restrain the growth of their breasts. The breasts of the nymphs and goddesses were never represented swelling, because that is peculiar to those women who suckle. The paps of Venus contract and end in a point, this being considered as an essential characteristic of perfect beauty. Some of the moderns have transgressed these rules, and have fallen into great improprieties.

The lower parts of the body in the statues of men were formed like that of the living body after a profound sleep and a good digestion. The

navel was considerably sunk, especially in female statues.

As beauty never appears in equal perfection in every part of the same individual, perfect or ideal beauty can only be produced by selecting the most beautiful parts from different models; but this must be done with such judgment and care that these detached beauties when united may form the most exact symmetry. Yet the ancients sometimes confined themselves to one individual, even in the most flourishing age. Theodorus, whom Socrates and his disciples visited, served as a model to the artists of his time. Phryne also appears to have been a model to the painters and sculptors. But Socrates, in his conversation with Parrhasius, says that, when a perfect beauty was to be produced, the artists joined together the most striking beauties which could be collected from the finest figures. We know that Zeuxis, when he was going to paint Helen, united in one picture all the beauties of the most handsome women of Crotona.

SECT. V.—OF THE DRAPERY OF GRECIAN STATUES.

The Grecian sculptors, who represented with such success the most perfect beauty of the human form, were not regardless of the drapery of their statues. They clothed their figures in the most proper stuff, which they wrought into that shape which was best calculated to give effect to their design.

The vestments of women in Greece generally consisted of linen cloth, or some other light stuff, and in latter times of silk, and sometimes of woollen cloth. They had also garments embroidered with gold. In the works of sculpture, as well as in those of painting, one may distinguish the linen by its transparency and small united folds. The other light stuffs which were worn by the women were generally of cotton produced in the isle of Cos; and these the art of statuary was able to distinguish from the linen vestments. The cotton cloth was sometimes striped, and sometimes embellished with a profusion of flowers. Silk was also employed; but whether it was known in Greece before the time of the Roman emperors, cannot easily be determined. In paintings it is distinguishable by changing its color in different lights to red, violet, and sky-blue. There were two sorts of purple; that which the Greeks call the color of the sea, and Tyrian purple, which resembled lac. Woollen garments are easily known by the amplitude of their folds. Besides these, cloth of gold sometimes composed their drapery; but it was not like the modern fabric, consisting of a thread of gold or of silver spun with a thread of silk; it was composed of gold or silver alone without any mixture.

The vestments of the Greeks, which deserve particular attention, are the tunic, the robe, and the mantle.

The tunic was that part of the dress which was next to the body. It may be seen in sleeping figures, or in those in dishabille; as in the Flora Farnese, and in the statues of the Amazons in the capitol. The youngest of the daughters of Niobe, who throws herself at her mother's

side, is clothed only with a tunic. It was of linen, or some other light stuff, without sleeves, fixed to the shoulders by a button, so as to cover the whole breast. None but the tunics of the goddess Ceres and comedians have long straight sleeves.

The robes of women commonly consisted of two long pieces of woollen cloth, without any particular form, attached to the shoulders by a great many buttons, and sometimes by a clasp. They had straight sleeves which came down to the wrists. The young girls, as well as the women, fastened their robe to their side by a cincture, in the same way as the high priest of the Jews fastened his, as it is still done in many parts of Greece. The cincture formed on the side a knot of ribbons, sometimes resembling a rose in shape, which has been particularly remarked in the two beautiful daughters of Niobe. In the younger of these the cincture is seen passing over the shoulders and the back. Venus has two cinctures, the one passing over the shoulder, and the other surrounding the waist. The latter is called *cestus* by the poets.

The mantle was called *peplon* by the Greeks, which signifies properly the mantle of Pallas. The name was afterwards applied to the mantles of the other gods, as well as to those of men. This part of the dress was not square, as some have imagined, but of a roundish form. The ancients indeed speak in general of square mantles, but they received this shape from four tassels which were affixed to them; two of these were visible, and two were concealed under the mantle. The mantle was brought under the right arm, and over the left shoulder; sometimes it was attached to the shoulder by two buttons, as may be seen in the beautiful statue of Leucothoe at Villa Albani.

The color of vestments peculiar to certain statues is too curious to be omitted. To begin with the figures of the gods:—The drapery of Jupiter was red, that of Neptune is supposed by Winkelman to have been sea-green. The same color also belonged to the Nereids and Nymphs. The mantle of Apollo was blue, or violet. Bacchus was dressed in white. Martianus Capella assigns green to Cybele. Juno's vestments were sky-blue, but she sometimes had a white veil. Pallas was robed in a flame-colored mantle. In a painting of *Herculeaneum*, Venus is in flowing drapery of a golden yellow. Kings were arrayed in purple; priests in white; and conquerors sometimes in sea-green.

With respect to the head, women generally wore no covering but their hair; when they wished to cover their head, they used the corner of their mantle.—Sometimes we meet with veils of a fine transparent texture. Old women wore a kind of bonnet upon their head, an example of which may be seen in a statue in the capitol, called the *Præfeca*; but Winkelman thinks it is a statue of Hecuba.

The covering of the feet consisted of shoes or sandals. The sandals were generally an inch thick, and composed of more than one sole of cork. Those of Pallas in Villa Albani have two soles, and other statues had no fewer than five.

SECT. VI.—OF THE STYLES OF GRECIAN SCULPTURE.

Winkelman has assigned four different styles to this art. The *ancient* style, which continued until the time of Phidias; the *grand* style, formed by that celebrated statuary; the *beautiful*, introduced by Praxiteles, Apelles, and Lyssippus; and the *imitative* style, practised by those artists who copied the works of the ancient masters.

The most authentic monuments of the ancient style are medals, containing an inscription, which leads us back to very distant times. The writing is from right to left, in the Hebrew manner; a usage which was abandoned before the time of Herodotus. The statue of Agamemnon at Elis, which was made by Ornatas, has an inscription from right to left. This artisan flourished fifty years before Phidias; it is in the intervening period therefore between these two artists that we are to look for the cessation of this practice. The statues formed in the ancient style were neither distinguished by beauty of shape nor by proportion, but bore a close resemblance to those of the Egyptians and Etrurians; the eyes were long and flat; the section of the mouth not horizontal; the chin was pointed; the curls of the hair were ranged in little rings, and resembled grains enclosed in a heap of raisins. What was still worse, it was impossible by inspecting the head to distinguish the sex. The characters of this ancient style were these: the designing was energetic, but harsh; it was animated, but without gracefulness; and the violence of the expression deprived the whole figure of beauty.

The grand style was brought to perfection by Phidias, Polyclethus, Scopas, Alcamenes, Myron, and other illustrious artists. It is probable, from some passages of ancient writers, that in this style were preserved some characters of the ancient manner, such as the straight lines, the squares and angles. The ancient masters, such as Polyclethus, being the legislators of proportions, says Winkelman, and of consequence thinking they had a right to distribute the measures and dimensions of the parts of the human body, have undoubtedly sacrificed some degree of the form of beauty to a grandeur which is harsh, in comparison of the flowing contours and graceful forms of their successors.—The most considerable monuments of the grand style are the statues of Niobe and her daughters, and a figure of Pallas, to be seen in Villa Albani; which, however, must not be confounded with the statue which is modelled according to the first style, and is also found in the same place. The head possesses all the characters of dignified beauty, at the same time exhibiting the rigidity of the ancient style. The face is defective in gracefulness; yet it is evident how easy it would have been to give the features more roundness and grace. The figures of Niobe and her daughters have not, in the opinion of Winkelman, that austerity of appearance which marks the age of the statue of Pallas. They are characterised by grandeur and simplicity; so simple are the forms that they do not appear to be the tedious productions of art, but to have been created by an instantaneous effort of nature.

The third style was the graceful or beautiful. Lysippus was perhaps the artist who introduced this style. Being more conversant than his predecessors with the sweet, the pure, the flowing, and the beautiful lines of nature, he avoided the square forms which the masters of the second style had too much employed. He was of opinion that the use of the art was rather to please than to astonish, and that the aim of the artist should be to raise admiration by giving delight. The artists who cultivated this style did not, however, neglect to study the sublime works of their predecessors. They knew that grace is consistent with the most dignified beauty, and that it possesses charms which must ever please; they knew also that these charms are enhanced by dignity. Grace is infused into all the movements and attitudes of their statues, and it appears in the delicate turns of the hair, and even in the adjusting of the drapery. Every sort of grace was well known to the ancients; and great as the ravages of time have been amongst the works of art, specimens are still preserved, in which can be distinguished *dignified* beauty, *attractive* beauty, and a beauty *peculiar to infants*. A specimen of dignified beauty may be seen in the statue of one of the Muses in the palace of Barberini at Rome; and in the garden of the pope, on the Quirinal, is a statue of another Muse, which affords a fine instance of attractive beauty. Winkelman says that the most excellent model of infant beauty which antiquity has transmitted to us is a satyr of a year old, which is preserved, though a little mutilated, in Villa Albani.

The great reputation of Praxiteles and Apelles raised an ardent emulation in their successors, who, despairing to surpass such illustrious masters, were satisfied with imitating their works. But it is well known that a mere imitator is always inferior to the master whom he attempts to copy. When no original genius appears, the art must therefore decline.

SECT. VII.—OF THE MATERIALS OF GRECIAN STATUES.

Clay was the first material which was employed in statuary. An instance of this may be seen in a figure of Alcamenes in bas-relief in Villa Albani. The ancients used their fingers, and especially their nails, to render certain parts more delicate and lively: hence arose the phrase *ad unguem factus homo*, 'an accomplished man.' It was the opinion of count Caylus that the ancients did not use models in forming their statues. But, to disprove this, it is only necessary to mention an engraving on a stone in the cabinet of Stosch, which represents Prometheus engraving the figure of a man, with a plummet in his hand to measure the proportions of his model. The ancients as well as the moderns made works in plaster; but no specimens remain except some figures in bas-relief, of which the most beautiful were found at Baia.

The works made of ivory and silver were generally of a small size. Sometimes, however, statues of a prodigious size were formed of gold and ivory. The colossal Minerva of Phidias, which was composed of these materials, was

twenty-six cubits high. It is indeed scarcely possible to believe that statues of such a size could entirely consist of gold and ivory. The quantity of ivory necessary to a colossal statue is beyond conception. M. de Pauw calculates that the statue of Jupiter Olympus, which was fifty-four feet high, would consume the teeth of 300 elephants.

The Greeks generally hewed their marble statues out of one block, though they after worked the heads separately, and sometimes the arms. The heads of the famous group Niobe and her daughters have been adapted to their bodies after being separately finished. It is proved by a large figure representing a river, which is preserved in Villa Albani, that the ancients first hewed their statues roughly, before they attempted to finish any part. When the statue had received its perfect figure, they next proceeded to polish it with pumice-stone, and again carefully re-touched every part with the chisel.

The ancients, when they employed porphyry, usually made the head and extremities of marble. It is true that at Venice there are four figures entirely composed of porphyry; but these are the productions of the Greeks of the middle age. They also made statues of basalt and alabaster.

SECT. VIII.—OF EXPRESSION, GESTURE, AND ATTITUDE.

Without expression, gesture, and attitude, no figure can be beautiful, because in these the graces always reside. It was for this reason that the graces are always represented as the companions of Venus.

The expression of tranquillity was frequent in Grecian statues, because, according to Plato, that was considered as the middle state of the soul between pleasure and pain. Experience, too, shows that in general the most engaging manner. Without a sedate tranquillity, dignified beauty could not exist. It is in this tranquillity, therefore, that we must look for the complete display of genius.

The most elevated species of tranquillity and repose was studied in the figures of the gods. The father of the gods, and even inferior divinities, are represented without emotion or resentment. Jupiter is not always exhibited in this tranquil state. In a bas-relief belonging to the marquis Rondini, he appears seated on an arm-chair with a melancholy aspect. The Apollo of the Vatican represents the god in a fit of rage against the serpent Python, which he kills at a blow. The artist, adopting the opinion of the poets, has made the nose the seat of anger, and the lips the seat of disdain.

To express the action of a hero, the Grecian sculptors delineated the countenance of a noble virtuous character repressing his groans, and allowing no expression of pain to appear. In describing the action of a hero, the poet has much more liberty than the artist. The poet can paint them such as they were before men were taught to subdue their passions by the restraints of law, or the refined customs of social life. But the artist, obliged to select the most beautiful forms, is reduced to the necessity of giving such an ex-

pression of the passions as may not shock our feelings, and disgust us with his production. The truth of these remarks will be acknowledged by those who have seen two of the most beautiful monuments of antiquity; one of which represents the fear of death, the other the most violent pains and sufferings. The daughters of Niobe, against whom Diana has discharged her fatal arrows, are exhibited in that state of stupefaction which we imagine must take place when the certain prospect of death deprives the soul of all sensibility. The fable presents us an image of that stupor which Eschylus describes as seizing Niobe when they were transformed into a rock. The other monument referred to is the image of Laocoon, which exhibits the most agonising pain that can affect the muscles, the nerves, and the veins. The sufferings of the body and the elevation of the soul are expressed in every member with equal energy, and form the most sublime contrast imaginable. Laocoon appears to suffer with such fortitude, that, whilst his lamentable situation pierces the heart, the whole figure fills us with ambitious desire of imitating his constancy and magnanimity in the pains and sufferings that may fall to our lot.

Philoctetes is introduced by the poets, shedding tears, uttering complaints, and rending the air with his groans and cries; but the artist exhibits him silent, and bearing his pains with dignity. The Ajax of the celebrated painter Timomachus is not drawn in the act of destroying the sheep which he took for the Grecian chiefs, but in the moments of reflection which succeeded that frenzy. So far did the Greeks carry their love of calmness and slow movements, that they thought a quick step always announced rusticity of manners. Demosthenes reproaches Nicobulus for this very thing; and from the words he makes use of it appears, that to speak with insolence and to walk hastily were reckoned synonymous.

In the figures of women, the artists have conformed to the principle observed in all the ancient tragedies and recommended by Aristotle, never to make women show too much intrepidity or excessive cruelty. Conformable to this maxim, Clytemnestra is represented at a little distance from the fatal spot, watching the murderer, but without taking any part with him. In a painting of Timomachus representing Medea and her children, when Medea lifts up the dagger they smile in her face, and her fury is immediately melted into compassion for the innocent victims. In another representation of the same subject, Medea appears hesitating and indecisive. Guided by the same maxims, the artists of most refined taste were careful to avoid all deformity, choosing rather to recede from truth than from their accustomed respect for beauty, as may be seen in several figures of Hecuba. Sometimes, however, she appears in the decrepitude of age, her face furrowed with wrinkles, and her breasts hanging down.

Illustrious men, and those invested with offices of dignity, are represented with a noble assurance and firm aspect. The statues of the Roman emperors resemble those of heroes, and are far removed from every species of flattery, in the gesture,

in the attitude, and action. They never appear with haughty looks, or with the splendor of royalty; no figure is ever seen presenting any thing to them with bended knee, except captives; and none addresses them with an inclination of the head. In modern works too little attention has been paid to the ancient costume. Winkelman mentions a bas-relief, which was lately executed at Rome for the fountain of Trevi, representing an architect in the act of presenting the plan of an aqueduct to Marcus Agrippa. The modern sculptor, not content with giving a long beard to that illustrious Roman, contrary to all the ancient marble statues as well as medals which remain, exhibits the architect on his knees.

In general it was an established principle to banish all violent passions from public monuments. This will serve as a decisive mark to distinguish the true antique from supposititious works. A medal has been found exhibiting two Assyrians, a man and woman tearing their hair, with this inscription, ASSYRIA. ET. PALESTINA. IN. POTEST. P. R. REDAC. S. C. The forgery of this medal is manifest from the word *Palestina*, which is not to be found in any ancient Roman medal with a Latin inscription. Besides the violent action of tearing the hair does not suit any symbolical figure. This extravagant style, which was called by the ancients *parenthyrsis*, has been imitated by most of the modern artists. Their figures resemble comedians on the ancient theatres, who, in order to suit the distant spectators, put on painted masks, employed exaggerated gestures, and far overleaped the bounds of nature. This style has been reduced into a theory in a treatise on the passions composed by Le Brun. The designs which accompany that work exhibit the passions in the very highest degree, approaching even to frenzy: but these are calculated to vitiate the taste, especially of the young; for the ardor of youth prompts them rather to seize the extremity than the middle; and it will be difficult for that artist who has formed his taste from such empassioned models ever to acquire that noble simplicity and sedate grandeur which distinguished the works of ancient taste.

SECT. IX.—OF PROPORTION.

Proportion is the basis of beauty, and there can be no beauty without it; on the contrary, proportion may exist where there is little beauty. Experience every day teaches us that knowledge is distinct from taste; and proportion, therefore, which is founded on knowledge, may be strictly observed in any figure, and yet the figure have no pretensions to beauty. The ancients, considering ideal beauty as the most perfect, have frequently employed it in preference to the beauty of nature.

The body consists of three parts as well as the members. The three parts of the body are the trunk, the thighs, and the legs. The inferior parts of the body are, the thighs, the legs, and the feet. The arms also consist of three parts. These three parts must bear a certain proportion to the whole as well as to one another. In a well-formed man the head and body must be proportioned to the thighs, the legs, and the feet, in the same manner as the thighs are proportioned to

the legs and the feet, and the arms to the hands. The face also consists of three parts, that is, three times the length of the nose; but the head is not four times the length of the nose, as some writers have asserted. From the place where the hair begins to the crown of the head are only three-fourths of the length of the nose, or that part is to the nose as nine to twelve.

It is probable that the Grecian, as well as the Egyptian artists, have determined the great and small proportions by fixed rules; that they have established a positive measure for the dimensions of length, breadth, and circumference. This supposition alone can enable us to account for the great conformity which we meet with in ancient statues. Winkelman thinks that the foot was the measure which the ancients used in all their great dimensions, and that it was by the length of it that they regulated the measure of their figures by giving to them six times that length. This in fact is the length which Vitruvius assigns, *Pes vero altitudinis corporis sextæ, l. 3, cap. 1.* That celebrated antiquary thinks the foot is a more determinate measure than the head or the face, the parts from which modern painters and sculptors too often take their proportions. This proportion of the foot to the body, which has appeared strange and incomprehensible to the learned Huetius, and has been entirely rejected by Perrault, is, however, founded upon experience. After measuring with great care a vast number of figures, Winkelman found this proportion observed not only in Egyptian statues, but also in those of Greece. This fact may be determined by an inspection of those statues the feet of which are perfect. One may be fully convinced of it by examining some divine figures, in which the artists have made some parts beyond their natural dimensions. In the *Apollo Belvidere*, which is a little more than seven heads high, the foot is three Roman inches longer than the head. The head of the *Venus de Medicis* is very small, and the height of the statue is seven heads and a half; the foot is three inches and a half longer than the head, or precisely the sixth part of the length of the whole statue.

SECT. X.—OF THE PRACTICE OF SCULPTURE.

We have been thus minute in our account of the Grecian sculpture because it is the opinion of the ablest critics that modern artists have been more or less eminent as they have studied with the greater or less attention the models left us by that ingenious people; Winkelman goes so far as to contend that the most finished works of the Grecian masters ought to be studied in preference even to the works of nature. This appears to be paradoxical; but the reason assigned by the abbé for his opinion is that the fairest lines of beauty are more easily discovered, and make a more striking and powerful impression, by their reunion in these sublime copies, than when they are scattered far and wide in the original. Allowing, therefore, the study of nature the high degree of merit it so justly claims, it must nevertheless be granted that it leads to true beauty by a much more tedious, laborious, and difficult path than the study of the antique, which presents immediately to the artist's view the ob-

ject of his researches, and combines in a clear and strong point of light the various rays of beauty that are dispersed through the wide domain of nature.

As soon as the artist has laid this excellent foundation, acquired an intimate degree of familiarity with the beauties of the Grecian statues, and formed his taste after the admirable models they exhibit, he may then proceed with advantage and assurance to the imitation of nature. The ideas he has already formed of the perfection of nature, by observing her dispersed beauties combined and collected in the compositions of the ancient artists, will enable him to acquire with facility and to employ with advantage the detached and partial ideas of beauty which will be exhibited to his view in a survey of nature in her actual state. When he discovers these partial beauties, he will be capable of combining them with those perfect forms of beauty with which he is already acquainted. In a word, by having always present to his mind the noble models already mentioned, he will be in some measure his own oracle, and will draw rules from his own mind.

There are, however, two ways of imitating nature. In the one, a single object occupies the artist, who endeavours to represent it with precision and truth; in the other, certain lines and features are taken from a variety of objects, and combined and blended into one regular whole. All kinds of copies belong to the first kind of imitation; and productions of this kind must be executed necessarily in the Dutch manner, that is to say, with high finishing, and little or no invention. But the second kind of imitation leads directly to the investigation and discovery of true beauty, of that beauty whose idea is conate with the human mind, and is only to be found there in its highest perfection. This is the kind of imitation in which the Greeks excelled, and in which men of genius excite the young artists to excel after their example, viz. by studying nature as they did.

After having studied in the productions of the Grecian masters their choice and expression of select nature, their sublime and graceful contours, their noble draperies, together with that sedate grandeur and admirable simplicity that constitute their chief merit, the curious artist will do well to study the manual and mechanical part of their operations, as this is absolutely necessary to the successful imitation of their excellent manner.

The ancients almost always formed their first models in wax: to this modern artists have substituted clay, or some such composition: they prefer clay before wax in the carnations, on account of the yielding nature of the latter, and its sticking in some measure to every thing it touches. We must not, however, imagine hence, that the method of forming models of wet clay was either unknown or neglected among the Greeks; on the contrary, it was in Greece that models of this kind were invented. Their author was Dibutades of Sicyon: and it is well known that Arcesilas, the friend of Lucullus, obtained a higher degree of reputation by his clay models than by all his other productions. Indeed, if clay

could be made to preserve its original moisture, it would undoubtedly be the fittest substance for the models of the sculptor; but when it is placed either in the fire, or left to dry imperceptibly in the air, its solid parts grow more compact, and the figure, losing thus a part of its dimensions, is necessarily reduced to a smaller volume. This diminution would be of no consequence, did it equally affect the whole figure, so as to preserve its proportions entire. But this is not the case; for the smaller parts of the figure dry sooner than the larger; and thus, losing more of their dimensions in the same space of time than the latter do, the symmetry and proportions of the figure inevitably suffer. This inconveniency does not take place in those models that are made in wax. It is indeed extremely difficult, in the ordinary method of working the wax, to give it that degree of smoothness that is necessary to represent the softness of the carnations or fleshy parts of the body. This inconvenience may, however, be remedied, by forming the model first in clay, then moulding it in plaster, and lastly, casting it in wax. And, indeed, clay is seldom used but as a mould in which to cast a figure of plaster, stucco, or wax, to serve henceforth for a model by which the measures and proportions of the statue are to be adjusted. In making waxen models, it is common to put half a pound of colophony to a pound of wax; and some add turpentine, melting the whole with oil of olives.

So much for the first or preparatory steps in this procedure. It remains to consider the manner of working the marble after the model so prepared; and the method here followed by the Greeks seems to have been extremely different from that which is generally observed by modern artists. In the ancient statues we find the most striking proofs of the freedom and boldness that accompanied each stroke of the chisel, and which resulted from the artist's being perfectly sure of the accuracy of his idea, and the precision and steadiness of his hand: the most minute parts of the figure carry these marks of assurance and freedom; no indication of timorousness or diffidence appear; nothing that can induce us to fancy that the artist had occasion to correct any of his strokes. It is difficult to find, even in the second-rate productions of the Grecian artists, any mark of a false stroke or a random touch. The firmness and precision of the Grecian chisel were certainly derived from a more determined and perfect set of rules than those which are observed in modern times.

The method generally observed by the modern sculptor is as follows: first, out of a great block of marble he saws another of the size required, which is performed with a smooth steel saw, without teeth, casting water and sand thereon from time to time: then he fashions it, by taking off what is superfluous with a steel point and a heavy hammer of soft iron; after this, bringing it near the measure required, he reduces it still nearer with another finer point; he then uses a flat cutting instrument, having notches in its edge; and then a chisel, to take off the scratches which the former has left; till at length, taking rasps of different degrees of fineness, by de-

grees he brings his work into a condition for polishing.

After this, having studied his model with all possible attention, he draws upon this model horizontal and perpendicular lines intersecting each other at right angles. He then copies these lines upon his marble, as the painter makes use of such transversal lines to copy a picture, or to reduce it to a smaller size. These transversal lines or squares, drawn in an equal number upon the marble and upon the model, in a manner proportioned to their respective dimensions, exhibit accurate measures of the surfaces upon which the artist is to work; but cannot determine, with equal precision, the depths that are proportioned to these surfaces.—The sculptor, indeed, may determine these depths by observing the relation they bear to his model; but, as his eye is the only guide he has to follow in this estimate, he is always more or less exposed to error, or at least to doubt; he is never sure that the cavities made by his chisel are exact; a degree of uncertainty accompanies each stroke; nor can he be assured that it has carried away neither too much nor too little of his marble. It is equally difficult to determine, by such lines as have already been mentioned, the external and internal contours of the figures, or to transfer them from the model to the marble. By the internal contour is understood that which is described by the parts which approach towards the centre, and which are not marked in a striking manner.

In a complicated and laborious work, which an artist cannot execute without assistance, he is often obliged to make use of foreign hands, that have not the talents or dexterity that are necessary to finish his plan. A single stroke of the chisel that goes too deep is a defect not to be repaired; and such a stroke may easily happen, where the depths are so imperfectly determined. Defects of this kind are inevitable, if the sculptor, in chipping his marble, begins by forming the depths that are requisite in the figure he designs to represent. Nothing is more liable to error than this manner of proceeding. The cautious artist ought, on the contrary, to form these depths gradually, by little and little, with the utmost circumspection and care; and the determining of them with precision ought to be considered as the last part of his work, and as the finishing touches of the chisel.

The various inconveniences attending this method determined several eminent artists to look out for one that would be liable to less uncertainty, and productive of fewer errors. The French academy of painting at Rome hit upon a method of copying the ancient statues, which some sculptors have employed with success even in the figures which they finished after models in clay or wax. This method is as follows:—The statue that is to be copied is enclosed in a frame that fits it exactly. The upper part of this frame is divided into a certain number of equal parts, and to each of these parts a thread is fixed with a piece of lead at the end of it. These threads, which hang freely, show what parts of the statue are most removed from the centre with much more perspicuity and precision than the lines which are drawn upon its surface, and which

pass equally over the higher and hollow parts of the block: they also give the artist a tolerable rule to measure the more striking variations of height and depth, and thus render him more bold and determined in the execution of his plan.

But even this method is not without its defects: for as it is impossible, by the means of a straight line, to determine with precision the procedure of a curve, the artist has, in this method, no certain rule to guide him in his contours; and as often as the line which he is to describe deviates from the direction of the plumb line, which is his main guide, he must necessarily find himself at a loss, and be obliged to have recourse to conjecture.

It is also evident that this method affords no certain rule to determine exactly the proportion which the various parts of the figure ought to bear to each other, considered in their mutual relation and connexion. The artist, indeed, endeavours to supply this defect by intersecting the plumb-lines by horizontal ones. This recourse has, nevertheless, its inconveniences, since the squares formed by transversal lines, that are at a distance from the figure (though they be exactly equal), yet represent the parts of the figure as greater or smaller, according as they are more or less removed from our position or point of view. But, notwithstanding these inconveniences, the matter now under consideration is certainly the best that has hitherto been employed: it is more practicable and sure than any other we know, though it appears, from the remarks we have now been making, that it does not exhibit a sure and universal criterion to a sculptor who executes after a model.

To polish the statue, or make the parts of it smooth and sleek, they use pumice-stone and smelt, then tripoli; and, when a still greater lustre is required, they use burnt straw. For the casting of statues, see **FOUNDRY**

SECT. XI.—OF THE MODERN HISTORY AND STATE OF THE ART.

The art of sculpture (which never found any very distinguished followers among the Romans) fell into complete disuse in the middle ages, although ornaments of different kinds, together with rude images, were profusely lavished on the various churches. The revival of painting produced a like resuscitation of the sister art; and, amongst the earliest professors who strove to rescue sculpture from its disrespected state, appeared Donatello, or (to give him his true name) Donato di Bardi, born at Florence in 1383. There had, indeed, been some efforts made even a century before his time towards the same laudable purpose; and, of those engaged therein, we may mention the names of Nicholas Pisano, who was designated by his countrymen *Ritrovatore del buon gusto nella Scultura*, ‘Restorer of fine taste in Sculpture,’ and his son, Giovanni Pisano, who was one of the best artists of his age, and whose works are numerous at Pisa his country; Angelo and Agostino Sanese, who died about 1340; Andre Ugolino died 1345; Andre Orcagna, surnamed *Bufalmaco*, who was an excellent artist, for his time, and died 1389, as did also André Pisani, the author of several good

figures in the church of Santa Maria del Fiore at Florence. Michelo Aignani died in 1400; Jac. della Quercia in 1418; N. di Banco in 1421; Luca della Robbia in 1442. This man possessed the means of overlaying his productions in terra cotta with a fine varnish, which circumstance caused them to be much sought for throughout Europe.

Donato was one of the greatest men concerned in the revival of the art of sculpture. It was one of his figures, a bronze statue of St. Mark, that Michel Angiolo is said to have addressed in these emphatic words—'Marco, per che non mi parli?' 'Mark, why do you not speak to me?' Another remarkable production of his hand is the figure of an old man with his head shaved, to be found at Florence, and called the Tondù or bald man. Donato died in 1466, at the advanced age of eighty-three. Amongst his most favorite pupils we may class:—Bertolde, a Florentine; Didier da Settignano, a most promising artist, who died at the early age of twenty-eight; Vellano of Padua; Rossellino; F. Camilliani, and M. Michelozzi. Simon, brother of Donatello, also followed his manner. This artist was summoned to Rome by the pope Eugenius IV., and made one of the bronze gates of St. Peter's. Prato, Rimini, Florence, and Arezzo possess sundry works of Simon. Benedetto di Majana flourished about 1460. André Pisano, commonly called Pisanello, a pupil of André del Castagno for painting, acquired considerable reputation in sculpture, more particularly distinguishing himself in the execution of medals. We also find, Giovanni Antonio Amadei, died 1470; A. Rossellino, called Gamberelli, 1490; G. Vellano, 1493; A. Abondio, 1520; G. F. Rustichio, 1528; A. Contucci, 1529; A. R. Briosco, 1532; G. Sanctacroce, 1537; A. Rusto, called Bambaja, about 1538; L. Lotto, called Lorenzetto, 1541 (according to Vasari, this was the first restorer of the antique statues); B. Agnolo, 1543; P. Clemente, 1548; G. Campagna and L. Leoni, about 1550; S. Mosca, 1554; A. Begarelli and G. Bandini, called Benedetto, about 1555, with A. Zotto; D. Cattaneo, A. Minganti, and F. Mosca, called Moschino, 1560; A. Berrugineta, 1561; A. and L. Calamech, 1564. André Verocchio is particularly known through the celebrity of his pupils Pierre Perugin and Lionardo da Vinci—of the latter of whom becoming jealous, he quitted painting altogether and attached himself wholly to sculpture. Jean François Rustici, born at Florence about 1470, was an élève of Verocchio, and afterwards of Lionardo da Vinci, who taught him the methods of modelling, of carving in marble, and casting in bronze. Rustici was invited to Paris by Francis I., who employed him to work from the model of a horse twice as large as life, and his performance when finished was to have borne a statue of the king himself; but that prince's death suspended the undertaking. Rustici died at Paris in 1550.

We now cite the name of Michel Angiolo Buonarroti, one of the very greatest names of modern art, whether regarded as sculptor, painter, or architect. He was born in 1474 and died in 1564, at the advanced age of ninety. The pro-

ductions of his chisel enriched several of the Italian cities. The beautiful group of Notre Dame de Pitié in the basilica of St. Peter's; the colossal statue of Julius II.; the three figures executed for the tomb of that pontiff, the centre one of which is the far famed Moses; the David combating Goliath; the victory at Florence:—these, among many others, bear abundant evidence of the transcendent skill of the artist. The statue representing Night, upon the tomb of Julian de Medicis, is considered by Keyssler worthy of a parallel with the most admired works of antiquity. Giacomo Tatti, better known under the title of Sansovino (the place where he was born), was architect likewise as well as sculptor. See ARCHITECTURE. This artist made at Rome (at the same time with two other able sculptors) a model of the famous antique group of the Laocoon to cast in bronze. Sansovino's was esteemed the best, on the authority of Raffaele. The lodge of St. Mark's Place at Venice is the work of the same artist, who placed in niches four bronze statues representing Palas, Apollo, Mercury, and Peace. One of his celebrated performances (the greater part of which are at Rome and Florence) was a marble statue of Bacchus, lost in the fire at the grand duke's palace in 1762: an engraving of it remains in the third volume of the Musée de Florence. The Virgin in the church of St. Mark, and a figure St. John Baptist, in that of Casa Grandia, pass for the chefs d'œuvre of this master. He died at Venice in 1570, eighty-three years old. Baccio Bandinelli, born at Florence in 1487, had for his first master his father, who was a goldsmith, but afterwards received instructions from Rustici. He was a good designer; his manner was learned and striking, and bore some resemblance to that of Michel Angiolo. There is, however, in the Pitti palace, a Bacchus in marble treated in a manner very soft and graceful. To Bandinelli was imputed the heavy charge of his having been seduced by jealousy to destroy the cartoons of Michel Angiolo and of Lionardo da Vinci. It was he who restored, in terra cotta, the right arm of the Laocoon, the original having been lost. Skilful in anatomy, he was accused of having been too fond of displaying that knowledge. He died in 1559. Amongst his most renowned pupils were:—P. da Vinci (nephew of Lionardo), died 1570; B. Ammanati, born at Florence in 1511; V. Rossi and J. B. D. Lorenzi, who sculptured, at Florence, at the tomb of Michel Angiolo, a figure of painting, together with the bust of that great artist. Benvenuto Cellini was born at Florence in 1500, and died in 1570. He was painter, goldsmith, and sculptor. He also was summoned to Paris by Francis I. Propertia Rossi is one of the few female names that we meet with among the sculptors of this early date. This interesting woman lays claim to notice in several ways. She studied and well understood the laws of perspective and architecture; nor did the science of music escape her observation. She likewise executed some pretty drawings in pen and ink. Her fame as a sculptor rests principally on a bust of the count Guido, and upon two angels in marble with which she decorated the façade of the church

of St. Petronia. This poor young creature fell a victim to the chagrin arising from a hopeless attachment, in 1530. D. Ricciarelli, called Volterra (the town wherein he was born, about 1509), was the friend and imitator of Michel Angiolo. L. Ricciarelli, his nephew, was likewise a good sculptor. Amongst his other élèves were:—M. Alberti, of Florence; F. da San Vito, of Rome; J. Mazzoni; Pelegrin, of Bologna, called Tibaldi; M. di Sienne; J. P. Rossetti, of Volterra; and D. B. da Cormigliano, of Pistoia. The year 1576 witnessed the death of Gaspard Bicerra. V. Dante, who executed the admired statue of pope Julius II., died in 1576. G. D. D'Auria in 1585. A. Fontana in 1587. P. Scavezzi in 1590. G. B. Lorenzi in 1593. G. Della Porta, born at Milan, studied under his uncle, and cultivated the art of drawing at Geneva from the lessons of Pérm del Vaga. In this town he also produced several works in sculpture. At Rome, he restored several antiques, particularly the legs of the Farnese Hercules, the work of the Athenian Glycon. These were esteemed so very beautiful that, although the antique limbs were subsequently found, Michel Angiolo expressed himself against their being restored. The pupils of Della Porta were:—G. Tedesco, who executed small statues, and ornaments in basso-rilievo, and B. Torregiani, of Bologna, who died 1596. There were also in his own family several other renowned sculptors, such as the Chevaliers J. B. and T. Della Porta. —F. Ferrucci, surnamed Tadla, lived towards the middle of the sixteenth century.

J. L. Bernini, born at Naples in 1598, was a great architect as well as sculptor. A. Algardi, born at Bologna in 1602, and died in 1654, studied painting at first in the school of Ludovico Caracci, but he afterwards went over to the sister art. He could not, however, divest himself of his old attachment; and accordingly we find him praised by some and blamed by others for endeavouring to add to the generally understood beauties of sculpture some of the effects previously considered proper to painting. Algardi, however, formed a school, which has produced D. Guidi, J. M. Baratta, J. Peroni, H. Ferrata, G. Brunelli, and C. Mazza, of Bologna. Neither should we omit to state that Algardi likewise occupied himself with engraving. A. Raggi, called the Lombard, was born in 1624 at Vicomorto, on the confines of the Milanese territory, and was successively the pupil of Algardi and Bernini. His works are numerous at Rome. J. Gonnelli, surnamed the blind man of Cambassi (the name of his country in Tuscany), studied successfully under Peter Tacca. Having lost his sight, at the early age of twenty, he nevertheless did not abandon the practice of his art, but executed several figures in terra cotta, guided by tact alone. It is thus that he made a statue of Cosmo, first grand duke of Tuscany. J. B. Tubi saw the light at Rome in 1630. This man appears to have practised chiefly in France, where he was admitted into the Royal Academy in 1663. He made a beautiful copy of the group of the Laocoon, which ornaments one of the apartments in the palace of Trianon. He died at Paris in 1700. C.

Rusconi was born at Milan in 1658, where he learnt sculpture, and afterwards proceeded to Rome in order to perfect himself therein. Passionately devoted to the antique, he copied the Antinous, the Rape of Proserpine, the Belvidere Apollo, and twice the Farnese Hercules. The Apollo and one of the latter figures were brought over to this country. The disciples of Rusconi were J. Rusconi and J. B. Maini, both artists of reputation. Angelo Rossi follows, distinguished both as a sculptor and drawer. His claim to merit is more particularly founded on the excellence of his bassi rilievi. Not only has he surpassed all his predecessors in that particular walk, but has served as a model to those succeeding him. Rossi did not treat bassi rilievi in the manner of Algardi, who gave a considerable projection to the figures, but observed that demi-relief which certainly approaches very near to the method taken by the ancients. His basso rilievo made for the tomb of Alexander VIII., and representing several canonisations made by that pope, is regarded as the most exquisite of all the ornaments of a similar character which adorn the basilica of St. Peter's. He left only one pupil of any note—namely, F. Moderati, of Milan, of whom there are extant two stucco figures of Venus in the palace of the apostolical chancery at Rome. G. G. Zumbo, born at Syracuse in 1656, became a sculptor without any other aid than that of his own genius. He used in all his works no other substance than colored wax, which, however, he prepared in a peculiar manner. Warin and Le Bel had possessed, it is true, this secret before him: but it was reserved for Zumbo to bring it to perfection. It was this artist who executed for the grand duke of Tuscany the famous subject known by the name of La Corruzione: this singular composition consists of five figures, of which the first is a man dying, the second a dead corpse, the third a body beginning to decay, the fourth, another in a further stage of decomposition, and the fifth an appalling spectacle of complete putrefaction! Great horror is inspired by the sight of these objects, owing to the truth and correctness which the artist has thrown into their delineation. He died in France in 1701.

The following names will complete our catalogue of Italian sculptors: of their peculiar merits little is now known.—A. Vittoria, died 1608; A. G. Da Faenza, 1609; F. Cordine, surnamed Franciosino, 1612; O. Censore, 1622; C. Garafaglia, 1630; C. Molli and P. G. Tacca, 1640; F. Mocchi, 1646; F. Agnesini and P. Bacci, about 1650; G. B. Bissoni, 1657; F. Baratta, 1666; G. B. Volpi, about 1670; M. Maglia, 1768; L. Bernini, 1682; P. P. Nardini, 1684; F. Ferrata, 1686; L. Ottoni, about 1691; G. B. Foggini, about 1700; G. Mazzoli, 1725; M. Benzi and G. Mazza, 1740; P. Mazetti, 1744; A. Corradini, 1752; and, to conclude, F. Schiavino, 1765. The most celebrated name connected in our day with Italian sculpture is that of the lamented Canova. Thorwaldsen, however, although by country a Dane, has been accustomed so long to practise in Italy, that his name may be permitted to stand by the great one just mention'd.¹

We now proceed to give a list of those sculptors who have distinguished themselves in the neighbouring kingdom of *France*. The first of these, respecting whom their countrymen have much cause to boast, is Jean Goujon, of Paris. The date of his birth is unknown; nor are there many authentic circumstances related of his life. He must, nevertheless, be regarded as the restorer of sculpture in France. One of his most considerable performances is the fountain of Nymphs, called the Innocents, begun in the reign of Francis I., and completed under that of Henry II., in 1550. Goujon also distinguished himself, not only as an architect but as an engraver of medals. This artist was slain, as a huguenot, on the bloody festival of St. Bartholomew, 1572. G. Pilon, of Paris, was the author of various works, chiefly distributed about the churches of that city, which may be said to possess the principle of grace rather than that of correctness. The town of Douai gave birth to Jean de Bologne, whose works enriched several of the Italian cities. This artist wrought perhaps the most colossal figure that owes its origin to modern art. It is named, we know not why, the Appennine, and represents Jupiter Pluvius seated. It is so large that within the head is a capacious pigeon-house, whilst the hollow of the trunk is occupied by a grotto adorned with shells and jets d'eau. John of Bologna wrought with great skill both in marble and bronze, and his naked figures are particularly elegant and graceful. Born in 1524, he died in 1608. Amongst the great body of his pupils we may select P. Francoville; Anzireville; Adrian, a Fleming; Moca; A. Susini; F. Della Bella, and Gasper his brother, both of Florence; and Pierre Tacca. The latter is, perhaps, the most celebrated of any, and was engaged to complete all the works left unfinished at his master's death; among which was the horse which bore the statue of Henry IV., on the Pont Neuf at Paris. He died 1640. S. Guillin was born at Paris in 1581. His father was a sculptor, known by the appellation of Père Cambrai, the place of his birth. This man, having taught his son the first rudiments of his art, sent him to perfect himself therein at Rome. The greater part of Guillin's works were destroyed, together with those of other artists, during the Revolution. His style may, however, be perceived from the figures ornamenting the portals of St. Gervas, of the Sorbonne, and of the Feuillans. His followers were Anguier, Hutinot, and Jacques Sarrasin; which latter is well known among French sculptors. He was born at Noyon, but sojourned eighteen years at Rome. The performances of Sarrasin manifest almost throughout a correct taste; but his chef-d'œuvre is the group of Caryatides, decorating the grand pavilion of the old Louvre, figures, although colossal, still light and delicate. The group of Romulus and Remus, at Versailles, is likewise worthy of distinction. The school of Sarrasin has produced many excellent artists; among whom we may cite Lerambert, Le Gros, and J. Burette, of Paris, who died 1699. François Anguier, born at Eu in 1604, wrought under Simon Guillin, and under Algardi at Rome. Sentiment appears to have

been his strong point, the expression of which was before his time but comparatively little known to the French statuariers. Paris received the ornament of many of this sculptor's works, but the most distinguished was the superb mausoleum of the Duc de Montmorency, beheaded at Toulouse. This monument is to be seen at Moulins, in the church of St. Mary. M. Anguier, brother of the preceding, should be classed rather amongst Italian sculptors, since he was born at Rome, and studied in the school of Algardi. The same may be said of Théodon, who died at Paris about 1680. L. Lerambert, born at Paris in 1614, preceded but a little Peter Paul Puget, painter, architect, and sculptor, born at Marseilles in 1622. Of all the performances of this celebrated artist, the most admired are, a basso-relievo representing the Assumption, at Mantua; the famous statue of Milo, placed in the park at Versailles: the rape of Andromeda by Perseus; and the Alexander before Diogenes, at Versailles; his last work, also, which was left unfinished, and is at Marseilles, has been highly esteemed; its subject is the plague of Milan. Puget died 1694. Gaspard and Balthazar Marsy were born at Cambrai, the former 1624, the latter 1628. They were first educated by their father, and did not go to Paris until 1648, where they received instructions, successively, of Sarrasin, Anguier, and Buyster. These two brothers generally worked in concert; and a favorable idea of their talent may be gained from the group of tritons giving drink to the horses of the sun, in the baths of Apollo at Versailles. E. Le Hongre, born at Paris 1628, studied under Sarrasin. Of all the sculptors employed during the splendid reign of Louis XIV. the one who has left behind him the highest reputation is François Girardon, born in 1630 at Troyes in Champagne, where he acquired the first elements of his art from studying the beautiful sculptures which then adorned his native town. After having passed some time at Rome, he repaired to Paris, where his talents were duly encouraged. The production most contributing to his fame is the mausoleum of Richelieu, in the church of Sorbonne. The equestrian statue of Louis XIV., in the Place Vendôme, is another of his finest works. But, after all, the strongest point in the genius of Girardon is his facility and skill in modelling. Among the number of his pupils were Frémin, Nourrisson, Charpentier, Jean Joly of Troyes, and P. Granier, born near Montpellier in 1635. M. Van den Bogaert, surnamed Desjardins, although a Dutchman by birth (born at Breda, 1640), takes rank among French artists, since he established himself when very young at Paris, where he remained. A. Coysevox, of Spanish origin, was born at Lyons in 1640. His statues, portraits, and bassi-relievi, have embellished Paris, Versailles, Sceaux, and Chantilly. He particularly excelled in representing horses, his skill in which respect is abundantly manifested by the two groups of those animals placed at the principal entrance gate of the Tuileries. C. Vancèlève was born at Paris in 1645, and studied under François Anguier. A. Flamen, born at St. Omer in 1647, had for his master Gaspard

Marsy. P. Francville, a native of Cambrai, was remarkable for purity of taste. Pierre Le Gros is a name which served to illustrate greatly the art of sculpture during the seventeenth century. He was born at Paris 1656, but did not long abide among his countrymen, having repaired to Rome at the age of ten years. N. Coustou, born 1658, excelled in the art of modelling to such a degree as rarely to use the pencil. His draperies are rich and flowing; his style chaste and delicate; but he does not seem to have caught the genuine spirit of the antique. M. Chabry, a pupil of Puget, was born in 1660. The chief of his performances embellish the town of Lyons. P. Le Pautre was born in the same year. His name is immortalised in France by the group at the Tuilleries of Æneas bearing the body of his father Anchises. J. L. Lemoyne, born at Paris 1665, was an élève of Coysevox. R. Le Lorrain, born in 1666, was distinguished for scientific style, elegant and piquant expression, and masterly handling of the marble. He formed two sculptors, whose productions reflect honor on his tutoring. These were Lemoyne and Pigalle. A. Cayot was born in 1667, and wrought fourteen years under Vanelève. L. Magnière died in 1700. P. Mazeline in 1708. F. Coudrai, pupil of Coysevox, and who became first sculptor to the king of Prussia, died 1727. J. Thierry, born at Lyons 1669, was invited to Spain, where he wrought many years in marble, bronze, and lead, for the gardens and palace of St. Ildefonso. R. Frémin, born at Paris in 1672, worked at Rome in the school of the chevalier Bernini. C. Falconet was born at Lyons in 1671, and died at Paris 1762. L'Amoureux, born in 1674, was an élève of Nicolas Coustou. His native city, Lyons, possesses his best productions. G. Coustou, born at Lyons 1678, was a pupil of Coysevox, his uncle. He was brother of Nicolas. His most celebrated works are—the pediment of the Chateau d'eau, opposite the Palais Royal, and the two fine horses placed at the entrance of the Champs Elysées. J. Rousseau, élève of Nicolas Coustou, born in 1681, became first sculptor to the king of Spain, and died at Madrid. A. Vassé was born at Seine, in Provence, in 1683. Dandré Bardon commends, among others, his sculpture in the gate of the Capuchins at Paris. F. Dumont, born at Paris in 1688, was the sculptor of the two figures of St. John and St. Joseph, as well as the two corresponding ones of St. Peter and St. Paul, which decorate the portal of St. Sulpice. The Dominicans of Lisle have also a fine specimen of this sculptor's ability, in the mausoleum of Louis de Melun. G. Bouchardon, born in 1698, belongs to the school of Guillaume Coustou. In the construction of the fountain in the Rue de Grenelle at Paris, he has displayed his talent as an architect as well as statuary; and another performance well worthy of eulogy is the equestrian statue of Louis XV., erected in the place of that name, and destroyed in 1792. The horse was a perfect chef-d'œuvre. The expression of this artist was, generally speaking, rather sweet than sublime—his ideas learned rather than bold. L. S. Adam, born at Nancy in 1700, after having studied at Paris under the

most able masters, repaired to Rome, where he was employed to restore, among others, twelve antique statues, exhumed from the ruins of the palace of Marius. Two colossal figures by this artist, representing the Seine and the Marne, decorate the head of the cascade at St. Cloud. C. Francini was born at Strasburgh in 1701. Jean Baptiste, son of Jean Louis Lemoyne, was born at Paris in 1704. His two most famous works are a monument dedicated to Louis XV. in 1744, by the states of Bretagne, and the colossal equestrian statue of the same prince at Bordeaux. Lemoyne was likewise author of the mausoleum of Mignard (a very rich piece of sculpture), as also of that of Crebillon. René Michel Slodtz, better known by the appellation of Michel-Ange, was born at Paris in 1705, and demands the praise due to a style grand although simple, and to a skill in representing draperies which has, perhaps, seldom found a parallel in modern art. N. S. Adam (brother to the artist of that name before mentioned) was born at Nancy in 1705. A basso-relievo in the chapel at Versailles, representing the martyrdom of St. Victoire, is amongst the number of his most successful works. He took part with his brother in the principal group of the basin at Versailles. F. G. Adam, another brother of the preceding, was born at Nancy in 1710. J. B. Pigalle, born at Paris in 1714, was a pupil of Le Lorrain, and Lemoyne the father. This sculptor wrought at Lyons a statue of Mercury, which alone sufficed to raise his reputation. The group of infants is also fine, embellishing the façade of St. Louis at the Louvre—more particularly the naïve figure of an infant holding a cage from which a bird has escaped. The mausoleum of marshal Saxe at Strasburgh, and the pedestrian statue of Louis XV. in bronze, erected at Rheims, are both regarded as chefs-d'œuvre of execution. Amongst the pupils of this artist, we may particularize M. M. Mouchy (his nephew), Moette, Lebrun, Bocquet, and Dupre, which latter passed his life very obscurely, lending his talents to more fortunate artists, who thus fathered works above their own ability. J. F. J. Saly, born at Valenciennes in 1717, was author of a pedestrian statue of Louis XV., placed in his native town. His 'second best' was an equestrian statue in bronze of Christian IV., king of Denmark, which was erected at Copenhagen.

It may not be uninteresting to the reader to possess the following list of French sculptors who were flourishing at the commencement of the present century, and many of whom are, no doubt, still pursuing their honorable avocation:—J. L. Boyer, élève of Allegrin; L. F. Boizot; J. B. Budelot, and — Cartellier, both pupils of Bridan the elder; T. N. Delaistre, pupil of Lecomte and of Vassé; he made the statue of Phocion at the Conservative Senate; J. Demontreuil; E. J. Dumont, élève of Pajou; Esparcieux, author of a well known bust of Raynal; Jopiere, pupil of Berruer, and author of an ivory group representing the death of Lucretia; J. P. Le Sueur; P. Méraud, of the school of Bouchardon; Monot, élève of Claude Vassé; Petitot; C. Ramey; P. Roland, pupil of Pajou, the executor of a marble bust of admiral Ruyter, for the

gallery of the Tuileries; Thierard, pupil of Barthélimi; J. B. Stouf, pupil of Coustou; Boquet; P. C. Bridan, the younger, author of a fine bust of the duke of Marlborough; Brunet; Chardin; J. M. Renaud; Mouchy, author of a marble bust of the Duc de Sully for the gallery of the Tuileries; F. Masson; Chaudet, pupil of Stouf, and author of the colossal bust of the emperor Napoleon, formerly in the hall of the Corps Législatif, and of a bust of the empress; M. Clodion; Comolli, a Piedmontese; C. L. Corbet, pupil of Berruer; J. L. Couasnon; J. C. N. Lucas; J. F. J. Leriche, superintendent of the sculpture at the manufactory of Sèvres; F. F. Lemot; Dumont; Lange, of Toulouse; E. P. A. Gois, and his son and pupil; Dejoux; Salvage; Renaud; P. N. Beauvallet; Blaise, author of a fine marble bust of Giulio Romano; Montpellier, pupil of Lemoyne; Lorta, pupil of Bridan, père; Foucou; D'Egenviller; Deseine; Cardelli; A. Pajou, pupil of Coustou; Houdon; P. Roland; Allegrin; and, finally, Moëtte, pupil of Pigalle. Nor has the gentler sex forborne to pay its devoirs to this interesting art. Madame Julia Charpentier, a pupil of Pajou; madame Antoniette G. Desfont, pupil of Carlini; and madame Milot, may be particularised with high commendation.

A wide field for observation presents itself in turning to the catalogue of *Spanish* sculptors, and we regret that our confined limits will not allow us to dwell on it as the theme deserves! We shall, however, take a rapid glance over the principal names, commencing with that of Aparicio, who flourished in the eleventh century, and was commissioned by Don Sancho the Great to construct the shrine of St. Millan, still preserved in the monastery of Yuso, and presenting, if we consider its remote date, great merit both of grace and proportion. Aparicio was assisted in his work by Rodolphe. About the same time flourished Mateo, sculptor and architect. Bartolomé made, in 1278, nine stone statues, of the size of life, for the gate of the cathedral church of Tarragona. J. Castayls, of Barcelona, lived towards the end of the fourteenth century, as did also Annrique, who executed the reliefs of the tomb of Don Henry II. F. Gonzalez flourished in 1399, and Centellas in 1410. A. and F. Diaz, A. F. de Sahagun, A. Rodriguez, A. Gonzalez, A. Martinez, Alvar Rodriguez, Christophe Rodriguez, J. Fernandez, F. Garcia, F., J. and M. Sanchez, J. Alfonso, John Fernandez, John Rodriguez, M. Ruiz, P. Gutierrez Nieto, together with P. and A. Lopez, were all employed, from 1418 to 1425, in executing the ornaments of the principal façade and tower of the cathedral church of Toledo. To this number we may add A. Gomez, James Rodriguez, Garcia Martinez, and John Ruiz. The marble altar-piece of the grand altar of the church of Tarragona was commenced in 1426 by P. Juan, and finished afterwards by his associate G. De La Mota. A. De Lima flourished at Toledo in 1459, as did also F. De Las Arenas, F. Garcia, &c. The sculptors belonging to the last half of the fifteenth century are:—J. Castellon, sculptor and goldsmith of Valencia, and James his son; the works of both are consider-

ably valued. J. Aleman, of Toledo, eminent for the beautiful attitudes and draperies of his statues. G. De Siloe, who obtained great reputation at Burgos from his tomb of king John II., and of the Infant, Don Alfonso. Paul Ortiz, one of the most famous names in the circle of Spanish art, and the most considerable of the restorers of sculpture. Andres, who wrought in conjunction with Nicolas:—their performances, as also those of J. De La Cruz, have a Gothic character, but display much facility of execution. B. De Ortega must not be forgotten amongst the masters of Seville, nor (still more particularly) Dancart and his pupil Marco.

Amongst the most eminent of Spanish sculptors who adorned the beginning of the sixteenth century may be ranked A. De Fries, B. J. Moran, Christiano, J. De Guadalupe, F. De Aranda, F. De Ciudad, Guillemín Digante, J. De Aranda, J. De Augos, J. Peti, P. De St. Michel, Rodrigo, Salas, Solorzano, J. De Lanos, Laberrox, and Luxan, each of whom contributed more or less to the advancement of the art generally, and in particular to the sculptures embellishing both exterior and interior, and to the beautiful shrine of the cathedral of Toledo. In the course of the same half century—namely, from 1500 to 1550, appeared P. Millan, and his son John; J. Olotzaga, sculptor and architect; F. De Lara; G. Orozco; S. De Aponte, whose productions manifest a most refined taste; D. Micier, pupil of Dancart; J. Perez, of Seville, author of several colossal figures for the cathedral of that city; John, pupil of G. F. Aleman; J. Morlanes, who first among the Spanish sculptors adopted the style of Albert Durer, which subsequently became general; B. De Aguilar and G. De Cardenas, who were selected, with F. De Sahagun and P. Izquierdo, to adorn with sculptures the ecclesiastical theatre of the University of Alcázar de Henarez; R. Aleman, remarkable for his grotesque compositions; J. Millan, son and pupil of Peter; B. Ordóñez, of Barcelona, one of the most celebrated artists of his time, particularly in bassi-relievi of marble; &c. &c. We must not omit the famous Alfonso Berruguete, who likewise adorned this period as sculptor, painter, and architect. This illustrious artist, after having long sojourned at Rome, where he studied under Vasari and Buonarroti, returned to his native country; and was the first to establish there perfect correctness of drawing, the most beautiful proportions of the human body, antique grandeur and expression—in short, all which gives life to marble or to canvas. Saragossa, Granada, Valladolid, and Salamanca, as well as the capital itself, all contain evidences of the talent of Berruguete, whose return threw into the shade the artist who had previously occupied the largest share of public attention, Philip De Vignani.

The interval from 1550 to 1600 was not fruitful with respect to the followers of sculpture in Spain; there are, however, a few great names to be selected. Among these are:—J. de Navas, pupil of Berruguete, with J. de Valencia, from the same school. P. de Salamanca had the honor of obtaining, in 1558, a royal edict whereby the art of sculpture was elevated from the me-

chanical vocations to the rank of a liberal profession. Christopher of Salamanca deserves also honorable notice. But the most celebrated artist belonging to this era was Paul de Cespedes, born at Cordova, and one of the first of Spanish artists. Not only did he successively practise painting, sculpture, and architecture, but found time also to court the muse of poetry. The elegance and purity of his drawings are admirable, as is the noble air of his figures. He was skilful in anatomy, had a perfect knowledge of chiaro-scuro, and excelled in coloring. The seventeenth century produced A. Sardino and G. Hernandez or Fernandez: the latter of whom embellished with his works Madrid, Salamanca, and, above all, Valladolid. This artist followed the impressive style of Michel Angiolo. He had the assistance of his kinsman and pupil J. F. de Hibaerne. A. Pugol, of Catalonia, composed and designed with great spirit and taste, and his draperies are particularly admirable. E. Pereyra, a Portuguese, who settled early in Spain, left, among other works, a statue of St. Bruno at Madrid, eminent for character and expression. J. M. Montagnez had the talent to give his figures expressive and natural attitudes. A. Cano, born at Grenada in 1601, was an admirable sculptor; abundant proof of which is to be found in the temples of Seville, Cordova, Madrid, &c. L. F. de la Vega, born in Asturias, died at Oviedo in 1675. Don J. de Rebengo, of Saragossa, obtained a high reputation for his little figures in wax, which were remarkable for their grace and finish. J. de Mora died in 1725. Peter Roldan, and Louis his son, were both greatly esteemed among the sculptors of their day. The eighteenth century gave birth in Spain to several excellent sculptors. Don P. Duque Cornejo of Seville, and Don J. de Hiestrosa, both deserve favorable notice. A. Salvador, surnamed the Roman, died in 1766. L. S. Carmona, in 1767. Philip de Castro, of Galicia, is a most prominent artist of this era, and contributed greatly to spread the principles of fine taste throughout his country. He died in 1775. F. Gutierrez, in 1782. Besides these we may particularise Zarcillo y Alcaraz, J. P. de Mena, C. Salas, and E. Alvarez. For this list of Spanish artists we are indebted to the work published at Madrid, in 1800, in 6 vols. 12mo., entitled *Diccionario Historico de los mas Ilustres Profesores de las Bellas Artes en Espagna*, compuesto por Don Juan Augustin Cean Bermudez.

We select the following names from the list of sculptors who have rendered themselves celebrated in *Germany, Holland, or Russia*. F. Duquesnoi, born at Brussels in 1594, was surnamed by the Italians the Fleming, by which appellation he is best known. This artist was most successful in the representation of infants, in which department of sculpture he has been rarely excelled. P. Buyster, born at Brussels in 1595, passed the greater part of his life in France, where he died at the age of eighty-four. Sebastian Slodtz, born at Anvers 1655, went to perfect himself in the French school of Girardon. A. Quellius, also of Anvers, embellished his native city with many admirable productions. G. Van

Obstal died at Paris in 1668. Albert Durer, so famous in other branches of the fine arts, excelled also in sculpture, both in stone and wood. L. Kern, and his son J. J. Kern, were also celebrated in their day. The latter practised a long while in England where he died in 1668. G. Leygebe, born in 1630 in Silesia, died at Berlin in 1683, in possession of the singular art of cutting beautiful little equestrian statues out of large ingots of iron. One of his most esteemed performances of this kind is at Dresden, and represents Charles II. of England, as the Chevalier St. George. M. Rauchmüller just preceded A. de Schlüter, of Hamburgh, who learnt the art of sculpture at Dantzic, and afterwards repaired to Rome, where he attached himself to the manner of Michel Angiolo. B. Permoser, who died in 1732, is better known by his Christian name, Balthazar. F. X. Messerschmidt adorned Vienna, his native town, with many excellent performances. C. Osner, of Nürnberg, died at Petersburg in 1704. The count Rastrelli, of Italian origin, Zwenkof, Dunker, and Stahlmeyer, of Vienna, all practised in Russia; as likewise did Domacht, of Swiss origin. Schwartz, of Dresden, also settled at Petersburg; nor must we omit to notice a Russian artist of the name of Pawlof, who, having studied under Dunker, resorted to Paris for further instruction. To this nomenclature we may add the names of G. Petel, who died in 1636; N. Millich, in or about 1669; M. Barthel in 1674; G. G. Weyhenmeyer in 1715; A. de Papenhoren, about 1745; and A. Nahl, V. Sonnenschein, and Ohnmacht, who were living at the commencement of the present century.

In our own country sculpture has not been very successfully practised until late years. The reader is, however, congratulated on the chance now exhibited of this department of art, like painting, reaching a high point of excellence in these islands. Several admirable modern sculptors elevate with their productions the artistical reputation of the British empire, and we can reflect with pride on such names as Nollekins, Wilton, Gibbons, Scheemaker, and Banks. The following are among the most eminent of our late or living sculptors:—J. Bacon, E. H. Bailey, R. A., J. G. Bubb, F. L. Chantry, R. A., J. Flaxman, R. A., professor of sculpture to the Royal Academy, S. V. and L. Gahagan, G. Garrard, A. R. A., J. Henning, C. Rossi, R. A., Rouw (modeller of gems and cameos), P. Turnere, and R. Westmacott, R. A. Nor must we omit to mention the fair sculptor, Miss C. Adams.

In the *modern practice of the art of sculpture* the greatest name is certainly that of Michel Angiolo. 'He considered,' says Mr. Duppa, 'sculpture as his profession, and his studies throughout his whole life were more particularly directed to it, than to painting or to architecture. His first work of celebrity was a group of a Madonna with a dead Christ, called in Italian la Pietà. The subject, in its nature, is impressive, and the composition is felt with appropriate simplicity; and, of all his works, it is that which seems to have cost him the most laborious attention. With Michel Angiolo expression and

character was a primary consideration: and, although he set the antique sculpture before him as an example and a guide, this marked distinction is to be taken between his view of the subject and that of the ancients; he made ideal beauty and form subservient to expression; they, on the contrary, made expression and animation subservient to form. The *Laocoon** and his two sons have more expression in their countenance than all the other antique statues united; yet Sir Joshua Reynolds has observed that, even in this instance, there is only the general expression of pain, and that the pain is still more strongly expressed by the writhing and contortion of the body than by the features. In consulting all the examples which are left of ancient sculpture, it would seem, they established it as a general principle that, to preserve the most perfect beauty, in its most perfect state, the passions were not to be expressed; all of which may be supposed, in some degree, to produce distortion and deformity in the features of the face. The group of the boxers is a remarkable instance in favor of this opinion; they are engaged in the most animated action with the greatest serenity of countenance; and, without attributes, it would be difficult to discriminate between the Juno or the Minerva, the Bacchus or the Meleager; nevertheless, in the *Apollo Pythius*, there is a graceful, negligent, and animated air, and in the *Discobolus* a vulgar eagerness of expression, which deserves to be remarked, to show the nice discrimination of character which the ancients were capable of making when the expression was not incompatible with what they considered as a higher excellence. The *Bacchus* of Michel Angiolo is an attempt to unite a degree of drunkenness with his character; but, inasmuch as that effect is produced, both the sculpture and the deity are degraded: of this character there are several examples in antique gems, but, however skillful the representation may be in so small a size as a gem, it is certainly not a fit subject for a statue of the proportion of life. The two female figures composing part of the present monument of Julius II. are simple and elegant; and those of *Morning* and *Night*, in the *Lorenzo Chapel*, are composed with great grandeur of design. The works of Michel Angiolo have always a strong and marked character of their own, his thoughts are elevated, and his figures are conceived with dignity; and, if he wants the purity and correctness of the antique (which he certainly does, in an eminent degree), his faults never degrade him into feebleness; when he is

not sublime he is not insipid; the sentiment of aggrandising his subject ever prevails, and, however he may fail in the execution, his works are still entitled to the first rank among modern productions in sculpture. Barry has truly observed, when speaking of his statue of *Moses*, that, although that figure may be considered as rather extravagant, yet it contains such proofs of knowledge and capacity as will ever make his name sacred among artists; and this criticism may be extended with equal propriety to his other works, whatever may be their faults. Michel Angiolo was of the middle stature, bony in his make, and rather spare, although broad over the shoulders. He had a good complexion; his forehead was square, and somewhat projecting; his eyes rather small, of a hazel color, and on his brows but little hair: his nose was flat, being disfigured by a blow he received from *Torrigiano*, a contemporary student with Michel Angiolo, and a sculptor of great merit, but a proud, inconsiderate, and ungovernable character.

Bevenuto Cellini, in his own life, has recorded this affair with Michel Angiolo, as it was related to him by *Torrigiano* himself:—‘His conversation one day happened to turn upon Michel Angiolo Buonarroti, on seeing a drawing of mine made from the celebrated cartoon of the *Battle of Pisa*. ‘This Buonarroti and I,’ said *Torrigiano*, ‘when we were young men, went to study in the church of the Carmelites, in the chapel of *Masaccio*; and it was customary with Buonarroti to rally those who were learning to draw there. One day, amongst others, a sarcasm of his having stung me to the quick, I was extremely irritated, and, clutching my fist, gave him such a violent blow upon his nose, that I felt the cartilage yield as if it had been made of paste, and the mark I then gave him he will carry to his grave.’ B. Cellini’s account of *Torrigiano* is, ‘That he was a handsome man, but of consummate assurance, having rather the air of a bravo than a sculptor: above all, his strange gestures and his sonorous voice, with a manner of knitting his brows enough to frighten any man who saw him, gave him a most tremendous appearance, and he was continually talking of his great feats amongst those bears of Englishmen whose country he had but recently left.’ We are indebted to *Torrigiano* for the monument of *Henry VII.* in *Westminster Abbey*, finished, according to *Stow*, in 1519, and for which the sculptor received £1000. His ungovernable and restless habits often precipitated him into great difficulties, and the circumstances of his death furnish a melancholy instance of the vicissitudes of life, and the baneful effects of inquisitorial jurisprudence.

‘Upon leaving England he visited Spain, and, after distinguishing himself by many excellent works, was employed by the duke *D’Arcus* to execute in marble a *Madonna* and infant *Christ*, of the size of nature, with high promises to be rewarded in proportion to his merit. As the duke was a grandee of the first rank, *Torrigiano* flattered himself with a proportional expectation. After much study and application he completed his work to his own satisfaction; and his performance was seen with delight and reverence. Impatient to possess this treasure, the duke im-

* ‘The *Laocoon* is finished with the chisel, showing an incredible command of execution; but in Rome I once heard a very eminent sculptor say that he believed the statue had been previously finished with the rasp and file, and that the marks of the chisel were made afterwards, to give the appearance of facility to the execution, and at the same time a roughness to the surface, which was more favorable to the general effect of the figure than if it had been left quite smooth. If the statue had been brought down to this surface at once, he said, the dexterity of the artist was more wonderful than any thing he knew of in sculpture.’

mediately sent for it; and, that his generosity might be displayed to the greatest advantage, he loaded two lacqueys with the money to defray the purchase. The bulk was promising; but when the bags were found to contain nothing but brass maravedi, which amounted only to the small sum of thirty ducats, vexation and disappointment roused Torrigiano's resentment; who, considering this present rather as an insult than as a reward for his merit, on a sudden snatched up his mallet, and without regard to the perfection of his workmanship, or the sacred character of the image, he broke it into pieces, and dismissed the lacqueys with their load of farthings to tell the tale. The grandee, with every passion alive to this merited disgrace, and perhaps impressed with horror for the sacrilegious nature of the act, presented him before the court of inquisition, and impeached him for his conduct as an infidel and a heretic. Torrigiano urged the right of an author over his own creation: Reason pleaded on his side, but Superstition sat in judgment, and he was condemned to lose his life with torture; but the holy office lost its victim—Torrighiano starved himself to death in prison (1522), to avoid its torments and the horror of the execution! He was about fifty years of age.—Vasari, tom. iii. p. 76.

Canova and Thorwaldsen, together with our own Chantrey, occupy the topmost rank among sculptors of the present day, or rather did so until death snatched away the former of these eminent artists. Still we are inclined to think that the performances of Canova have been somewhat over-rated. Many of them have a studied and theatrical air quite inconsistent with good taste as well as with the higher productions of Grecian art, which this sculptor always affected to copy. Mr. Mathews, in his *Diary of an Invalid*, speaking of Canova's *Venus*, one of his most vaunted figures, says: 'The boudoir of the Pitti Palace, in the centre of which stands Canova's *Venus*, brilliantly illuminated, and lined with mirrors, reflected the beauties of her figure in all directions, and exhibited the statue to the highest advantage. This is the statue which occupied the pedestal of the Medicean *Venus* during her flight to Paris, but I can find nothing divine about Canova's *Venus*. She is not worthy to officiate as chambermaid to the goddess of the Tribune. It is simply the representation of a modest woman, who seems to shrink from exposure in such a dishabille; while her Grecian prototype, in native innocence and simplicity, scarcely conscious of nakedness, seems to belong to an order of beings to whom the sentiment of shame was as yet unknown. The attitude of Canova's is constrained, and perhaps even awkward. This may arise from the manner in which she compresses that scanty drapery which the sculptor has given her, intending, I suppose, to 'double every charm it seeks to hide.' The symmetry, too, is by no means perfect. The head is manifestly too large. It is perhaps unfair to attribute to the sculptor the faults of the marble; but it is impossible not to remark that, even if the work had been more perfect than it is, the unfortunate flaws, just in those places where they are most mal à-propos, must still

have detracted much from its beauty. Many of the copies of this statue seem to me quite equal, if not superior, to the original; an infallible proof, if the remark be correct, of its mediocrity of merit.' The same intelligent traveller thus speaks of the talents of Thorwaldsen, a Danish sculptor practising at Rome:—'There is a freshness and originality in his designs, guided by the purest taste. What can be more elegant and beautiful than his *basso-relievo* of Night? His *Venus viatrix* approaches nearer than any modern statue to the *Venus di Medici*. There is a shepherd, too, which is a delightful specimen of simplicity and nature; and the charm of these statues is, that while they emulate they have not borrowed any thing from the works of the ancients.'

On the works of our own Chantrey we are disposed to enlarge with all the spirit of nationality; but a recollection of our confined limits, together with that sense of delicacy which restrains us from discussing minutely the merits of a living artist, withhold us. Mr. Chantrey's principal productions are busts; but the work which first fixed his high reputation, and is still regarded by many as his *chef-d'œuvre*, is a group of sleeping infants, to be seen in the cathedral at Litchfield.

Of the different modern modes of process.—Works of sculpture are performed either by hollowing or excavating, as in metals, agates, and other precious stones, and in marbles of every description; or by working in relief, as in *bass-relievi* in the materials just mentioned, or in statues of metal, clay, wood, wax, marble, or stone. The excavation of precious stones forms a particular branch of art called *intaglio*, which, together with the working them in *relievo*, when the term *cameyen* is applied to them, belongs to the art of seal-engraving.

The excavation of metals constitutes the art of engraving, in its various branches, on metal of any kind; and its relief comprises enclashing, casting in bronze, &c.

The process of hollowing hard stone or marble will need no particular description; especially as it is now wholly in disuse, except for the forming of letters in monumental or other inscriptions.

In working in *relievo* the process is necessarily different, according to the materials in which the work is performed. As not only the beginning of sculpture was in clay, for the purpose of forming statues, but as models are still made in clay or wax, for every work undertaken by the sculptor; we shall first consider the method of modelling figures in clay or wax.

Few tools are necessary for modelling in clay. The clay being placed on a stand, or sculptor's easel, the artist begins the work with his hands, and puts the whole into form by the same means. The most expert practitioners of this art seldom use any other tool than their fingers, except in such small or sharp parts of their work as the fingers cannot reach.

In modelling in wax, the artist sometimes uses his fingers, and sometimes tools of the same sort as those alluded to for modelling in clay. It is at first more difficult to model in wax than

in clay, but practice will render it familiar and easy.

Of the use of the model.—Whatever considerable work is undertaken by the sculptor, whether basso-relievo, or statue, &c., it is always requisite to form a previous model of the same size as the intended work; and the model being perfected, according to the method before described, whether it is in clay, or in wax, or a cast in plaster of Paris, becomes the rule whereby the artist guides himself in the conduct of his work, and the standard from which he takes all its measurements:

Of sculpture in wood.—A sculptor in wood should first take care to choose wood of the best quality, and the most proper for the work which he intends to execute. If he undertakes a large work, requiring strength and solidity, he ought to choose the hardest wood, and that which keeps best, as oak and chestnut; but, for works of moderate size, pear or apple trees serve very well. As even these latter woods are still of considerable hardness, if the work consists only of delicate ornaments, the artist will find it preferable to take some more tender wood, provided it is at the same time firm and close; as, for instance, the Indian tree, which is excellent for this purpose, as the chisel cuts it more neatly and easily than any other wood.

The ancients made statues out of almost every different kind of wood. At Sicyon was a statue of Apollo made of box; the statue of Diana at Ephesus was of cedar. As these two sorts of wood are extremely hard and undecaying; and as cedar, in particular, is of such a nature as, according to Pliny, to be nearly indestructible, the ancients preferred them for the images of their divinities. In the temple built on Mount Cyllene in honor of Mercury, Pausanias relates, that there was a statue of that god made of citron-wood, eight feet in height. This wood was also much esteemed. The cypress likewise, being a wood not apt to spoil, nor to be damaged by worms, was also used for statues; as were the palm-tree, olive, and ebony, of which latter, according to Pliny's account, there was another statue of Diana at Ephesus. Several other kinds of wood were equally employed for this purpose, even the vine, of which the same author says there were statues of Jupiter, Juno, and Diana.

Felicien speaks of a French artist at Florence, of the name of Janni, who executed several statues in wood, in a style of finishing equal to marble, and particularly one of St. Roque, which Vasari considered as a marvellous production. The beauty of sculpture in wood consists in the tender manner of cutting the wood, free from all appearance of hardness or dryness.

Of sculpture in stone and marble.—For sculpture in marble, and other stone, the artist must make use of tools made of good steel, well tempered, and of strength proportioned to the hardness of the material.

We have in a preceding section adverted to the ordinary practice. By the dexterous and delicate use of the chisel, the sculptor gives all the softness and tenderness to the figure, till at length the rasp prepares it for being polished. Rasps are of several kinds, some straight, some curved,

and some harder or softer than others. When the sculptor has thus far finished his work with the best tools he can procure, wherever certain parts or particular works require polishing, he uses pumice-stone to make all the parts smooth and even. He then goes over them with tripoli, and, when he would give a still higher gloss, he rubs them with leather and straw ashes.

Besides the tools already mentioned, sculptors use also the *pick*, which is a small hammer pointed at one end, and at the other formed with teeth made of good steel and squared, to render them the stronger. This serves to break the marble, and is used in all places where the two hands cannot be employed to manage the mallet and chisel. The *bouchard*, which is a piece of iron, well steeled at the bottom, and formed into several strong and short points like a diamond, is used for making a hole of equal dimensions, which cannot be done with cutting tools. The *bouchard* is driven with the mallet or beetle, and its points bruise the marble and reduce it to powder. Water is thrown into the hole from time to time, in proportion to the depth that is made, to bring out the dust of the marble, and to prevent the tool from heating, which would destroy its temper; for the freestone dust on which tools are edged is only moistened with water to prevent the iron from heating and taking off the temper of the tool by being rubbed dry; and the trepans are wetted for the same reason. The sculptor uses the *bouchard* to bore or pierce such parts of his work as the chisel cannot reach without danger of spoiling or breaking them. In using it he passes it through a piece of leather, which leather covers the hole made by the *bouchard*, and prevents the water from spirting up in his face.

The tools necessary for sculpture, on marble or stone, are the *roundel*, which is a sort of rounded chisel; the *houquet*, which is a chisel squared and pointed; and various compasses to take the requisite measures.

The process of sculpture in stone is the same as in marble, excepting that, the material being less hard than marble, the tools used are not so strong, and some of them are of a different form, as the rasp, the handsaw, the ripe, the straight chisel with three teeth, the *roundel*, and the grater. If the work is executed in freestone, tools are employed which are made on purpose, as the freestone is apt to scale, and does not work like hard stone or marble. Sculptors in stone have commonly a bowl in which they keep a powder composed of plaster of Paris, mixed with the same stone in which their work is executed. With this composition they fill up the small holes, and repair the defects which they meet with in the stone itself.

In the work of Junius, *De Pictura Veterum* (lib. 2, chap. 3), and in the *Bibliothèque Grecque* of Fabricius (lib. 3, chap. 24, sect. x.), a catalogue is to be found of ancient authors who have treated of the art of sculpture. Among modern works on the theory and practice of this art, we may cite the following:—*Pomponii Gaurici, De Sculptura sive Statuaria Veterum Dialogus*, Florent. 1504, 4to., and in the ninth volume of the *Thesaurus* of Gronovius. L. B. de

Albertis, *De Sculptura*, Basil, 1540, 8vo., *De Cœlatura et Sculptura Veterum*, by Ald. Manuce, also to be found in the ninth volume of the *Thesaurus* of Gronovius. The third and fourth books of the work entitled *Gallus Romæ Hospes*, by Ludovicus Demontiosius, Rome, 1585. These have been reprinted in the *Dactylionthèque* of Goriæus, likewise in the ninth volume of the *Thesaurus* of Gronovius. Jul. C. Bulengeres, *De Pictura, Plasticæ, et Statuaria*, in his *Opusculæ*, Leyden, 1621, 8vo., and in the ninth volume of Gronovius. P. P. Rubenius, *De Imitatione Statuarum Græcarum*, in the *Cours de Peinture*, by Depiles, Paris, 1760, 12mo. The first chapter of the first book, and the fifth and sixth chapters of the second book of the *Archæologia Litteraria* of Ernesti, treat of Marmoribus, de Toreutice, et de Plasticæ. *Commentationes duæ super Veterum Eboræ, Eburneisque Signis*, by M. Heyne, in the first volume of the new *Memoirs* of the Royal Society of Göttingen; in the fourth and fifth volumes of which same *Memoirs* we find *Monumentorum Etruscorum Artis ad Genera sua et Tempora revocatorum Illustratio*, by the same.

Among Italian works :—Il Disegno del S. Ant. Franc. Doni, ove si Tratta della Scultura e Pittura de' Colori, de' Getti, de' Modegli, con molte Cose appartenenti, Venice, 1549, 8vo. Several chapters of the Introduction to *Vite* de più eccellenti Architetti, Pittori e Scultori Italiani, by Vasari, treat of Sculpture. Due Trattati, uno dalle otto principale Parti d'Oreficeria, l'altero in materie dell'Arte della Scultura, dove si vedono infiniti Segreti per lavorare le Figure di Marmo, e del gettarle di Bronzo, da Benvenuto Cellini, Firenze, 1568, 4to. In the Lezione di M. Benedetto Varchi, *Sopra diverse Materie Poetiche e filosofiche*, Firenze, 1549, we find a letter of Cellini on the advantage which sculpture has over painting; and another little treatise of this nature is added, by the same author, to the *Essequie* di Michel Angiolo Buonarroti, Firenze, 1564, 4to. *Discorsi sopra le Antichità Romana*, di Vincentio Scamozzi, Venice, 1582, with forty folio engravings, contain several articles on sculpture, and on the marbles to be preferred for statues. Il Riposo di Raffaele Borghini, in cui si favella della Pittura e della Scultura e de' più illustri Pittori et Scultori, antichi e moderni, Firenze, 1584, 4to., and 1730, 4to. Discorso intorno alla Scultura e Pittura, di Alessandro Lami, Cremona, 1584, 4to. L'Idea de' Pittori, Scultori, e Architetti, del Cav. Fed. Zuccaro, Torino, 1607, 4to. Avvertimenti e Regole sopra l'Architettura, civile e milit., la Pittura Scultura, e Prospettiva, da Pietro Ant. Barca, Milan, 1620, fol. Le Pompe della Scultura, da Giamb. Moroni, Ferrara, 1640, 12mo. Trattato della Pittura e Scultura, uso ed abuso loro, composto da un Teologo (Father Ottonelli), e da un Pittore (Pietro da Cortona), Firenze, 1652, 4to. Discorso delle Statue, da Giovanni Andrea Borboni, Rome, 1661, 4to. Lettera, nella quale si risponde ad alcuni Quesiti di Pittura, Scultura, &c., addressed to the marquis V. Capponi, by Filippo Baldinucci, Rome, 1681. *Sfogamenti d'Ingegno sopra la Pittura e la Scultura*, dal P. F. Minozzi, Venice, 1739, 12mo. *Raccolta di Lettere sulla*

Pittura, Scultura, ed Architettura, scritte da più celebri Personaggi che in dette Arti fiorirono dal sec. xv. all. xvii. Rome, 1754, 4to, 7 vols. Dialoghi sopra le tre Arti del Disegno, by Giovanni Bottari, Lucca, 1754, 8vo.

In Spanish is the following :—*Varia Commensuración para la Escultura y Architettura*, por Don Juan de Arphez Villafane, Madrid, 1675, 4to.

In the French tongue we find :—*Conférences de l'Académie Royale de Peinture et Sculpture pendant l'année*, 1667, by Felbien, Paris, 1668, 4to. *Des Principes de l'Architecture*, de la Sculpture, de la Peinture, et des Arts qui en dépendent, by Felbien, Paris, 1697, 4to. *Sentimens des plus habiles Peintres, sur la Pratique de la Peinture et de la Sculpture*, mis en table de Préceptes, avec plusieurs Discours académiques, by Henri Testelin, Paris, 1680, folio. *Traité des Statues*, by F. Lemée, Paris, 1688, 8vo. *Manuscrit pour connoître les Médailles et les Statues anciennes*, by Nicolas de Porcignano, and four of the most famous and learned antiquaries of Italy, Naples, 1713, 4to. *De la Sculpture*, du Talent qu'elle demande, et de l'Art des Bas-reliefs, by Dubos, to be found in the fiftieth chapter of the first part of his *Réflexions critiques sur la Poésie et sur la Peinture*;—*Discours sur le Beau Idéal des Peintres, Sculpteurs, et Poètes*, by L. H. Ten-Kate, included in a translation of Richardson's Works, Amst. 1728, 8vo. *Lettre sur la Peinture, Sculpture, et Architecture*, Amst., 1749, 8vo. *Essai sur la Peinture, Sculpture, et Architecture*, by L. P. de Bauchamont, Paris, 1731, 12mo. In the twenty-ninth volume of *Memoires de l'Académie des Inscriptions* is a Memoir of the Comte de Caylus, sur un Moyen d'incorporer la Couleur dans le Marbre, et de fixer le Trait. *Réflexions sur la Sculpture*, by E. Falconet, Paris, 1761, 12mo. *Nouveaux Sujets de Peinture et de Sculpture*, Paris, 1755, 12mo. *Essai sur la Sculpture*, to be found with the *Traité de Peinture* of Dandré Bardon, Paris, 1765, 2 vols. 12mo. *Histoire Universelle traitée relativement aux Arts de Peindre et de Sculpter*, Paris, 1769, 2 vols. 12mo. *Ichnographie, ou Discours sur les quatre Arts d'Architecture, Peinture, Sculpture, et Gravure*, avec des Notes historiques, cosmographiques, chronologiques, généalogiques, et Monogrammes, Chiffres, Lettres initiales, Logogriphes, &c., by M. Herbert, Paris, 1767, 5 vols. 12mo. *De l'Usage des Statues chez les Anciens*, *Essai historique*, Brussels, 1768, 4to, with prints. (The Comte de Guasco is the author of this work). *Lettre sur la Sculpture à M. Théodore de Smeth*, by M. Hemsterhuis the younger, Amst. 1768, 4to., with engravings. *Observations historiques et critiques sur les Erreurs des Peintres, Sculpteurs, &c., dans la Représentation des Sujets tirés de l'Histoire-sainte, avec des Eclaircissemens pour les rendre plus exactes*, Paris, 1771, 12mo. In the *Cours d'Architecture* de F. Blondel (Paris, 1771), we find a *Mémoire sur l'Origine de la Sculpture*.

The following also may be cited as conveying information with respect to the execution of various works of sculpture :—*Discours sur la Statue Equestre de Frédéric Guillaume érigée sur*

le Pont-Neuf à Berlin, by C. Ancillon, Berlin, 1703, fol. Description de ce qui a été pratiqué pour fondre d'un seul jet la Statue Equestre de Louis XIV. en 1699, by G. Boffrand, Paris, 1743, fol. Description des Travaux qui ont précédé, accompagné, et suivi la Fonte en bronze, d'un seul jet, de la Statue Equestre de Louis XV., Paris, 1768, fol. Description de la Statue Equestre que la Compagnie des Indes Orientales à Copenhague, a consacrée à la Gloire de Frédéric V., avec les explications des motifs qui ont déterminé le choix des différentes parties qu'on a suivi dans la composition de ce monument, by J. F. J. Saily, Copenhagen, 1771, fol.

In German:—Joachim de Sandrart, *Admiranda Artis Statuarie*, Normandy, 1680, fol. Summary of the History and Principles of the Fine Arts and Sciences, the first division of which relates to the history and principles of sculpture, Berlin, 1772, 8vo. by A. F. Busching. Sketch of a History of the Arts of Design, Hamburg, 1781, 8vo. by the same. *Philosophy of Sculptors*, by E. L. Huch, Brandenburg, 1775, 8vo. The fifth and sixth chapters of the Treatise on Literature and the Works of Art of Antiquity, by J. F. Christ, Leipsic, 1776, 8vo. Treatise on the Plastic Art, including sundry Observations on Form and Figure, Riga, 1778. In the first volume of an Essay on an Academy of Fine Arts, by C. F. Prangen, we find a treatise on the Mechanism of Sculpture. Essay on a History of Sculpture among the Ancients, by Hofstater, Vienna, 1778, 8vo.: in addition to which the different works of Winkelman may be consulted.

In our own language the works more particularly useful for reference are:—A Letter on Poetry, Painting, and Sculpture, by H. King, London, 1768, 8vo. Collection of Greek, Etruscan, and Roman Antiquities, from the Hamilton Cabinet, Naples, 1766, folio, which work contains a paper on Expression in Painting and Sculpture, as well as an Historical Summary on the State of Sculpture among the Greeks.

The following books treat of certain monuments of antique sculpture in particular:—*Calistrati, 'Εκφρασεις*, sive *Descriptio Statuarium*, found among the works of Philostrates. The Description of Greece, by Pausanias, and the 33d and 37th books of Pliny's Natural History. Several Mémoires of the Comte de Caylus on passages of Pliny relative to objects of art, are inserted in the 19th, 25th, and 32d vols. of Mémoires de l'Académie des Inscriptions et Belles Lettres. Edmundi Figrellii, *De Statuis illustrium Romanorum, liber singularis*, Holmiæ, 1656, 8vo. Joannes Henrici Schlemmii, *De Imaginibus Veterum Atriensibus Prælim. et cubicularis Dissertatio*, Jena, 1664, 4to. Frederici Mulleri, *delineat lib. xi. quos molitus est de Statuis Romanorum et præcipue de Natura Statuarium quibus prisca Romani bene meritos honorabant*, Giessæ, 1664, 4to. Joannis Nicolai, *Diatribe de Mercuriis et Hermis*, Francofurti, 1701, 12mo. Chr. Gottfr. Barthii, *De Imaginibus Veterum in Bibliothecis vel alibi positis*, Hallæ, 1702, 4to. Jacobi Gronovii, *De Imaginibus et Statuis principum Dissertatio*, Ludg. Bat., 1706, 4to. J. Munchii, *De Statuis Veterum*

Romanorum Dissertatio, Hafniæ, 1714, 4to. F. G. Freytage, *De Statuis Τετελεσμεναις Veterum Dissertatio*, Lip., 1715, 4to. *Oratorum et Rhetorum Græcorum, quibus Statuæ honoris causa positæ fuerunt*, decas, Lips., 1752, 8vo., by the same. G. G. Bœrneri, *De Statuis Achilleis Dissertatio*, Lips., 1759, 4to.

With respect to sculpture, as practised by the moderns, the reader is referred to:—*Cabinet des Singularités d'Architecture, Peinture, Sculpture, et Gravure*, by F. Le Comte, Paris, 1699, 3 vols. 12mo. Catalogue historique du Cabinet de Sculpture Française de M. de la Live de July, Paris, 1764, 12mo. Monuments érigés en France à la Gloire de Louis XIV. précédés d'un Tableau du Progrès des Arts et des Sciences sur ce Règne, ainsi que d'une Description des Honneurs et des Monuments accordés aux grands Hommes, tant chez les Anciens que chez les Modernes, et suivis d'un Choix des principaux Projets qui ont été proposés pour placer la Statue du Roi, by M. Patte, Paris, 1765, fol., with fifty-seven plates. *Antiquités Nationales, ou Recueil de Monuments pour servir à l'Histoire de l'Empire Français*, tels que Tombeaux, Inscriptions, Statues, Vitraux, Frescoes, &c., tirés des Abbayes, Monastères, et Châteaux, by A. L. Millin, Paris, 1791, 5 vols. 4to. and fol., with plates.

A catalogue of ancient sculptors is to be found in the second edition of *De Pictura Veterum*, by Junius, Rot. 1694, fol., whilst the preceding treat of modern Italian sculptors:—*Vite de' più insigni Pittori e Scultori Ferraresi*, by G. Baruffaldi, Ferrara, 1703, 4to. *Notizie intorno alla Vita ed alle Opere de' Pittori, Scultori ed intagl. di Bassana*, by G. Verci, Bass. 1775, 8vo. *Catal. Istoriche de Pittori ed Scultori Ferraresi, e dell' loro Opere*, Ferrara, 1783, 2 vols. 8vo.

On modern Spanish sculptors, independently of the work by Bermudez, already quoted (see preceding article), we have:—*Vidas de los Pintores y Estatuarios eminentes Españoles*, by D. A. P. Velasco, London, 1742, 8vo., and, in French, Paris, 1749, 12mo. This forms the third part of the same author's *Museo Pittorici*, Madrid, 1725, fol.

On German sculptors:—J. C. Schumann, *Alcimedon, or Lives of the most celebrated German Sculptors and Engravers*, Dresden, 1684, 8vo. *History of the best Swiss Artists*, by J. C. Fussli, Zurich, 1780, 5 vols. 8vo. *Notices of sundry Artists of Frankfurt, of the Life and Works of its Painters and Sculptors*, by Hugen, Frankfurt, 1780, 8vo. Several papers on the same subject are likewise to be found in the *Journal of Arts* of M. de Murr, and in that of Meusel.

We conclude with the admirable practical remarks of Sir Joshua Reynolds. 'The sculptor,' says Sir Joshua, 'may be safely allowed to practise every means within the power of his art to produce a deception, provided this practice does not interfere with or destroy higher excellencies; on these conditions he will be forced, however loath, to acknowledge that the boundaries of his art have long been fixed, and that all endeavours will be vain that hope to pass beyond the best works which remain of ancient sculpture.'

'Imitation is the means, and not the end, of art: it is employed by the sculptor as the language

b which his ideas are presented to the mind of the spectator. Poetry and elocution of every sort make use of signs, but those signs are arbitrary and conventional. The sculptor employs the representation of the thing itself; but still as a means to a higher end—as a gradual ascent always advancing towards faultless form and perfect beauty. It may be thought at the first view that even this form, however perfectly represented, is to be valued and take its rank only for the sake of a still higher object, that of conveying sentiment and character, as they are exhibited by attitude, and expression of the passions. But we are sure, from experience, that the beauty of form alone, without the assistance of any other quality, makes of itself a great work, and justly claims our esteem and admiration. As a proof of the high value we set on the mere excellence of form, we may produce the greatest part of the works of Michel Angiolo, both in painting and sculpture; as well as most of the antique statues, which are justly esteemed in a very high degree, though no very marked or striking character or expression of any kind is represented. But, as a stronger instance that this excellence alone inspires sentiment, what artist ever looked at the Torso without feeling a warmth of enthusiasm, as from the highest efforts of poetry! Whence does this proceed? What is there in this fragment that produces this effect, but the perfection of this

science of abstract form? A mind elevated to the contemplation of excellence perceives in this defaced and shattered fragment, *disjecta membra poetæ*, the traces of superlative genius, the relics of a work on which succeeding ages can only gaze with inadequate admiration.

It may be said that this pleasure is reserved only to those who have spent their whole life in the study and contemplation of this art; but the truth is that all would feel its effects, if they could divest themselves of the expectation of deception, and look only for what it really is, a partial representation of nature. The only impediment of their judgment must then proceed from their being uncertain to what rank, or rather kind of excellence, it aspires; and to what sort of approbation it has a right. This state of darkness is, without doubt, irksome to every mind; but by attention to works of this kind the knowledge of what is aimed at comes of itself, without being taught, and almost without being perceived. The sculptor's art is limited in comparison of others, but it has its variety and intricacy within its proper bounds. Its essence is correctness: and when to correct and perfect form is added the ornament of grace, dignity of character, and appropriate expression, as in the Apollo, the Venus, the Laocoon, the Moses of Michel Angiolo, and many others, this art may be said to have accomplished its purpose.

SCUM, *n. s. & v. a.* Fr. *cscume*; Ital. *schiuma*; Dan. and Goth. *skum*. That which rises to the top of any liquor; spume; froth; refuse; hence, in contempt, the lowest of the people: to clear off the scum.

The rest had several offices assigned;
Some to remove the scum as it did rise,
Others to bear the same away did mind,
And others it did use according to his kind.

Faerie Queene.

There flocked unto him all the scum of the Irish
out of all places, that ere long he had a mighty army.
Spenser.

Some forty gentlemen excepted, had we the very
scum of the world, such as their friends thought it
an exceeding good gain to be discharged of.

Raleigh's Essays.

The salt part of the water doth partly rise into a
scum on the top, and partly goeth into a sediment in
the bottom.

Bacon.

Gathered like scum, and settled to itself,
Self-fed and self-consumed.

Milton.

A second multitude
Severing each kind, and scummed the bullion dross.

Id.

I told thee what would come
Of all thy vapouring, base scum.

Hudibras.

The Scythian and Egyptian scum
Had almost ruined Rome.

Roscommon.

Away, ye scum,
That still rise upmost when the nation boils.

Dryden.

Hear, ye sullen powers below;

Hear, ye taskers of the dead!

You that boiling cauldrons blow,

You that scum the molten lead!

Dryden and Lee's Edipus.

What corns swim upon the top of the brine, *scum*
off. *Mortimer's Husbandry.*

The great and innocent are insulted by the scum
and refuse of the people. *Addison's Freeholder.*

SCUPPER HOLES, *n. s.* Belg. *schoepen*, to draw off. In a ship, small holes on the deck, through which water is carried into the sea. The leathers over those holes are called scupper leathers; and the nails with which they are fastened, scupper nails.

The blood at scupper holes run out. *Ward.*

SCUPPERS, in a ship, are certain channels cut through the water-ways and sides of a ship, at proper distances, and lined with plated lead, to carry the water off from the deck into the sea. The scuppers of the lower deck of a ship of war are usually furnished with a leathern pipe, called the scupper hose, which hangs downward from the mouth or opening of the scupper. The intent of this is to prevent the water from entering when the ship inclines under a weight of sail.

SCURF, *n. s.* Sav. *scupf*; Goth and Swed. *skorf*; Dan. *skurff*; Belg. *schorft*. A kind of dry military scab; a soil or stain adhering to the skin or surface.

Her crafty head was altogether bald,
And, as in hate of honourable eld,
Was overgrown with scurf and filthy scald.

Faerie Queene.

There stood a hill, whose grisly top
Shone with a glossy scurf.

Milton.

Then are they happy, when by length of time
The scurf is worn away of each committed crime,
No speck is left.

Dryden.

Upon throwing in a stone, the water boils ; and at the same time are seen little fleaks of *scurf* rising up.
Addison.

The virtue of his hands

Was lost among Pactolus' sands,
Against whose torrent while he swims,

The golden *scurf* peels off his limbs. *Swift.*

SCUR'RL, *adj.*

Lat. *scurrilis*. Low ;

SCUR'RL'ITY, *n. s.*

} mean ; grossly oppro-

SCUR'RILOUS, *adj.*

} brious : the more com-

SCUR'RILOUSLY, *adv.*

} mon adjective is *scur-*

rilous, of the same signification ; the adverb and noun substantive correspond.

Scurrilous and more than satirical immodesty.

Hooker.

With him Patroclus,

Upon a lazy bed, the live-long-day
Breaks *scurril* jests.

Shakspeare. Troilus and Cressida.

Good master Holofernes, purge ; so it shall please you to abrogate *scurrility*.

Shakspeare.

Let him approach singing. Forewarn him that he use no *scurrilous* words in's tunes.

Id. Winter's Tale.

Nothing conduces more to letters than to examine the writings of the ancients, provided the plagues of judging and pronouncing against them be away ; such as envy, bitterness, precipitation, impudence, and *scurril* scoffing.

Ben Jonson.

It is barbarous incivility, *scurrilously* to sport with that which others count religion.

Tillotson.

Thou movest me more by barely naming him,
Than all thy foul unmannered *scurril* taunts.

Dryden.

Banish *scurrility* and profaneness, and restrain the licentious insolence of poets.

Id.

Such men there are, who have written *scurrilously* against me, without any provocation.

Id.

How often is a person, whose intentions are to do good by the works he publishes, treated in as *scurrilous* a manner as if he were an enemy to mankind !

Addison's Freeholder.

Their characters have been often treated with the utmost barbarity and injustice by *scurrilous* and enraged orators.

Swift.

SCUR'VILY, *adv.* From SCUR'VY : Vilely ; basely ; coarsely. It is seldom used but in a ludicrous sense.

Look i' your glass now,

And see how *scurvily* that countenance shews :

You would be loth to own it.

Ben Jonson's Catiline.

This alters the whole complexion of an action, that would otherwise look but very *scurvily*, and makes it perfect.

South.

The clergy were never more learned, or so *scurvily* treated.

Swift.

SCUR'VY, *n. s. & adj.* From SCURF. A well-known disease of low countries and of seamen, see below. This word was, I believe, originally an adjective, says Dr. Johnson ; and it signifies as such scabbed ; diseased with scurvy ; vile ; bad ; low ; offensive.

Whatsoever man be *scurvy* or scabbed.

Lcv. xxi. 20.

I know him for a man divine and holy ;

Not *scurvy*, nor a temporary meddler.

Shakspeare.

He spoke *scurvy* and provoking terms

Against your honour.

Id.

The *scurvy* is a distemper of the inhabitants of cold countries, and amongst those such as inhabit marshy, fat, low, moist soils, near stagnating water, fresh or salt ; invading chiefly in the winter such as

are sedentary, or live upon salted or smoked flesh and fish, or quantities of unfermented farinaceous vegetables, and drink bad water.

Arbuthnot.

A crane, which is but *scurvy* meat, lays but two eggs.

Cheyne.

It would be convenient to prevent the excess of drink, with that *scurvy* custom of taking tobacco.

Swift.

SCUR'VY, in medicine. See MEDICINE.

SCUR'VY-GRASS, common officinal, or cochlearia officinalis, grows upon rocks on the sea-coast, and on the Highland mountains, abundantly. It has an acrid bitter, and acid taste, and is highly recommended for the scurvy. As it abounds with acid salts, there can be no doubt but that it is a great resister of putrefaction. The best way of taking it is raw in a salad. It is also diuretic, and useful in dropsies. The Highlanders esteem it as a good stomachic.

'SCUSES. For excuses. A mere barbarism of Shakspeare's.

I shifted him away,

And laid good *scuses* on your ecstasy.

Shakspeare. Othello.

SCUT, *n. s.* Isl. *skott* ; Goth. *skot*. The tail of certain animals whose tails are very short.

In the hare it is adversely seated, and in its distension inclines unto the coxix or *scut*.

Browne's Vulgar Errors.

He fled to earth, but first it cost him dear ;

He left his *scut* behind, and half an ear.

Swift.

SCUTAGE, *n. s.* [Sax. *scutagium*, scildepning] was a tax or contribution raised by those that held lands by knights' service, towards furnishing the king's army with one, two, or three merks for every knight's fee. Henry III., for his voyage to the Holy Land, had a tenth granted by the clergy, and scutage, three merks of every knight's fee by the laity. This was also levied by Henry II., Richard I., and king John.

SCUTARI, a lake of Albania, Greece, situated about fifteen miles from the coast. It is about sixteen miles in length, and seven in breadth, containing several small islands. The Moracca enters its northern extremity, and issues from its south-eastern, where it is known as the Bojane.

SCUTARI, or ISKENDERJE, a large fortified town of Albania, on the Bojane, at the south-east extremity of the lake of Scutari. Its highest point is crowned by a castle. The town consists of four quarters ; and has several mosques and Greek churches, being the see of a Greek bishop. The neighbouring plain is one of the richest in Albania in vines and olive plantations. Scutari is the capital of a pachalic, one of the most considerable in Albania. Population 12,000. Fifty miles east by south of Cattaro, and 448 west of Constantinople.

SCUTARI, a large town on the Bosphorus, immediately opposite to Constantinople. Its site is most beautiful, on the slope of several hills, and thickly intermingled with trees. The strait appears here like a lake, planted round with cities : and the minarets of Scutari command the most brilliant views of Constantinople. It carries on a considerable trade as a rendezvous for caravans from the interior of Asia. Population 30,000.

SCUTCH'EON, *n. s.* Ital. *scuccione*, from

Lat. *scutum*. The shield represented in heraldry; the ensigns armorial of a family. See ESCUTCHEON.

And thereto had she that *scutcheon* of her desires,
supported by certain badly diligent ministers.

Sidney.

Your *scutcheons*, and your signs of conquest, shall
hang in what place you please.

Shakspeare. *Antony and Cleopatra*.

Honour is a mere *scutcheon*. Id. *Henry IV.*

The chiefs about their necks the *scutcheons* wore,
With orient pearls and jewels powdered o'er.

Dryden.

SCUTE, a French gold coin of 3s. 4d. in the reign of king Henry V. Catherine queen of England had an assurance made her of sundry castles, manors, lands, &c., valued at the sum of 40,000 scutes, every two whereof were worth a noble.

SCUTELLARIA, skull-cap, in botany, a genus of the gymnospermia order, and didynamia class of plants; natural order fortieth, personate: CAL. short, tubulated, has the mouth entire, and close after flowering. There are two species, natives of Britain, viz.

1. *S. galericulata*, blue skull-cap, or hooded willow-herb. The stems are weak, branched, and above a foot high: the leaves are heart-shaped, narrow-pointed, on short foot-stalks, and scalloped; the flowers are blue, in pairs, on pedicles from the *axæ* of the leaves, and pendulous. It grows on the banks of rivers and lakes, is bitter, and has a garlic smell.

2. *S. minor*, little red skull-cap, or willow-herb. The stalks are about eight inches high; the leaves are heart-shaped, oval; the flowers are purple. It grows in fens, and on the sides of lakes.

SCUTELLATED, *adj.* Lat. *scutella*. Divided into small surfaces.

It seems part of the *scutellated* bone of a sturgeon, being flat, of a porous or cellular constitution.

Woodward.

SCUTTLE, *n. s.* Lat. *scutella*; Celt. *scutill*. Ainsworth. A wide shallow basket, so named from a dish or platter which it resembles in form.

A *scuttle* or skreim to rid soil fro' the corn.

Tusser.

The earth and stones they are fain to carry from
under their feet in *scuttles* and baskets.

Hakewill on Providence.

To the hole in the door have a small *scuttle*, to
keep in what mice are there. *Mortimer's Husbandry*.

SCUTTLE, *n. s. & v. n.* From SCUD or SCOUT. A quick pace; a short run; a pace of affected precipitation: to run in this manner.

She went with an easy *scuttle* out of the shop.

Spectator.

The old fellow *scuttled* out of the room.

Arbuthnot.

SCUTTLES, in a ship, are square holes cut in the deck, big enough to let down a man, and which serve to let the people down into any room below, or from one deck to another.

SCUTUM, in antiquity, the name of a shield with which the Roman soldiers were formerly armed. The scutum differed from the clypeus, inasmuch that the former was oval and the latter round. That which was used among the

Grecians was sometimes round, at others square, and not unfrequently oval. The scutum, or buckler, which the Lacedæmonians used, was so large that the dead and wounded were carried on it.

SCYLAX, a celebrated mathematician and geographer of Caria, who flourished in the reign of Darius Hystaspis, about 558 B.C. Darius sent him to make discoveries in the east, and, after a journey of thirty months, he visited Egypt. The best edition of his *Periplus* is that of Gronovius, in 4to., Lug. Bat. 1697. Some have attributed to him the invention of geographical tables. We have under his name a geographical work published by Hoeschelius; but it is written by a much later author, and is perhaps an abridgment of Scylax's Geography.

SCYLLA, in the mythology, a daughter of Nisus, king of Megara, who fell in love with Minos while he was besieging her father's capital, and offered to make him master of it, if he would marry her. Minos promising this, she cut off a golden hair of her father's head, while he was asleep, on which the fate of Megara depended. Minos took the city, but treated her with the contempt her treason merited: on which she threw herself into the sea, and was turned into a lark, and her father into a hawk.

SCYLLA, a daughter of Typhon, or Phorcys, who was beloved by the sea-god Glaucus, but rejected his addresses. Glaucus applied to Circe to use her spells, and turn Scylla's affection to him; but Circe, falling in love with Glaucus herself, employed her most poisonous plants to ruin her rival; and, pouring the juice of them into a fountain where Scylla bathed, all the under part of her body was changed into monsters, which never ceased barking like dogs. On this Scylla threw herself into the sea, between Italy and Sicily, where she was metamorphosed into the rocks opposite to Charybdis, that still bear her name.—Hom. *Od.* xii. 85. Ovid. *Met.* xiv. 66, &c.

SCYLLA, in ancient geography, a rock in the Fretum Siculum, near the coast of Italy, dangerous to shipping, opposite to Charybdis, a whirlpool on the coast of Sicily.

SCYLLA AND CHARYBDIS, according to the fables of the poets, were two sea-monsters, continually on the watch to destroy unfortunate mariners; the one situated on the right, and the other on the left extremity of the strait of Messina, where Sicily fronts Italy. Thus Virgil describes them:—

Dextrum Scylla latus, lævum implacata Charybdis
Obsidet, atque imo barathri ter gurgite vastos
Sorbet in abruptum fluctus, rursusque sub auras
Erigit alternos, et sidera verberat unda:
At Scyllam cæcis cohibet spelunca latebris
Ora exertantem, et naves in saxa trahentem.
Prima hominis facies et pulchro pectore virgo
Pube tenus; postrema immani corpore pristis
Delphinum caudas utero commissa luperum.

Æneid. lib. iii.

Far on the right her dogs foul Scylla hides;
Charybdis roaring on the left presides,
And in her greedy whirlpool sucks the tides,
Then spouts them from below; with fury driven
The waves mount up, and wash the face of heaven.

But Scylla from her den, with open jaws,
The sinking vessel in her eddy draws,
Then dashes on the rocks : a human face,
And virgin bosom, hide her tail's disgrace ;
Her parts obscure below the waves descend,
With dogs enclosed, and in a dolphin end. *Dryden.*

The description of Virgil, above cited, differs from that of Homer only in placing a deep gulf below. Strabo, Isidorus, Tzetzes, Hesychius, Didymus, Eustathius, &c., concur in the same description. The abbé Spallanzani thus describes Scylla in his time : 'It is a lofty rock, twelve miles from Messina, which rises almost perpendicularly from the sea on the shore of Calabria, and beyond which is the small city of the same name. Though there was scarcely any wind, I began to hear, two miles before I came to the rock, a murmur and noise like a confused barking of dogs, and on a nearer approach readily discovered the cause. This rock, in its lower parts, contains a number of caverns, one of the largest of which is called by the people there *Dragara*. The waves, when in the least agitated, rushing into these caverns, break, dash, throw up frothy bubbles, and thus occasion these various and multiplied sounds. I then perceived with how much truth and resemblance of nature Homer and Virgil, in their personifications of Scylla, had portrayed this scene, by describing the monster they drew as lurking in the darkness of a vast cavern, surrounded by ravenous mastiffs, together with wolves, to increase the horror.

The same author thus describes *Charybdis* : '*Charybdis* is distant from the shore of Messina about 750 feet, and is called by the people of the country *Calofaro*, not from the agitation of the waves, as some have supposed, but from *καλος* and *φαρος* ; that is, the beautiful tower, from the light-house erected near it for the guidance of vessels. The phenomenon of the *Calofaro* is observable when the current is descending ; for when the current sets in from the north, the pilots call it the descending rema or current ; and, when it runs from the south, the ascending rema. The current ascends or descends at the rising or setting of the moon, and continues for six hours. In the interval between each ascent or descent there is a calm which lasts at least a quarter of an hour, but not longer than an hour. Afterwards, at the rising or setting of the moon, the current enters from the north, making various angles of incidence with the shore, and at length reaches the *Calofaro*. This delay sometimes continues two hours ; sometimes it immediately falls into the *Calofaro* ; and then experience has taught that it is a certain token of bad weather.'

The saying which became proverbial among the ancients, '*Incidit in Scyllam, qui vult vitare Charybdim* ; he who endeavours to avoid *Charybdis*, dashes upon Scylla,' is still in a great measure true. If a ship be extricated from the fury of *Charybdis*, and carried by a strong southerly wind along the strait towards the northern entrance, it will indeed pass out safely ; but, should it meet with a wind in a nearly opposite direction, it would become the sport of both these winds, and, unable to advance or recede, be driven in a middle course between their two directions, that is to say, full upon the rock

of Scylla, if it be not immediately assisted by the pilots.

The following is an account of these bugbears of antiquity, given by captain Smyth, an intelligent British seaman : 'The flights of poetry,' observes our author, 'can seldom bear to be shackled by homely truth ; and if we are to receive the fine imagery that places the summit of this rock (*Scylla*) in clouds, brooding eternal mists and tempests ; that represents it as inaccessible, even to a man provided with twenty hands and twenty feet, and immerses its base among ravenous sea-dogs ; why not also receive the whole circle of mythological dogmas of Homer, who, though so frequently dragged forth as an authority in history, theology, surgery, and geography, ought in justice to be read only as a poet ! In the writings of so exquisite a bard, we must not expect to find all his representations strictly confined to a mere accurate narration of facts. Moderns of intelligence, in visiting this spot, have gratified their imaginations, already heated by such descriptions as the escape of the Argonauts, and the disasters of Ulysses, with fancying it the scourge of seamen, and that, in a gale, its caverns 'roar like dogs ;' but I, as a sailor, never perceived any difference between the effect of the surges here, and on any other coast ; yet I have frequently watched it closely in bad weather. It is now, as I presume it ever was, a common rock, of bold approach, a little worn at its base, and surmounted by a castle, with a sandy bay on each side. The one on the south side is memorable for the disaster that happened there, during the dreadful earthquake of 1783, when an overwhelming wave (supposed to have been occasioned by the fall of part of a promontory into the sea) rushed up the beach, and, in its retreat, bore away with it upwards of 2000 people. Outside the tongue of land, or Braccio di St. Rainierê, that forms the harbour of Messina, lies the *Salofaro*, or celebrated vortex of *Charybdis*, which has, with more reason than Scylla, been clothed with terrors by the writers of antiquity. To the undecked boats of the Rhegians, Locrians, Zancleans, and Greeks, it must have been formidable ; for, even in the present day, small craft are sometimes endangered by it ; and I have seen several men-of-war, and even a seventy-four-gun ship, whirled round on its surface ; but, by using due caution, there is generally very little danger or inconvenience to be apprehended. It appears to be an agitated water, of from seventy to ninety fathoms in depth, circling in quick eddies. It is owing, probably, to the meeting of the harbour, and lateral currents, with the main one, the latter being forced over, in this direction, by the opposite point of Pezzo. This agrees, in some measure, with the relation of Thucydides, who calls it a violent reciprocation of the Tyrrhene and Sicilian Seas ; and he is the only writer of remote antiquity I remember to have read who has assigned this danger its true situation, and not exaggerated its effect. Many wonderful stories are told respecting this vortex, particularly some, said to have been related by the celebrated diver Colas, who lost his life here.' See also our article *MEDITERRANEAN*.

SYCROS, in ancient geography, an island in the *Ægean Sea*, at the distance of about twenty-eight miles north-east from *Eubœa*. Fifty miles in circumference. It was originally in the possession of the *Pelasgians* and *Carians*. *Achilles* retired thither to avoid going to the *Trojan war*, and became father of *Neoptolemus* by *Deidamia*, the daughter of king *Lycœnes*. *Seyros* was conquered by the *Athenians* under *Cimon*. It was very rocky and barren. It is now called *Seiro*.

SCYTALA LACONICA, in antiquity, a stratagem of the *Lacedæmonians*, for the secret writing of letters, so that, if they should chance to be intercepted, nobody might be able to read them.—To this end they had two wooden cylinders, perfectly alike and equal; one of which was kept in the city, the other by the person to whom the letter was directed. A skin of very thin parchment was wrapped round the roller, in which the letter was written; which done, it was taken off, and sent away to the party, who, upon putting it in the same manner upon his roller, found the lines and words in the same order as when they were first written. This expedient they set a very high value on; though, in truth, artless and simple enough.

SCYTALIA, in botany, a genus of the monogynia order, and octandria class of plants: *cal.* very short, monophyllous, and somewhat quinque-dentate: *con.* pentapetalous; filaments hairy at the base; berry unilocular: *seed* one of a soft pulpy consistence. There is only one species, viz.

S. sinensis, a native of China and the East Indies.

SCYTHES, in fabulous history, the son of *Jupiter* and *Tellus*, who was half man half serpent. According to *Diodorus* he became king of the country, called from him *Scythia*.

SCYTHIA, an ancient name for the northern parts of Asia, now called *Tartary*, and also for some of the north-east parts of Europe. This vast territory, which extends from the *Ister* or *Danube*, the boundary of the *Celts*, that is, from about 25°, to nearly 100° long. E., was divided into *Scythia* in Europe, and *Scythia* in Asia, including the two *Sarmatias*, or *Sauromatias*. *Sarmatia* was divided from the European *Scythia* by the *Don* or *Tanaïs*, which falls into the *Palus Meotis*; and from the Asiatic by the *Rha*, now the *Volga*, which runs into the *Caspian Sea*.

SCYTHIA ASIATICA, the Asiatic *Scythia*, comprehended, in general, *Tartary*, and *Russia* in Asia. As for *Sarmatia*, it contained *Albania*, *Iberia*, and *Colchis*; which makes now the *Circassian Tartary*, and the province of *Georgia*.

SCYTHIA EUROPEA, *Scythia* in Europe, reached towards the south-west, to the *Po* and the *Alps*, by which it was divided from *Celtogallia*. It was bounded on the south by the *Ister* or *Danube* and the *Euxine Sea*. Its northern limits have been supposed to stretch to the spring-heads of the *Boristhenes* or *Nieper*, and the *Rha* or *Volga*, and so to those of the *Tanaïs*. The ancients divided this country into *Scythia Arima-paa*, which lay east, joining to *Scythia* in Asia; and *Sarmatia Europeana* on the west. In *Scythia*, properly so called,

were the *Arimaspi* on the north, the *Getæ* or *Dacians* along the *Danube* on the south, and the *Neuri* between these two: so that it contained European *Russia*, and the Lesser *Crim Tartary* on the east, and on the west *Lithuania*, *Poland*, part of *Hungary*, *Transylvania*, *Walachia*, *Bulgaria*, and *Moldavia*. The ancient geographers divided the west part of *Sweden* and *Norway* from Northern Germany, by the *Mare Sarmaticum* or *Scythicum*, which they supposed ran up into the Northern Ocean, and, dividing *Lapland* into two parts, formed the western part of *Sweden*, with *Norway*, into one island, and *Finland* into another; supposing this also to be cut off from the continent by the gulf of that name.

SCYTHIANS, the natives of *Scythia*. Although the ancient *Scythians* were celebrated as a warlike people, yet their history is too uncertain and obscure to enable us to give any detail which would prove interesting. See the very opposite accounts given of the ancient *Scythians*, by *Herodotus* and *Justin* under *SCULPTURE*. Hist. Mr. *Pinkerton*, in a dissertation on their origin, endeavours to prove that they were the most ancient of nations; and he assigns for the place of their first habitation the country known by the name of *Persia*. From *Persia*, he thinks, they proceeded in numerous hordes westward, surrounded the *Euxine*, peopled Germany, Italy, Gaul, the countries bordering on the *Baltic*, with part of *Britain* and *Ireland*. That the *Scythians* were of Asiatic origin cannot, we think, be questioned; and, as *Persia* was peopled at a very early period, it may not improbably have been their parent country; but when our author contends that their empire had subsisted for more than 1500 years before *Ninus* the founder of the *Assyrian* monarchy, and that it extended from *Egypt* to the *Ganges*, and from the *Persian Gulf* and *Indian Sea* to the *Caspian*, we cannot help thinking that his prejudices against the *Celts*, and his desire to do honor to his favorite *Goths*, have made him advance a paradox inconsistent with the most authentic records of antiquity. His dissertation, however, is ingenious, and replete with a variety of curious learning.

SCYTHROPS, a generic name given by Mr. *Latham* to a bird of which hitherto but one species has been observed. It is about the size of a crow, and two feet three inches in length. The bill is large, convex, furrowed on the sides, and bent at the tip; the nostrils are placed at the base of it, and the tongue is cloven at the end. The general color of the plumage is a brownish ash, but the tip of each feather of the back, wings, and tail, is black. The tail has each feather banded with black at the end, and the tip itself white; but the inner webs of the feather are marked with black and white bands. The toes are placed two forwards and two backwards, as in the parrot genus. This curious bird is a native of *New Holland*.

SDEIGN, *v. a.* Ital. *sdegnare*. Used by *Spenser* and *Milton* for disdain.

They now, puffed up with sdeignful insolence,
Despise the brood of blessed sapience. *Spenser*.

Lifted up so high,
I sdeigned subjection. *Milton*.

Sax. *ræ*; Goth. *sæ*; Belg. *zee*; Teut. *sec*. The ocean; the water of the earth as opposed to the land; any collection of waters; a lake; a large quantity of any fluid; any thing rough or tempestuous: 'half-seas-over' is half-drunk. None of the compounds appear to require any further explanation than the extracts in which they occur will supply.

He made the *sea*, and all that is therein.

Exodus xx. 11.

Their camels were without number, as the sand by the *seaside*.

Judges vii. 12.

Seamonsters gave suck to their young.

Lamentations iv. 3.

By the *sea* of Galilee.

Matthew iv. 18.

The sovereign of the *seas* he blames in vain, That once *seabeat* will to *sea* again.

Spenser's Pastorals.

The venturous mariner that way, Learning his ship from those white rocks to save,

Which all along the southern *seacoast* lay, For safety's sake that same his *seamark* made, And named it Albion.

Faerie Queene.

Those white rocks, Which all along the southern *seacoast* lay, Threatening unheedy wreck and rash decay, He for his safety's sake his *seamark* made, And named it Albion.

Id.

I heard it wished, that all that land were a *seapool*.

Spenser.

Barbarossa was not able to come on shore, for that he was, as they said, *seasick*, and troubled with an ague.

Knolles.

Will all great Neptune's ocean wash this blood Clean from my hand? No, this my hand will rather Thy multitudinous *sea* incarnadine,

Making the green one red.

Shakspeare. Macbeth.

Canst thou, O partial sleep! give thy repose To the wet *seaboy* in an hour so rude, And in the calmest and the stillest night

Deny it to a king?

Shakspeare.

My wife fastened him unto a small spare mast, Such as *seafaring* men provide for storms.

Id.

I know your favour well, Though now you have no *seacape* on your head.

Id.

VOL. XIX.

We'll have a posset soon at the latter end of a *sea-coal* fire.

Id.

Certain stars shot from their spheres,

To hear the *seamaids'* musick.

Id.

Though you do see me weaponed,

Here is my journey's end, here is my butt,

The very *seamark* of my utmost sail.

Id. Othello.

Witches mummy, maw and gulf

Of the ravening salt *seashark*.

Shakspeare.

She began to be much *seasick*, extremity of weather continuing.

Id.

The needle in the *seacompass* still moving but to the north point only, with moveor immotus, notified the respective constancy of the gentleman to one only.

Camden's Remains.

Seafights have been often final to the war; but this is when princes set up their rest upon the battles.

Bacon.

Seagulls, when they flock together from the *sea* towards the shores, foreshow rain and wind.

Id. Natural History.

Seacoal lasts longer than charcoal.

Bacon.

They were executed at divers places upon the *seacoast*, for *seamarks* or lighthouses, to teach Perkin's people to avoid the coast.

Id. Henry VII.

There is *searoom* enough for both nations, without offending one another.

Id. Advice to Villiers.

By digging of pits in the *seashore*, he did frustrate the laborious works of the enemies, which had turned the *seawater* upon the wells of Alexandria.

Id. Natural History.

So do the winds and thunders cleanse the air, So working *seas* settle and purge the wine.

Davies.

The rivers run into the *sea*.

Carcev.

They stiffly refused to vail their bonnets by the summons of those towns, which is reckoned intolerable contempt by the better enabled *seafarers*.

Id.

The *seahedgehog* is inclosed in a round shell, fashioned as a loaf of bread, wrought and pinched, and guarded by an outer skin full of prickles, as the land urchin.

Id.

Cornwall bringeth forth greater store of *seaholm* and samphire than any other county.

Id.

That *sea* of blood, which hath in Ireland been barbarously shed, is enough to drown in eternal infamy and misery the malicious author and instigator of its effusion.

King Charles.

This pulmonicque indisposition of the air is very much heightened, where a great quantity of *seacoal* is burnt.

Harvey.

She, looking out,

Beholds the fleet, and hears the *seamen* shout.

Denham.

Amphibious between *sea* and land,

The river horse.

Milton

To sorrow abandoned, but worse felt within, And in a troubled *sea* of passion tossed.

Id.

Neptune, besides the sway

Of every salt flood and each ebbing stream,

Took in by lot, 'twixt high and nether Jove,

Imperial rule of all the *seagirt* isles.

Id.

An island salt and bare,

The haunt of seals, and orks, and *seamews* clang.

Id.

Where luxury lately reigned, *seamonsters* whelp.

Id.

Like Neptune and his *seaborn* niece, shall be The shining glories of the land and *sea*.

Waller.

The bigger whale like some huge carrack lay, Which wanteth *searoom* with her foes to play.

Id.

But like a rock unmoved, a rock that braves The raging tempest and the rising waves,

2 Z

Propped on himself he stands : his solid sides
Wash off the *seaweeds*, and the sounding tides.

Dryden.

All these in order march, and marching sing
The warlike actions of their *seaborn* king. *Id.*

Borne each by other in a distant line,
The *seabuilt* forts in dreadful order move. *Id.*

Seahorses blundering in the slimy mud,
Tossed up their heads, and dashed the ooze about
'em. *Id.*

Aeneas ordered

A stately tomb, whose top a trumpet bore,
A soldier's falchion, and a *seaman's* oar ;
Thus was his friend interred. *Id.*

The fault of others sway

He set as *seamarks* for himself to shun. *Id.*
That *seashore* where no more world is found,
But foaming billows breaking on the ground. *Id.*

In love's voyage, nothing can offend ;

Women are never *seasick*. *Id. Juvenal.*
To an impetuous woman, tempests and *seabreeches*
are nothing. *L'Estrange.*

If our sense of hearing were a thousand times
quicker than it is, we should, in the quietest retire-
ment, be less able to sleep than in the middle of a
seafight. *Locke.*

White, red, yellow, blue, with their mixtures, as
green, scarlet, purple, and *seagreen*, come in by the
eyes. *Id.*

Seals live at land and at *sea*, and porpoises have
the warm blood and intrails of a hog, not to mention
mermaids or *seamen*. *Id.*

To say a man has a clear idea of any quantity,
without knowing how great it is, is as reasonable as
to say he has the positive idea of the number of the
sands on the *seashore*. *Id.*

Hedges, in most places, would be of great ad-
vantage to shelter the grass from the *seabreeze*.

Mortimer.

Upon the *seacoast* are many parcels of land, that
would pay well for the taking in. *Id. Hasbrouck.*
Bitterns, herons, and *seagulls*, are great enemies
to fish. *Id.*

Seashells are great improvers of sour or cold land.

McTear.

All *seawoaze*, or oozy mud, and the mud of rivers,
are of great advantage to all sorts of land. *Id.*

The *seawolf*, or seal, so called from the noise he
makes like a calf : his head comparatively not big,
shaped rather like an otter's, with teeth like a dog's,
and mustaches like those of a cat : his body long,
and all over hairy : his fore feet, with fingers clawed,
but not divid'd, yet fit for going : his hinder feet,
more properly fins, and fitter for swimming, being
an amphibious animal. *Grew's Museum.*

Toussier gives an account of an earthquake in
China, that reached three hundred leagues along the
seabore. *Burns.*

The whole magi-traey was pretty well disguis'd
before I gave 'em the slip : our friend the alderman
sets half seas e'er before the bonfire was out.

Spectator.

Had they applied themselves to the increase of
their strength by *sea*, they might have had the great-
est fleet, and the most *seamen*, of any state in Europe.

Addison.

Painters often employ their pencils upon *seapieces*.

Id.

Small fragments of shells, broken by storms on
some shores, are used for manuring of *sea* land.

Woodward.

Part of a large tooth, round and tapering : a tusk
of the morse, or walrus, called by some the *sea-
horse*. *Id.*

They put to *sea* with a fleet of three hundred sail.

Arbutnot.

Shipwrecks were occasioned by their ships being
bad *seaboats*, and themselves but indifferent *seamen*. *Id.*

It was death to divert the ships of *seafaring* people,
against their will, to other uses than they were ap-
pointed. *Id.*

This fleet they recruited with two hundred sail,
whereof they lost ninety-three in a *seafight*.

Id. on Coins.

He was so great an encourager of commerce that
he charged himself with all the *searisque* of such
vessels as carried corn to Rome in the winter.

Arbutnot.

My design was to help the *seasurgeon*.

Wisceman's Surgery.

The bills of curlews, and many other *seafowl*, are
very long, to enable them to hunt for the worms.

Derham.

The *sea* could not be much narrower than it is,
without a great loss to the world. *Bentley.*

Fierce *seadogs* devour the mangled friends.

Roscommon.

So when the first bold vessel dared the *seas*,
High on the stern the Thracian raised his strain,

While Argo saw her kindred trees

Descend from Pelion to the main. *Pope.*

Darkness covered o'er

The face of things : along the *seaboard* shore

Satiate we slept. *Id. Odyssey.*

A wandering merchant, he frequents the main,

Some mean *seafarer* in pursuit of gain ;

Studious of freight, in naval trade well skilled,

But dreads the 'thletic labours of the field. *Pope.*

A length of ocean and unbounded sky,

Which scarce the *seafowl* in a year o'er-fly. *Id.*

'Upon his urn reclined,

His *seagreen* mantle waving in the wind,

The god appeared. *Id.*

Telemachus, the blooming heir

Of *seagirt* Ithaca, demands my care :

'Tis mine to form his green unpractised years

In sage debates. *Id.*

The chongh, the *seamew*, the loquacious crow,
Scream aloft. *Id. Odyssey.*

There disembarking on the green *seaside*,

We land our cattle and the spoil divide. *Pope.*

To *seasurrounded* realms the gods assign

Small tract of fertile lawn, the least to mine. *Id.*

I agree with you in your censure of the *seaterms* in
Dryden's Virgil, because no terms of art or cant
words suit the majesty of epick poetry. *Id.*

You were pressed for the *seaservice* and got off with
much ado. *Swift's Directions to Servants.*

Weary and *seasick*, when in thee confined ;

Now, for thy safety, cares distract my mind. *Swift.*

A *seafowl* properly represents the passage of a
deity over the *seas*. *Broom.*

Seawater has many gross, rough, and earthy par-
ticles in it, as appears from its saltness ; whereas fresh
water is more pure and unmixt. *Id.*

Virgil, after Homer's example, gives us a trans-
formation of *Aeneas's* ships into *seanymphs*. *Id.*

The situations of the parts of the earth are better
learned by a map or *seachart*, than reading the de-
scription. *Watts.*

Seamen, through dismal storms, are wont

To pass the oyster-breeding Hellespont. *Keelm.*

The *seacow* is of the cetaceous kind. It grows to
fifteen feet long, and to seven or eight in circum-
ference : its head is like that of a hog, but longer
and more cylindrick : its eyes are small, and it has
no external ears, but only two little apertures. Its
hips are thick, and it has two long tanks standing

out. It has two fins, which stand forward on the breast like hands, whence the Spaniards called it manatee. The female has two round breasts placed between the pectoral fins. The skin is very thick and hard, and not scaly, but hairy. *Hill's Mat. Med.*

The species are *seaholly*, or *eryngo*. Common *eryngo*. The roots of the first are candied, and sent to London for medicinal use, being the true *eryngo*. *Id.*

SEA, in a strict sense, signifies a large portion of water almost surrounded by land, as the Baltic and Mediterranean seas; but it is frequently used for that vast body of water which encompasses the whole earth.

What proportion the superficies of the sea bears to that of the land cannot be ascertained with exactness. Buffon has supposed that the surface of our globe is equally divided between land and water, and has accordingly calculated the superficies of the sea to be 85,490,506 square miles. But it is now well known that the ocean covers more than the half of the earth's surface. The French naturalist believed in the existence of a vast southern continent, which captain Cook has shown to be visionary. It was this circumstance which misled him. The sea occupies, according to Le Brun and the best modern writers, about six-tenths of the earth's surface. See our articles OCEAN and GEOGRAPHY. To ascertain the depth of the sea is still more difficult than its superficies, both on account of the numerous experiments which it would be necessary to make, and the want of proper instruments for that purpose. The sea is often found unfathomable; and, though several methods have been contrived to average its depth, none of them has completely answered the purpose. We know in general that the depth of the sea increases gradually as we leave the shore; but, if this continued beyond a certain distance, the depth in the middle of the ocean would be prodigious. Indeed, the numerous islands every where scattered in the sea demonstrate the contrary, by showing us that the bottom of the water is unequal like the land, and that, so far from uniformly sinking, it sometimes rises into lofty mountains. If the depth of the sea be in proportion to the elevation of the land, as has been generally supposed, its greatest depth will not exceed five or six miles, for there is no mountain six miles perpendicular above the level of the sea. The sea has never been actually sounded to a depth much exceeding a mile; every thing beyond therefore rests entirely upon conjecture and analogical reasoning, which ought never to be admitted to determine a single point that can be ascertained by experiment. Along the coasts, where the depth of the sea is in general well known, it has always been found proportioned to the height of the shore: when the coast is high and mountainous, the sea that washes it is deep; when, on the contrary, the coast is low, the water is shallow. Whether this analogy holds at a distance from the shore, experiments alone can determine.

To calculate the quantity of water contained in the sea, while its depth is unknown, is of course impossible. But, if we suppose with Buffon, that its medium depth is the fourth part of a mile, the ocean, if its superficies be

128,235,759 square miles, will then contain 32,058,939,75 cubic miles of water. Let us now endeavour to compute the quantity of water which is constantly discharged into the sea. For this purpose let us take a river whose velocity and quantity of water is known, the Po for instance, which according to Riccioli is 1000 feet (or 100 perches of Boulogne) broad, ten feet deep, and runs at the rate of four miles in an hour consequently that river discharges into the sea 200,000 cubic perches of water in an hour, or 4,800,000 in a day. A cubic mile contains 125,000,000 cubic perches; the Po therefore will take twenty-six days to discharge a cubic mile of water into the sea. Let us now suppose, what is perhaps not very far from the truth, that the quantity of water which the sea receives from the rivers in any country is proportioned to the extent of that country. The Po, from its origin to its mouth, traverses a country 380 miles long, and the rivers which fall into it on every side rise from sources about sixty miles distant from it. The Po therefore, and the rivers which it receives, water a country of 45,600 square miles. Now, since the whole superficies of the dry land is about 42,745,253 square miles, it follows, from our supposition, that the quantity of water discharged by all the rivers in the world, in one day, is thirty-six cubic miles, and in a year 13,140. If therefore the sea contains 32,058,939 cubic miles of water, it would take all the rivers in the world 2439 years to discharge an equal quantity.

It may seem surprising that the sea, since it is continually receiving an immense supply of water, does not visibly increase, and at last cover the whole earth. But our surprise will cease, if we consider that the rivers themselves are supplied from the sea, and that they do nothing more than carry back those waters which the ocean is continually lavishing upon the earth. Dr. Halley has demonstrated that the vapors raised from the sea, and transported upon land, are sufficient to maintain all the rivers in the world. The simplicity of this great process is astonishing; the sea not only connects distant countries, and renders it easy to transport the commodities of one nation to another, but its waters rising in the air descend in showers to fertilise the earth, and nourish the vegetable kingdom; and, collecting into rivers, flow onwards, bringing fertility, and wealth, and commerce, along with them, and again return to the sea to repeat the same round. The knowledge of this process of nature might, one would think, have convinced philosophers that the proportion between sea and land continued always nearly the same. They however have formed different theories about this as well as most other subjects, maintaining on the one hand that the sea is continually encroaching on the land, and, on the other, that the land is constantly gaining on the sea. Both sides have supported their theories by arguments, demonstrations, and incontrovertible facts! The height of the mountains, say the philosophers who support the encroachments of the sea, is continually diminishing; exposed to the violence of every storm, the hardest rocks must at last give way and tumble down. The tides are continually sweeping

along with them particles of earth which they deposit in the bottom of the sea. Both the depth of the ocean then, and the height of the dry land, must be always decreasing; the waters therefore must, unless a part of them were annihilated, spread over a greater extent of surface in proportion as these causes operate. This reasoning, convincing as it is, might be confirmed by a great number of facts: it will be sufficient, however, to mention one or two. In the reign of Augustus, the Isle of Wight made a part of Britain, so that the English crossed over to it at low water with cart loads of tin: yet that island is at present separated from Britain by a channel half a mile wide. The Godwin sands on the eastern shore of England were formerly the fertile estate of earl Godwin. Nor are the encroachments of the sea confined to Britain. In the bay of Baia, near Naples, there are remains of houses and streets still visible below the present level of the sea. The sea therefore is making continual encroachments upon the land; and the time will come, say they, when the waters will again cover the surface of the earth. Such are the arguments of those philosophers who maintain the continual encroachments of the sea. Those who maintain the opposite theory, that the land is continually gaining on the sea, though they pretend not to deny the facts advanced by their opponents, affirm that they are altogether insufficient to establish their hypothesis. Though the rivers carry down particles of earth into the sea, these, say they, are either accumulated on other shores, or, collecting in the bottom of the ocean, harden into stone, which, being possessed of a vegetative power, rises by degrees above the surface of the sea, and form rocks, and mountains, and islands. The vegetative nature of stone indeed is sufficient, of itself, to convince us that the quantity of earth must be daily accumulating, and consequently that the surface of the sea is diminishing in extent. Celsius, a Swedish philosopher (for this dispute has been carried on in Sweden with the greatest keenness), has endeavoured to build this theory with more solid materials than vegetable stone. In a curious memoir, published in 1743, he asserts that the Baltic and the Atlantic, at least that part of it which washes Norway, is constantly diminishing; and he proves this by the testimony of many aged pilots and fishermen, who affirmed that the sea was become much shallower in many places than it had been during their youth; that many rocks formerly covered with water were now several feet above the surface of the sea; that loaded vessels used formerly to ride in many places where pinnaces and barks could now with difficulty swim. He produces instances of ancient sea-port towns now several leagues from the shore, and of anchors and wrecks of vessels found far within the country. He mentions a particular rock, which 168 years before was at the bottom of the sea, but was then raised eight feet above its surface. In another place, where the water fifty years before had reached to the knee, there was then none. Several rocks too, which, during the infancy of some old pilots, had been two feet under water, were then three

feet above it. From all these observations, M. Celsius concludes that the water of the Baltic decreases in height four lines and a half in a year, four inches five lines in eighteen years, four feet five inches in 100 years, and in 1000 years forty-five feet. Conscious, however, that these facts, how conclusive soever as far as relates to the Baltic, can never determine the general question, M. Celsius advances another argument in support of his theory. All that quantity of moisture, says he, which is imbibed by plants, is lost to the general mass of water, being converted into earth by the putrefaction of vegetables. This notion had been mentioned by Newton, and was adopted by Van Helmont; if granted, it follows as a consequence that the earth is continually increasing, and the water diminishing in a very rapid degree. Such are the arguments advanced in support of both theories; for it is needless to mention a notion of Linnaeus, that the whole earth was formerly covered with water, except a single mountain. When fairly weighed they amount to nothing more than this, that the sea has encroached upon the land in some places, and retired in others; a conclusion which we are very willing to allow. What was advanced by those philosophers who maintain that the sea is continually encroaching on the land, about the depth of the sea constantly diminishing, must remain a mere assertion till they prove by experiments, either that it is really the case, or that nature has no way of restoring those particles of earth which are washed down by the rivers. Nor have they any good reason to affirm that the height of the mountains is decreasing. Can a single instance be produced? Are the Alps or the Appennines, or Taurus, or Caucasus, less lofty now than they were 1000 years ago? We mean not to deny that the rain actually washes down particles of earth from the mountains, nor to affirm that the hardest rocks are able to resist continual storms, nor that many mountains have suffered, and continue to suffer daily, from a thousand accidents. But the effects produced by all these causes are so trifling as to be altogether imperceptible. Nature has assiduously guarded against such accidents; she has formed the mountains of the most durable materials; and, where they are covered with earth, she has bound it together by a thick and firm matting of grass, and thus secured it from the rains; and should accident deprive it of this covering, she takes care immediately to supply the defect. Even should the earth be swept away, together with its covering, nature has still such resources left as frequently restore things to their former state. Many kinds of moss, one would be tempted to think, have been created for this very purpose; they take root and flourish almost upon the bare rock, and furnish as they decay a sufficient bed for several of the hardy Alpine plants. These perish in their turn, and others succeed them. The roots of the plants bind fast the earth as it accumulates, more plants spring up and spread wider, till by degrees the whole surface is covered with a firm coat of grass. Even the rain, which always contains in it a good deal of earth, contributes something to hasten the process. As

the vegetation of stone is now, we believe, given up by all parties, it is needless to take any farther notice of it here. See STONE. The hypothesis of M. Celsius, that water is converted into earth, has also shared the same fate, because it was unsupported by experiment, and contrary to every thing that we know either about earth or water. It is a little extraordinary that philosophers have been so lavish of water as to convert it in this manner into stone and earth, when they had given it, one would think, sufficient employment before in making new worlds, and in confuting Moses.

The sea contains the greatest quantity of salt in the *torrid zone*, where otherwise, from the excessive heat, it would be in danger of putrefaction; as we advance northward this quantity diminishes, till at the pole it nearly vanishes altogether. Under the line Lucas found that the sea contained a seventh part of solid contents, consisting chiefly of sea salt. At Harwich he found it yielded one-twenty-fifth of sea-salt. At Carlsroon, in Sweden, it contains one-thirtieth part, and on the coast of Greenland a great deal less. This deficiency of salt near the poles probably contributes a good deal towards the prodigious quantities of ice which are met with in these seas; for salt water requires a much greater degree of cold to freeze it than fresh water. It was this circumstance, probably, together with its constant motion, which induced the ancients to believe that the sea never froze. Even among the moderns, it has been a generally received opinion that sea-ice is originally formed in rivers. Buffon has made the great quantities of ice with which the South Sea abounds an argument for the existence of a continent nearer the Antarctic pole. But it is now well known that great quantities of ice are formed at a distance from land. Sea-ice is of two kinds: field-ice which extends along the shore, and is only two or three feet thick; and mountain ice, which abounds in the middle of the ocean. The size of these mountains is sometimes prodigious. The sea-ice is always fresh, and has been often of great use to navigators. The weight of sea-water is to that of river water as seventy-three to seventy; that is, a cubic foot of sea-water weighs seventy-three pounds, while the same quantity of river-water weighs only seventy pounds; but this proportion varies in different places. It is worthy of our attention, too, that the water at the surface of the sea contains less salt than near the bottom; the difference indeed is inconsiderable, but still it is something. The compte de Marsigli found the same quantity of water, when taken from the bottom of the Mediterranean, to weigh one ounce, three penny-weights, fifty-one grains; whereas from the surface it weighed only one ounce, three penny-weights, forty-nine grains. He repeated the experiment frequently with nearly the same result; but see OCEAN.

As the sea covers so great a portion of the globe, we should, no doubt, by exploring its bottom, discover a vast number of interesting particulars. Unfortunately, in the greater part of the ocean, this has hitherto been impossible. Part, however, has been examined; and the discoveries which this examination has produced,

may enable us to form some idea of the whole. The bottom of the sea bears a great resemblance to the surface of the dry land, being, like it, full of plains, rocks, caverns, and mountains; some of which are abrupt, and almost perpendicular, while others rise with a gentle declivity, and sometimes tower above the water, and form islands. Neither do the materials differ which compose the bottom of the sea, and the basis of the dry land. If we dig to a considerable depth in any part of the earth, we uniformly meet with rock; the same thing holds in the sea. The strata, too, are of the same kind, disposed in the same manner, and form indeed but one whole. The same kind of mineral and bituminous substances are also found interspersed with these strata; and it is to them probably that the sea is indebted for its bitter taste. Over these natural and original strata, an artificial bed has pretty generally been formed, composed of different materials in different places. It consists frequently of muddy tartareous substances firmly cemented together, sometimes of shells or coral reduced to powder, and near the mouths of rivers it is generally composed of fine sand or gravel. The bottom of the sea resembles the land likewise in another particular; many fresh springs, and even rivers rise out of it, which, displacing the salt water, render the lower part of sea, wherever they abound, quite fresh. An instance of this kind occurs near Goa, on the western coast of Indostan, and another in the Mediterranean Sea, not far from Marseilles. These facts occasioned a notion, which later experiments have exploded, that the sea beyond a certain depth was always fresh. Substances of a very beautiful appearance are frequently brought up by the sounding line from the bottom of the sea. The plummet is hollowed below, and this cavity filled with tallow, to which some of the substances adhere which form the bed of the ocean. These are generally sand, gravel, or mud; but they are sometimes of the brightest scarlet, vermilion, purple, and yellow; and sometimes, though less frequently, they are blue, green, or white. These colors are owing to a kind of jelly which envelopes the substances, and vanish entirely as soon as this jelly dries. At times, however, they assume the appearance of tartareous crusts, and are then so permanent that they can be received into white wax melted and poured round them, and perhaps by proper care might be converted into valuable paints.

For the temperature, color, &c., of the sea, and other interesting phenomena respecting it, see the articles OCEAN and GEOGRAPHY.

We have to add however the result of some interesting experiments on the *specific gravity* of sea-water by Dr. Traill of Liverpool, and some remarks on the same subject, and on the *temperature* of the sea at different depths, made by Dr. J. C. Horner, the naturalist to the expedition of discovery lately undertaken by Kotzebue:—

‘In the course of some experiments on the specific gravity of different fluids,’ says the first of these gentlemen, ‘I had occasion to examine sea-water drawn in different latitudes, and from various depths in the Atlantic Ocean. The re-

sult is somewhat remarkable; and, though the number of my experiments may not entitle me to deduce from them a general law, yet their publication may excite the attention of those who have opportunities of repeating them. The specimens of sea-water were procured at my request by nautical friends some time ago; but all were taken up within the same year. Each specimen filled a common glass bottle, and had a label immediately affixed to it, indicating the place where it was obtained. The water, from considerable depths, for want of better apparatus, was procured by the following contrivance. It was found that a bottle might be so corked as to prevent the admission of water, until the pressure of the superincumbent column, on sinking it by an attached weight, pushed the cork inwards, when the escape of the air, and the filling of the bottle with water, again forced the cork into its neck, and thus obviated the change of displacement of the included water, as the bottle was drawn upward. The pressure required to force the cork being ascertained by previous experiment, the bottle, thus prepared, was sunk to the requisite depth; and, after remaining there for half an hour or more, was drawn up and immediately secured.

My experiments were carefully conducted by means of a delicate balance, and a thin flask, capable of holding upwards of 1050 grains of distilled water, when its ground stopper was adjusted. A bottle of distilled water, and all the specimens of sea-water, were reduced to the same temperature, by being placed for many days on the same table, in a room without a fire; and, to prevent error from this source, each liquid was examined by a good thermometer previously to the experiment. The weight of the distilled water bearing the same ratio to the weight of an equal volume of the other fluids, as 1·0000 to the sought specific gravities, is the simple formula from which the following table is deduced:—

Table of Specific Gravities at Temperature 51° Fahrenheit.

1. Sea-water drawn from the surface, lat. 47° 47' N., long. 10° 40' W. = 1·0277
2. Ditto from the depth of forty fathoms, ditto, ditto = 1·0280
3. Ditto from the surface, lat. 37° N., long. 9° W. off Cape St. Vincent = 1·0281
4. Ditto from the surface, Maderia, bearing north-east distance, sixteen leagues = 1·0284
5. Ditto from the depth of forty fathoms in the same spot = 1·0286
6. Ditto from the depth of thirty-six fathoms, lat. 26° N., long. 64° W., during a voyage to Demerara = 1·0287
7. Ditto from the surface, lat. 92° 11' N., longitude not given; but, as it was in the same voyage as No. 6, it was probably more to the west = 1·0289
8. Ditto from the surface, lat. 8° 20' N., longitude not given; but as the three last numbers were obtained in the same voyage to Demerara, and this one, at my request, was taken when the captain supposed that he would make land in a day or two, there can be little doubt of the ship being at this time just off the mouth of the Orinoco = 1·0267

In calculating these specific gravities, I had carried them to several decimal places farther; but I have suppressed these in the Table, because it might appear an affectation of accuracy which the case does not admit; for the difference of a single one-tenth of a grain in weighing each fluid in the above experiments, would make a difference of nearly $\frac{1}{10000}$ th in their specific gravities; or would alter the last figure of the present decimal series.

The inferences to which these experiments lead are, 1st. That the specific gravity of the waters of the Atlantic increases as we approach the equator. 2d. That the specific gravity of sea-water increases with the depth from which it is drawn.

The only exception in the table to the first inference is No. 8; but the great diminution of density here observed is undoubtedly owing to the vast mass of rushing water poured into the ocean by the Orinoco, the stream of which is said to discolor the sea many leagues from land, and at a considerable distance from the shore to preserve the freshness of its current.

The results of captain Scoresby's experiments, on the specific gravity of sea-water, seem to agree with the inferences above mentioned. This intelligent navigator found that the density of the waters of the ocean, near the meridian of Greenwich, gradually diminished from lat. 57° 42' N., to lat. 66° 45'; being at the former 1·0280, at the latter 1·0263. In higher latitudes, or in confined seas, we cannot expect to find a uniformity in such results; for the influence of the ice in the one, and of situation in the other, are sufficient to conceal such minute differences. On referring to his valuable work, an examination of his experiments on the density of sea-water, at different depths, will confirm also the second inference. The few exceptions to it in captain Scoresby's Table may be explained by the influence of currents, and irregularities produced by the neighbourhood of ice, which is known to exercise a powerful influence on the atmosphere, and on the waters. In the prosecution of this interesting subject, no instrument appears more admirably adapted to procure water from any required depth, without chance of error, than that gentleman's marine diver; which, with simplicity of construction, unites every property that can insure accuracy and convenience in those delicate investigations for which it was intended by its ingenious contriver.

I am at a loss, adds this writer, what reason to assign for the increased density of water brought up from considerable depths; unless, according to a suggestion offered by my friend Dr. Brewster, it may be owing to the imperfect elasticity of water, which prevents its particles, when compressed by the superincumbent column, from regaining their original condition, when the pressure is removed. A curious series of experiments might be made on the mechanical compression of water, by employing the bathometer of Mr. Perkins, the inventor of the method of multiplying copper-plates by engravings on steel. In this machine, water enclosed in a brass tube, the sides of which need not exceed one-tenth of an inch in thickness, is com-

pressed by a solid piston, sliding in a leather collar, and acted on by the superincumbent column when sunk in the depths of the ocean. This seems one of the simplest means of producing an immense pressure; and, when conversing with Mr. Perkins, I remember his stating that the piston did not exactly return to its original position, on bringing up the instrument.'

Dr. Horner has embodied the result of his observations in a table which demonstrates the facts also proved by the experiments of Krusenstern's voyage, that the sea on the surface, between the tropics, is specifically heavier, and that it contains more salt, than in higher latitudes. If we take together the statements from 25° S. as far as 25° N. lat., and in the same manner, from 50° to 65° of N. lat., the mean of the first is 1.0288, that of the latter 1.0245, which gives the difference of 0.0043 or $\frac{1}{231}$. But this by no means proves an absolute inequality in the saltness of the water in general. To give a decided opinion on it, the sea-water must be fetched up from considerable depths, and weighed. Probably the greater saltness arises from the rapid decrease of the fresh water, in consequence of evaporation. From the well known slowness of the transition of chemical elements, in undisturbed compounds, this decrease is but slowly repaired; and, as the upper layers are also the warmer, they may, notwithstanding their greater specific density, in consequence of their extent, be maintained by the warm swimming above the lower cooler layers, by which a principal agent of commixture, the difference of weight, is rendered of no effect. The slowness of change, and the condensation of the saline solution at the surface, which results from it, has the advantage that the acceleration of the evaporation sets bounds to itself, because, with the increasing condensation, the attraction of the salt to the parts of the water is greater, and, consequently, the diminution of the latter less. Without this arrangement the tropical seas would perhaps be covered, like the frozen seas of the north, with constant fogs. Subsequent experiments will show how far our explanation of this inequality is correct; of which we have now more hopes, as convenient accurate apparatus have been discovered to fetch up water from any depth, at pleasure, and unmixed.

The considerable number of observations (there are 116 of them) on the temperature of the sea below the surface, their extent over waters of the ocean remote from each other, and probably, also, their accuracy, give them a decided claim to the attention of the natural philosopher; and the perseverance with which they were continued, under various circumstances, does honor, as well to the naturalist of the expedition, as to the commander, who not only in calms, but in some periods almost daily, afforded the necessary assistance. They were all made with Six's Thermometer, which is a good assurance of their accuracy. It is certainly remarkable that an instrument so simple, so convenient in the use, so certain in the results, and which has been long known, is not more frequently used for this purpose; so that in the latest scientific voyages much more uncertain thermometers

have been used, to which only the deep sea column of captain Ross forms an exception. Our observations fall under two heads: measurements of the temperature in different depths, in the same places of the ocean, and in statements of the warmth in the usual soundings, from sixty to eighty fathoms, in different places.

The most complete observations on the changes of the temperature, in increasing depths, are, in the South Sea, of the 13th and 14th of September, 1817, in 36° N. lat., and 148° W. long. Besides confirming the general law, that the cold increases with the depth, they also afford the following results:—1. The upper parts of the water show a particular warmth, as the temperature, in the first eight fathoms, diminished only $0^{\circ} 4'$, R., but from that depth to twenty-five fathoms fell 6° , R. From twenty-five to 100 fathoms' depth the decrease of warmth is considerably less, since in the next twenty-five fathoms, it is only $1^{\circ} 7'$, R., and in the next fifty fathoms only $1^{\circ} 5'$, R.; a decrease which amounts to only the tenth part of the preceding. It is still slower between 100 and 300 fathoms. 2. If we compare these observations with those of the 6th of June 1816, in 37° N. and in 193° W. long., consequently in the same parallel of latitude, the influence of the season is particularly observable in the temperature on the surface, which in June is 13° , R., in September 18° R. It, however, does not go much deeper than from twenty-five to fifty fathoms; and at 100 fathoms it is already within the limits of the accuracy of such observations; for we have

	6th June	$9^{\circ} 4'$ Reaumur.
For 100 fathoms	13th September	9 4
	14th September	3 6

3. A certain coincidence with these results, only on a greater scale, is shown by the experiments of the 15th of November, 1817, in 9° N. lat., and 205° W. long., in which the temperature decreases from the surface to about sixty or seventy fathoms, rapidly and uniformly, from $24^{\circ} 7'$, R., to $8^{\circ} 8'$, R. From nine to 101 fathoms, this rapid decrease, instead of proceeding, is suddenly reduced to the small amount of $0^{\circ} 9'$, R. But if we compare these observations with those immediately preceding and succeeding them of the 13th, 14th, and 17th, of November, we shall hesitate to draw from them decisive conclusions.

4. The observations of the 13th of April, 1816, in 15° S., and 130° W., follow a quite different course from those in September, 1817, in 36° N. The decrease of warmth from the surface, to as far as 100 fathoms' depth, is much more inconsiderable, being here only $3^{\circ} 6'$, there nearly treble, namely, $9^{\circ} 4'$, R. It becomes more considerable between 100 and 200 fathoms, namely, $8^{\circ} 8'$, R. Remarkable as this inequality is, it yet seems impossible to ascribe it to an error in the observation, such as too soon drawing up the thermometer: for, on the one hand, the regular course of the experiments of the 14th of September, 1817, and their coincidence with those of the 13th, at the depths of $0^{\circ} 25'$ and 100 fathoms, does not allow us to suppose any thing of the kind; on the other side, the observations of the 13th of April, 1816, find their

confirmation in the preceding ones of the 7th of April, in 18° S., which give a difference of 0 to 125 fathoms of $4^{\circ} 8'$ R., that is, from 0 to 100 fathoms; likewise $3^{\circ} 8'$ R. The same observations then give for the second hundred of the depth in fathoms, likewise about 8° R. It is not to be discovered from the observations, whence this difference in the progressive decrease of the warmth arises. It cannot well be ascribed to the influence of the seasons, at least in lat. 35° N.: the observations of June and September show an agreement with each other. The reason perhaps is, that the perpendicular rays of the sun penetrate the water, between the tropics, to a greater depth than in latitudes where the sun never appears in the zenith. The place of constant temperature, independent of

the seasons, must probably lie much deeper between the tropics than beyond them.

5. The observations of the 22nd of September 1817, in 28° N. lat. and in 152° W. long., seem to present a much more uniform course, particularly if we set aside the statement in twenty-five fathoms' depth, which does not appear to agree with the higher or lower observations. We have from them a decrease of heat of $3^{\circ} 5'$ R. for the first fifty fathoms; $3^{\circ} 0'$ R. for the second fifty fathoms, and $4^{\circ} 3'$ R. from 100 to 200.

The collective observations on the progress of the decrease of heat were made in the South Sea. From the Atlantic Ocean we received only a few insulated statements for depths of 100 to 200 fathoms. The experiments in both oceans are arranged in the following Table:—

WARMTH of the SEA-WATER at different depths, arranged according to the Geographical Latitudes in degrees of Reaumur's Thermometer.

Month.	Surface.	70 to 90 Fathoms.	100 Fathoms.	200 Fathoms.	300 Fathoms.	Latitude.	Longitude.	
April . . .	21.0	—	17.2	9.9	—	18 S.	125 W.	
—	21.4	—	17.8	10.8	—	15	134	
May . . .	22.6	—	13.5	—	—	1 N.	177	
November . .	24.5	—	10.7	—	—	9	204	In the South Sea.
—	23.0	14.1	—	—	—	12	210	
December . .	22.1	12.8	—	—	—	16	240	
—	21.7	16.6	—	—	—	18	224	
September . .	20.1	—	13.0	8.8	—	28	152	
June . . .	18.7	—	13.5	—	9.4	29	199	
September . .	18.0	—	9.3	7.0	5.4	36	147	* In 400 Fathoms.
—	—	—	—	—	(4.8)*	—	—	
June . . .	13.0	—	9.3	—	5.0	37	199	
January . . .	10.4	—	—	3.2	—	44 S.	57	
March . . .	17.3	—	12.3	—	—	34	27	In the Atlantic Ocean.
April . . .	15.8	12.8	—	7.9	—	31	15	
October . . .	18.9	—	10.6	—	—	30 N.	15	
—	16.4	—	—	11.0	—	39	13	

The temperatures, in the usual soundings from seventy to eighty fathoms, appear, on account of their considerable number, from which mean numbers may be deduced, the best calculated to supply fundamental data. Yet some singular results appear in them. Among these is the statement in the South Sea, that in 18° N. lat. and seventy-six fathoms' depth, in December, the water was $2\frac{1}{2}^{\circ}$ R. warmer than in 11° N. lat. and seventy fathoms depth in November. Perhaps the local places of observation have had here some influence. The observation in 11° lat. lies in the west of the Mariana Islands, and in the north of the Philippines, consequently sheltered against the warmer currents from the south by a kind of wall, and open only to the north, while, on the other hand, the place in 18° lat.

lies more in the open sea. The temperature found at the depth of ninety fathoms in the Chinese Sea to the west of Luçon is remarkably cold; perhaps in consequence of the north-east currents prevailing in December.

Almost daily observations on the temperature were made in the Atlantic Ocean from the 20th of April to the 13th of June, 1818, mostly at the depth of seventy fathoms. In order to balance the possible errors of the observations which may arise from the difference in the time that the thermometer was under water, I have added several together, and noted the mean number. They are in the following Table. The figures in parentheses show the number of observations, the mean of which is given.

Observation.	Temperature of the water.		Depth in Fathoms.	Latitude.	Longitude.
	On the Surface.	Below the Surface.			
April 20—26. . . . (5)	18·6	13·0	57	17° 15' S.	3° 20' W.
— 27—30. . . . (4)	20·8	13·5	66	10 24	12 2
— 30—May 4. . . . (5)	22·1	11·8	67	5 12	17 5
May 3—10 (8)	22·7	11·4	74	0 43 N.	20 28
— 10—16. . . . (7)	22·6	11·4	75	4 51	24 38
— 15—19. . . . (5)	21·2	11·5	67	9 34	29 38
— 20—24. . . . (5)	20·3	16·1	71	19 30	35 7
— 25—30. . . . (6)	18·3	14·8	71	31 0	36 30
— 31—June 6. . . . (5)	15·1	12·3	68	40 30	29 40
June 7—13. . . . (7)	13·2	9·6	77	48 9	17 15

This table shows a similar anomaly to that which we noticed in the South Sea. That is, the proportionately low temperature near the equator from 5° S. to 10° N. Perhaps the greater heat between 20° and 30° of S. lat. might be a remnant of the southern summer. But the considerable increase of temperature in the zone, between 15° and 30° N. lat., is still more remarkable. For though, towards the end of May, the sun was near the zenith of those parts, yet this influence, which could be only commencing here, must have shown itself in the waters near the equator, which the sun had just traversed at the time of those observations (in April), which was by no means the case. The temperatures at the surface indicate indeed this influence of the sun, being the highest at the equator (22½° R.), while the southern half of the tropical seas had already assumed an autumnal temperature, since we observe here, in 17° S., the same warmth (18½° R.) as in 30° N.

SEABURY (Samuel), the first bishop of the episcopal church of the United States of America, was born in 1728, and educated at Yale College, after which he went to Scotland to study medicine. His father being a minister in Connecticut, the son finally chose the ecclesiastical profession; and in 1753 was ordained in London. He fixed finally at New London in Connecticut, and in 1784 he made a voyage to England, to obtain consecration as a bishop of the new independent episcopal church. Meeting with obstacles to his wishes from the English prelates, he went to Scotland, where he was consecrated by three bishops of the episcopal church of that kingdom. He returned thus qualified to his native country, and fulfilled the duties of his pastoral office in an exemplary manner till his death, which happened in 1796. Bishop Seabury published two volumes of sermons, to which a supplement was added in 1798.

SEA CORMORANT. See LARUS.

SEA COW. See HIPPOPOTAMUS, and TRICHECUS.

SEAFORD, a borough and sea-port town of England, one of the cinque ports. It sends two members to the imperial parliament. Its inhabitants are employed in fishing, but of late it has been resorted to as a bathing place. The privilege of a cinque-port was given it by Charles I., and it has sent two members to parliament since

the 26th of Edward I. The right of election is in the inhabitants paying scot and lot; and the returning officer is the bailiff; who is the head of the corporation, which consists of twelve jurats, and an indefinite number of freemen. Its market is disused. In 1560 it was attacked by the French, but they were repulsed. It is eight miles S. S. E. of Lewes, and sixty-three south by east of London.

SEA-GRASS. See FUCUS.

SEA-GULL. See LARUS.

SEA-HEDGEHOG. See ECHINUS.

SEAL, *n. s.* Sax. *feol, fele*; Dan. *seel*. The sea calf.

The seal or soyle is in make and growth not unlike a pig, ugly faced, and footed like a mold-warp: he delighteth in musick, or any loud noise, and thereby is trained to shew himself above water: they also come on land. *Carew.*

An island salt and bare,
The haunt of seals, and orks, and seamews clang. *Milton.*

SEAL, *n. s., v. a., & v. n.* } Sax. *rigel*; Lat. SEALING-WAX, *n. s.* } *sigillum*. A stamp engraved with a particular impression; the impression made: to attach, confine, or fasten by a seal: hence to shut up; enclose; mark with a seal: as a verb neuter, to fix a seal.

We make a sure covenant and write it, and our princes and priests seal unto it. *Nehemiah ix. 33.*

When I have performed this, and sealed to them this fruit, I will come into Spain. *Romans xv. 28.*

Solyman shewed him his own letters, asking him if he knew not that hand, and if he knew not that seal? *Knolles.*

The king commands you
To render up the great seal.

Shakspeare. Henry VIII.
Till thou canst rail the seal from off my bond,
Thou but offendest thy lungs to speak so loud.

Shakspeare.
He that brings this love to thee,
Little knows this love in me;
And by him seal up thy mind. *Id. As You Like It.*
God joined my heart to Romeo's; thou *OL* hands;

And ere this hand, by thee to Romeo sealed,
Shall be the label to another deed,
Or my true heart with treacherous revolt
Turn to another, this shall slay them both.

Shakspeare.

Seal up your lips, and give no words but mum!

Id.

You'd rail upon the hostess,
And say you would present her at the lect,
Because she bought stone jugs, and no sealed quarts.

Id.

I will seal unto this bond.

Id.

The sense is like the sun; for the sun seals up the
lobe of heaven, and opens the globe of earth; so
the sense doth obscure heavenly things, and reveals
earthly things.

Bacon.

They their fill of love

Took largely, of their mutual guilt the seal. *Milton.*

Back to the infernal pit I drag thee chained,

And seal thee so as henceforth not to scorn

The facil gates of hell, too slightly barred.

Id.

The prominent orifice was closed with sealingwax.

Boyle.

If the organs of perception, like wax overhardened
with cold, will not receive the impression of the
seal; or, like wax of temper too soft, will not hold
it; or else supposing the wax of a temper fit, but the
seal not applied with a sufficient force to make a
clear impression: in any of these cases the print left
by the seal will be obscure.

Locke.

He saw his monkey picking the seal wax from a
letter.

Arbuthnot.

The same his grandsire wore about his neck

In three seal rings; which after, melted down,

Formed a vast buckle for his widow's gown. *Pope.*

A SEAL is a stamp of metal, stone, or some other convenient substance, whereon are engraven the arms, device, &c., of some prince, state, community, magistrate, or private person, often with a legend or inscription; the impression whereof in wax serves to make acts, instruments, &c., authentic. The use of seals, as a mark of authenticity to letters and other instruments in writing, is extremely ancient. We read of it among the Jews and Persians in the earliest and most sacred records of history. And in the book of Jeremiah there is a very remarkable instance, not only of an attestation by seal, but also of the other usual formalities attending a Jewish purchase. In the civil law also seals were the evidence of truth, and were required, on the part of the witnesses, at least at the attestation of every testament. But in the times of the Anglo-Saxons they were not much in use in England. For though Sir Edward Coke relies on an instance of king Edwyn's making use of a seal, about 100 years before the conquest, yet it does not follow that this was the usage among the whole nation, as we are assured by all our ancient historians that sealing was not then in common use. The method of the Saxons was for such as could write to subscribe their names, and, whether they could write or not, to affix the sign of the cross; which custom our illiterate vulgar to this day keep up, by signing a cross for their mark when unable to write their names. This inability to write his name, and therefore making a cross in its stead, is honestly avowed by Cædwalla, a Saxon king, at the end of one of his charters. For the same unsurmountable reason, the Normans, a brave but illiterate nation, at their first settlement in France, used the practice of sealing only, without writing their names; which custom continued when learning had made its way among them, though the reason had ceased; and hence the charter of Edward

the Confessor to Westminster Abbey, himself being brought up in Normandy, was witnessed only by his seal, and is generally thought to be the oldest sealed charter of any authenticity in England. At the Conquest the Norman lords brought over into this kingdom their own customs; and introduced waxen seals only, instead of the English method of writing their names, and signing with the sign of the cross. The impressions of the seals were sometimes a knight on horseback, sometimes other devices; but coats of arms were not introduced into seals till about the reign of Richard I.

SEAL is also used for the wax or lead, and the impression thereon, affixed to the thing sealed. The color of impressions of seals has varied considerably. That sort of wax most anciently used was white. The employment of yellow wax on public documents prevailed a good deal about the twelfth century. Ultimately, however, red wax became preferred in almost all the European countries, and remains so at the present moment. The western patriarchs and emperors sealed in green wax certain letters to persons of distinction. This usage was adopted in the twelfth century in France, and at a date somewhat subsequent introduced into Germany. Specimens of this variety are however extremely rare. In our own country the green seal is still occasionally used on charters. The emperor Charles V., in 1524, accorded the privilege of sealing in blue, but the example is unique of the employment of that color among European potentates. Certain princes have, at different times, adopted black wax to seal withal; as, for instance, Jeremy, patriarch of Constantinople. In the thirteenth century it was employed in France. Impressions are also found in mixed wax, i. e. of different colors. Seals vary, besides, in size and shape; they are sometimes large, sometimes small, square, round, long, trefoil, lozenge, &c.

SEAL, in zoology. See PNOCA.

SEAL, KING'S GREAT, is that whereby all patents, commissions, warrants, &c., coming down from the king, are sealed; the keeping whereof is in the hands of the lord chancellor.

SEALER is an officer in chancery appointed by the lord chancellor, or keeper of the great seal, to seal the writs and instruments there made in his presence.

SEALING WAX. See WAX

SEA-LION. See PNOCA.

SEAM, *n. s. & v. a.* } Saxon *ream*; Goth.
SEAMSTRESS, } *scym*; Belg. *zoom*; Teut.
SEAM'Y, *adj.* } *saum*. The suture where
the two edges of cloth are sewed together; a cicatrice; scar: a seamstress is a woman employed in sewing: seamy, having or showing seams.

Some such squire he was.

That turned your wit the seamy side without,
And made me to suspect you. *Shakspeare. Othello.*

They wanted food and raiment; so they took
Religion for their seamstress and their cook.

Cleveland.

In velvet white as snow the troop was gown'd,
The seams with sparkling emeralds set around.

Dr. cen.

Precepts should be so finely wrought together in the same piece that no coarse *seam* may discover where they join.

Addison.

Seamed o'er with wounds, which his own sabre gave.

Pope.

Say, has the small or greater pox

Sunk down her nose, or *seamed* her face? *Swift.*

SEAM, *n. s.* Sax. *feme*; Welsh *saim*. Tal-
low; grease; hog's lard.

Shall the proud lord,

That bastes his arrogance with his own *seam*,
Be worshipped? *Shakspeare. Troilus and Cressida.*

Part scour the rusty shields with *seam*, and part
New grind the blunted ax. *Dryden's Æneid.*

S E A M A N S H I P.

SEAMANSHIP, *n. s.* [from sea, man, and ship] the art of working a ship; including the science, knowledge, qualifications, and experience, which enable a man to exercise this noble art. A seaman, in the language of the profession, is not merely a mariner or laborer on board a ship, but a man who understands the structure of this machine, and every subordinate part of its mechanism, so as to enable him to employ it to the best advantage for pushing her forward in a particular direction, and for avoiding the numberless dangers to which she is exposed by the violence of the winds and waves. He also knows what courses can be held by the ship, according to the wind that blows, and what cannot, and which of these is most conducive to her progress in her intended voyage; and he must be able to perform every part of the necessary operation with his own hands. As the seamen express it, he must be able 'to hand, reef, and steer.'

Seamanship merits the title of a noble art, not only by its importance, which to Britons is peculiarly great, both in peace and in war, as a great means both of enriching and defending their country, but also by its immense extent and difficulty, and the number and variety of principles on which it is founded—all of which must be possessed in such a manner that they shall offer themselves, without reflection, in an instant, otherwise the pretended seaman is but a lubber, and cannot be trusted on his watch. This art is practised by seamen without what is called education, and in the humbler walks of life; and therefore it suffers in the estimation of the careless spectator. It is thought little of, because little attention is paid to it. But if multiplicity, variety, and intricacy of principles, and a systematic knowledge of these principles, entitle any art to the appellation of scientific and liberal, seamanship claims these epithets in an eminent degree. We are amused with the pedantry of the seaman, which appears in his whole language. Indeed it is the only pedantry that amuses. A scholar, a soldier, a lawyer, nay, even the elegant courtier, would disgust us, were he to make the thousandth part of the allusions to his profession that is well received from the jolly seaman; and we do the seaman no more than justice. His profession must engross his whole mind, otherwise he can never learn it.

A ship is a machine. We know the forces which act on it, and we know the results of its construction. All these are as fixed as the laws of motion. What, then, prevents this art from being reduced to a set of practical maxims, as well founded and as logically deduced as the working of a steam engine or a cotton mill? Ought not the rough seaman to look for the

same assistance; and may not the ingenious speculatist in his closet unravel the intricate thread of mechanism, which connects all the manual operations with the unchangeable laws of nature, and both furnish the seaman with a better machine, and direct him to a more dexterous use of it?

We cannot help thinking that much may be done; nay, we may say that much has been done in this way. We think highly of the progressive labors of Remaud, Pitot, Bouguer, Du Hamel, Grognard, Bernouilli, Euler, Rome, Gordon, Gower, and others. M. Bouguer was professor of hydrology at a marine academy of France, and was enjoined, as part of his duty, to compose dissertations both on the construction and the working of ships. His *Traité du Navire*, and his *Manœuvre des Vaisseaux*, are undoubtedly valuable performances: so are those of Euler and Bernouilli, considered as mathematical dissertations, and they are surprising works of genius, considered as the productions of persons who hardly ever saw a ship, and were totally unacquainted with the profession of a seaman. In this respect Bouguer had great superiority, having always lived at a sea-port, and having made many very long voyages. His treatises therefore are infinitely better accommodated to the demands of the seaman, and more directly instructive; but still the author is more a mathematician than an artist, and his performance is intelligible only to mathematicians.

The whole science of the art must proceed on the knowledge of the impulsions of the wind and water. These are the sources which act on the machine; and its motions, which are the ultimatum of our research, whether as an end to be obtained, or as a thing to be prevented, must depend on these forces. Now it is with respect to this fundamental point that we are as yet almost totally in the dark. And, in the performances of M. Bouguer, and the other authors above named, the theory of these forces, by which their quantity and the direction of their action are ascertained, is altogether erroneous; and its results deviate so enormously from what is observed in the motions of a ship that the person who should direct the operations on shipboard, in conformity to the maxims deducible from their propositions, would be baffled in most of his attempts, and be in danger of losing the ship. The whole proceeds on the supposed truth of that theory which states the impulse of a fluid to be in the proportion of the square of the sine of the angle of incidence; and that its action on any small portion, such as a square foot of the sails or hull, is the same as if that portion were detached from the rest, and exposed, single

and alone, to the wind or water in the same angle. But both these principles are erroneous, and to a very great degree, in cases which occur most frequently in practice, that is, in the small angles of inclination. When the wind falls nearly perpendicular on the sails, theory is not very erroneous; but, in these cases, the circumstances of the ship's situation are generally such that the practice is easy, occurring almost without thought; and in this case, too, even considerable deviations from the very best practice are of no great moment. The interesting cases are, where the intended movement requires or depends upon very oblique actions of the wind on the sails, and its practicability or impracticability depends on a very small variation of this obliquity; a mistake of the force, either as to intensity or direction, then produces a mighty effect on the resulting motion. This is the case in sailing to windward; the most important of all the general problems of seamanship. The trim of the sails, and the course of the ship, so as to gain most on the wind, are very nice things; that is, they are confined within very narrow limits, and a small mistake produces a very considerable effect. The same thing obtains in many of the nice problems of tacking, box-hauling, wearing after lying-to in a storm, &c.

The error in the second assertion of the theory is still greater, and the action on one part of the sail or hull is so greatly modified by its action on another adjoining part, that a stay-sail is often seen hanging like a loose rag, although there is nothing between it and the wind; and this merely because a great sail in its neighbourhood sends off a lateral stream of wind, which completely hinders the wind from getting at it. Till the theory of the action of fluids be established, we cannot tell what are the forces which are acting on every point of the sail and hull: therefore we cannot tell either the mean intensity or direction of the whole force which acts on any particular sail, nor the intensity and mean direction of the resistance to the hull; circumstances absolutely necessary for enabling us to say what will be their energy in producing a rotation round any particular axis. In like manner, we cannot, by such a computation, find the spontaneous axis of conversion, or the velocity of such conversion. In short, we cannot pronounce with tolerable confidence *a priori* what will be the motion in any case, or what dispositions of the sails will produce the movement we wish to perform. The experienced seaman learns by habit the general effects of every disposition of the sails; and, though his knowledge is far from being accurate, it seldom leads him into any very blundering operation. Perhaps he seldom makes the best adjustment possible, but seldomer still does he deviate very far from it; and in the most general and important problems, such as working to windward, the result of much experience and many corrections has settled the trim of the sails, which is certainly not far from the truth, though it deviates widely and uniformly from the theory of the mathematician.

But the theory is defective in one point only; and although this is a most important point, and

the errors in it destroy the conclusions of the chief propositions, the reasoning remains in full force, and the *modus operandi* is precisely such as is stated in the theory. The principles of the art are therefore to be found in these treatises; but false inferences have been drawn, by computing from erroneous quantities. The rules and the practice of the computation, however, are still beyond controversy: nay, since the process of investigation is legitimate, we may make use of it to discover the very circumstance in which we are at present mistaken; for by converting the proposition, instead of finding the motions by means of the supposed forces, combined with the known mechanism, we may discover the forces by means of this mechanism and the observed motions.

We shall therefore in this place give a very general view of the movements of a ship under sail, showing how they are produced and modified by the action of the wind on her sails, and of the water on her rudder and on her bows.

SECT. I.—OF THE MOVEMENTS OF A SHIP UNDER SAIL.

We shall not attempt a precise determination of any of these movements; but we shall say as much as may enable the curious landsman to understand how this mighty machine is managed amidst the fury of the winds and waves; and, what is more to our wish, we hope to enable the uninstructed but thinking seaman to generalise that knowledge which he possesses; to class his ideas, and give them a sort of rational system; and even to improve his practice, by making him sensible of the immediate operation of every thing he does, and in what manner it contributes to produce the movement which he has in view.

A ship may be considered as a mass of inert matter in free space, at liberty to move in every direction, according to the forces which impel or resist her; and when she is in actual motion, in the direction of her course, we may still consider her as at rest in absolute space, but exposed to the impulse of a current of water moving equally fast in the opposite direction: for in both cases the pressure of the water on her bows is the same; and we know that it is possible, and frequently happens in currents, that the impulse of the wind on her sails, and that of the water on her bows, balance each other so precisely that she not only does not stir from the place, but also remains steadily in the same position, with her head directed to the same point of the compass. This state of things is easily conceived by any person accustomed to consider mechanical subjects, and every seaman of experience has observed it. It is of importance to consider it in this point of view, because it gives us the most familiar notion of the manner in which these forces of the wind and water are set in opposition, and made to balance or not to balance each other by the intervention of the ship, in the same manner as the goods and the weights balance each other in the scales by the intervention of a beam or steel-yard.

When a ship proceeds steadily in her course, without changing her rate of sailing, or varying

the direction of her head, we must conceive the accumulated impulses of the wind on all her sails is precisely equal and directly opposite to the impulse of the water on her bows. The seaman has two principal tasks to perform. The first is to keep the ship steadily in that course which will bring her farthest on in the line of her intended voyage. Having chosen such a course as he thinks most advantageous, he must set such a quantity of sail as the strength of the wind will allow him to carry with safety and effect, and must trim the sails properly, or so adjust their positions to the direction of the wind that they may have the greatest possible tendency to impel the ship in the line of her course, and to keep her steadily in that direction.

His other task is to produce any deviations which he sees proper from the present course of the ship; and to produce these in the most certain, the safest, and the most expeditious manner. It is chiefly in this movement that the mechanical nature of a ship comes into view, and it is here that the superior address and resource of an expert seaman is to be perceived. Under the article SAILING some notice has been taken of the first task of the seaman, and it was there shown how a ship, after having taken up her anchor and fitted her sails, accelerates her motion, by degrees which continually diminish, till the increasing resistance of the water becomes precisely equal to the diminished impulse of the wind, and then the motion continues uniformly the same so long as the wind continues to blow with the same force and in the same direction.

It is perfectly consonant to experience that the impulse of fluids is in the duplicate ratio of the relative velocity. Let it be supposed that when water moves one foot per second, its perpendicular pressure or impulse on a square foot is m pounds. Then, if it be moving with the velocity V , estimated in feet per second, its perpendicular impulse on a surface S , containing any number of square feet, must be mSV^2 . In like manner, the impulse of air on the same surface may be represented by nSV^2 ; and the proportion of the impulse of these two fluids will be that of m to n . We may express this by the ratio of q to 1, making $\frac{m}{n} = q$.

M. Bouguer's computations and tables are on the supposition that the impulse of sea-water moving one foot per second is twenty-three ounces on a square foot, and that the impulse of the wind is the same when it blows at the rate of twenty-four feet per second. These measures are all French. They by no means agree with the experiments of others; and what we have already said, under resistance of fluids, is enough to show that nothing like precise measures can be expected. It was shown as the result of a rational investigation, and confirmed by the experiments of Buat and others, that the impulsions and resistances at the same surface, with the same obliquity of incidence and the same velocity of motion, are different according to the form and situation of the adjoining parts. Thus the total resistance of a thin board is greater than that of a long prism, having this board for its front or bow, &c. We are greatly at a loss what

to give as absolute measures of these impulsions.

1. With respect to water. The experiments of the French academy on a prism two feet broad and deep, and four feet long, indicate a resistance of 0.973 lb. avoirdupois to a square foot, moving with the velocity of one foot per second at the surface of still water. Mr. Buat's experiments on a square foot wholly immersed in a stream were as follow:—

A square foot as a thin plate . . . 1.81 lb.

Ditto as the front of a box one foot

long . . . 1.42

Ditto as the front of a box three foot

long . . . 1.29

The resistance of sea-water is about $\frac{1}{3}$ greater.

2. With respect to air, the varieties are as great. The resistance of a square foot to air moving with the velocity of one foot per second appears from Mr. Robins's experiments on sixteen square inches to be on a square foot 0.001596 lb.

Chevalier Borda's on 16 inches 0.001757

on 81 inches 0.002042

Mr. Rouse's on large surfaces 0.002291

Precise measures are not to be expected, nor are they necessary in this enquiry. Here we are chiefly interested in their proportions, as they may be varied by their mode of action in the different circumstances of obliquity and velocity.

We begin by recurring to the fundamental proposition concerning the impulse of fluids, viz. that the absolute pressure is always in a direction perpendicular to the impelled surface, whatever may be the direction of the stream of fluid. We must therefore illustrate the doctrine by always supposing a flat surface of sail stretched on a yard, which can be braced about in any direction, and giving this sail such a position and such an extent of surface that the impulse on it may be the same both as to direction and intensity with that on the real sails. Thus the consideration is greatly simplified. The direction of the impulse is therefore perpendicular to the yard. Its intensity depends on the velocity with which the wind meets the sail, and the obliquity of its stroke. We shall adopt the constructions founded on the common doctrine, that the impulse is as the square of the sine of the inclination, because they are simple; whereas, if we were to introduce the values of the oblique impulses, such as they have been observed in the excellent experiments of the academy of Paris, the constructions would be complicated in the extreme, and we could hardly draw any consequences which would be intelligible to any but expert mathematicians. The conclusions will be erroneous, not in kind but in quantity only; and we shall point out the necessary corrections, so that the final results will be found not very different from real observation.

If a ship were a round cylindrical body like a flat tub, floating on its bottom, and fitted with a mast and sail in the centre, she would always sail in a direction perpendicular to the yard. This is evident. But she is an oblong body, and may be compared to a chest, whose length greatly exceeds its breadth. She is so shaped that a moderate force will push her through the water with her head or stern foremost; but it requires a very great force to push her sidewise

SEAMANSHIP.

The leeway depends only on the direction of the impulse of the wind; and this depends solely on the position of the sails with respect to the keel, whatever may be the direction of the wind. This is a very important observation, and will be frequently referred to in the progress of the present investigation. Note, however, that we are here considering only the action on the sails, and on the same sails. We are not considering the action of the wind on the hull and rigging. This may be very considerable; and it is always in a lee direction, and augments the leeway; and its influence must be so much the more sensible as it bears a greater proportion to the impulse on the sails. A ship under courses, or close-reefed topsails and courses, must make more leeway than when under all her canvas trimmed to the same angle. But to introduce this additional cause of deviation here would render the investigation too complex to be of any use.

This doctrine will be considerably illustrated by attending to the manner in which a lighter is tracked along a canal, or swings to its anchor in

a stream. The track rope is made fast to some staple or bolt E on the deck, and is passed between two of the timber-heads of the bow at D, and laid hold of at F on shore. The men or cattle walk along the path FG, the rope keeps extended in the direction DF, and the lighter arranges itself in an oblique position AB, and is thus dragged along in the direction ab , parallel to the side of the canal. Or, if the canal has a current in the opposite direction ba , the lighter may be kept steady in its place by the rope DF made fast to a post at F. In this case it is always observed that the lighter swings in a position AB, which is oblique to the stream ab . Now the force which retains it in this position, and which precisely balances the action of the stream, is certainly exerted in the direction DF; and the lighter would be held in the same manner if the rope were made fast at C amidship, without any dependence on the timber-heads at D; and it would still be held in the same position, if, instead of the single rope CF, it were riding by two ropes CG and CH, of which CH is in a direction right a-head, but oblique to the stream, and the other CG is perpendicular to CH or AB. And, drawing DI and DK perpendicular to AB and CG, the strain on the rope CH is to that on the rope CG as CI to CK. The action of the rope in these cases is precisely analogous to that of the sail yY ; and the obliquity of the keel to the directions of the motion, or to the direction of the stream, is analogous to the leeway. All this must be evident to any person accustomed to mechanical disquisitions.

A most important use may be made of this illustration. If an accurate model be made of a ship, and if it be placed in a stream of water, and ridden in this manner by a rope made fast at any point D of the bow, it will arrange itself in some determined position AB. There will be a certain obliquity to the stream, measured by the angle Bob ; and there will be a corresponding obliquity of the rope, measured by the angle FCB. Let yCY be perpendicular to CF. Then CY will be the position of the yard or trim of the sails corresponding to the leeway bCB . Then, if we shift the rope to a point of the bow distant from D by a small quantity, we shall obtain a new position of the ship, both with respect to the stream and the rope; and in this way may be obtained the relation between the position of the sails and the leeway, independent of all theory, and susceptible of great accuracy; and this may be done with a variety of models suited to the most usual forms of ships.

In farther reflection on this subject we are persuaded that these experiments, instead of being made on models, may with equal ease be made on a ship of any size. Let the ship ride in a stream at a mooring D (fig. 1, Plate SEAMANSHIP), by means of a short hawser BCD from her bow, having a spring AC on it carried out from her quarter. She will swing to her moorings, till she ranges herself in a certain position AB with respect to the direction ab of the stream; and the direction of the hawser DC will point to some point E of the line of the keel. Now it is plain, to any person acquainted with mechanical disquisitions, that the deviation BEb is precisely the leeway that the ship will make when the average position of the sail is that of the line GEH perpendicular to ED; at least this will give the leeway which is produced by the sails alone. By heaving on the spring, the knot C may be brought into any other position we please; and for every new position of the knot the ship will take a new position with respect to the stream and to the hawser. And we persist in saying that more information will be got by this train of experiments than from mathematical theory; for all theories of the impulses of fluids must proceed on physical postulates, with respect to the motions of the filaments, which are exceedingly conjectural.

And it must now be farther observed that the substitution which we have made of an oblong parallelopiped for a ship, although well suited to give us clear notions of the subject, is of small use in practice; for it is next to impossible (even granting the theory of oblique impulses) to make this substitution. A ship is of a form which is not reducible to equations; and therefore the action of the water on her bow or broadside can only be had by a most laborious and intricate calculation for almost every square foot of its surface. See *Bezout's Cours de Mathem.* vol. v, p. 72, &c. And this must be different for every ship. But, which is more unlucky, when we have got a parallelopiped which will have the same proportion of direct and lateral resistance for a particular angle of leeway, it will

not answer for another leeway of the same ship; for, when the leeway changes, the figure actually exposed to the action of the water changes also. When the leeway is increased, more of the leeward is acted on by the water, and a part of the weather-bow is now removed from its action. Another parallelopiped must therefore be discovered, whose resistances shall suit this new position of the keel with respect to the real course of the ship.

We proceed in the next place to ascertain the relation between the velocity of the ship and, that of the wind, modified as they may be by the trim of the sails, and the obliquity of the impulse.

Let A B (fig. 2, 3, and 4, plate SEAMANSHIP) represent the horizontal section of a ship. In place of all the drawing sails, that is, the sails which are really filled, we can always substitute one sail of equal extent, trimmed to the same angle with the keel. This being supposed attached to the yard D C D, let this yard be first of all at right angles to the keel, as represented in fig. 2. Let the wind blow in the direction W C, and let C E (in the direction W C continued) represent the velocity V of the wind. Let C F be the velocity v of the ship. It must also be in the direction of the ship's motion, because, when the sail is at right angles to the keel, the absolute impulse on the sail is in the direction of the keel; and there is no lateral impulse, and consequently no leeway. Draw E F, and complete the parallelogram C F E e, producing e C through the centre of the yard to w. Then w C will be the relative or apparent direction of the wind, and C e or F E will be its apparent or relative velocity: for if the line C e be carried along C F, keeping always parallel to its first position, and if a particle of air move uniformly along C E (a fixed line in absolute space) in the same time, this particle will always be found in that point of C E where it is intersected at that instant by the moving line C e; so that, if C e were a tube, the particle of air, which really moves in the line C E, would always be found in the tube C e. While C E is the real direction of the wind, C e will be the position of the vane at the mast head, which will therefore mark the apparent direction of the wind, or its motion relative to the moving ship.

We may conceive this in another way. Suppose a cannon-shot fired in the direction C E at the passing ship, and that it passes through the mast at C with the velocity of the wind. It will not pass through the off-side of the ship at P, in the line C E: for, while the shot moves from C to P, the point P has gone forward, and the point p is now in the place where P was when the shot passed through the mast. The shot will therefore pass through the ship's side in the point p, and a person on board seeing it pass through C and p will say that its motion was in the line C p.

Thus it happens that when a ship is in motion the apparent direction of the wind is always ahead of its real direction. The line w C is always found within the angle W C B. It is easy to see from the construction that the difference between the real and apparent directions of the wind is so much the more remarkable as the velocity of the ship is greater: for the angle W C w

or E C e depends on the magnitude of E e or C F, in proportion to C E. Persons not much accustomed to attend to these matters are apt to think all attention to this difference to be nothing but affectation of nicety. They have no notion that the velocity of a ship can have any sensible proportion to that of the wind. 'Swift as the wind' is a proverbial expression; yet the velocity of a ship always bears a very sensible proportion to that of the wind, and even very frequently exceeds it. We may form a pretty exact notion of the velocity of the wind, by observing the shadows of the summer clouds flying along the face of a country, and it may be very well measured by this method. The motion of such clouds cannot be very different from that of the air below; and when the pressure of the wind on a flat surface, while blowing with a velocity measured in this way, is compared with its pressure when its velocity is measured by more unexceptionable methods, they are found to agree with all desirable accuracy. Now observations of this kind frequently repeated, show, that what we call a pleasant brisk gale blows at the rate of about ten miles an hour, or about fifteen feet in a second, and exerts a pressure of half a pound on a square foot. Mr. Smeaton has frequently observed the sails of a windmill, driven by such a wind, moving faster, nay much faster, towards their extremities, so that the sail, instead of being pressed to the frames on the arms, was taken a-back, and fluttering on them. Nay, we know that a good ship, with all her sails set and the wind on the beam, will in such a situation sail above ten knots an hour on smooth water. There is an observation made by every experienced seaman which shows this difference between the real and apparent directions of the wind very distinctly. When a ship that is sailing briskly with the wind on the beam tacks about, and then sails equally well on the other tack, the wind always appears to have shifted and come more a-head. This is familiar to all seamen. The seaman judges of the direction of the wind by the position of the ship's vanes. Suppose the ship sailing due west on the star-board tack, with the wind apparently N. N. W. the vane pointing S. S. E. If the ship puts about, and stands due east on the larboard tack, the vane will be found no longer to point S. S. E. but perhaps S. S. W., the wind appearing N. N. E.; and the ship must be nearly close hauled, in order to make an east course. The wind appears to have shifted four points. If the ship tacks again, the wind returns to its old quarter. We have often observed a greater difference than this. The celebrated astronomer, Dr. Bradley, taking the amusement of sailing in a pinnace on the river Thames, observed this, and was surprised at it, imagining that the change of wind was owing to the approaching to or retiring from the shore. The boatmen told him that it always happened at sea, and explained it to him in the best manner they were able. This explanation struck him, and set him a musing on an astronomical phenomenon which he had been puzzled by for some years, and which he had called the aberration of the fixed stars. Every star changes its place a small matter for half a year, and re-

turns to it at the completion of the year. He compared the stream of light from the star to the wind, and the telescope of the astronomer to the ship's vane, while the earth was like the ship, moving in opposite directions when in the opposite points of its orbit. The telescope must be always pointed a-head of the real direction of the star, in the same manner as the vane is always in a direction a-head of the wind; and thus he ascertained the progressive motion of light, and discovered the proportion of its velocity to the velocity of the earth in its orbit by observing the deviation which was necessarily given to the telescope. Observing that the light shifted its direction about 40° , he concluded its velocity to be about 11,000 times greater than that of the earth; just as the intelligent seaman would conclude, from this apparent shifting of the wind, that the velocity of the wind is about triple that of the ship. This is indeed the best method for discovering the velocity of the wind. Let the direction of the vane at the mast-head be very accurately noticed on both tacks, and let the velocity of the ship be also accurately measured. The angle between the direction of the ship's head on these different tacks, being halved, will give the real direction of the wind, which must be compared with the position of the van, in order to determine the angle contained between the real and apparent directions of the wind or the angle $E C e$, or half of the observed shifting of the wind, will show the inclination of its true and apparent directions. This being found, the proportion of $E C$ to $F C$ (fig. 4) is easily measured.

We have been very particular on this point, because, since the mutual actions of bodies depend on their relative motions only, we should make prodigious mistakes if we estimated the action of the wind by its real direction and velocity, when they differ so much from the relative or apparent.

By an easy process we might investigate the following particulars of a ship with its sails at right angles to the keel.

1. The velocity of the ship is (*cæteris paribus*) proportional to the velocity of the wind and to the sine of its incidence on the sail, when no sail becalms another. This observation is not, however, of great importance; for it is very unusual to put a ship in the situation considered hitherto; that is, with the yards square, unless she be right before the wind.

2. The surface of sail is proportional to the square of the ship's velocity directly, and to the square of the relative velocity inversely. Thus, if a ship be sailing with one-eighth of the velocity of the wind, and we would have her sail with one-fourth of it, we must quadruple the sails. This is more easily seen in another way. The velocity of the ship is proportional to the velocity of the wind; and therefore the relative velocity is also proportional to that of the wind; and the impulse of the wind is as the square of the relative velocity. Therefore, in order to increase the relative velocity by an increase of sail only, we must make this increase of sail in the duplicate proportion of the increase of velocity.

When the sails stand oblique to the keel it

might be shown that, while the trim of the sails remains the same, the leeway and the angle of the yard and course remains the same, and that the velocity of the ship is as the sine of the angle of real incidence, that is, as the sine of the angle of the sail and the real direction of the wind.

Let the ship $A B$ (fig. 5) hold the course $C F$, with the wind blowing in the direction $W C$, and having her yards $D C D$ braced up to the smallest angle $B C D$ which the rigging can admit. Let $C F$ be to $C E$ as the velocity of the ship to the velocity of the wind; join $F E$, and draw $C w$ parallel to $E F$; it is evident that $F E$ is the relative motion of the wind, and $w C D$ is the relative incidence on the sail. Draw $F O$ parallel to the yard $D C$, and describe a circle through the points $C O F$; then we say that if the ship, with the same wind and the same trim of the same drawing sails, be made to sail on any other course $C f$, her velocity along $C F$ is to the velocity along $C f$ as $C F$ is to $C f$; or, in other words, the ship will employ the same time in going from C to any point of the circumference $C F O$. Join $f O$. Then, because the angles $C F O$, $c f O$, are on the same chord $C O$, they are equal, and $f O$ is parallel to $d C d$, the new position of the yard corresponding to the new position of the keel $a b$, making the angle $d C b = D C B$. Also, by the nature of the circle, the line $C F$ is to $C f$ as the sine of the angle $C O F$ to the sine of the angle $C O f$, that is (on account of the parallels $C D$, $O F$, and $C d$, $O f$), as the sine of $W C D$ to the sine of $W C d$. But when the trim of the sails remains the same the velocity of the ship is as the sine of the angle of the sail with the direction of the wind; therefore $C F$ is to $C f$ as the velocity on $C F$ to that on $C f$, and the proposition is demonstrated.

Let it now be required to determine the best course for avoiding a rock R , lying in the direction $C R$, or for withdrawing as fast as possible from a line of coast $P Q$. Draw $C M$ through R , or parallel to $P Q$, and let m be the middle of the arch $C m M$. It is plain that m is the most remote from $C M$ of any point of the arch $C m M$, and therefore the ship will recede farther from the coast $P Q$ in any given time by holding the course $C m$ than by any other course.

This course is easily determined; for the arch $C m M = 360^\circ - (\text{arch } C O + \text{arch } O M)$, and the arch $C O$ is the measure of twice the angle $C F O$, or twice the angle $D C B$, or twice $b + x$, and the arch $O M$ measures twice the angle $E C M$. Thus, suppose the sharpest possible trim of the sails to be 35° , and the observed angle $E C M$ to be 70° ; then $C O + O M$ is $70^\circ + 140^\circ$ or 210° . This being taken from 360° leaves 150° , of which the half $M m$ is 75° , and the angle $M C m$ is $37^\circ 30'$. This added to $E C M$ makes $E G m$ $107^\circ 30'$, leaving $W C m = 72^\circ 30'$, and the ship must hold a course making an angle of $72^\circ 30'$, with the real direction of the wind, and $W C D$ will be $37^\circ 30'$.

This supposes no leeway. But if we know that, under all the sail which the ship can carry with safety and advantage, she makes 5° of leeway, the angle $D C m$ of the sail and course, or $b + x$, is 40° . Then $C O + O M = 220^\circ$, which being taken from 360° leaves 140° , of which the

half is 70° , $\angle M m$, and the angle $M C m \angle 35^\circ$, and $E C \angle m 105^\circ$, and $W C m \angle 75^\circ$, and the ship must lie with her head 70° from the wind, making 5° of leeway, and the angle $W C D$ is 35° .

The general rule for the position of the ship is, that the line on shipboard which bisects the angle $b + x$ may also bisect the angle $W C M$, or make the angle between the course and the line from which we wish to withdraw equal to the angle between the sail and the real direction of the wind. It is plain that this problem includes that of plying to windward. We have only to suppose $E C M$, to be 90° ; then, taking our example in the same ship, with the trim and the same leeway, we have $b + x \angle 40^\circ$. This taken from 90° leaves 50° , and $W C n \angle 90 - 25 \angle 65$, and the ship's head must lie 60° from the wind, and the yard must be 25° from it. It must be observed here that it is not always eligible to select the course which will remove the ship fastest from the given line $C M$; it may be more prudent to remove from it more securely, though more slowly. In such cases, the procedure is very simple, viz. to shape the course as near the wind as is possible.

The reader will also easily see, that the propriety of these practices is confined to those courses only where the practicable trim of the sails is not sufficiently sharp. Whenever the course lies so far from the wind that it is possible to make the tangent of the apparent angle of the wind and sail double the tangent of the sail and course, it should be done.

These are the chief practical consequences which can be deduced from the theory. But we should consider how far this adjustment of the sails and course can be performed. And here occur difficulties so great as to make it almost impracticable. We have always supposed the position of the surface of the sail to be distinctly observable and measurable; but this can hardly be affirmed even with respect to a sail stretched on a yard. Here we suppose the surface of the sail to have the same inclination to the keel that the yard has. This is by no means the case; the sail assumes a concave form, of which it is almost impossible to assign the direction of the mean impulse. We believe that this is always considerably to leeward of a perpendicular to the yard, lying between $C I$ and $C E$ (fig. 4). This is of some advantage, being equivalent to a sharper trim. We cannot affirm this, however, with any confidence, because it renders the impulse on the weather-leech of the sail so exceedingly feeble as hardly to have any effect. In sailing close to the wind, the ship is kept so near that the weather-leech of the sail is almost ready to receive the wind edgewise, and to flutter or shiver. The most effective or drawing sails with a side-wind, especially when plying to windward, are the stay-sails. We believe that it is impossible to say, with any thing approaching to precision, what is the position of the general surface of a stay-sail, or to calculate the intensity and direction of the general impulse; and we affirm with confidence that no man can pronounce on these points with any exactness. If we can guess within a third or a fourth part of the truth, it is all we can pre-

tend to: and, after all, it is but a guess. Add to this, the sails coming in the way of each other, and either becalming them, or sending the wind upon them in a direction widely different from that of its free motion. All these points we think beyond our power of calculation; and therefore that it is in vain to give the seaman mathematical rules, or even tables of adjustment ready calculated, since he can neither produce that medium position of his sails that is required, nor tell what is the position which he employs.

This is one of the principal reasons why so little advantage has been derived from the very ingenious and promising disquisitions of Bouguer and other mathematicians, and has made us omit the actual solutions of the chief problems, contenting ourselves with pointing out the process to such readers as have a relish for these analytical operations. But there is another principal reason for the small progress which has been made in the theory of seamanship: this is the errors of the theory itself, which supposes the impulsions of a fluid to be in the duplicate ratio of the sine of incidence. The most careful comparison which has been made between the results of this theory and matter of fact, is to be seen in the experiments made by the members of the Royal Academy of Sciences at Paris. We subjoin an abstract of them in the following table; where column first gives the angle of incidence, column second gives the impulsions really observed; column third the impulses, had they followed the duplicate ratio of the sines; and column fourth the impulses, if they were in the simple ratio of the sines:—

Angle of Incid.	Impul-sion observed.	Impulse as Sine ₂ .	Impulse as Sine.
90	1000	1000	1000
84	989	989	995
78	958	957	978
72	908	905	951
66	845	835	914
60	771	750	866
54	693	655	809
48	615	552	742
42	543	448	669
36	480	346	587
30	440	250	500
24	424	165	407
18	414	96	309
12	406	43	208
6	400	11	105

Here we see an enormous difference in the great obliquities. When the angle of incidence is only 6° , the observed impulse is forty times greater than the theoretical impulse; at 12° it is ten times greater; at 18° it is more than four times greater; and at 24° it is almost three times greater.

No wonder, then, that the deductions from this theory are so useless and so unlike what we familiarly observe. We took notice of this when we were considering the leeway of a rectangular box,

and thus saw a reason for admitting an incomparably smaller leeway than what would result from the laborious computations necessary by the theory. This error in theory has as great an influence on the impulsions of air when acting obliquely on a sail; and the experiments of M. Robins and of the chevalier Borda, on the oblique impulsions of air, are perfectly conformable (as far as they go) to those of the academicians on water. The oblique impulsions of the wind are, therefore, much more efficacious for pressing the ship in the direction of her course than the theory allows us to suppose; and the progress of a ship plying to windward is much greater, both because the oblique impulses of the wind are more effective, and because the leeway is much smaller than we suppose. Were not this the case, it would be impossible for a square-rigged ship to get to windward. The impulse on her sails when close hauled would be so trifling that she would not have a third part of the velocity which we see her acquire; and this trifling velocity would be wasted in leeway; for we have seen that the diminution of the oblique impulses of the water is accompanied by an increase of leeway. But we see that, in the great obliquities, the impulsions continue to be very considerable, and that even an incidence of 6° gives an impulse as great as the theory allows to an incidence of 40° . We may therefore, on all occasions, keep the yards more square; and the loss which we sustain by the diminution of the very oblique impulse will be more than compensated by its more favorable direction with respect to the ship's keel. Let us take an example of this:—Suppose the wind about two points before the beam, making an angle of 68° with the keel. The theory assigns 43° for the inclination of the wind to the sail, and 25° for the trim of the sail. The perpendicular impulse being supposed 1000, the theoretical impulse for 43° is 465. This, reduced in the proportion of radius to the sine of 25° , gives the impulse in the direction of the course only 197.

But if we ease off the lee-braces till the yard makes an angle of 50° with the keel, and allows the wind an incidence of no more than 18° , we have the experimented impulse 414, which, when reduced in the proportion of radius to the sine of 50° , gives an effective impulse 317. In like manner, the trim 56° , with the incidence 12° , gives an effective impulse 337; and the trim 62° , with the incidence only 6° , gives 353.

Hence it would at first sight appear that the angle DCB of 62° and WCD of 6° would be better for holding a course within six points of the wind than any more oblique position of the sails; but it will only give a greater initial impulse. As the ship accelerates, the wind apparently comes a-head, and we must continue to brace up as the ship freshens her way. It is not unusual for her to enquire half or two-thirds of the velocity of the wind; in which case the wind comes apparently a-head more than two points, when the yards must be braced up to 35° , and this allows an impulse no greater than about 7° . Now this is very frequently observed in good ships, which in a brisk gale and smooth water will go five or six knots close hauled, the ship's head six points from the wind, and the sails no

more than just full, but ready to shiver by the smallest luff. All this would be impossible by the usual theory; and in this respect these experiments of the French academy give a fine illustration of the seaman's practice. They account for what we should otherwise be much puzzled to explain; and the great progress which is made by a ship close hauled, being perfectly agreeable to what we should expect from the law of oblique impulse deducible from these so often mentioned experiments, while it is totally incompatible with the common theory, should make us abandon the theory without hesitation, and strenuously set about the establishment of another, founded entirely on experiments. For this purpose the experiments should be made on the oblique impulsions of air on as great a scale as possible, and in as great a variety of circumstances, so as to furnish a series of impulsions for all angles of obliquity. We have but four or five experiments on this subject, viz., two by Mr. Robins, and two or three by chevalier Borda. Having thus gotten a series of impulsions, it is very practicable to raise on this foundation a practical institute, and to give a table of the velocities of a ship suited to every angle of inclination and of trim; for nothing is more certain than the resolution of the impulse perpendicular to the sail into a force in the direction of the keel, and a lateral force.

We also think that experiments might be made on a model very nicely rigged with sails, and trimmed in every different degree, which would point out the mean direction of the impulse on the sails, and the comparative force of these impulsions in different directions of the wind. The method would be very similar to that of examining the impulse of the water on the hull. If this can also be ascertained experimentally, the intelligent reader will easily see that the whole motion of a ship under sail may be determined for every case. Tables may then be constructed by calculation, or by graphical operations, which will give the velocities of a ship in every different course, and corresponding to every trim of sail. And let it be here observed that the trim of the sail is not to be estimated in degrees of inclination of the yards; because, as we have already remarked, we cannot observe nor adjust the lateen sails in this way. But, in making the experiments for ascertaining the impulse, the exact position of the tacks and sheets of the sails are to be noted; and this combination of adjustments is to pass by the name of a certain trim. Thus that trim of all the sails may be called forty, whose direction is experimentally found equivalent to a flat surface trimmed to the obliquity 40° .

Having done this, we may construct a figure for each trim similar to fig. 5, where, instead of a circle, we shall have a curve C O M' F', whose chords C F', c f', &c., are proportional to the velocities in these courses; and by means of this curve we can find the point m', which is most remote from any line C M from which we wish to withdraw; and thus we may solve all the principal problems of the art.

It will not be accounted presumption to expect more improvement from a theory founded on judicious experiments only, than from a theory

of the impulse of fluids, which is found so inconsistent with observation, and of whose fallacy all its authors, from Newton to D'Alembert, entertained strong suspicions. With these observations we conclude our discussion of the first part of the seaman's task, and now proceed to consider the means that are employed to prevent or to produce any deviations from the uniform rectilinear course which has been selected.

SECT. II.—OF THE MEANS USED TO PREVENT OR PRODUCE DEVIATIONS FROM A UNIFORM RECTILINEAR COURSE.

Here the ship is to be considered as a body in free space, convertible round her centre of inertia. For, whatever may be the point round which she turns, this motion may always be considered as compounded of a rotation round an axis passing through her centre of gravity or inertia. She is impelled by the wind and by the water acting on many surfaces differently inclined to each other, and the impulse on each is perpendicular to the surface. In order therefore that she may continue steadily in one course, it is not only necessary that the impelling forces, estimated in their mean direction, be equal and opposite to the resisting forces estimated in their mean direction; but also that these two directions may pass through one point, otherwise she will be affected as a log of wood is when pushed in opposite directions by two forces, which are equal indeed, but are applied to different parts of the log. A ship must be considered as a lever, acted on in different parts by forces in different directions, and the whole balancing each other round that point or axis where the equivalent of all the resisting forces passes. This may be considered as a point supported by this resisting force, and as a sort of fulcrum; therefore, in order that the ship may maintain her position, the energies or momenta of all the impelling forces round this point must balance each other.

When a ship sails right afore the wind, with her yards square, it is evident that the impulses on each side of the keel are equal, as also their mechanical momenta round any axis passing perpendicularly through the keel. So are the actions of the water on her bows. But when she sails on an oblique course, with her yards braced up on either side, she sustains a pressure in the direction CI (fig. 3) perpendicular to the sail. This, by giving her a lateral pressure LI , as well as a pressure CL a-head, causes her to make leeway, and to move in a line Cb inclined to CB . By this means the balance of action on the two bows is destroyed; the general impulse on the lee-bow is increased; and that on the weather-bow is diminished. The combined impulse is therefore no longer in the direction BC , but (in the state of uniform motion) in the direction IC .

Suppose that in an instant the whole sails are annihilated, and the impelling pressure CI , which precisely balanced the resisting pressure on the bows, removed. The ship tends, by her inertia, to proceed in the direction Cb . This tendency produces a continuation of the resistance in the opposite direction IC , which is not

directly opposed to the tendency of the ship in the direction Cb ; therefore the ship's head would immediately come up to the wind. The experienced seaman will recollect something like this when the sails are suddenly lowered when coming to anchor. It does not happen solely from the obliquity of the action on the bows: It would happen to the parallelopiped of our second diagram, which was sustaining a lateral impulsion $B \sin. ^2 r$, and a direct impulsion $A \cos. ^2 r$. These are continued for a moment after the annihilation of the sail; but being no longer opposed by a force in the direction CD , but by a force in the direction Cb , the force $B \sin. ^2 r$ must prevail, and the body is not only retarded in its motion, but its head turns towards the wind. But this effect of the leeway is greatly increased by the curved form of the ship's bows. This occasions the centre of effort of all the impulsions of the water on the lee side of the ship to be very far forward, and this so much the more remarkably as she is sharper afore. It is in general not much abaft the foremast. Now the centre of the ship's tendency to continue her motion is the same with her centre of gravity, and this is generally but a little before the mainmast in a direction parallel to Cb , and at the foremast by a force parallel to IC . The evident consequence of this is a tendency to come up to the wind. This is independent of all situation of the sails, provided only that they have been trimmed obliquely.

This tendency of the ship's head to windward is called *gripping* in the seaman's language, and is greatest in ships which are sharp forward, as we have said already. This circumstance is easily understood. Whatever is the direction of the ship's motion, the absolute impulse on that part of the bow immediately contiguous to B is perpendicular to that very part of the surface. The more acute, therefore, that the angle of the bow is, the more will the impulse on that part be perpendicular to the keel, and the greater will be its energy to turn the head to windward.

Thus we are enabled to understand or to see the propriety of the disposition of the sails of a ship. We see her crowded with sails forward, and even many sails extended far before her bow, such as the spritsail, the bowsprit topsail, the fore top-mast staysail, the jib and flying jib. The sails abaft are comparatively smaller. The sails on the mizen-mast are much smaller than those on the foremast. All the staysails hoisted on the mainmast may be considered as headsails, because their centres of effort are considerably before the centre of gravity of the ship; and, notwithstanding this disposition, it generally requires a small action of the rudder to counteract the windward tendency of the lee-bow. This is considered as a good quality when moderate; because it enables the seaman to throw the sails a-back, and stop the ship's way in a moment, if she be in danger from any thing a-head; and the ship which does not carry a little of a weather-helm is always a dull sailer.

In order to judge somewhat more accurately of the action of the water and sails, suppose the ship $A B$ (fig. 6) to have its sails on the mizen-mast D , the mainmast E , and foremast F , braced

ap or trimmed alike, and that the three lines $D i$, $E e$, $F f$, perpendicular to the sails, are in the proportion of the impulses on the sails. The ship is driven a-head and to leeward, and moves in the path $a C b$. This path is so inclined to the line of the keel that the medium direction of the resistance of the water is parallel to the direction of the impulse. A line $C I$ may be drawn parallel to the lines $D i$, $E e$, $F f$, and equal to their sum; and it may be drawn from such a point, C , that the actions on all the parts of the hull between C and B may balance the momenta of all the actions on the hull between C and A . This point may justly be called the centre of effort, or the centre of resistance. We cannot determine this point for want of a proper theory of the resistance of fluids. Nay, although experiments like those of the Parisian academy should give us the most perfect knowledge of the oblique impulses on a square foot, we should hardly be benefited by them; for the action of the water on a square foot of the hull at p , for instance, is so modified by the intervention of the stream of water which has struck the hull about B , and glided along the bow $B o p$, that the pressure on p is totally different from what it would have been were it a square foot or surface detached from the rest, and presented in the same position to the water moving in the direction $b C$. For it is found that the resistances given to planes joined so as to form a wedge, or to curved surfaces, are widely different from the accumulated resistances, calculated for their separate parts, agreeably to the experiments of the academy on single surfaces. We therefore do not attempt to ascertain the point C by theory; but it may be accurately determined by the experiments which we have so strongly recommended; and we offer this as an additional inducement for prosecuting them.

Draw through C a line perpendicular to $C I$, that is, parallel to the sails; and let the lines of impulse of the three sails cut in the points, i , k , and m . This line $i m$ may be considered as a lever, moveable round C , and acted on at the points i , k , and m , by three forces. The rotatory momentum of the sails on the mizenmast is $D i \times i C$; that of the sails on the mainmast is $E e \times k C$; and the momentum of the sails on the foremast is $F f \times m C$. The two first tend to press forward the arm $C i$, and then to turn the ship's head towards the wind. The action of the sails on the foremast tends to pull the arm $C m$ forward, and produce a contrary rotation. If the ship under these three sails keep steadily in her course, without the aid of the rudder, we must have $D i \times i C + E e \times k C = F f \times m C$. This is very possible, and is often seen in a ship under her mizen topsail, main topsail, and fore topsail, all parallel to one another, and their surfaces daily proportioned by reefing. If more sails are set, we must always have a similar equilibrium. A certain number of them will have their efforts directed from the larboard arm of the lever $i m$ lying to leeward of $C i$, and a certain number will have their efforts directed from the starboard arm lying to windward of $C I$. The sum of the products of each of the first set, by their distances from C must be equal to

the sum of the similar products of the other set. As this equilibrium is all that is necessary for preserving the ship's position, and the cessation of it is immediately followed by a conversion; and as these states of the ship may be had by means of the three square sails only, when their surfaces are properly proportioned—it is plain that every movement may be executed and explained by their means. This will greatly simplify our future discussions. We shall therefore suppose in future that there are only the three topsails set, and that their surfaces are so adjusted by reefing that their actions exactly balance each other round that point C , of the middle line $A B$, where the actions of the water on the different parts of her bottom in like manner balance each other. This point C may be differently situated in the ship according to the leeway she makes, depending on the trim of the sails; and therefore, although a certain proportion of the three surfaces may balance each other in one state of leeway, they may happen not to do so in another state. But the equilibrium is evidently attainable in every case, and we therefore shall always suppose it.

It must now be observed that when this equilibrium is destroyed, as, for example, by turning the edge of the mizen topsail to the wind, which the seamen call shivering the mizen topsail, and which may be considered as equivalent to the removing the mizen topsail entirely, it does not follow that the ship will round the point C , this point remaining fixed. The ship must be considered as a free body, still acted on by a number of forces, which no longer balance each other; and she must therefore begin to turn round a spontaneous axis of conversion, which must be determined before proceeding farther. It is of importance to point out in general where this axis is situated. Therefore let G (fig. 7) be the centre of gravity of the ship. Draw the line $q G v$ parallel to the yards, cutting $D d$ in q , $E e$ in r , $C I$ in t , and $F f$ in v . While the three sails are set, the line $q v$ may be considered as a lever acted on by four forces, viz. $D d$, impelling the lever forward perpendicularly in the point q ; $E e$ impelling it forward in the point r ; $F f$ impelling it forward in the point v ; and $C I$ impelling it backward in the point t . These forces balance each other both in respect of progressive motion and of rotatory energy: for $C I$ was taken equal to the sum of $D d$, $E e$, and $F f$; so that no acceleration or retardation of the ship's progress in her course is supposed.

But, by taking away the mizen topsail, both the equilibriums are destroyed. A part $D d$ of the accelerating force is taken away; and yet the ship, by her inertia or inherent force, tends, for a moment, to proceed in the direction $C p$ with her former velocity; and by this tendency exerts for a moment the same pressure $C I$ on the water, and sustains the same resistance $C I$. She must therefore be retarded in her motion by the excess of the resistance $C I$ over the remaining impelling forces $E e$ and $F f$; that is, by a force equal and opposite to $D d$. She will therefore be retarded in the same manner as if the mizen topsail were still set, and a force equal and opposite to its action were applied to G the centre

of gravity, and she would soon acquire a smaller velocity, which would again bring all things into equilibrium; and she would stand on in the same course, without changing either her leeway or the position of her head.

But the equilibrium of the lever is also destroyed. It is now acted on by three forces only, viz. Ee and Ff , impelling it forward in the points r and v , and IC impelling it backward in the point t . Make $rv : ro = Ee + Ff : Ff$, and make op parallel to CI and equal to $Ee + Ff$. Then we know, from the common principles of mechanics, that the force op acting at o will have the same momentum or energy to turn the lever round any point whatever as the two forces Ee and Ff applied at r and v ; and now the lever is acted on by two forces, viz. IC urging it backwards in the point t , and op urging it forwards in the point o . It must therefore turn round like a floating log, which gets two blows in opposite directions. If we now make $IC - op : op = to : tx$, or $IC - op : IC = to : ox$, and apply to the point x a force equal to $IC - op$ in the direction IC ; we know, by the common principles of mechanics, that this force $IC - op$ will produce the same rotation round any point as the two forces IC and op applied in their proper directions at t and o . Let us examine the situation of the point x .

The force $IC - op$ is evidently $= Dd$, and op is $= Ee + Ff$. Therefore $ot : tx = Dd : op$. But because, when all the sails were filled, there was an equilibrium round C , and therefore round t , and because the force op acting at o is equivalent to Ee and Ff acting at r and v , we must still have the equilibrium; and therefore we have the momentum $Dd \times qt = op \times ot$. Therefore $ot : tq = Dd : op$, and $tq = tx$. Therefore the point x is the same with the point q .

Therefore, when we shiver the mizen topsail, the rotation of the ship is the same as if the ship were at rest, and a force equal and opposite to the action of the mizen topsail were applied at q or at D , or at any point in the line Dq .

This might have been shown in another and shorter way. Suppose, all sails filled, the ship is in equilibrio. This will be disturbed by applying to D a force opposite to Dd ; and, if the force be also equal to Dd , it is evident that these two forces destroy each other, and that this application of the force dD is equivalent to the taking away of the mizen topsail. But we chose to give the whole mechanical investigation, because it gave us an opportunity of pointing out to the reader, in a case of very easy comprehension, the precise manner in which the ship is acted on by the different sails and by the water, and what share each of them has in the motion ultimately produced. We shall not repeat this manner of procedure in other cases, because a little reflection on the part of the reader will now enable him to trace the *modus operandi* through all its steps.

We now see that, in respect both of progressive motion and of conversion, the ship is affected by shivering the sail D in the same manner as if a force equal and opposite to Dd were applied at D , or at any point in the line Dd . We must now have recourse to the principles established under the article *ROTATION*.

Let p represent a particle of matter, r its radius vector, or its distance pG from an axis passing through the centre of gravity G , and let M represent the whole quantity of matter of the ship. Then its momentum of inertia is $= \int p.r^2$. The ship, impelled in the point D by a force in the direction dD , will begin to turn round a spontaneous vertical axis, passing through a point S of the line gG , which is drawn through the centre of gravity G , perpendicular to the direction dD of the external force, and the distance GS of this axis from the centre of gravity is $= \frac{\int p.r^2}{MGq}$ and it is taken on the opposite side of G from q , that is, S and q are on opposite sides of G .

Let us express the external force by the symbol F . It is equivalent to a certain number of pounds, being the pressure of the wind moving with the velocity V and inclination a on the surface of the sail D ; and may therefore be computed either by the theoretical or experimental law of oblique impulses. Having obtained this, we can ascertain the angular velocity of the rotation, and the absolute velocity of any given point of the ship. See *ROTATION*.

But, before we proceed to this investigation, we shall consider the action of the rudder, which operates precisely in the same manner. Let the ship AB (fig. 8) have her rudder in the position AD , the helm being hard a-starboard, while the ship sailing on the starboard tack, and making leeway, keeps on the course ab . The lee surface of the rudder meets the water obliquely. The very foot of the rudder meets it in the direction DE parallel to ab . The parts farther up meet it with various obliquities, and with various velocities, as it glides round the bottom of the ship and falls into the wake. It is absolutely impossible to calculate the accumulated impulse. We shall not be far mistaken in the deflection of each contiguous filament, as it quits the bottom and glides along the rudder; but we neither know the velocity of these filaments, nor the deflection and velocity of the filaments gliding without them. We therefore imagine that all computations on this subject are in vain. But it is enough for our purpose that we know the direction of the absolute pressure which they exert on its surface. It is in the direction Dd , perpendicular to that surface. We also may be confident that this pressure is very considerable, in proportion to the action of the water on the ship's bows, or of the wind on the sails; and we may suppose it to be nearly in the proportion of the square of the velocity of the ship in her course; but we cannot affirm it to be accurately in that proportion, for reasons that will readily occur to one who considers the way in which the water falls in behind the ship.

It is observed, however, that a fine sailer always steers well, and that all movements by means of the rudder are performed with great rapidity when the velocity of the ship is great. We shall see, by and by, that the speed with which the ship performs the angular movements is in the proportion of her progressive velocity: for we shall see that

the squares of the times of performing the evolutions are as the impulses inversely, which are as the squares of the velocities. There is perhaps no force which acts on a ship that can be more accurately determined by experiment than this. Let the ship ride in a stream or tideway whose velocity is accurately measured; and let her ride from two moorings, so that her bow may be a fixed point. Let a small tow-line be laid out from her stern or quarter at right angles to the keel, and connected with some apparatus fitted up on shore or on board another ship, by which the strain on it may be accurately measured; a person conversant with mechanics will see many ways in which this can be done. Perhaps the following may be as good as any: let the end of the tow-line be fixed to some point as high out of the water as the point of the ship from which it is given out, and let this be very high. Let a block with a hook be on the rope, and a considerable weight hung on this hook. Things being thus prepared, put down the helm to a certain angle, so as to cause the ship to sheer off from the point to which the far end of the tow-line is attached. This will stretch the rope, and raise the weight out of the water. Now heave upon the rope, to bring the ship back again to her former position, with her keel in the direction of the stream. When this position is attained, note carefully the form of the rope, that is, the angle which its two parts make with the horizon. Call this angle a . Every person acquainted with these subjects knows that the horizontal strain is equal to half the weight multiplied by the cotangent of a , or that 2 is to the cotangent of a as the weight to the horizontal strain. Now it is this strain which balances, and therefore measures, the action of the rudder, or De in fig. 8. Therefore, to have the absolute impulse Dd , we must increase De in the proportion of radius to the secant of the angle b which the rudder makes with the keel. In a great ship, sailing six miles in an hour, the impulse on the rudder, inclined 30° to the keel, is not less than 3000 pounds. The surface of the rudder of such a ship contains nearly eighty square feet. It is not, however, very necessary to know this absolute impulse Dd , because it is its part De alone which measures the energy of the rudder in producing a conversion. Such experiments, made with various positions of the rudder, will give its energies corresponding to these positions, and will settle that long disputed point which is the best position for turning a ship. On the hypothesis that the impulsions of fluids are in the duplicate ratio of the sines of incidence, there can be no doubt that it should make an angle of $54^\circ 44'$ with the keel. But the form of a large ship will not admit of this, because a tiller of a length sufficient for managing the rudder in sailing with great velocity has not room to deviate above 30° from the direction of the keel; and in this position of the rudder the mean obliquity of the filaments of water to its surface cannot exceed 40° or 45° . A greater angle would not be of much service, for it is never for want of a proper obliquity that the rudder fails of producing a conversion.

A ship misses stays in rough weather for want

of a sufficient progressive velocity, and because her bows are beat off by the waves; and there is seldom any difficulty in wearing the ship, if she has any progressive motion. It is, however, always desirable to give the rudder as much influence as possible. Its surface should be enlarged (especially below) as much as can be done consistently with its strength and with the power of the steersman to manage it; and it should be put in the most favourable situation for the water to get at it with great velocity; and it should be placed as far from the axis of the ship's motion as possible. These points are obtained by making the stern-post very upright, as has always been done in the French dock yards. The British ships have a much greater rake; but our builders are gradually adopting the French forms, experience having taught us that their ships, when in our possession, are much more obedient to the helm than our own. In order to ascertain the motion produced by the action of the rudder, draw from the centre of gravity a line Gq perpendicular to Dd (Dd being drawn through the centre of effort of the rudder). Then, as in the consideration of the action of the sails, we may conceive the line qG as a lever connected with the ship, and impelled by a force Dd acting perpendicularly at q . The consequence of this will be an incipient conversion of the ship about a vertical axis passing through some point S in the line qG , lying on the other side of G from q ; and we have, as

$$\text{in the former case, } GS = \frac{\int p \cdot r^2}{M \cdot Gq}.$$

Thus the action and effects of the sails, and of the rudder, are perfectly similar, and are to be considered in the same manner. We see that the action of the rudder, though of a small surface in comparison of the sails, must be very great; for the impulse of water is many hundred times greater than that of the wind; and the arm qG of the lever, by which it acts, is incomparably greater than that by which any of the impulsions on the sails produces its effect; accordingly the ship yields much more rapidly to its action than she does to the lateral impulse of a sail.

If G were a fixed or supported axis, it would be the same thing whether the absolute force Dd of the rudder acts in the direction Dd , or its transverse part De acts in the direction De , both would produce the same rotation; but it is not so in a free body. The force Dd both tends to retard the ship's motion and to produce a rotation: It retards it as much as if the same force Dd had been immediately applied to the centre. And thus the real motion of the ship is compounded of a motion of the centre in a direction parallel to Dd , and of a motion round the centre. These two constitute the motion round S .

Hence we might deduce that the times of performing similar evolutions with similar ships are proportional to the lengths of the ships when both are sailing equally fast; and since the evolutions are similar, and the forces vary similarly in their different parts, they not only describe equal angles of revolution, but also similar curves.

A small ship, therefore, works in less time and

in less room than a great ship, and this in the proportion of its length. This is a great advantage in all cases, particularly in wearing, in order to sail on the other tack close-hauled. In this case she will always be to windward and a-head of the large ship, when both are got on the other tack. It would appear at first sight that the large ship will have the advantage in tacking. Indeed the large ship is farther to windward when again trimmed on the other tack than the small ship when she is just trimmed on the other tack. But this happened before the large ship had completed her evolution, and the small ship in the mean time has been going forward on the other tack, and going to windward. She will therefore be before the large ship's beam, and perhaps as far to windward.

We have seen that the velocity of rotation is proportional, *cæteris paribus*, to $F \times G \cdot q$. F means the absolute impulse on the rudder or sail, and is always perpendicular to its surface. This absolute impulse on a sail depends on the obliquity of the wind on its surface. The usual theory says that it is as the square of the sine of incidence: but we find this is not true. We must content ourselves with expressing it by some as yet unknown function ϕ of the angle of incidence a , and call it ϕa ; and if S be the surface of the sail, and V the velocity of the wind, the absolute impulse is $n V^2 S \times \phi a$. This acts (in the case of the mizen-topsail, fig. 7) by the lever $q G$, which is equal to $D G \times \cos. D G q$, and $D G q$ is equal to the angle of the yard and keel; which angle we formerly called b . Therefore its energy in producing a rotation is $n V^2 S \times \phi a \times D G \times \cos. b$. Leaving out the constant quantities n , V^2 , S , and $D G$, its energy is proportional to $\phi a \times \cos. b$. In order, therefore, that any sail may have the greatest power to produce a rotation round G , it must be so trimmed that $\phi a \times \cos. b$ may be a maximum. Thus, if we would trim the sails on the foremast, so as to pay the ship off from the wind right a-head with the greatest effect, and if we take the experiments of the French academicians as proper measures of the oblique impulses of the wind on the sail, we shall brace up the yard to an angle of 48° with the keel. The impulse corresponding to 48° is 615, and the cosine of 48° is 669. These give a product of 411435. If we brace the sail to 54.44 , the angle assigned by the theory, the effective impulse is 405274. If we make the angle 45° , the impulse is 408774. It appears then that 48° is preferable to either of the others. But the difference is inconsiderable, as in all cases of maximum a small deviation from the best position is not very detrimental. But the difference between the theory and this experimental measure will be very great when the impulses of the wind are of necessity very oblique. Thus, in tacking ship, as soon as the headsails are taken aback, they serve to aid the evolution, as is evident: but, if we were now to adopt the maxim inculcated by the theory, we should immediately round in the weather-braces so as to increase the impulse on the sail, because it is then very small; and although we by this means make yard more square, and therefore diminish the rotatory momentum of this impulse, yet the impulse is more

increased (by the theory) than its vertical lever is diminished. Let us examine this a little more particularly, because it is reckoned one of the nicest points of seamanship to aid the ship's coming round by means of the headsails; and experienced seamen differ in their practice in this manœuvre. Suppose the yard braced up to 40° , which is as much as can be usually done, and that the sail shivers (the bowlines are usually let go when the helm is put down), the sail immediately takes aback, and in a moment we may suppose an incidence of 6° . The impulse corresponding to this is 400 (by experiment), and the cosine of 40° is 766. This gives 306400 for the effective impulse. To proceed, according to the theory, we should brace the yard to 70° , which would give the wind (now 34° on the weather-bow) an incidence of nearly 36° , and the sail an inclination of 20° , to the intended motion, which is perpendicular to the keel. For the tangent of 20° is about one-half the tangent of 36° . Let us now see what effective impulse the experimental law of oblique impulsions will give for this adjustment of the sails. The experimental impulse for 36° is 480; the cosine of 70° is 342: the product is 164160, not much exceeding the half of the former. Nay, the impulse for 36° , calculated by the theory, would have been only 346, and the effective impulse only 118332. And it must be farther observed that this theoretical adjustment would tend greatly to check the evolution, and in most cases would entirely mar it, by checking the ship's motion a-head, and consequently the action of the rudder, which is the most powerful agent in the evolution, for here would be a great impulse directed almost a-stern.

We are justifiable, therefore, in saying, in the beginning of this article, that a seaman would frequently find himself baffled if he were to work a ship according to the rules deduced from M. Bouguer's work; and we see by this instance of what importance it is to have the oblique impulsions of fluids ascertained experimentally. The practice of the most experienced seamen is directly the opposite to this theoretical maxim, and its success greatly confirms the usefulness of those experiments of the academicians so often praised by us.

We return to the general consideration of the rotatory motion. We found the velocity $v = \frac{F \cdot q \cdot G}{\int p r^2}$,

It is therefore proportional, *cæteris paribus*, to $q G$. We have seen in what manner $q G$ depends on the position and situation of the sail or rudder when the point G is fixed. But it also depends on the position of G . With respect to the action of the rudder, it is evident that it is so much the more powerful as it is more remote from G . The distance from G may be increased either by moving the rudder farther aft, or G farther forward. And, as it is of the utmost importance for a ship to answer her helm with the greatest promptitude, those circumstances have been attended to which distinguished fine steering ships from such as had not this quality; and it is in a great measure to be ascribed to this that, in the gradual improvement of naval architecture, the

centre of gravity has been placed far forward. Perhaps the notion of a centre of gravity did not come into the thoughts of the rude builders in early times: but they observed that those boats and ships steered best which had their extreme breadth before the middle point, and consequently the bows not so acute as the stern. This is so contrary to what one would expect that it attracted attention more forcibly; and, being somewhat mysterious, it might prompt to attempts of improvement, by exceeding in this singular maxim. We believe that it has been carried as far as is compatible with other essential requisites in a ship.

This is the chief circumstance in what is called the trim of a ship; and it were greatly to be wished that the best place for the centre of gravity could be accurately ascertained. A practice prevails which is the opposite of what we are now advancing. It is usual to load a ship so that her keel is not horizontal, but lower abaft. This is found to improve her steerage. The reason of this is obvious. It increases the acting surface of the rudder, and allows the water to come at it with much greater freedom and regularity; and it generally diminishes the griping of the ship forward by removing a part of the bows out of the water. It has not always this effect; for the form of the harping aloft is frequently such that the tendency to gripe is diminished by immersing more of the bow in the water. But waving these circumstances, and attending only to the rotatory energy of the rudder, we see that it is of advantage to carry the centre of gravity forward. The same advantage is gained to the action of the after-sails. But, on the other hand, the action of the head-sails is diminished by it; and we may call every sail a head-sail whose centre of gravity is before the centre of gravity of the ship; that is, all the sails hoisted on the bowsprit and foremast; and the staysails hoisted on the mainmast; for the centre of gravity is seldom far before the mainmast.

Suppose that, when the rudder is put into the position AD (fig. 8), the centre of gravity could be shifted to g , so as to increase qG , and that this is done without increasing the sum of the products pr^2 , it is obvious that the velocity of conversion will be increased in the proportion of qG to qg . This is very possible by bringing to that side of the ship parts of her loading which were situated at a distance from G on the other side. Nay we can make this change in such a manner that $\int pr^2$ shall even be less than it was before, by taking care that every thing which we shift shall be nearer to g than it was formerly to G . Suppose it all placed in one spot m , and that m is the quantity of matter so shifted, while M is the quantity of matter in the whole ship. It is only necessary that mg^2 shall be less than the sum of the products pr^2 corresponding to the matter which has been shifted. Now although the matter, which is easily moveable, is generally very small in comparison to the whole matter of the ship, and therefore can make but a small change in the place of the centre of gravity, it may frequently be brought from places

so remote that it may occasion a very sensible diminution of the quantity $\int pr^2$, which expresses the whole momentum of inertia.

This explains a practice of the seamen in small wherries or skiffs, who in putting about are accustomed to place themselves to leeward of the mast. They even find that they can aid the quick motions of these light boats by the way in which they rest on their two feet, sometimes leaning all on one foot, and sometimes on the other. And we have often seen this evolution very sensibly accelerated in a ship of war, by the crew running suddenly, as the helm is put down, to the lee-bow. And we have heard it asserted by very expert seamen that, after all attempts to wear ship (after lying-to in a storm) have failed, they have succeeded by the crew collecting themselves near the weather fore-shrouds the moment the helm was put down. It must be agreeable to the reflecting seaman to see this practice supported by undoubted mechanical principles.

SECT. III.—OF THE PRINCIPAL EVOLUTIONS.

We conclude this dissertation by describing some of the chief movements or evolutions. What we have said hitherto is intended for the instruction of the artist, by making him sensible of the mechanical procedure. The description is rather meant for the amusement of the landsman, and enabling him to understand operations that are familiar to the seaman. The latter will perhaps smile at the awkward account given of his business by one who cannot hand, reef, nor steer.

1. *To tack ship*.—The ship must first of all be kept full, that is, with a very sensible angle of incidence on the sails, and by no means hugging the wind. For, as this evolution is chiefly performed by the rudder, it is necessary to give the ship a good velocity. When the ship is observed to luff up of herself, that moment is to be caught for beginning the evolution, because she will by her inherent force continue this motion. The helm is then put down. When the officer calls out, 'Helm's a-lee,' the fore-sheet, fore-top bow-line, jib, and flag sail sheets forward are let go. The jib is frequently hauled down. Thus the obstacles to the ship's head coming up to the wind by the action of the rudder are removed. If the mainsail is set, it is not unusual to clue up the weather side, which may be considered as a head-sail, because it is before the centre of gravity. The mizen must be hauled out, and even the sail braced to windward. Its power in paying off the stern from the wind conspires with the action of the rudder. It is really an aerial rudder. The sails are immediately taken a-back. In this state the effect of the mizen topsail would be to obstruct the movement, by pressing the stern the contrary way to what it did before. It is therefore either immediately braced about sharp on the other tack, or lowered. Bracing it about evidently tends to pay round the stern from the wind, and thus assists in bringing the head up to the wind. But in this position it checks the progressive motion of the ship, on which the evolution chiefly depends. For a rapid evolution, therefore, it is as well to lower the mizen-topsail. Meantime the head-sails are all a-back, and the

action of wind on them tends greatly to pay the ship round. To increase this effect it is not unusual to haul the fore-top bowline again. The sails on the mainsail are now almost becalmed; and therefore when the wind is right a-head, or a little before, the mainmast is hauled round and braced up sharp on the other tack with all expedition. The stay-sail sheets are now shifted over to their places for the other tack. The ship is now entirely under the power of the headsail and of the rudder, and their actions conspire to promote the conversion. The ship has acquired an angular motion, and will preserve it, so that now the evolution is secured she falls off apace from the wind on the other tack. The farther action of the rudder is therefore unnecessary, and would even be prejudicial, by causing the ship to fall off too much from the wind before the sails can be shifted and trimmed for sailing on the other tack. It is therefore proper to right the helm when the wind is right a-head, that is, to bring the rudder into the direction of the keel. The ship continues her conversion by her inherent force and the action of the headsails.

When the ship has fallen off about four points from the wind, the headsails are hauled round, and trimmed sharp on the other tack with all expedition; and although this operation was begun with the wind four points on the bow it will be fixed before the sails are braced up, and therefore the headsails will immediately fill. The aftersails have filled already, while the headsails were inactive, and therefore immediately check the farther falling off from the wind. All sails now draws, for the staysail sheets have been shifted over while they were becalmed or shaking in the wind. The ship now gathers way, and will obey the smallest motion of the helm to bring her close to the wind.

We have here supposed that during all this operation the ship preserves her progressive motion. She must therefore have described a curve line advancing all the while to windward. Fig. 10 is a representation of this evolution when it is performed in the completest manner. The ship standing on the course Ea , with the wind blowing in the direction WF , has her helm put hard a-lee when she is in the position A . She immediately deviates from her course, and, describing a curve, comes to the position B , with the wind blowing in the direction WF of the yards, and the square sails now shiver. The mizen-topsail is here represented braced sharp on the other tack, by which its tendency to aid the angular motion (while it checks the progressive motion) is distinctly seen. The main and fore-sails are now shivering, and immediately after are taken aback. The effect of this on the headsails is distinctly seen to be favorable to the conversion, by pushing the point F in the direction Fi ; but for the same reason it continues to retard the progressive motion. When the ship has attained to the position C , the mainsail is hauled round and trimmed for the other tack. The impulse in the direction Fi still aids the conversion and retards the progressive motion. When the ship has attained a position between C and D , such that the main and mizen topsails are in the direction of the wind, there is

nothing to counteract the force of the headsails, to pay the ship's head off from the wind. Nay, during the progress of the ship to this intermediate position, if any wind gets at the main or mizen topsails, it acts on their anterior surfaces, and impels the after parts of the ship away from the curve $abcd$, and thus aids the revolution. We have therefore said that when once the sails are taken fully aback, and particularly when the wind is brought right a-head, it is scarcely possible for the evolution to sail; as soon, therefore, as the main topsail (trimmed for the other tack) shivers, we are certain that the head sails will be filled by the time they are hauled round and trimmed. The staysails are filled before this, because their sheets have been shifted and they stand much sharper than the square-sails; and thus every thing tends to check the falling off from the wind on the other tack, and this no sooner than it should be done. The ship immediately gathers way, and holds on in her new course dG .

But it frequently happens that in this conversion the ship loses her whole progressive motion. This sometimes happens while the sails are shivering before they are taken fully a-back. It is evident that in this case there is little hope of success, for the ship now lies like a log, and neither sails nor rudder have any action. The ship drives to leeward like a log, and the water acting on the lee-side of the rudder checks a little the driving of the stern. The head therefore falls off again, and by and by the sails fill, and the ship continues on her former tack. This is called missing stays, and it is generally owing to the ship's having too little velocity at the beginning of the evolution. Hence the propriety of keeping the sails well filled for some little time before. Rough weather, too, by raising a wave which beats violently on the weather bow, frequently checks the first luffing of the ship, and beats her off again.

If the ship loses all her motion after the head sails have been fully taken a-back, and before we have brought the wind right a-head, the evolution becomes uncertain, but by no means desperate; for the action of the wind on the headsails will presently give her stern-way. Suppose this to happen when the ship is in the position C . Bring the helm over hard to windward, so that the rudder shall have the position represented by the small dotted line of . It is evident that the resistance of the water to the stern-way of the rudder acts in a favorable direction, pushing the stern outwards. In the mean time the action of the wind on the headsails pushes the head in the opposite direction. These actions conspire therefore in promoting the evolution; and, if the wind is right a-head, it cannot fail, but may even be completed speedily, because the ship gathers stern-way, and the action of the rudder becomes very powerful; and, as soon as the wind comes on the former lee-bow, the action of the water on the now lee-quarter will greatly accelerate the conversion. When the wind therefore has once been brought nearly right a-head, there is no risk of being baffled.

But, should the ship have lost all her head-way considerably before this, the evolution is very

uncertain; for the action of the water on the rudder must not be nearly equal to its contrary action on the lee-quarter; in which case the action of the wind on the headsails may not be sufficient to make up the difference. When this is observed, when the ship goes astern without changing her position, we must immediately throw the headsails completely a-back, and put the helm down again, which will pay off the ship's head from the wind enough to enable us to fill the sails again on the same tack, to try our fortune again; or we must boxhaul the ship, in the manner to be described by and by.

Such is the ordinary process of tacking ship; a process in which all the different modes of action of the rudder and sails are employed. To execute this evolution in the most expeditious manner, and so as to gain as much on the wind as possible, is considered as the test of an expert seaman. We have described the process which is best calculated for ensuring the movement. But if the ship be sailing very briskly in smooth water, so that there is no danger of missing stays, we may gain more to windward considerably by keeping fast the fore-top bowline, and the jib and staysail sheets, till the square-sails are all shivering; for these sails, continuing to draw with considerable force, and balancing each other tolerably fore and aft, keep up the ship's velocity very much, and thus maintain the power of the rudder. If we now let all fly when the square-sails are shivering, the ship may be considered as without sails, but exposed to the action of the water on the lee-bow; from which arises a strong pressure of the bow to windward which conspires with the action of the rudder to aid the conversion. It evidently leaves all that tendency of the bow to windward which arises from leeway, and even what was counteracted by the formerly unbalanced action of these head-staysails. This method lengthens the whole time of the evolution, but it advances the ship to windward. Observe, too, that keeping fast the fore-top bowline till the sail shivers, and then letting it go, insures the taking a-back of that sail, and thus instantly produces an action that is favorable to the evolution.

The most expert seamen, however, differ among themselves with respect to these two methods, but the first is the most generally practised in the British navy, because least liable to fail. The forces which oppose the conversion are sooner removed, and the production of a favorable action by the backing of the fore-topsail is also sooner obtained, by letting go the fore-top bowline at the first. Having entered so minutely into the description and rationale of this evolution, we have sufficiently turned the reader's attention to the different actions which co-operate in producing the motions of conversion. We shall therefore be very brief in our description of the other evolutions.

2. *To wear ship.*—When the seaman sees that his ship will not go about head to wind, but will miss stays, he must change his tack the other way; that is, by turning her head away from the wind, going a little way before the wind, and then hauling the wind on the other tack. This is called wearing or veering ship.

It is most necessary in stormy weather with little sail, or in very faint breezes, or in a disabled ship. The process is exceedingly simple; and the mere narration of the procedure is sufficient for showing the propriety of every part of it.

Watch for the moment of the ship's falling off, and then haul up the mainsail and mizen, and shiver the mizen top-sail, and put the helm a-weather. When the ship falls off sensibly (and not before) let go the bowlines. Ease away the fore-sheet, raise the fore-tack, and gather aft the weather fore-sheet, as the lee-sheet is eased away. Round in the weather-braces of the fore and main masts, and keep the yards nearly bisecting the angle of the wind and keel, so that when the ship is before the wind, the yards may be square. It may even be of advantage to round in the weather-braces of the main-topsail more than those of the headsails; for the mainmast is abaft the centre of gravity. All this while the mizen topsail must be kept shivering, by rounding in the weather-braces as the ship pays off from the wind. Then the main-topsail will be braced up for the other tack by the time that we have brought the wind on the weather quarter. After this it will be full, and will aid the evolution. When the wind is right aft, shift the jib and staysail sheets. The evolution now goes on with great rapidity; therefore briskly haul on board the fore and main tacks, and haul out the mizen, and set the mizen-staysail as soon as they will take the wind the right way. We must now check the great rapidity with which the ship comes to the wind on the other tack, by righting the helm before we bring the wind on the beam; and all must be trimmed sharp fore and aft by this time, that the headsails may take and check the coming-to. All being trimmed, stand on close by the wind.

We cannot help losing a great deal of ground in this movement. Therefore, though it be very simple, it requires much attention and rapid execution to do it with as little loss of ground as possible. One is apt to imagine at first that it would be better to keep the headsails braced up on the former tack, or at least not to round in the weather-braces so much as is here directed. When the ship is right afore the wind, we should expect assistance from the obliquity of the headsails; but the rudder being the principal agent in the evolution, it is found that more is gained by increasing the ship's velocity, than by a smaller impulse on the headsails more favorably directed. Experienced seamen differ, however, in their practice in respect of this particular.

3. *To boxhaul a ship.*—This is a process performed only in critical situations, as when a rock, or ship, or some danger, is suddenly seen right a-head, or when a ship misses stays. It requires the most rapid execution.

The ship being close-hauled on a wind, haul up the mainsail and mizen, and shiver the topsails, and put the helm hard a-lee altogether. Raise the fore-tack, let go the head bowlines, and brace about the headsails sharp on the other tack. The ship will quickly lore her way, get stern-way, and then fall off, by the joint action of the headsails and of the inverted rudder. When she has fallen off eight points, brace

the after-sails square, which have hitherto been kept shivering. This will at first increase the power of the rudder, by increasing the stern-way, and at the same time it makes no opposition to the conversion which is going on. The continuation of her circular motion will presently cause them to take the wind on their after-surfaces. This will check the stern-way, stop it, and give the ship a little headway. Now shift the helm, so that the rudder may again act in conjunction with the headsails in paying her off from the wind. This is the critical part of the evolution, because the ship has little or no way through the water, and will frequently remain long in this position. But, as there are no counteracting forces, the ship continues to fall off. Then the weather-braces of the after-sails may be gently rounded in, so that the wind acting on their hinder surfaces may both push the ship a little a-head, and her stern laterally in conjunction with the rudder. Thus the wind is brought upon the quarter, and the headsails shiver. By this time the ship has acquired some headway. A continuation of the rotation would now fill the headsails, and their action would be contrary to the intended evolution. They are therefore immediately braced the other way, nearly square, and the evolution is now completed in the same manner with the wearing ship.

Some seamen brace all the sails a-back the moment that the helm is put hard a-lee, but the after-sails no more a-back than just to square the yards. This quickly gives the ship stern-way, and brings the rudder into action in its inverted direction; and they think that the evolution is accelerated by this method.

There is another problem of seamanship deserving of our attention, which cannot properly be called an evolution. This is lying-to. This is done in general by laying some sails back, so as to stop the head-way produced by others. But there is a considerable address necessary for doing this in such a way that the ship shall lie easily, and under command, ready to proceed in her course, and easily brought under weigh.

To bring-to with the fore or main-topsail to the mast, brace that sail sharp a-back, haul out the mizen, and clap the helm hard a-lee.

Suppose the fore-topsail to be a-back; the other sails shoot the ship a-head, and the lee-helm makes the ship come up to the wind, which makes it come more perpendicularly on the sail which is a-back. Then its impulse soon exceeds those on the other sails, which are now shivering, or almost shivering. The ship stands still awhile, and then falls off, so as to fill the after-sails, which again shoot her ahead, and the process is thus repeated. A ship lying-to in this way goes a good deal a-head and also to leeward. If the main-topsail be a-back, the ship shoots a-head, and comes up till the diminished impulse of the drawing sails in the direction of the keel is balanced by the increased impulse on the main-topsail. She lies a long while in this position, driving slowly to leeward; and she at last falls off by the beating of the water on her weather-bow. She falls off but little, and soon comes up again.

Thus a ship lying-to is not like a mere log,

but has a certain motion which keeps her under command. To get under weigh again, we must watch the time of falling off; and when this is just about to finish, brace about briskly, and fill the sail which is a-back. To aid this operation, the jib and fore-topmast staysail may be hoisted, and the mizen brailled up; or, when the intended course is before the wind or large, back the fore-topsail sharp, shiver the main and mizen topsail, brace up the mizen, and hoist the jib and fore-top-mast staysails altogether.

In a storm with a contrary wind, or on a lee shore, a ship is obliged to lie-to under a very low sail. Some sail is absolutely necessary, in order to keep the ship steadily down, otherwise she would kick about like a cork, and roll so deep as to strain and work herself to pieces. Different ships behave best under different sails. In a very violent gale, the three lower staysails are in general well adapted for keeping her steady, and distributing the strain. This mode seems also well adapted for wearing, which may be done by hauling down the mizen-staysail. Under whatever sail the ship is brought-to in a storm, it is always with a fitted sail, and never with one laid a-back. The helm is lashed down hard a-lee; therefore the ship shoots a-head, and comes up till the sea on her weather-bow beats her off again. Getting under weigh is generally difficult; because the ship and rigging are lofty abaft, and hinder her from falling off readily when the helm is put hard a-weather. We must watch the falling off, and assist the ship by some small headsail. Sometimes the crew get up on the weather fore-shrouds in a crowd, and thus present a surface to the wind.

These examples of the three chief evolutions will enable those who are not seamen to understand the propriety of the different steps, and also to understand the other evolutions as they are described by practical authors. We are not acquainted with any performance in our language where the whole are considered in a connected, scientific, and systematic manner.

We add the following collection and explanation of terms used in seamanship as useful not merely to seamen but to all voyagers:—

Aback. The situation of the sails, when their surfaces are pressed aft against the mast by the force of the wind.

Abaft. The hinder part of a ship, or toward the stern. It also signifies farther aft or nearer to the stern; as, the barricade stands abaft the main mast; that is, nearer to the stern.

Abaft the beam denotes the relative situation of any object with the ship, when the object is placed in any part of that arch of the horizon which is contained between a line at right angles with the keel and that point of the compass which is directly opposite to the ship's course. See *Bearing*.

Aboard. The inside of a ship.

Aboard main tack! The order to draw the lower corner of the mainsail down to the ches-tree.

About. The situation of a ship as soon as she has tacked or changed her course.

About ship! The order to the ship's crew to prepare for tacking.

Abreast. The situation of two or more ships lying with their sides parallel, and their heads equally advanced; in which case they are abreast of each other, as are the ships A B C. But, if their sides be not parallel, then that ship which is in a line with the beam of the other is said to be abreast of her, as the ship E is abreast of D and F. With regard to objects within the ship it implies on a line parallel with the beam, or at right angles with the ship's length. Abreast of any place means off or directly opposite to it.

Adrift. The state of a ship broken from her moorings, and driving about without control.

Afloat. Buoyed up by the water from the ground.

Afore. All that part of a ship which lies forward, or near the stem. It also signifies farther forward; as, the manger stands afore the foremast; that is, nearer to the stem.

Aft. Behind, or near the stern of a ship.

After. A phrase applied to any object in the hinder part of the ship, as the after-hatchway, the after-sails, &c.

A-ground. The situation of a ship when her bottom or any part of it rests on the ground.

A-head. Any thing which is situated on that point of the compass to which a ship's stem is directed is said to be a-head of her. See *Bearing*.

A-hull. The situation of a ship, when all her sails are furled and her helm is lashed to the lee side; by which she lies nearly with her side to the wind and sea, her head being somewhat inclined to the direction of the wind.

A-lee. The position of the helm when it is pushed down to the lee-side.

All in the wind. The state of a ship's sails, when they are parallel to the direction of the wind, so as to shake or shiver.

All hands hoay! The call by which all the ship's company are summoned upon deck.

Aloft. Up in the tops, at the mast-heads, or any where about the higher rigging.

Along-side. Side by side, or joined to a ship, wharf, &c.

Along-shore. Along the coast; a course which is in sight of the shore, and nearly parallel to it.

Amain. At once, suddenly; as, let go amain!

A-midships. The middle of a ship, either with regard to her length or breadth.

To anchor. To let the anchor fall into the ground, for the ship to ride thereby.

Anchorage. Ground, fit to hold a ship by her anchor.

The anchor is a cock-bill. The situation of the anchor, when it drops down perpendicularly from the cat-head, ready to be sunk at a moment's warning.

An-end. The position of any mast, &c., when erected perpendicularly on the deck. The top-masts are said to be an-end when they are hoisted up to their usual stations.

A-peek. Perpendicular to the anchor; the cable having been drawn so tight as to bring the

ship directly over it. The anchor is then said to be a-peek.

A-shore. On the shore, as opposed to aboard. It also means a-ground.

A-stern. Any distance behind a ship, as opposed to a-head. See *Bearing*.

At anchor. The situation of a ship riding by her anchor.

Athwart. Across the line of a ship's course.

Athwart-house. The situation of a ship when driven by accident across the fore part of another, whether they touch or are at a small distance from each other, the transverse position of the former being principally understood.

Athwart the fore foot. When any object crosses the line of a ship's course, but a-head of her, it is said to be athwart her fore foot.

Athwart-ships. Reaching, or in a direction across the ship from one side to the other.

Atrip. When applied to the anchor, it means that the anchor is drawn out of the ground, and hangs, in a perpendicular direction, by the cable or buoy-rope. The topsails are said to be atrip when they are hoisted up to the mast-head, or to their utmost extent.

Avast! The command to stop, or cease, in any operation.

Aweigh. The same as atrip, when applied to the anchor.

To back the anchor. To carry out a small anchor a head of the large one, in order to support it in bad ground, and to prevent it from loosening or coming home.

To back a-stern, in rowing, is to impel the boat with her stern foremost, by means of the oars.

To back the sails. To arrange them in a situation that will occasion the ship to move a-stern.

To bagpipe the mizen. To lay it a-back, by bringing the sheet to the mizen shrouds.

To balance. To contract a sail into a narrower compass, by folding up a part of it at one corner. Balancing is peculiar to the mizen of a ship, and the mainsail of those vessels wherein it is extended by a boom.

Bare poles. When a ship has no sail set she is under bare poles.

Bearing. The situation of one place from another, with regard to the points of the compass. The situation also of any distant object, estimated from some part of the ship, according to her situation:

these latter bearings are either on the beam, as A and B; before the beam, as the arcs A D and D B; abaft the beam, as the arcs A C and C B; on the lee or weather bow, as the lines E E; on the lee or weather quarter, as the lines F F; a-head, as the line D; or a-stern, as the line C.

Bear a-hand! Make haste, despatch.

To bear in with the land is when a ship sails towards the shore.

To bear off. To thrust or keep off from the ship's side, &c., any weight, when hoisting.

To bear up, or away.

The act of changing a ship's course, to make her sail more before the wind. Thus the ship A bears away from a close-hauled course, when she gets into either of the courses B and C.

Beating to windward. The making a progress against the direction of the wind, by steering alternately close hauled on the starboard and larboard tacks.

To becalm. To intercept the current of the wind, in its passage to a ship, by any contiguous object, as a shore above her sails, a high sea behind, &c.; and thus one sail is said to becalm another.

Before the beam denotes an arch of the horizon comprehended between the line of the beam and that point of the compass on which the ship stems. See *Bearing*.

To belay. To fasten a rope, by winding it several times round a cleat or pin.

To bend a sail is to affix to it its proper yard or stay.

Beneaped. See *Neaped*.

Berth. The station in which a ship rides at anchor, either alone or in a fleet; the due distance between two ships; and also a room or apartment on board for the officers of a mess.

Between decks. The space contained between any two decks of a ship.

Bilge water is that which, by reason of the flatness of a ship's bottom, lies on her floor, and cannot go to the well of the pump.

To bitt the cable is to confine the cable to the bitts, by one turn under the cross piece and another turn round the bitt-head. In this position it may be either kept fixed or it may be veered away.

Bitter. The turn of the cable round the bitts.

Bitter-end. That part of the cable which stays within board round about the bitts when the ship is at anchor.

A board is the distance run by a ship on one tack; thus they say, a good board, when a ship does not go to leeward of her course; a short board and a long board, according to the distance run.

Board-and-board. When two ships come so near as to touch each other, or when they lie side-by-side.

To board a ship. To enter an enemy's ship in an engagement.

Bold shore. A steep coast, permitting the close approach of shipping.

Boot-topping. Cleaning the upper part of a ship's bottom, or that part which lies immediately under the surface of the water; and daubing it over with tallow, or with a mixture of tallow, sulphur, resin, &c.

Both sheets aft. The situation of a ship sailing right before the wind.

Bow grace. A frame of old rope or junk, laid out at the bows, stems, and sides, of ships, to prevent them from being injured by flakes of ice.

To bowse. To pull upon any body with a tackle, in order to remove it.

Boxhauling. A particular method of veering a ship, when the swell of the sea renders tacking impracticable.

Boxing. An operation somewhat similar to boxhauling. It is performed by laying the headsails a-back, to receive the greatest force of the wind in a line perpendicular to their surfaces, in order to return the ship's head into the line of her course, after she had inclined to windward of it.

To brace the yards. To move the yards, by means of the braces, to any direction required.

To brace about. To brace the yards round for the contrary tack.

To brace sharp. To brace the yards to a position in which they will make the smallest possible angle with the keel, for the ship to have head-way.

To brace-to. To ease off the lee braces, and round in the weather braces, to assist the motion of the ship's head in tacking.

To brail up. To haul up a sail by means of the brails, for the more readily furling it when necessary.

Brails. A name peculiar to certain ropes belonging to the mizen, used to truss it up to the mast. But it is likewise applied to all the ropes which are employed in hauling up the bottoms, lower corners, and skirths, of the other great sails.

To break bulk. The act of beginning to unload a ship.

To break sheer. When a ship at anchor is forced by the wind or current from that position in which she keeps her anchor most free of herself and most firm in the ground, so as to endanger the tripping of her anchor, she is said to break her sheer.

Breaming. Burning off the filth from a ship's bottom.

Breast-fast. A rope employed to confine a ship side-ways to a wharf or to some other ship.

To bring by the lee. See *To Broach to*.

To bring to. To check the course of a ship when she is advancing, by arranging the sails in such a manner as that they shall counteract each other, and prevent her from either retreating or advancing. See *to lie to*.

To broach to. To incline suddenly to windward of the ship's course, so as to present her side to the wind, and endanger her oversetting. The difference between *broaching to* and *bringing by the lee* may be thus defined: Suppose a ship under great sail to be steering south, having the wind at N. N. W.; then west is the weather-side, and east the lee-side. If, by any accident, her head turns round to the westward, so as that her sails are all taken a-back on the weather-side, she is said to *broach to*. If, on the contrary, her head declines so far eastward as to lay her sails a-back on that side which was the lee-side, it is called *bringing by the lee*.

Broadside. A discharge of all the guns on one side of a ship both above and below.

Brokenbacked. The state of a ship which is so loosened in her frame as to drop at each end.

By the board. Over the ship's side.

By the head. The state of a ship when she is so unequally loaded as to draw more water forward than aft.

By the wind. The course of a ship as near as possible to the direction of the wind, which is generally within six points of it.

To careen. To incline a ship on one side so low down, by the application of a strong purchase to her masts, as that her bottom on the other side may be cleansed by breasting.

Casting. The motion of falling off, so as to bring the direction of the wind on either side of the ship after it had blown some time right-a-head. It is particularly applied to a ship about to weigh anchor.

To cat the anchor is to hook the cat-block to the ring of the anchor and haul it up close to the cat-head.

Cat's paw. A light air of wind perceived at a distance in a calm, sweeping the surface of the sea very lightly, and dying away before it reaches the ship.

Centre. This word is applied to that squadron of a fleet, in line of battle, which occupies the middle of the line; and to that column (in the order of sailing) which is between the weather and lee columns.

Change the mizen. Bring the mizen-yard over to the other side of the mast.

Chapeling. The act of turning a ship round in a light breeze of wind when she is close-hauled, so as that she will lie the same way she did before. This is usually occasioned by negligence in steering or by a sudden change of wind.

Chase. A vessel pursued by some other.

Chaser. The vessel pursuing.

Cheerly. A phrase implying heartily, quickly, cheerfully.

To claw off. The act of turning to windward from a lee-shore to escape shipwreck, &c.

Clear is variously applied. The weather is said to be clear when it is fair and open; the sea-coast is clear when the navigation is not interrupted by rocks, &c. It is applied to cordage, cables, &c., when they are disentangled, so as to be ready for immediate service. In all these senses it is opposed to foul.

To clear the anchor is to get the cable off the flukes, and to disencumber it of ropes ready for dropping.

Clear house. When the cables are directed to their anchors without lying athwart the stem.

To clear the house is to untwist the cables when they are entangled by having either a cross, an elbow, or a round turn.

Clenched. Made fast, as the cable is to the ring of the anchor.

Close-hauled. That trim of the ship's sails when she endeavours to make a progress in the nearest direction possible towards that point of the compass from which the wind blows.

To club-haul. A method of tacking a ship when it is expected she will miss stays on a lee-shore.

To clue up. To haul up the clues of a sail to its yard by means of the clue-lines.

Coasting. The act of making a progress along the sea-coast of any country.

To coil the cable. To lay it round in a ring, one turn over another.

To come home. The anchor is said to come home when it loosens from the ground by the effort of the cable, and approaches the place where the ship floated, at the length of her moorings.

Coming to denotes the approach of a ship's head to the direction of the wind.

Course. The point of the compass on which a ship steers.

Crank. The quality of a ship, which, for want of sufficient ballast, is rendered incapable of carrying sail without being exposed to the danger of oversetting.

To crowd sail. To carry more sail than ordinary.

Cunning. The art of directing the steersman to guide the ship in her proper course.

To cut and run. To cut the cable and make sail instantly, without waiting to weigh anchor.

To deaden a ship's way. To impede her progress through the water.

Dead water. The eddy of water which appears like whirl-pools, closing in with the ship's stern as she sails on.

Dismasted. The state of a ship that has lost her masts.

Doubling. The act of sailing round or passing beyond a cape or point of land.

Doubling upon. The act of enclosing any part of a hostile fleet between two fires, or of cannonading it on both sides.

To douse. To lower suddenly, or slacken.

To drag the anchor. To trail it along the bottom, after it is loosened from the ground.

To draw. When a sail is inflated by the wind, so as to advance the sail in her course, the sail is said to draw; and so to keep all drawing is to inflate all the sails.

Drift. The angle which the line of a ship's motion makes with the nearest meridian, when she drives with her side to the wind and waves, and not governed by the power of the helm. It also implies the distance which the ship drives on that line.

Driving. The state of being carried at random, as impelled by a storm or current. It is generally expressed of a ship when accidentally broke loose from her anchors or moorings.

Drop. Used sometimes to denote the depth of a sail; as the fore-top-sail drops twelve yards.

To drop anchor. Used synonymously with to anchor.

To drop a-stern. The retrograde motion of a ship.

To ease, to ease away, or to ease off. To slacken gradually; thus they say, ease the bow-line, ease the sheet.

Ease the ship! The command given by the pilot, to the steersman, to put the helm hard a-lee, when the ship is expected to plunge her fore part deep in the water when close-hauled.

To edge away. To decline gradually from the shore or from the line of the course which the ship formerly held, in order to go more large.

To edge in with. To advance gradually towards the shore or any other object.

Elbow in the hause. A particular twist in the cables by which a ship is moored; explained heretofore at length.

End-for-end. A reversal of the position of any thing is turning it end-for-end. It is applied also to a rope that has run quite out of the block in which it was reeved, or to a cable which has all run out of the ship.

End on. When a ship advances to a shore, rock, &c., without an apparent possibility of preventing her, she is said to go end on for the shore, &c.

Even keel. When the keel is parallel with the horizon a ship is said to be upon an even keel.

Fair. A general term for the disposition of the wind when favorable to a ship's course.

Fair-way. The channel of a narrow bay, river, or haven, in which snips usually advance in their passage up and down.

To fall a-board of. To strike or encounter another ship when one or both are in motion.

To fall a-stern. The motion of a ship with her stern foremost.

To fall calm. To become in a state of rest by a total cessation of the wind.

To fall down. To sail or be towed down a river nearer towards its mouth.

Falling off denotes the motion of the ship's head from the direction of the wind. It is used in opposition to coming to.

Full not off! The command to the steersman to keep the ship near the wind.

To fetch way. To be shaken or agitated from one side to another so as to loosen any thing which was before fixed.

To fill. To brace the sails so as to receive the wind in them, and advance the ship in her course, after they had been either shivering or braced a-back.

To fish the anchor. To draw up the flukes of the anchor towards the top of the bow, in order to stow it, after having been catted.

Flat aft. The situation of the sails when their surfaces are pressed aft against the mast by the force of the wind.

To flat in. To draw in the aftermost lower corner or clue of a sail towards the middle of the ship, to give the sail a greater power to turn the vessel.

To flat in forward. To draw in the fore-sheet, jib-sheet, and fore-staysail sheet, towards the middle of the ship.

Flaw. A sudden breeze or gust of wind.

Flouting. The state of being buoyed up by the water from the ground.

Flood tide. The state of a tide when it flows or rises.

Flowing sheets. The position of the sheets of the principal sails when they are loosened to the wind, so as to receive it into their cavities more nearly perpendicular than when close-hauled, but more obliquely than when the ship sails before the wind. A ship going two or three points large has flowing sheets.

Fore. That part of a ship's frame and machinery that lies near the stem.

Fore-and-aft. Throughout the whole ship's length. Lengthways of the ship.

To fore-reach upon. To gain ground of some other ship.

To forge over. To force a ship violently over a shoal by a great quantity of sail.

Forward. Towards the fore part of a ship.

Foul is used in opposition both to clear and fair. As opposed to clear, we say *foul weather*, *foul bottom*, *foul ground*, *foul anchor*, *foul hause*. As opposed to fair, we say *foul wind*.

To founder. To sink at sea by filling with water.

To free. Pumping is said to free the ship when it discharges more water that leaks into her.

To freshen. When a gale increases it is said to freshen.

To freshen the hause. Veering out or heaving in a little cable to let another part of it endure the stress at the hause-boles. It is also applied to the act of renewing the service round the cable at the hause-boles.

Fresh way. When a ship increases her velocity she is said to get fresh way.

Full. The situation of the sails, when they are kept distended by the wind.

Full-and-by. The situation of a ship, with regard to the wind, when close-hauled; and sailing so as to steer neither too nigh the direction nor to deviate to leeward.

To furl. To wrap or roll a sail close up to the yard or stay to which it belongs, and winding a cord round it to keep it fast.

To gain the wind. To arrive on the weather-side, or to windward of, some ship or fleet in sight, when both are sailing as near the wind as possible.

To gather. A ship is said to gather on another as she comes nearer to her.

Gimbleting. The action of turning the anchor round by the stock, so that the motion of the stock appears similar to that of the handle of a gimblet, when employed to turn the wire.

To give chase to. To pursue a ship or fleet.

Goose-wings of a sail. The clues or lower corners of a ship's mainsail or foresail, when the middle part is furled or tied up to the yard.

Gripping. The inclination of a ship to run to windward of her proper course.

Grounding. The laying a ship a-shore, in order to repair her. It is also applied to running a-ground accidentally.

Ground-tackle. Every thing belonging to a ship's anchors, and which are necessary for anchoring or mooring; such as cables, hawsers, tow-lines, warps, buoy-ropes, &c.

Growing. Stretching out; applied to the direction of the cable from the ship towards the anchors; as, the cable grows on the starboard bow.

Gybing. The act of shifting any boom-sail from one side of the mast to the other.

To hail. To salute or speak to a ship at a distance.

To hand the sails. The same as to furl them.

Hand-over-hand. The pulling of any rope, by the men's passing their hands alternately one before the other or one above another. A sailor is said to go aloft hand-over-hand, when he climbs into the tops by a single rope, dexterously throwing one hand over another.

Handsomely. Gradually; as, lower handsomely!

Hank-for-hank. When two ships tack and make a progress to windward together.

Hard a-lee. The situation of the helm, when pushed close to the lee side of the ship.

Hard a-weather. The situation of the helm, when pushed close to the weather side of the ship.

To haul. To pull a single rope without the assistance of blocks.

To haul the wind. To direct the ship's course nearer to the point from which the wind blows. Thus the ship A hauls the wind, when, by the trim of her sails and the action of her rudder, she veers on either of the courses B and C.

Haue. The situation of the cables before the ship's stem, when she is moored with two anchors out from forward. It also denotes any small distance a-head of a ship, or the space between her head and the anchors employed to ride her.

Head-fast. A rope employed to confine the head of a ship to a wharf or to some other ship.

Headmost. The situation of any ship or ships which are the most advanced in a fleet.

Head-sails. All the sails which belong to the fore-mast and bowsprit.

Head-sea. When the waves meet the head of a ship in her course they are called a head-sea. It is likewise applied to a large single wave coming in that direction.

Head-to-wind. The situation of a ship when her head is turned to the point from which the wind blows, as it must when tacking.

Head-way. The motion of advancing used in opposition to stern-way.

To heave. To turn about a capstan, or other machine of the like kind, by means of bars, handspicks, &c.

To heave a-head. To advance the ship by heaving-in the cable or other rope fastened to an anchor at some distance before her.

To heave a-peek. To heave in the cable, till the anchor is a-peek.

To heave a-stern. To move a ship backwards by an operation similar to that of heaving a-head.

To heave down. To careen.

To heave in the cable. To draw the cable into the ship, by turning the capstan.

To heave in stays. To bring a ship's head to the wind, by a management of the sails and rudder, in order to get on the other tack.

To heave out. To unfurl or loose a sail; more particularly applied to the staysails; thus we say, loose the topsails and heave out the staysails.

To heave short. To draw so much of the cable into the ship as that she will be almost perpendicularly over her anchor.

To heave tight or taught. To turn the capstan round, till the rope or cable becomes straightened.

To heave the capstan. To turn it round.

To heave the lead. To throw the lead overboard, in order to find the depth of water.

To heave the log. To throw the log over-

board, in order to calculate the velocity of the ship's way.

To heel. To stoop or incline to one side; thus they say to *heel to port*, that is, to heel to the larboard side.

Helm a-lee! A direction to put the helm over to the lee side.

Helm a-weather! An order to put the helm over to the windward side.

High-and-dry. The situation of a ship when so far run a-ground as to be seen dry upon the strand.

To hoist. To draw up any body by the assistance of one or more tackles. Pulling by means of a single block is never termed hoisting, except only the drawing of the sails upwards along the masts or stays.

To hold its own is applied to the relative situation of two ships when neither advances upon the other; each is then said to hold its own. It is likewise said of a ship which, by means of contrary winds, cannot make a progress towards her destined port, but which however keeps nearly the distance she had already run.

To hold on. To pull back or retain any quantity of rope acquired by the effort of a capstan, windlass, tackle, block, &c.

Home implies the proper situation of any object; as to haul home the topsail-sheets is to extend the bottom of the top-sail to the lower yard, by means of the sheets. In stowing a hold, a cask, &c., is said to be home, when it lies close to some other object.

To hull a ship. To fire cannon-ball into her hull within the point-blank range.

Hull-to. The situation of a ship when she lies with all her sails furled; as in trying.

In stays. See to *heave in stays*.

Keckled. Any part of a cable, covered over with old ropes, to prevent its surface from rubbing against the ship's bow or fore-foot.

To keep away. To alter the ship's course to one rather more large, for a little time, to avoid some ship, danger, &c. Keep away is likewise said to the steersman, who is apt to go to windward of the ship's course.

To keep full. To keep the sails distended by the wind.

To keep hold of the land. To steer near to or in sight of the land.

To keep off. To sail off or keep at a distance from the shore.

To keep the land aboard. The same as to *keep hold of the land*.

To keep the luff. To continue close to the wind.

To keep the wind. The same as to *keep the luff*.

Knot. A division of the log-line, answering, in the calculation of the ship's velocity, to one mile.

To labor. To roll or pitch heavily in a turbulent sea.

Laden in bulk. Freight with a cargo not packed, but lying loose, as corn, salt, &c.

Laid-up. The situation of a ship when moored in a harbour for want of employ.

Land-fall. The first land discovered after a sea-voyage. Thus a *good land-fall* implies the

hand expected or desired; a *bad land-fall* the reverse.

Land-locked. The situation of a ship surrounded with land, so as to exclude the prospect of the sea, unless over some intervening land.

Larboard. The left side of a ship, looking towards the head.

Larboard-tack. The situation of a ship when sailing with the wind blowing upon her larboard side.

Laying the land. A ship which increases her distance from the coast, so as to make it appear lower and smaller, is said to lay the land.

Leading-wind. A fair wind for a ship's course.

Leak. A chink or breach in the sides or bottom of a ship, through which the water enters into the hull.

To leak. To admit water into the hull through chinks or breaches in the sides or bottom.

Lee. That part of the hemisphere to which the wind is directed, to distinguish it from the other part which is called to windward.

Lee-gage. A ship or fleet to leeward of another is said to have the lee-gage.

Lee-lurches. The sudden and violent rolls which a ship often takes to leeward, in a high sea; particularly when a large wave strikes her on the weather side.

Lee of the shore. See *under the lee of the shore*.

Lee-quarter. That quarter of a ship which is on the lee-side.

Lee-shore. That shore upon which the wind blows.

Lee-side. That half of a ship, lengthwise, which lies between a line drawn through the middle of her length and the side which is farthest from the point of wind.

To leeward. Towards that part of the horizon to which the wind blows.

Leeward ship. A ship that falls much to leeward of her course, when sailing close-hauled.

Leeward tide. A tide that sets to leeward.

Lee-way. The lateral movement of a ship to leeward of her course; or the angle which the line of her way makes with a line in the direction of her keel.

To lie along. To be pressed down sideways by a weight of sail in a fresh wind.

To lie to. To retard a ship in her course, by arranging the sails in such a manner as to counteract each other with nearly an equal effort, and render the ship almost immovable, with respect to her progressive motion or headway. Thus the position of the yards, in the figures A and B, causes the sails to counteract each other, the wind blowing upon the after surface of one and the fore-surface of the other.

A long sea. A uniform motion of long waves.

Look out. A watchful attention to some important object or event that is expected to arise. Thus persons on board of a ship are occasionally stationed to look out for signals, other ships, for land, &c.

To loose. To unfurl or cast loose any sail.

To lower. To ease down gradually.

Luff! The order to the steersman to put the helm towards the lee-side of the ship, in order to sail nearer to the wind.

To make a board. To run a certain distance upon one tack, in beating to windward.

To make foul water. To muddy the water, by running into shallow places, so that the ship's keel disturbs the mud at bottom.

To make sail. To increase the quantity of sail already set, either by unreefing or by setting others.

To make sternway. To retreat, or move with the stern foremost.

To make the land. To discover it from afar.

To make water. To leak.

To man the yard, &c. To place men on the yard, in the tops, down the ladder, &c., to execute any necessary duties.

Masted. Having all her masts complete.

To middle a rope. To double it into two equal parts.

Midships. See *a-midships*.

To miss stays. A ship is said to miss stays when her head will not fly up into the direction of the wind, in order to get her on the other tack.

Mooring. Securing a ship in a particular station by chains or cables, which are either fastened to an adjacent shore or to anchors at the bottom.

Mooring service. When a ship is moored, and rides at one cable's length, the mooring service is that which is at the first splice.

Neaped. The situation of a ship left a-ground on the height of a spring tide, so that she cannot be floated till the return of the next spring tide.

Near! or no near! An order to the steersman not to keep the ship so close to the wind.

Off-and-on. When a ship is beating to windward, so that by one board she approaches towards the shore, and by the other stands out to sea, she is said to stand off-and on shore.

Offing. Out at sea, or at a competent distance from the shore, and generally out of anchor-ground.

Offward. From the shore; as, when a ship lies a-ground and leans towards the sea, she is said to lieel offward.

On the beam. Any distance from the ship on a line with the beams, or at right angles with the keel. See *Bearing*.

On the bow. An arch of the horizon, comprehending about four points of the compass on each side of that point to which the ship's head is directed. Thus, they say, the ship in sight bears three points on the starboard bow; that is, three points towards the right hand, from that part of the horizon which is right a head. See *Bearing*.

On the quarter. An arch of the horizon, comprehending about four points of the compass on each side of that point to which the ship's stern is directed. See *On the bow* and *Bearing*.

Open. The situation of a place exposed to the wind and sea. It is also expressed of any distant object to which the sight or passage is not intercepted.

Open hause. When the cables of a ship at

her moorings lead straight to their respective anchors, without crossing, she is said to ride with an open hause.

Over-board. Out of the ship.

Over-grown sea is expressed of the ocean when the surges and billows rise extremely high.

To over-haul. To open and extend the several parts of a tackle, or other assemblage of ropes, thereby fitting them the better for running easily.

Over-rake. When a ship at anchor is exposed to a head-sea, the waves of which break in upon her, the waves are said to over-rake her.

Over-set. A ship is overset when her keel turns upwards.

Out-of-trim. The state of a ship when she is not properly balanced for the purposes of navigation.

Parliament-heel. The situation of a ship when she is made to stoop a little to one side, so as to clean the upper part of her bottom on the other side. See *Boot-topping*.

Parting. Being driven from the anchors, by the breaking of the cable.

To pawl the capstan. To fix the pawls, so as to prevent the capstan from recoiling, during any pause of heaving.

To pay. To daub or cover the surface of any body with pitch, tar, &c., in order to preserve it from the injuries of the weather.

To pay away or pay out. To slacken a cable or other rope, so as to let it run out for some purpose particular.

To pay off. To move a ship's head to leeward.

To peek the mizen. To put the mizen yard perpendicular by the mast.

Pitching. The movement of a ship, by which she plunges her head and after-part alternately into the hollow of the sea.

To ply to windward. To endeavour to make a progress against the direction of the wind. See *Beating to windward*.

Point-blank. The direction of a gun when levelled horizontally.

Pooping. The shock of a high and heavy sea upon the stern or quarter of a ship, when she scuds before the wind in a tempest.

Port. A name given on some occasions to the larboard side of the ship; as, the ship heels to port; top the yards to port! &c.

Port the helm! The order to put the helm over to the larboard side.

Port-last. The gunwale.

Portoise. The same as *port-last*; to ride a portoise is to ride with a yard struck down to the deck.

Press of sail. All the sail a ship can set or carry.

Prizing. The application of a lever to move any weighty body.

Purchase. Any sort of mechanic power employed in raising or removing heavy bodies.

Quarters. The several stations of a ship's crew in time of action.

Quartering. When a ship under sail has the wind blowing on her quarter.

To Raise. To elevate any distinct object at sea by approaching it; thus to raise the land is used in opposition to lay the land.

To Rake. To cannonade a ship at the stern or head, so that the balls scour the whole length of the docks.

Range of cable. A sufficient length of cable drawn upon deck before the anchor is cast loose, to admit of its sinking to the bottom without any check.

Reach. The distance between any two points on the banks of a river, wherein the current flows in an uninterrupted course.

Ready about! A command of the boatswain to the crew, and implies that all the hands are to be attentive and at their stations for tacking.

Rear. The last division of a squadron, or the last squadron of a fleet. It is applied likewise to the last ship of the line, squadron, or division.

Reef. Part of a sail from one row of eyelet-holes to another. It is applied likewise to a chain of rocks lying near the surface of the water.

Reefing. The operation of reducing a sail by taking in one or more of the reefs.

To reeve. To pass the end of a rope through any hole, as the channel of a block, the cavity of a thimble, &c.

Rendering. The giving way or yielding to the efforts of some mechanical power. It is used in opposition to jamming or sticking.

Riding, when expressed of a ship, is the state of being retained in a particular station by an anchor and cable. Thus she is said to ride easy or to ride hard, in proportion to the strain upon her cable. She is likewise said to ride leeward tide, i. e. anchored in a place at a time when the tide sets to leeward, and to ride windward tide if the tide sets to windward: to ride between wind and tide, when the wind and tide are in direct opposition, causing her to ride without any strain upon her cables.

Rigging out a boom. The running out a pole at the end of a yard to extend the foot of a sail.

To rig the capstan. To fix the bars in their respective holes.

Righting. Restoring a ship to an upright position, either after she has been laid on a careen, or after she has been pressed down on her side by the wind.

To right the helm is to bring it into midships, after it has been pushed either to starboard or larboard.

Rolling. The motion by which a ship rocks from side to side like a cradle.

Rough-tree. A name applied to any mast, yard, or boom, placed in merchant ships, as a rail or fence above the vessel's side, from the quarter-deck to the fore-castle.

Rounding-in. The pulling upon any rope which passes through one or more blocks in a direction nearly horizontal; as, round-in the weather-braces.

Round-turn. The situation of the two cables of a ship when moored, after they have been several times crossed by the swinging of the ship.

Rounding-up. Similar to rounding-in, except that it is applied to ropes and blocks which act in a perpendicular direction.

To row. To move a boat with oars.

Rousing. Pulling upon a cable or rope without the assistance of tackles.

To run out a warp. To carry the end of a rope out from a ship in a boat, and fasten it to some distant object, so that the ship may be removed by pulling on it.

To sag to leeward. To make considerable leeway.

Sailing-trim is expressed of a ship when in the best state for sailing.

Seanting. The variation of the wind, by which it becomes unfavorable to a ship's making great progress, as it deviates from being large, and obliges the vessel to steer close-hauled, or nearly so.

Seudding. The movement by which a ship is carried precipitately before the wind in a tempest.

Scuttling. Cutting large holes through the bottom or sides of a ship, either to sink her or to unlade her expeditiously when stranded.

Sea. A large wave is so called. Thus they say, a *heavy sea*. It implies likewise the agitation of the ocean, as, a *great sea*. It expresses the direction of the waves, as, a *head sea*. A *long sea* means a uniform and steady motion of long and extensive waves; a *short sea*, on the contrary, is when they run irregularly, broken, and interrupted.

Sea-bout. A vessel that bears the sea firmly, without straining her masts, &c.

Sea-clothes. Jackets, trousers, &c.

Sea-mark. A point or object on shore conspicuously seen at sea.

Sea-room. A sufficient distance from the coast or any dangerous rocks, &c.: so that a ship may perform all nautical operations without danger of shipwreck.

Sending. The act of pitching precipitately into the hollow between two waves.

Setting. The act of observing the situation of any distant object by the compass.

To set sail. To unfurl and expand the sails to the wind in order to give motion to the ship.

To set up. To increase the tension of the shrouds, backstays, &c., by tackles, laniards, &c.

To settle the land. To lower in appearance. It is synonymous with *to lay the land*.

To shape a course. To direct or appoint the track of a ship in order to prosecute a voyage.

Sheering. The act of deviating from the line of the course, either to the right or left.

To sheer off. To remove to a greater distance.

To sheet-home. To haul the sheets of a sail home to the block on the yard-arm.

To shift the helm. To alter its position from starboard to port, or from port to starboard.

To ship. To take any person, goods, or article, on board. It also implies to fix any thing in its proper place; as, *to ship the ours*, to fix them in their rowlocks.

Shivering. The state of a sail when fluttering in the wind.

Shoal. Shallow.

To shoe the anchor. To cover the flukes with a piece of plank to give it firmer hold in soft ground.

To shoot a-head. To advance forward.

Shore. A general name for the sea-coast of any country.

To shorten sail. Used in opposition to *make sail*.

Slack-water. The interval between the flux and reflux of the tide, when no motion is perceptible in the water.

Slatch is applied to the period of a transitory breeze.

To slip the cable. To let it run quite out when there is not time to weigh the anchor.

Slaps. Look to *Sea-clothes*.

To slue. To turn any cylindric piece of timber about its axis without removing it. Thus, *to slue a mast or boom* is to turn it in its cap or boom-iron.

Sounding. Trying the depth of the water with a plummet, sunk from a ship to the bottom.

To spell the mizen. To let go the sheet and peek it up.

To spill. To discharge the wind out of the cavity or belly of a sail, when it is drawn up in the brails, in order to furl or reef it.

Split. The state of a sail rent by the violence of the wind.

Spoon-drift. A sort of showery sprinkling of the sea-water, swept from the surface of the waves in a tempest, and flying like a vapor before the wind.

Spray. The sprinkling of a sea, driven occasionally from the top of a wave; but not continual as *spoon-drift*.

To spring a mast, yard, &c. To crack a mast, yard, &c., by means of straining in blowing weather, so that it is rendered unsafe for use.

To spring a leak. When a leak first commences, a ship is said to spring a leak.

To spring the luff. A ship is said to spring her luff when she yields to the effort of the helm, by sailing nearer to the wind than before.

Squall. A sudden violent blast of wind.

Square. This term is applied to yards that are very long, as *taunt* is to high masts.

To square the yards. To brace the yards, so as to hang at right angles with the keel.

To stand on. To continue advancing.

To stand in. To advance towards the shore.

To stand off. To recede from the shore.

Starboard. The right hand side of the ship when looking forward.

Starboard-tack. A ship is said to be on the starboard-tack, when sailing with the wind blowing upon her starboard-side.

Starboard the helm! An order to push the helm to the starboard-side.

To stay a ship. To arrange the sails and move the rudder, so as to bring the ship's head to the direction of the wind, in order to get her on the other tack.

Steady! The order to the helmsman to keep the ship in the direction she is going at that instant.

Steering. The art of directing the ship's way by the movement of the helm.

Steerage-way. Such degree of progressive motion of a ship as will give effect to the motions of the helm.

To stem the tide. When a ship is sailing against the tide at such a rate as enables her to overcome its power she is said to stem the tide.

Sternfast. A rope confining a ship by her stern to any other ship or wharf.

Sternmost. The farthest a-stern, opposed to *headmost*.

Sternway. The motion by which a ship falls back with her stern foremost.

Stiff. The condition of a ship when she will carry a great quantity of sail without hazard of oversetting. It is used in opposition to crank.

To stow. To arrange and dispose aship's cargo.

To stream the buoy. To let it fall from the ship's side into the water, previously to casting anchor.

To strike. To lower or let down any thing. Used emphatically to denote the lowering of colors, in token of surrender to a victorious enemy.

To strike sounding. To touch ground, when endeavouring to find the depth of water.

Surf. The swell of the sea that breaks upon shore or on any rock.

To surge the capstan. To slacken the rope heaved round upon it.

Swell. The fluctuating motion of the sea either during or after a storm.

Sweeping. The act of dragging the bight or loose part of a rope along the surface of the ground, in a harbour or road, in order to drag up something lost.

Swinging. The act of a ship's turning round her anchor at the change of wind or tide.

To tack. To turn a ship about from one tack to another, by bring her head to the wind. Thus the ship A passes from the larboard to the starboard tack a.

Taking in. The act of furling the sails. Used in opposition to setting.

Taken a-back. See *A-back*.

Taught. Improperly, though very generally, used for *tight*.

Taunt. High or tall: particularly applied to masts of extraordinary length.

Tending. The turning or swinging of a ship round her anchor in a tide-way at the beginning of ebb and flood.

Thwart. See *A-thwart*.

Thwart ships. See *A-thwart ships*.

Thus! An order to the helmsman to keep the ship in her present situation, when sailing with a scant wind.

Tide-way. That part of a river in which the tide ebbs and flows strongly.

Tier. One range of any thing placed horizontally.

Topping. Pulling one of the ends of a yard higher than the other.

To tow. To draw a ship in the water by a rope fixed to a boat or other ship which is rowing or sailing on.

Trim. The state or disposition by which a ship is best calculated for the purposes of navigation.

To trim the hold. To arrange the cargo regularly.

To trim the sails. To dispose the sails in the best arrangement for the course which a ship is steering.

To trip the anchor. To loosen the anchor from the ground, either by design or accident.

Trough of the sea. The hollow between two waves.

Trying. The situation in which a ship, in a tempest, lies in the trough or hollow of the sea, particularly when the wind blows contrary to her course.

Turning to windward. That operation in sailing whereby a ship endeavours to advance against the wind.

Van. The foremost division of a fleet in one line. It is likewise applied to the foremost ship of a division.

To veer. To change a ship's course, from one tack to the other, by turning her stern to windward; thus the ship A veers in passing from the course A to the course C. The wind is said to veer when it changes more aft.

To veer and haul. To pull a rope tight, by alternately drawing it in and slackening it.

To unballast. To discharge the ballast out of a ship.

To unbend. To take the sails off from their yards and stays: to cast loose the anchor from the cable: to untie two ropes.

To unbit. To remove the turns of a cable from off the bits.

Under foot is expressed of an anchor that is directly under the ship.

Under sail. When a ship is loosened from moorings, and is under the government of her sails and rudder.

Under way. The same as *under sail*.

Under the lee of the shore is to be close under the shore which lies to windward of the ship.

To unmoor. To reduce a ship to the state of riding at single anchor, after she has been moored.

To unreeve. To draw a rope from out of a block, thimble, &c.

To unrig. To deprive the ship of her rigging.

Wake. The print or track impressed upon the surface of water by a ship in her course. A ship is said to be in the wake of another when she follows her in the same track, or on a line supposed to be formed on a continuation of her keel. Thus the ship A is sailing in the wake of B, and the ship C is crossing in the wake of A and B.

To ware. See *to veer*.

Warp. A small rope employed occasionally to remove a ship from one place to another.

To Warp. To remove a ship by means of a warp.

Water-borne. The state of a ship, when there is barely a sufficient depth of water to float her off from the ground.

Water-logged. The state of a ship, become heavy and inactive on the sea, from the great quantity of water leaked into her.

Water-tight. The state of a ship when not leaky.

Weather. Synonymous with *windward*.

Weather-beaten. Shattered by a storm.

Weather-bit. A turn of the cable about the end of the windlass.

Weather-gage. When a ship or fleet is t.

windward of another, she is said to have the weather-gage of her.

Weather-quarter. That quarter of the ship which is on the windward side.

Weather-side. The side upon which the wind blows.

To weigh anchor. To heave up an anchor from the bottom.

To wind a ship. To change her position, bringing her head where her stern was.

Wind-road. When a ship is at anchor, and the wind, being against the tide, is so strong as to overcome its power and keep the ship to lee-

ward of her anchor, she is said to be windroad.

Wind's eye. The point from which the wind blows.

To windward. Towards that part of the horizon from which the wind blows.

Windward-tide. A tide that sets to windward.

To work a ship. To direct the movements of a ship, by adapting the sails and managing the rudder according to the course the ship has to make.

To work to windward. To make a progress against the direction of the wind.

Yaving. The motion of a ship, when she deviates from her course to the right or left.

SEA MARKS. The erection of beacons, light-houses, and sea-marks, is a branch of the royal prerogative. By 8 Eliz. 13, the corporation of the Trinity-house are empowered to set up any beacons or sea-marks wherever they shall think them necessary; and if the owner of the land or any other person shall destroy them, or take down any steeple, tree, or other known sea-mark, he shall forfeit £100 sterling, or, in case of inability to pay it, he shall be ipso facto outlawed.

SEA MEW. See **LARUS**.

SEA NYMPHS. See **NEREIDS**, **NYMPHS**, and **OCEANIDES** or **OCEANITIDES**.

SEA ONION, or **SCILL.** See **SCILLA**.

SEAPOYS, or **SEPOYS**, natives of Hindostan, serving in a military capacity under the European powers, and disciplined after the European manner. The seapoys of the English East India company compose perhaps the most numerous, regular, and best disciplined body of black troops in the world. They are raised from among the natives of the country, and consist of Moors or Mahometans, Raja-poots, Hindoos, Parias, besides many intermediate casts peculiar to themselves; the whole modelled in all corresponding particulars, and disciplined in every respect as the army of Great Britain. The seapoys are formed into complete, uniform, and regular battalions, like our marching regiments, being intended to answer fully every purpose in India of the like troops in Europe. Their arms are a firelock and bayonet; their accoutrements, or cross belts, black leather, with pouches of the same. A battalion unite in their exterior traits both the Indian and European appearance. They are brought to the utmost exactness of discipline; go through their evolutions and manœuvres with a regularity and precision equal to, and rarely surpassed by European troops. In action they are brave and steady, and have stood where Europeans have given way. Their discipline puts them on a footing with European troops, with whom they are always ready to act in concert. Their utility and services are evident; they secure to the company the internal good order and preservation of their territorial districts, which, though possible to be enforced with a strong hand by Europeans, requires numbers, and can only be conducted with that ease and address peculiar to the native forces of the country. Dr. Robertson has remarked, as a proof that the ingenuity of man has recourse in

similar situations to the same expedients, that the European powers have, in forming the establishment of these native troops, adopted the same maxims, and, probably without knowing it, have modelled their battalions of seapoys upon the same principles as Alexander the Great did his phalanx of Persians.

SEAR, *adj.* & *v. a.* Saxon *ƿearian*, to dry. Dry; not any longer green: to dry; burn; canterize.

Some shall depart from the faith, speaking lies, having their conscience *seared* with a hot iron.

1 Timothy iv. 2.

The scorching flame sore singed all his face,
And through his armour all his body *seared*.

Faerie Queene.

I have lived long enough: my May of life
Is fallen into the *sear*, the yellow leaf.

Shakspeare. Macbeth.

Ye myrtles brown, with ivy never *sear*. *Milton.*
Cherish veins of good humour, and *sear* up those
of ill. *Temple.*

Some may be cherished in dry places, as in *sear*
wood. *Ray.*

I'm *seared* with burning steel, till the scorched
marrow

Fries in the bones. *Rowe's Royal Convert.*

He lives, nor yet is past his manhood's prime,
Though *seared* by toil, and something touched by
time. *Byron.*

SEARCE, *v. a.* Fr. *sasser*. To sift finely.

Put the finely *searced* powder of alabaster into
a flat-bottomed and well-heated brass vessel.

Boyle.

For the keeping of meal, bolt and *searce* it from
the bran. *Mortimer's Husbandry.*

SEARCH, *v. a., v. n., & n. s.* Fr. *chercher*;
SEARCHER, *n. s.* { Ital. *circaeo*;

of Lat. *circo*. To examine; try; explore; enquire; probe surgically; taking out (intens.): as a verb neuter, to look; make enquiry; seek: the noun substantives both correspond.

They returned from *searching* of the land.

Numbers xiii. 25.

Who went before you, to *search* you out a place to
pitch your tents in? *Deuteronomy* i. 33.

For the divisions of Reuben there were great
searchings of heart. *Judges* v. 16.

Help to *search* my house this one time; if I find
not what I seek, let me for ever be your table sport.

Shakspeare.

With this good sword,
That ran through Cæsar's bowels, *search* this bosom.
Id.

Satisfy me once more ; once more *search* with me.

Id.

His reasons are as two grains of wheat hid in two bushels of chaff: you shall seek all day ere you find them, and when you have them they are not worth the *search*.

Id.

The *searchers* found a marvellous difference between the Anakins and themselves.

Raleigh.

Through the void immense

To *search* with wandering quest a place foretold.

Milton.

To ask or *search* I blame thee not.

Id.

The orb he roamed

With narrow *search*, and within inspection deep.

Id.

The *searchers*, who are ancient matrons sworn to their office, repair to the place where the dead corps lies, and by view of the same, and by other inquiries, examine by what disease the corps died.

Gravatt's Bills of Mortality.

Who great in *search* of God and nature grow,

They best the wise Creator's praise declare.

Dryden.

Now mourn thy fatal *search* :

It is not safe to have too quick a sense.

Id.

It suffices that they have once with care sifted the matter, and *searched* into all the particulars that could give any light to the question.

Locke.

By the philosophical use of words, I mean such an use as conveys the precise notions of things, which the mind may be satisfied with in its *search* after knowledge.

Id.

The parents, after a long *search* for the boy, gave him for drowned in a canal.

Addison.

Religion has given us a more just idea of the divine nature: he whom we appeal to is truth itself, the great *searcher* of hearts, who will not let fraud go unpunished, or hold him guiltless that taketh his name in vain.

Id.

In vain we lift up our presumptuous eyes

To what our Maker to their ken denies ;

The *searcher* follows fast, the object flies.

Prior.

The signs of wounds penetrating are discovered by the proportion of the *searching* candle, or probe which enters into the cavity.

Wiseman's Surgery.

With piercing eye some *search* where nature plays,
And trace the wanton through her darksome maze.

Tickel.

This common practice carries the heart aside from all that is honest in our *search* after truth.

Watts.

They may sometimes be successful to *search* out truth.

Id.

Avoid the man who practises any thing unbecoming a free and open *searcher* after truth.

Id.

SEARCHER, an officer in the customs, whose business it is to search and examine ships outward-bound, if they have any prohibited goods on board, &c.: 12 Car. II. There are also searchers of leather, &c.

SEARCHER, in ordnance, is an iron-socket with branches, from four to eight in number, a little bent outwards, with small points at their ends; to this socket is fixed a wooden handle, from eight to twelve feet long, of about an inch and a quarter diameter. After the gun has been fired this searcher is introduced into it, and turned round, in order to discover the cavities within. The distances of these cavities, if any be found, are then marked on the outside with chalk, when another searcher that has only one point, about which a mixture of wax and tallow is put, is introduced to take the impression of the holes; and if there be any hole a quarter of an inch deep, or

of any considerable length, the gun is rejected as unserviceable.

SEARCH WARRANT, in law, a kind of general warrant issued by justices of peace, or magistrates of towns, for searching all suspected places for stolen goods. In some English law-books there are precedents requiring the constable to search all such suspected places as he and the party complaining shall think convenient; but such practice is condemned by lord Hale, Mr. Hawkins, and the best authorities both amongst the English and Scottish lawyers. However, in case of a complaint, and oath made of goods stolen, and that the party suspects that those goods are in a particular house, and shows the cause of such suspicion, the justice may grant a warrant to search not only that house but other suspected places; and to attach the goods, and the party in whose custody they are found, and bring them before him or some other justice, to give an account how he came by them, and to abide such order as to law shall appertain; which warrant should be directed to the constable or other public officer, who may enter a suspected house and make search.

SEAR'CLOTH, *n. s.* Sax. *rapclað*, from *rap* pain, and *clað* a plaster; so that cerecloth, as written, from *cera* wax, seems to be wrong. A plaster; a large plaster.

Bees' wax is the ground of all *searcloth* salves.

Mortimer.

The SEA SERPENT is a fabulous animal, said to inhabit the northern seas about Greenland and the coasts of Norway. The following marvellous account of this monster is given by Guthrie. 'In 1756 one of them was shot by a master of a ship; its head resembled that of a horse; the mouth was large and black, as were the eyes, a white mane hanging from its neck; it floated on the surface of the water, and held its head at least two feet out of the sea; between the head and neck were seven or eight folds, which were very thick; and the length of this snake was more than 100 yards; some say fathoms. They have a remarkable aversion to the smell of castor; for which reason, ship, boat, and bark masters provide themselves with quantities of that drug, to prevent being overset, the serpent's olfactory nerves being remarkably exquisite. The particularities related of this animal would be incredible, were they not attested upon oath. Egede, a very reputable author, says that on the 6th day of July, 1734, a large and frightful sea-monster raised itself so high out of the water that its head reached above the main-top-mast of the ship; that it had a long sharp snout, broad paws, and spouted water like a whale; that the body seemed to be covered with scales; the skin was uneven and wrinkled, and the lower part was formed like a snake. The body of this monster is said to be as thick as a hog'shead; his skin is variegated like a tortoise shell; and his excrement, which floats upon the surface of the water, is corrosive.'

SEA SHARK. See SQUALUS.

SEA SICKNESS, a disorder incident to most persons on their first going to sea, occasioned by the agitation of the vessel. In voyages, sea-sickness, though it continues in general only for the

first day or two, is extremely harrassing to some people at intervals, especially on any increased motion of the vessel. Sometimes, by long continuance, it causes fever, headach, quick pulse, thirst, white tongue, and a total deprivation of the retention of the stomach; evils which are always difficult to remove, and frequently terminate only with the voyage. This indisposition is considerably alleviated by a small tea-spoonful of ether, taken now and then in a glass of water, and applying some of it to the temples and nostrils. The ancient writers recommend acid fruits, bread and vegetables soaked in vinegar, after the stomach has been cleansed by vomiting; but not to attempt to suppress the vomiting until that end was obtained. An old remedy for sea-sickness, and a very common one among sailors, is a draught or two of sea-water; which, though a disgusting medicine at such a time, yet where the first passages are foul and loaded, generally produces the desired effect when the perturbation it occasions ceases.

SEASON, *n. s., v. a., &c.* Fr. *saison*; Span. SEASONABLE, *adj.* [*v. n.*] *sazon*; barb. Lat. SEASONABleness, *n. s.* *sazio*. One of the SEASONABLY, *adv.* { four quarters of the SEASONER, *n. s.* } year; any particular SEASONING. } or fit time; any short time; relish; that which gives a relish: to give a relish to; qualify; imbue; taint; fit or mature for office or use: to become fit: the derivatives corresponding.

Every oblation of thy meat-offering shalt thou season with salt. *Leviticus ii. 13.*

Mercy is *seasonable* in the time of affliction, as clouds of rain in the time of drought. *Ecclesi. v. 2.*

The fairest flowers o' the *season*
Are our carnations and streaked gillyflowers.

Shakspeare.

We'll slip you for a *season*, but our jealousy
Does yet depend. *Id. Cymbeline.*

You lack the *season* of all natures, sleep.
Id. Macbeth.

Mercy is above this sceptered sway;
It is an attribute to God himself;
And earthily power does then shew likest God's,
When mercy *seasons* justice.

Id. Merchant of Venice.

The crow doth sing as sweetly as the lark,
When neither is attended; and, I think,
The nightingale, if she should sing by day,
When every goose is cackling, would be thought
No better a musician than the wren:
How many things by *season* *seasoned* are
To their right praise and true perfection!

Shakspeare.

We charge you, that you have contrived to take
From Rome all *seasoned* office, and to wind
Yourself unto a power tyrannical. *Id. Coriolanus.*

Breads we have of several grains, with divers
kinds of leavenings and *seasonings*; so that some do
extremely move appetites, and some do nourish so
as divers do live of them alone. *Bacon.*

The archers of his guard shot two arrows, every
man together, against an inch board of well *seasoned*
timber. *Hayward.*

Some abound with words without any *seasoning* or
taste of matter. *Ben Jonson.*

Secure their religion, *season* their younger years
with prudent and pious principles. *Taylor.*

The *season* prime for sweetest scents and airs.
Milton.

Whatever thing

The scythe of time mows down, devour unspared,
Till I, in man residing, through the race
His thoughts, his looks, words, actions, all infect,
And *season* him thy last and sweetest prey.

Id. Paradise Lost.

They *seasoned* every sacrifice, whereof a greater
part was eaten by the priests.

Brown's Vulgar Errors.

The proper use of wit is to *season* conversation,
to represent what is praiseworthy to the greatest advantage, and to expose the vices and follies of men.

Tillotson.

This summer, autumn, winter did appear;
And spring was but a *season* of the year. *Dryden.*

For active sports, for pleasing rest,

This is the time to be posset;

The best is but in *season* best. *Id.*

You *season* still with sports your serious hours;

For age but tastes of pleasures, youth devours. *Id.*

His plenteous stores do *seasoned* timber send;

Thither the brawny carpenters repair. *Id.*

A foundation of good sense, and a cultivation of
learning, are required to give a *seasoning* to retire-
ment, and make us taste the blessing. *Id.*

All business should be done betimes; and there's
as little trouble of doing it in *season* too, as out of
season. *L'Estrange.*

For breakfast and supper, milk and milk-pottage
are very fit for children; only let them not be *seasoned*
with sugar. *Locke.*

I would indulge the gladness of my heart!

Let us retire; her grief is out of *season*. *Phillips.*

Carpenters rough plane boards for flooring, that
they may set them by to *season*.

Moxon's Mechanical Exercises.

This is that to which I would most earnestly,
most *seasonably*, advise you all. *Sprat's Sermons.*

Sin, taken into the soul, is like a liquor poured
into a vessel; so much of it as it fills it also *seasons*:
the touch and tincture go together. *South.*

If ever it was *seasonable* to preach courage in the
despised abused cause of Christ, it is now, when his
truths are reformed into nothing, when the hands
and hearts of his faithful ministers are weakened.

South's Sermons.

We saw, in six days' travelling, the several *seasons*
of the year in their beauty. *Addison on Italy.*

A man should harden and *season* himself beyond
the degree of cold wherein he lives. *Addison.*

A British freeholder would badly discharge his
part, if he did not acknowledge the excellency and
seasonableness of those laws by which his country has
been recovered out of its confusions. *Id.*

Political speculations are of so dry and austere a
nature that they will not go down with the publick
without frequent *seasonings*. *Id. Freeholder.*

The wise contriver,
To keep the waters from corruption free,
Mixt them with salt, and *seasoned* all the sea.

Blackmore.

There is no *season* to which such thoughts as these
are more suitable. *Atterbury.*

Many vegetable substances are used by mankind
as *seasonings*, which abound with a highly exalted
aromatic oil; as thyme and savory.

Arbuthnot on Aliments.

The *season* when to come, and when to go,
To sing, or cease to sing, we never know. *Pope.*

This sum came very *seasonably*, as I was thinking
of indenting myself, for want of money, to procure
my passage. *Burns.*

SEASONS, in cosmography, certain portions or
quarters of the year, distinguished by the signs

which the sun then enters, or by the meridian altitudes of the sun; consequent on which are different temperatures of the air, different works in tillage, &c. The year is divided into four seasons: spring, summer, autumn, and winter.

SEASONING, a name given to the first illness to which persons, habituated to colder climates, are subject, on their arrival in the West Indies, particularly if at first they expose themselves in a shower of rain, or too long in the sun, or in the night air; or when the body is much heated, if they drink large draughts of cold liquors, or bathe in water, or use much exercise, or commit excess in drinking wine or spirits; or by heating the body and inflaming the blood; or by subjecting themselves to any cause that may suddenly check perspiration, which at first is generally excessive. The disorders are various that constitute this seasoning of new comers, as they are called; depending on age, constitution, and habit of body. But all seasoning diseases are said to be of the inflammatory kind; and yield to antiphlogistic treatment proportioned to their violence.

SEAT, *n. s. & v. a.* Sax. *seot*; Swed. *säte*; Teut. *sett*; Lat. *sedes*. A chair; bench; any thing on which one may sit: hence a throne, or royal or episcopal seat; hence also residence; situation; site: to seat is, to place on seats, or in authority or office; fix.

With due observance of thy goodly seat,
Great Agamemnon, Nestor shall supply
Thy latest words. *Shakspere. Troilus and Cressida.*

Thus we acbase
The nature of our seats, and make the rabble
Call our cares fears. *Id. Coriolanus.*

Thus high was king Richard seated.
Id. Richard III.

Why do I yield to that suggestion,
Whose horrid image doth upfix my hair,
And make my seated heart knock at my ribs,
Against the use of nature? *Id. Macbeth.*

It were enough in reason to succour with virtuels,
and other helps, a vast multitude, compelled by necessity to seek a new seat, or to direct them unto a country able to receive them. *Raleigh.*

It followeth now that we find out the seat of Eden;
in it was Paradise by God planted. *Id.*

He that builds a fair house upon an ill seat
committeth himself to prison. *Bacon.*

A church by Strand-bridge, and two bishops' houses, were pulled down to make a seat for his new building. *Hayward.*

The fittest and the easiest to be drawn
To our society, and to aid the war,

The rather for their seat, being next borderers
On Italy. *Ben Jonson's Catiline.*

By no means build too near a great neighbour,
which were in truth to be as unfortunately seated on the earth as Mercury is in the heavens: for the most part ever in combustion or obscurity, under brighter beams than his own. *Wotton.*

Whatsoever be the manner of the world's end,
most certain it is an end it shall have, and as certain that then we shall appear before the judgment seat of Christ, that every man may receive according to that which he hath done in his body, whether it be good or evil. *Hakewill on Providence.*

The sons of light
Hasted, resorting to the summons high,
And took their seats. *Milton's Paradise Lost.*

O earth, how like to heaven! if not preferred
Most justly, seat worthier of gods, as built
With second thoughts, reforming what was old. *Milton.*

Not Babylon,
Nor great Alcairo, such magnificence
Equalled in all their glories, to inscribe
Belus or Serapis their gods, or seat
Their kings. *Id.*

From their foundations loosening to and fro,
They plucked the seated hills. *Id.*

The lady of the leaf ordained a feast,
And made the lady of the flower her guest;
When, lo, a bower ascended on the plain,
With sudden seats ordained, and large for either
train. *Dryden.*

In Alba he shall fix his royal seat;
And, born a king, a race of kings beget. *Id.*

The promised seat of empire shall again
Cover the mountain and command the plain. *Prior.*

The guests were no sooner seated but they entered
into a warm debate. *Arbuthnot.*

A spirit of envy or opposition makes mankind uneasy to see others of the same species seated above them in a sort of perfection. *Pope.*

Themselves perhaps, when weary they retreat
To enjoy cool nature in a country seat,
To exchange the centre of a thousand trades,
For clumps, and lawns, and temples, and cascades,
May now and then their velvet cushions take,
And seem to pray for good example sake. *Cowper.*

SEATER, one of the chief deities of the ancient Saxons, reckoned by mythologists analogous to the Saturn of the Greeks and Romans. Saturday was named from this idol.

SEA'WARD, *adv.* Sea and Sax. *searþ*. Towards the sea.

The rock rushed seaward with impetuous roar,
Ingulfed, and to the' abyss the boaster bore. *Pope:*

SEA-WATER, ANALYSIS OF. In June, 1776, Sir Torbern Bergman analysed a pint of sea-water, taken from the depth of sixty fathoms in the latitude of the Canary Islands, and found the solid contents as follows:—Of common salt 253 $\frac{1}{11}$ grs., salited magnesia 69 $\frac{1}{11}$ grs., and gypsum 8 $\frac{1}{11}$ grs.; in all 330 $\frac{1}{11}$ grs., or 5 drams, 1 scruple, and 10 grs., and $\frac{1}{11}$ parts. The principal salts contained in sea-water are, 1st, Common marine or culinary salt, compounded of fossil alkali or soda and marine acid; 2dly, A salt formed by the union of the same acid with magnesian earth; and, lastly, A small quantity of selenite. The quantity of saline matter contained in a pint of sea-water, in the British seas, is, according to Neumann, about one ounce in each pint. See OCEAN and SEA.

SEA-WATER, MEDICAL USES OF. Dr. Russel published a dissertation on the medical uses of sea-water in diseases of the glands, &c., wherein the author premises some observations upon the nature of sea-water, considered as impregnated with particles of all the bodies it passes over, such as submarine plants, fish, salts, minerals, &c., and saturated with their several effluvia, to enrich it and keep it from putrefaction; whence this fluid is supposed to contract a soapiness; and the whole collection, being pervaded by the sulphureous steams passing through it, constitutes what we call sea-water; the confessed distinguishing characteristics of which are saltiness, bitterness, nitrosity, and unctuousity; whence the author cor-

cludes that it may be justly expected to contribute signally to the improvement of physic. The cases in which our author informs us we are to expect advantage from the sea-water are, 1. In all recent obstructions of the glands of the intestines and mesentery. 2. All recent obstructions of the pulmonary glands, and those of the viscera, which frequently produce consumptions. 3. All recent glandular swellings of the neck, or other parts. 4. Recent tumors of the joints, if they were not suppurated or become scirrhus or cancerous, and have not carious bones for their cause. 5. Recent defluxions upon the glands of the eye-lids. 6. All defecations of the skin, from an erysipelas to a lepra. 7. Diseases of the glands of the nose, with their usual companion a thickness of the lip. 8. Obstructions of the kidneys, where there is no inflammation, and the stone not large. 9. In recent obstructions of the liver, this method will be proper, where it prevents constipations of the belly, and assists other medicines directed in icterical cases. The same remedy is said to be of signal service in the bronchocele; and is likewise recommended for the prevention of those bilious colics that so frequently afflict our mariners.

The method of making sea-water fresh was long a desideratum in navigation. Many methods have been proposed for this purpose. Mr. Appleby published an account of a process which he had instituted in 1734. He distilled sea-water with a quantity of lapis infernalis and calcined bones; but this process was soon laid aside, as it was not only difficult in itself, but rendered the water unpalatable. Dr. Butler proposed soap-leys in place of Mr. Appleby's ingredients; but the water was still liable to the same objection. Dr. Stephen Hales recommended powdered chalk; but his method was expensive, and did not improve the taste of the water. Dr. Lind of Portsmouth distilled sea-water without any ingredients; but as the experiment he made was performed in a vessel containing only two quarts, with a glass receiver, in his study, nothing conclusive could be drawn from it for the use of sailors. At length Dr. Irving brought the process to a very high degree of simplicity and perfection, by which the water is obtained pure, without much expense of fuel, or a complicated apparatus. For this discovery he received a reward of £5000. The advantages of this method remain to be stated, which may be reduced to the following: 1. The abolishing all stills, still-heads, worm-pipes, and their tubes, which occupy so much space as to render them totally incompatible with the necessary business of the ship; and using in the room of these the ship's kettle or boiler, to the top whereof may occasionally be applied a simple tube, which can be easily made on board a vessel at sea, of iron plate, stove funnel, or tin sheet; so that no situation can prevent a ship from being completely supplied with the means of distilling sea-water. 2. In consequence of the principles of distillation being fully ascertained, the contrivance of the simplest means of obtaining the greatest quantity of distilled water, by making the tube sufficiently large to receive the whole column of vapor, and placing it nearly in a horizontal direction, to prevent any compression of the fluid, which takes place so much with the

common worm. 3. The adopting of the simplest and most efficacious means of condensing vapor; for nothing more is required in the distillation but keeping the surface of the tube always wet, which is done by having some sea-water at hand, and a person to dip a mop or swab into this water, and pass it along the upper surface of the tube. By this operation the vapor contained in the tube will be entirely condensed with the greatest rapidity imaginable; for by the application of the wet mop thin sheets of water are uniformly spread, and mechanically pressed upon the surface of the hot tube; which, being converted into vapor, make way for a succession of fresh sheets; and thus, both by the evaporation and close contact of the cold water constantly repeated, the heat is carried off more effectually than by any other method yet known. 4. The carrying on the distillation without any addition, a correct chemical analysis of sea-water having evinced the futility of mixing ingredients with it, either to prevent an acid from rising with the vapor, or to destroy any bituminous oil supposed to exist in sea-water, and to contaminate the distilled water, giving it that fiery unpalatable taste inseparable from the former processes. 5. The ascertaining the proper quantity of sea-water that ought to be distilled, whereby the fresh water is prevented from contracting a noxious impregnation of metallic salts, and the vessel from being corroded and otherwise damaged by the salts caking on the bottom of it. 6. The producing a quantity of sweet and wholesome water, perfectly agreeable to the taste, and sufficient for all the purposes of shipping. 7. The taking advantage of the dressing the ship's provisions, so as to distil a very considerable quantity of water from the vapor, which would otherwise be lost, without any addition of fuel. To sum up the merits of this method in a few words:—The use of a simple tube, of the most easy construction, applicable to any ship's kettle. The rejecting all ingredients; ascertaining the proportion of water to be distilled, with every advantage of quality, saving of fuel, and preservation of boilers. The obtaining fresh water, wholesome, palatable, and in sufficient quantities. Taking advantage of the vapor which ascends in the kettle while the ship's provisions are boiling. All these advantages are obtained by the above mentioned simple addition to the common ship's kettles. But Dr. Irving proposes to introduce two further improvements. The first is a hearth, or stove, so constructed that the fire which is kept up the whole day for the common business of the ship may serve likewise for distillation; whereby a sufficient quantity of water for all the economical purposes of the ship may be obtained, with a very inconsiderable addition to the expense of fuel. The other improvement is that of substituting, even in the largest ships, cast-iron boilers, of a new construction, in the place of coppers. As soon as sea-water is put into the boiler, the tube is to be fitted either into the top or lid, round which, if necessary, a bit of wet linen may be applied, to make it fit close to the mouth of the vessel; there will be no occasion for luting, as the tube acts like a funnel in carrying off the vapor. When the water begins to

boil, the vapor should be allowed to pass freely for a minute, which will effectually clean the tube and upper part of the boiler. The tube is afterwards to be kept constantly wet, by passing a mop or swab, dipped in sea-water, along its upper surface. The waste water running from the mop may be carried off by means of a board made like a spout, and placed beneath the tube. The distillation may be continued till three-fourths of the water be drawn off, and no further. This may be ascertained either by a gauge-rod put into the boiler, or by measuring the water distilled. The brine is then to be let out. Water may be distilled in the same manner while the provisions are boiling. When the tube is made on shore, the best substance for the purpose is thin copper well tinned, this being more durable in long voyages than tin-plates. Instead of mopping, the tube, if required, may have a case made also of copper, so much larger in diameter as to admit a thin sheet of water to circulate between them by means of a spiral copper thread, with a pipe of an inch diameter at each end of the case; the lower for receiving cold water, and the upper for carrying it off when heated.

SEA-WATER, METHOD OF PRESERVING. As it is sometimes necessary to preserve sea-water in casks, for bathing and other purposes, it is of importance to know how to keep it from putrefaction. Many experiments were made to determine this point by Mr. Henry, and are recorded in the first volume of the *Memoirs of the Literary and Philosophical Society of Manchester*. His first experiment we shall here present to our readers:—‘To one quart of sea-water were added two scruples of fresh quicklime; to another half an ounce of common culinary salt; and a third was kept as a standard without any addition. The mouths of the bottles being loosely covered with paper, they were exposed to the action of the sun in some of the hottest weather in summer. In about a week the standard became very offensive; and the water, with the additional quantity of salt, did not continue sweet many hours longer; whereas that with lime continued many months without ever exhibiting the least marks of putridity.’ When he added a dram more of quicklime, the whole of the magnesia contained in the water was separated; and, when a further addition was made, a lime-water was immediately formed. He therefore concluded that two scruples of quicklime are sufficient to preserve a quart of sea-water. The proportions, however, may vary a little, according to the strength of the quicklime employed.

SEA-WEED, or SEA-WARE, algamarina, is commonly used as a manure on the sea-coast, where it can be produced in abundance. The best sort grows on rocks, and is that from which kelp is made. The next to this is called the peasy sea-weed; and the worst is that with a long stalk. In the neighbourhood of Berwick, the farmers mix it with stable dung and earth, and thus obtain a great quantity of excellent manure. Sea-weed is found also to be a very fit manure for gardens, as it not only enriches them, but destroys the vermin by which they are usually infested. See **ALGÆ**.

SEBA (Albert), a learned Dutch naturalist, born at Etzeel, in East Friesland. He wrote an extensive work on natural history, published at Amsterdam in 1734, in 3 vols. folio. The explanations are in Latin and French.

SEBACIC ACID, the acid procured from fat. See **CHEMISTRY**, Index. Dr. Thomson gives the following account of it:—‘Chemists had long suspected that an acid could be obtained from tallow, on account of the acrid nature of the fumes which it emits at a high temperature; but it was M. Grutzmacher who first demonstrated it in a dissertation *De Ossium Medulla*, published in 1748. M. Rhodes mentioned it in 1753. Segner published a dissertation on it in 1754; and Crell examined its properties very fully in two dissertations in the *Philosophical Transactions* for 1780 and 1782. It was called at first acid of fat. It may be procured by the following process:—Mix quick-lime with melted tallow, and keep the mixture for some time in a melting heat. Then let it cool, and wash it in a great quantity of water. Evaporate this water, and there will be obtained a brown salt, which is impure sebate of lime. Heat this pretty strongly in a crucible, dissolve it in water, filter it, separate the excess by carbonic acid; then evaporate. Pure crystallised sebate of lime is obtained. Mix this with sulphuric acid, and distil with a moderate heat. Sebatic acid comes over. It is a liquid of an acid, sharp, bitterish taste. When concentrated, it exhales a white smoke, which has a strong, disagreeable, peculiar odor, and irritates the eyes and throat. It reddens tincture of turnsole. Heat causes it to assume a yellowish color. When distilled, it yields a brownish liquid, and, when distilled to dryness, it leaves a little charcoal. When passed through a red-hot tube, it is decomposed and converted into water, carbonic acid, carbonated hydrogen gas, and charcoal. It combines with alkalies, earths, and metallic oxides, and forms salts, called sebrates. It oxidates silver, mercury, copper, iron, lead, tin, zinc, antimony, and manganese. It does not act upon bismuth, cobalt, or nickel. When mixed with nitric acid it dissolves gold. Its affinities, according to Morveau, are as follows:—barytes, potassa, soda, lime, magnesia, ammonia, alumina, metallic oxides.’

SEBASTIAN, king of Portugal, the posthumous son of the infant John, by Joanna, daughter of the emperor Charles V., succeeded to the crown, at three years of age, in 1577, on the death of his grandfather John III. At the age of twenty he undertook a romantic expedition against the Moors in Africa, in which, however, he performed nothing of consequence: but, impressed with this object, on the application of Muley Hamet, king of Fez and Morocco, to assist him against his uncle, Muley Moloch, he determined to renew his attempt against the infidels. He accordingly embarked with the flower of his nobility and military in the summer of 1578 and proceeded to Arzilla. Here he was met by an overwhelming force, headed by Muley Moloch in person, although so debilitated by sickness as to be carried on a litter. In the battle that ensued the Portuguese army broke the first line of the Moors; and Muley in rally-

ing his men, was so exhausted, that he died in the arms of his guards; his last and much extolled action being to lay his fingers to his lips, as an injunction to keep his death secret, in order not to depress the spirits of his army. Sebastian, on the other hand, fought with great bravery, and had two horses killed under him. He at length, after his attendants were all slain, disappeared, nor was it ever known what became of him, although a body, supposed to be his, was restored by the Moors, and buried at Belem. Not more than fifty Portuguese are said to have survived this expedition; yet such was the attachment of the people to Sebastian's memory, that a disposition to believe that he would appear again prevailed for many years. Various impostors took advantage of it.

SEBASTIAN, a town in the intendency of Sonora, Mexico, situated on the skirt of a mountain. It is of a hot temperature, and the surrounding territory abounds in maize; but the principal pursuit is its fisheries, which are carried on to a great extent on the Mazatlan. They consist of mulattoes, mestizoes, and Indians. Long. 106° W., lat. 24° N.

SEBASTIAN, a river of the New Kingdom of Granada, in the province of Santa Martha, which has a northern course and enters the swamp of Santa Martha.

SEBASTIAN, SAN, DE BUENAVISTA, a decayed town of New Granada, 140 miles S.S.W. of Cartagena, at the mouth of the gulf of Darien. It was formerly of much importance.

SEBASTIAN (St.), a considerable town and fortress of Spain, the capital of the district of Guipuscoa, in the province of Biscay. It stands on a bay between two inlets, forming a peninsula at the mouth of the river Urumea. It has long been a place of great strength: the town being fortified with bastions and half moons, and the citadel standing on a conical eminence, accessible only by a path winding round it in a spiral form. The harbour is small and capable of containing only about thirty merchantmen; but it is nearly enclosed by the two moles, and protected from winds by the adjacent eminences. Here are three churches, five convents, and an hospital. The streets are wide, straight, and well paved; and the houses respectable. St. Sebastian exports ships' anchors, cables, and leather, the manufactures in the town. The environs are pleasant, the view commanding both the sea and the Pyrenees. The principal walk is in a delightful vale to the north. St. Sebastian has been often taken by the French, being only ten miles from the Spanish frontier; it fell into their hands in the war of 1719, in the revolutionary contest of 1794, and in Buonaparte's invasion in 1808. On the last occasion it remained five years in their possession; and when the victory of Vittoria had opened to the British the prospect of its capture, the French had time to throw into it a garrison capable of making an obstinate defence. An attempt on the part of our army to take it by assault on the 25th of July, 1813, was repulsed with great loss. It became necessary to make approaches with great caution, and even to incur a severe sacrifice of lives in the final attack, on the 31st of August, when it fell into the hands

of the British. A fire burst out in the town at this time, which, joined to the preceding bombardment, laid it almost entirely in ashes; but it was afterwards rebuilt. Inhabitants about 12,000. Eight miles west of Fontarabia, and forty east of Bilbao.

SEBASTIAN (St.), a sea-port, and capital of the island of Gomera, one of the Canaries.

SEBASTIAN (St.), an island in the Atlantic, separated from the coast of Brasil by a strait about three leagues wide. Lat. 23° 45' S. It is said to produce the best sugar, rum, and pulse, as well as the finest cattle in Brasil; and is situated on a low tract of ground about 300 yards from the beach. The inhabitants subsist chiefly on fish. The town has been noted for its very large canoes scooped out of the solid timber.

SEBASTIAN, (St.), DE LOS RYES, a city of Columbia, in the Caraccas, standing on the shore of the river Guarico. It was founded towards the end of the sixteenth century: it is rendered rather disagreeable for residence, by the very great heats which the continual and strong breezes from the north-east faintly temper. The water is abundant. The soil of its jurisdiction, fit for many commodities, produces scarcely any thing but maize, but its pastures feed large herds of cattle. Population 3500. Twenty-eight leagues S. $\frac{1}{2}$ S.W. of Caraccas.

SEBASTIANO, an eminent Venetian painter, called Del Piombo, from an office in the lead mines given him by pope Clement VII., was born in 1485. He was first a disciple of old Jolm Bellini; continued his studies under Giorgione; and, having attained an excellent manner of coloring, went to Rome, where he obtained the favor of Michael Angelo. He invented the art of preparing plaster-walls for oil-painting; but was so slow in his work that other hands were often employed to finish what he began. He died in 1547.

SEBATH, or SHEBET, in chronology, the fifth month of the civil year among the Jews, and the 11th of their sacred year. It consists of thirty days, and begins on January, and ends in February. The Jews observe two fasts in it; on the tenth for the death of the elders, who outlived Joshua, and on the 17th for the people of Gibeah. Judges xx.

SEBENICO, an old town of Austrian Dalmatia, near the mouth of the Kerka. It stands on the slope of a rocky hill, extending to the edge of the water, and is surrounded by fortifications. The Kerka here expands into a lake which forms an excellent and capacious harbour, protected by a fort, and communicating with the Adriatic by means of a short and narrow strait. The town is defended by two forts on the top of the hill. It is said to have been more considerable in the sixteenth century, but has long been a bishop's see, and has a Gothic cathedral, admired for the bold construction of its roof, formed of marble slabs. The environs are fertile. Inhabitants 6300. Thirty-seven miles south-east of Zara, and 143 north-west of Ragousa.

SEBOO, or SANR, a considerable river of Morocco, which rises in the Atlas, near the frontier, traverses the province of Fez, passing a little to the north of the capital, and then falls into the

sea. The mouth is, however, much accommodated by sand.

SECALE, rye, in botany, a genus of the digynia order, and triandria class of plants; natural order fourth, gramina: cal. a glume of two leaves, which are opposite to one another, erect, linear, pointed, and less than the corolla: cor. consists of two valves, the exterior of which ends in a beard. There are several species.

1. *S. cereale*, common rye, has glumes with rough fringes. It is a native of the island of Candia, was introduced into England many ages ago, and is the only species of rye cultivated in this kingdom. There are, however, two varieties, the winter and spring rye. 1. The winter rye, which is larger in the grain than the spring rye, is sown in autumn, at the same time with wheat, and sometimes mixed with it; but, as the rye ripens sooner than the wheat, this method must be very exceptionable. 2. The spring rye, sown along with the oats, usually ripens as soon as the winter rye; but the grain produced is lighter, and it is therefore seldom sown except where the autumnal crop has failed. Rye is commonly sown on poor, dry, limestone, or sandy soils, where wheat will not thrive. By continuing to sow it on such a soil for two or three years, it will at length ripen a month earlier than that which has been raised for years on strong cold ground. Rye is commonly used for bread, either alone or mixed with wheat. This mixture is called *meslin*, and was formerly a very common crop in some parts of Britain. Mr. Marshall tells us, that the farmers in Yorkshire believe that this mixed crop is never affected by mildew, and that a small quantity of rye sown among wheat will prevent this destructive disease. Rye is much used for bread in some parts of Sweden and Norway. About a century ago rye bread was also much used in England; but, being made of a black kind of rye, it was of the same color, clammy, very detergent, and consequently not so nourishing as wheat. Rye is subject to a disease which the French call *ergot*, and the English *horned rye*; which sometimes happens when a very hot summer succeeds a rainy spring. According to Tissot, horned rye is such as suffers an irregular vegetation in the middle substance between the grain and the leaf, producing an excrescence of a brownish color, about an inch and a half long, and two-tenths of an inch broad. Bread made of this kind of rye has a nauseous and acrid taste, and produces spasmodic and gangrenous disorders. In 1596 an epidemic disease prevailed in Hesse, which the physicians ascribed to bread made of horned rye. Some, we are told, were seized with an epilepsy, and these seldom ever recovered; others became lunatic, and continued stupid the rest of their lives; those who apparently recovered had annual returns of their disorder in January and February. The same disease was occasioned by the use of this bread in several parts of the continent in 1648, 1675, 1702, 1716, 1722, and 1736; and has been very minutely described by Hoffman, A. O. Goellicke, Vater Burghart, and J. A. Srink. In 1709 one-fourth part of all the rye raised in the province of Salone in France was horned, and the surgeon to the hospital of Or-

leans had no fewer than 500 patients under his care that were distempered by eating it; they consisted chiefly of men and boys, the number of women and girls being very small. The first symptom was a kind of drunkenness, then the local disorder began in the toes, and thence extended sometimes to the thigh, and the trunk itself, even after amputation. In 1710 the celebrated Fontenelle describes a case in the History of the Academy of Sciences of France. A peasant at Blois, who had eaten horned rye in bread, was seized with a mortification, which first caused all the toes of one foot to fall off, then the toes of the other, afterwards the remainder of the feet; and, lastly, it ate off the flesh of both his legs and thighs, leaving the bones bare. Horned rye is not only hurtful to man, but to other animals; it has been known to destroy even the flies that settled upon it; sheep, dogs, deer, geese, ducks, swine, and poultry, that were fed with it for experiment, died miserably, some convulsed, others mortified and ulcerated.

2. *S. creticum*, the cretan rye, has glumes fringed on the outside.

3. *S. orientale*, the oriental rye, has shaggy glumes, and the scales of the calyx are shaped like an awl.

4. *S. villosus*, the wood rye grass, has a calyx with wedge-shaped scales, and the fringes of the glom is woolly.

SECANT, in geometry, is a line that cuts another, or divides it into parts. The secant of a circle is a line drawn from the circumference on one side to a point without the circumference on the other; and it is demonstrated by geometers that, of several secants drawn to the same point, that is the longest which passes through the centre of the circle. The portions, however, of these several secants that are without the circle, are so much the greater as they recede from the centre, and the least external portion is of that secant which passes through it.

SECEDE, *v. n.* } Lat. *secedo*. To with-
SECEDES, *n. s.* } draw from society or asso-
SECESSION. } ciation: he who withdraws or departs: the act of withdrawing.

The accession of bodies upon, or *secession* thereof from the earth's surface, perturbs not the equilibrium of either hemisphere. *Brown.*

SECEDERS, in church history, a numerous body of Presbyterians in Scotland, who have withdrawn from the communion of the established church. As they take up their ground upon the establishment of religion from 1638 to 1650, which they hold to be the purest period of the Scottish church, we shall introduce our account of them by a short review of ecclesiastical history from that period to the era of the secession, and give a fair statement of those events with which, as they say, their secession is connected. James I. having for some time previous to his death entertained a wish to form the church of Scotland as much as possible upon the model of that of England, his son Charles, with the assistance of archbishop Laud, endeavoured to carry the design into execution, by establishing canons for ecclesiastical discipline, and introducing a liturgy into the public service of the church. Numbers of the clergy

and laity of all ranks took the alarm at what they considered to be a bold and dangerous innovation; and, after frequent applications to the throne, they at last obtained the royal proclamation for a free parliament and general assembly. The assembly met in 1638, and began their labors with a repeal of all the acts of the six preceding parliaments, which had favored the designs of James. They condemned the liturgy, together with every branch of the hierarchy. They cited all the Scottish bishops to their bar; and after having excommunicated nine of them, and deposed five from their episcopal office, they restored kirk-sessions, presbyteries, and synods, provincial as well as national. These proceedings were ratified by the parliament which met in 1640. The law of patronage was in full force for several years after this period; yet great care was taken that no minister should be obtruded on the Christian people contrary to their inclinations; and in 1649 it was abolished as an oppressive grievance. The restoration of Charles II., in 1660, changed the face of affairs in the church of Scotland. All that the general assembly had done, from 1638 to 1650, was rendered null and void, their covenants were pronounced to be unlawful, episcopacy was restored, and the king was declared to be the supreme head of the church in all causes civil and ecclesiastical. During this period the Presbyterians were subjected to fines and imprisonment, while numbers of them were publicly executed for their adherence to their political and religious tenets. The Revolution in 1688 gave a different turn to the affairs of the church. The first parliament which met after the event abolished prelacy, and the king's supremacy in ecclesiastical affairs. They ratified the Westminster Confessions of Faith, together with the Presbyterian form of church government and discipline, 'as agreeable to the word of God, and most conducive to the advancement of true piety and godliness, and the establishment of peace and tranquillity within these realms.' The same parliament abolished patronage, and lodged the election of ministers in the hands of heritors and elders, with the consent of the congregation. In the reign of queen Anne the true Protestant religion was ratified and established, together with the Presbyterian form of church government and discipline; and the unalterable continuance of both was declared to be an essential condition of the union of the two kingdoms in all time coming. In 1712 the law respecting patronage was revived, in resentment, it has been said, of that warm attachment which the church of Scotland discovered to the family of Hanover; but the severity of that law was greatly mitigated by the first parliament of George I. stat. 50, by which it is enacted that if the presentee do not signify his acceptance, in six months, the presentation shall become void and null in law. The church, however, did not avail herself of this statute; and an event which happened not many years afterwards gave rise to the secession.

In 1732 more than forty ministers presented an address to the general assembly, specifying in a variety of instances what they considered to be great defections from the established constitution of the church, and craving a redress of these grie-

vances. A petition to the same effect, subscribed by several hundreds of elders and private Christians, was offered at the same time; but the assembly refused a hearing to both, and enacted that the election of ministers to vacant charges, where an accepted presentation did not take place, should be competent only to a conjunct meeting of elders and heritors, being Protestants. To this act objections were made by numbers of ministers and private Christians. They asserted that more than thirty to one in every parish were not possessed of landed property, and were on that account deprived of what they deemed their natural right to choose their own pastors. It was also said that this act was extremely prejudicial to the honor and interest of the church as well as to the edification of the people; and, in fine, it was directly contrary to the appointment of Jesus Christ, and the practice of the apostles, when they filled up the first vacancy in the apostolic college, and appointed the election of deacons and elders in the primitive church. Many of those also who were thought to be the best friends to the church expressed their fears that this act would have a tendency to overturn the ecclesiastical constitution which was established at the Revolution. Mr. Ebenezer Erskine, minister at Stirling, distinguished himself by a bold and determined opposition to the measures of the assembly in 1732. Being at that time moderator of the synod of Perth and Stirling, he opened the meeting at Perth with a sermon from Psalm cxviii. 22: 'The stone which the builders rejected is become the head stone of the corner.' In the course of his sermon he remonstrated, with no small degree of freedom, against the act of the preceding assembly with regard to the settlement of the ministers, and alleged that it was contrary to the word of God and the established constitution of the church. A formal complaint was lodged against him, for uttering several offensive expressions in his sermon before the synod. Many of the members declared that they heard him utter nothing but sound and seasonable doctrine; but his accusers, insisting on their complaint, obtained an appointment of a committee of synod to collect what were called the offensive expressions, and to lay them before the next diet in writing. This was done accordingly; and Mr. Erskine gave in his answer to every article of the complaint. After three days' warm reasoning on this affair, the synod by a majority of six found him censurable; against which sentence he protested, and appealed to the next general assembly. When the assembly met, in May 1733, it affirmed the sentence of the synod, and appointed Mr. Erskine to be rebuked and admonished from the chair. Upon which he protested, that, as the assembly had found him censurable, and had rebuked him for doing what he conceived to be agreeable to the word of God and the standards of the church, he should be at liberty to preach the same truths, and to testify against the same or similar evils, on every proper occasion. To this protest Messrs. William Wilson minister at Perth, Alexander Moncrieff minister at Abernethy, and James Fisher minister at Kinclaven, gave in a written adherence, under the form of instrument; and these four withdrew, intending

to return to their respective charges, and act agreeably to their protest whenever they should have an opportunity. Had the affair rested here, there never would have been a secession; but the assembly, resolving to carry on the process, cited them by their officer to appear next day. They obeyed the citation; and a committee was appointed to retire with them to persuade them to withdraw their protest. The committee having reported that they still adhered to their protest, the assembly ordered them to appear before the commission in August following and retract their protest; and if they should not comply, and testify their sorrow for their conduct, the commission was empowered to suspend them from the exercise of their ministry, with certification that, if they should act contrary to the said sentence, the commission should proceed to a higher censure. The commission met in August accordingly; and the four ministers, still adhering to their protest, were suspended from the exercise of their office, and cited to the next meeting of the commission in the November following. From this sentence several ministers and elders, members of the commission, dissented. The commission met in November, and the suspended ministers compared. Addresses, representations, and letters from several synods and presbyteries, relative to the business now before the commission, were received and read. The synods of Dumfries, Murray, Ross, Angus and Mearns, Perth, and Stirling, craved that the commission would delay proceeding to a high censure. The synods of Galloway and Fife, as also the presbytery of Dornoch, addressed the commission for lenity, tenderness, and forbearance towards the suspended ministers; and the presbytery of Aberdeen represented that, in their judgment, the sentence of suspension inflicted on the aforesaid ministers was too high, and that it was a stretch of ecclesiastical authority. Many members of the commission reasoned in the same manner, and alleged that the act and sentence of the last assembly did not oblige them to proceed to a higher censure at this meeting of the commission. The question, however, was put, Proceed to a higher censure, or not? and the votes, being numbered, were found equal on both sides: upon which Mr. John Goldie, the moderator, gave his casting vote to proceed to a higher censure; which stands in their minutes in these words:— ‘The commission did and hereby do loose the relation of Mr. Ebenezer Erskine minister at Stirling, Mr. William Wilson minister at Perth, Mr. Alexander Moncrieff minister at Abernethy, and Mr. James Fisher minister at Kinclaven, to their respective charges, and declare them no longer ministers of this church; and do hereby prohibit all ministers of this church to employ them, or any of them, in any ministerial function. And the commission do declare the churches of the said ministers vacant from and after the date of this sentence.’ This sentence being intimated to them, they protested that their ministerial office, and relation to their respective charges, should be held as valid as if no such sentence had passed; and that they were now obliged to make a secession from the prevailing party in the ecclesiastical courts; and that it shall be lawful and warrant-

able for them to preach the gospel and discharge every branch of the pastoral office, according to the word of God and the established principles of the church of Scotland. Mr. Ralph Erskine minister at Dunfermline, Mr. Thomas Mair minister at Orwel, Mr. John McLaren minister at Edinburgh, Mr. John Currie minister at Kinglassie, Mr. James Wardlaw minister at Dunfermline, and Mr. Thomas Nairn minister at Abbotshall, protested against the sentence of the commission, and that it should be lawful for them to complain of it to any subsequent general assembly of the church. The secession properly commenced at this date. And accordingly the ejected ministers declared, in their protest, that they were laid under the disagreeable necessity of seceding, not from the principles and constitution of the church of Scotland, to which they said they stedfastly adhered, but from the present church-courts, which had thrown them out from ministerial communion.

The assembly which met in May 1734 did so far modify the above sentence that they empowered the synod of Perth and Stirling to receive the ejected ministers into the communion of the church, and restore them to their respective charges; but with this express direction, ‘that the said synod should not take upon them to judge of the legality or formality of the former procedure of the church judicatories in relation to this affair, or either approve or censure the same.’ As this appointment neither condemned the act of the preceding assembly, nor the conduct of the commission, the seceding ministers considered it to be rather an act of grace than of justice, and therefore they said they could not return to the church-courts upon this ground; and they published to the world the reasons of their refusal, and the terms upon which they were willing to return to the communion of the established church. They now erected themselves into an ecclesiastical court, which they called the Associated Presbytery, and preached occasionally to numbers of people who joined them in different parts of the country. They also published what they called an Act, Declaration, and Testimony, to the doctrine, worship, government, and discipline of the church of Scotland, and against several instances, as they said, of defection from these, both in former and in the present times. Some time after this several ministers of the established church joined them, and the Associated Presbytery now consisted of eight ministers. But the general assembly which met in 1738, finding that the number of seceders was much increased, ordered the eight ministers to be served with a libel, and to be cited to the next meeting of the assembly in 1739. They now appeared at the bar as a constituted presbytery, and, having formally declined the assembly’s authority, they immediately withdrew. The assembly which met next year deposed them from the office of the ministry, which, however, they continued to exercise in their respective congregations, who still adhered to them, and erected meeting-houses, where they preached till their death. Mr. James Fisher, the last survivor of them, was by a unanimous call, in 1741, translated from Kinclaven to Glasgow, where he continued in the exercise

of his ministry among a numerous congregation, respected by all ranks in that large city, and died in 1775, much regretted by his people and friends. In 1745 the seceding ministers were become so numerous that they were erected into three different presbyteries, under one synod, when a very unprobable dispute divided them into two parties. The burgess oath, in some of the royal burghs of Scotland, contains the following clause:—‘I profess and allow with my heart the true religion presently professed within this realm, and authorised by the laws thereof. I will abide at and defend the same to my life’s end, renouncing the Romish religion called Papistry.’ Messrs. Ebenezer and Ralph Erskine, James Fisher, and others affirmed that this clause was no way contrary to the principles upon which the secession was formed, and that therefore every seceder might lawfully swear it. Messrs. Alexander Moncrieff, Thomas Mair, Adam Gib, and others, contended, on the other hand, that the swearing of the above clause was a virtual renunciation of their testimony. And this controversy was so keenly agitated that they split into two different parties, and long met in different synods.

Those of them who asserted the lawfulness of swearing the burgess oath were called burghers, and the other party who condemned it anti-burgher seceders, each party claiming to itself the lawful constitution of the associate synod. The anti-burghers, after several previous steps, excommunicated the burghers on the ground of their sin, and of their contumacy in it. This rupture took place in 1747, since which period no successful attempts to effect a re-union were made until recently. The parties remained under the jurisdiction of different synods, and held separate communion; at length their former hostility was laid aside, and they finally became one body. See BURGHERS.

SECCERN, *v. a.* Lat. *scerno*. To separate finer from grosser matter; to make the separation of substances in the body.

Birds are better meat than beasts, because their flesh doth assimilate more finely, and *seccerneth* more subtilly.

Bacon.

The pituite or mucus *seccerned* in the nose and windpipe, is not an excrementitious but a laudable humour, necessary for defending those parts, from which it is *seccerned*, from excoorations. *Arbuthnot.*

SECIUM, in botany, a genus of the syngenesia order, and monœcia class of plants; natural order thirty-fourth, cucurbitaceæ: **MALE** CAT. quinque-dentate and monophyllous: **COR.** monopetalous; the five filaments are united in an erect tube. In the female flower the pistillum is cylindrical and erect; the stigma large, peltated, and reflected; the pericarpium large, oval, unequal, fleshy, and unilocular, containing one seed, which is smooth, compressed, and fleshy. Of this there is only one species, viz. *S. edule*, or Chocho vine. This is cultivated and grows very luxuriantly in many places in Jamaica. The vines run and spread very much. The fruit is boiled, and served up at table by way of greens; and the root of the old vine is somewhat like a yam (*dioscorea*), and, on being boiled & roasted, tastes farinaceous and wholesome.

SECKENDORF (Guy Lewis de), a very learned German, descended from an ancient and noble family, was born at Aurach in Franconia in 1626. He was a good linguist; learned in law, history, and divinity; and is said to have been a tolerable painter and engraver. He was honorably employed by several German princes; and died counsellor of state to Frederick III. elector of Brandenburg, and chancellor of the university of Halle, in 1692. He wrote *A History and Defence of Lutheranism*, 2 vols., fol., Frankfurt, 1702, in Latin, &c. &c.

SECKER (Thomas), a learned prelate of the church of England, born in 1693, at Sibthorp, in Nottinghamshire. His father was a protestant dissenter, who, having a small paternal fortune, followed no profession. His mother was the daughter of Mr. George Brough, a substantial gentleman farmer of Shelton in the same county. He received his education at several private schools and academies in the country. Notwithstanding the disadvantage of changing his teachers, he had, at the age of nineteen, not only made a considerable progress in Greek and Latin, but in French, Hebrew, Chaldee, and Syriac; logic, algebra, geometry, and conic sections, and gone through a course of lectures on Jewish antiquities. He had been destined by his father for taking orders among the dissenters. With this view his studies were chiefly turned towards divinity, in which he had made such quick advances that, by the time he was twenty-three, he had carefully-read over a great part of the Scriptures, particularly the New Testament, in the original, and the best comments upon it; Eusebius’s *Ecclesiastical History*; The *Apostolical Fathers*; Whiston’s *Primitive Christianity*; and the principal writers for and against Ministerial and Lay Conformity. But, though the result of these enquiries was a well-grounded belief of the Christian revelation, yet, not being then able to determine what communion he should embrace, he resolved to pursue some profession, which should leave him at liberty to weigh the various disputed points more maturely before he should decide upon them. In 1716, therefore, he studied physick, and, after gaining all the medical knowledge he could by reading and attending the best lectures in London, to improve himself farther, in January 1718–9, he went to Paris. There he lodged in the same house with the famous anatomist Winslow, whose lectures he attended, as he did those on the *materia medica*, chemistry, and botany, at the king’s gardens. The operations of surgery he saw at the Hotel Dieu, and attended also for some time M. Gregoire, the accoucheur, but without any design of practising surgery. Here he became acquainted with Mr. Martin Benson, soon afterwards bishop of Gloucester, one of the most virtuous men of his time. During his continuance at Paris he also kept up a correspondence with Mr. Joseph Butler, afterwards bishop of Durham. Mr. Butler, having been appointed preacher at the rolls on the recommendation of Dr. Clarke and Mr. Edward Talbot, son to bishop Talbot, he mentioned his friend Mr. Secker, without his knowledge, to Mr. Talbot, who promised, if he chose to take orders in the church of England, to engage the

bishop his father to provide for him. This was communicated to Mr. Secker in a letter from Mr. Butler, in May 1720. Having continued his studies in theology, his former difficulties with regard to conformity had gradually lessened as his reading and knowledge became more extensive. After deliberating on Mr. Butler's proposal of such a change for two months, he resolved to embrace the offer, and left France in August 1720. On his arrival in England he was introduced to Mr. Talbot, but in December that gentleman died of the small-pox. This was a great shock to all his friends, but especially to an amiable lady whom he had lately married, and who was very near sinking under so sudden and grievous a stroke. It was some encouragement, however, to Mr. Secker to find that Mr. Talbot had, on his death-bed, recommended him, with Mr. Benson and Mr. Butler, to his father's notice. Thus did that excellent young man (for he was but twenty-nine when he died) raise up, when he least thought of it, the truest friend and protector to his wife and unborn daughter; who afterwards found in Mr. Secker all that tender care and assistance which they could have hoped for from the nearest relation. Mr. Secker next went over to Leyden, and took his degree of M. D. in March 1721: and as part of his exercise for it he composed and printed a dissertation, *De Medicina Statica*, which is still extant, and is esteemed a sensible and learned performance. In April 1721 he entered commoner of Exeter College, Oxford; after which he obtained the degree of A. B. He now spent a considerable part of his time in London, where he gained the esteem of some of the most learned men of those days, particularly of Dr. Clarke, rector of St. James's, and the celebrated dean Berkeley, afterwards bishop of Cloyne. He paid frequent visits of gratitude to Mrs. Talbot, widow of Mr. Edward Talbot, by whom she had a daughter five months after his decease. With her lived Mrs. Catharine Benson, sister to bishop Benson, whom in several respects she resembled. She had been for many years Mrs. Talbot's inseparable companion, and was of unspeakable service to her at the time of her husband's death. Bishop Talbot, being in 1721 appointed to the see of Durham, Mr. Secker was, in 1722, ordained deacon by him, and priest not long after, in St. James's church, where he preached his first sermon, March 28th, 1723. The bishop's domestic chaplain at that time was Dr. Rundle, a man of warm fancy and very brilliant conversation. With him Mr. Secker was associated in the bishop's family, and both taken down by his lordship to Durham in July 1723. In 1724 the bishop gave Mr. Secker the rectory of Houghton-le-Spring. This enabling him to fix himself in the world, he proposed marriage to Mrs. Benson; which being accepted, they were married by bishop Talbot in 1725. At the earnest request of both, Mrs. Talbot and her daughter consented to live with them, and the two families from that time became one. About this time bishop Talbot also gave preferments to Mr. Butler and Mr. Benson, whose rise and progress in the church is here interwoven with the history of Mr. Secker. In the winter of 1725-6 Mr. Butler first published his in-

comparable sermons; on which Mr. Secker took pains to render the style more familiar, and the meaning more obvious. Mr. Secker gave his friend the same assistance in that noble work the *Analogy of Religion*, &c. He now devoted all the time he possibly could to his residence at Houghton, fulfilling all the duties of a country clergyman with the strictest propriety. He brought down his sermons to the level of the understandings of his people; he visited them in private, catechised the young and ignorant, received his neighbours and tenants kindly and hospitably, and was of great service to the poorer sort by his skill in physic. Though this place was in a very remote part of the world, yet the solitude of it perfectly suited his studious disposition, and the income satisfied his ambition. Here he would have been content to live and die; but Mrs. Secker's health, which was injured by the dampness of the situation, obliged him to think of exchanging it for a more healthy one. Accordingly an exchange was made, through the interposition of Mr. Benson, with Dr. Finney, prebendary of Durham, and rector of Ryton; and Mr. Secker was instituted to Ryton and the prebend June 3d, 1727. In July 1732 he was appointed chaplain to the king; for which favor he was indebted to Dr. Sherlock, who, having heard him preach at Bath, had conceived the highest opinion of his abilities. From that time an intimacy commenced between them. On Sunday the 27th of August he preached before the queen, the king being then abroad. A few days after her majesty sent for him into her closet, and held a long conversation with him; in the course of which he mentioned to her his friend Mr. Butler; which occasioned his rise to those high dignities which he afterwards attained. See BUTLER. Mr. Secker now began to have a public character, and was esteemed an eminent preacher. He was accordingly instituted rector of St. James's on the 18th May, 1733; and in July went to Oxford to take his degree of LL. D. On this occasion he preached his celebrated Act Sermon, on the advantages and duties of an academical education, which was universally allowed to be a masterpiece. It was printed at the desire of the heads of houses, and quickly passed through several editions. It is in the second collection of *Occasional Sermons*, published by himself in 1766. The reputation he acquired by this sermon contributed towards his farther promotion. In December 1734 the king fixed on him to be bishop of Bristol. Dr. Benson was at the same time appointed to the see of Gloucester, and Dr. Fleming to that of Carlisle; and the three new bishops were all consecrated together in Lambeth Chapel, January 19th 1734-5, the consecration-sermon being preached by Dr. Thomas, afterwards bishop of Winchester. The honors to which Dr. Secker was thus raised in the prime of life did not abate his diligence, for which, indeed, there was now more occasion than ever. The affairs of his parish of St. James's being likewise in great disorder, he regulated and adjusted every thing, particularly the management of the poor; and thus became of signal service to his parishioners, even in a temporal view; though their spiritual welfare engaged his chief attention.

He allowed out of his own income a salary for reading early and late prayers. He held a confirmation once a year; examined the candidates several weeks before in the vestry; and gave them religious tracts, which he also distributed very liberally to all that needed them. He drew up, for the use of his parishioners, that admirable course of Lectures on the Church Catechism which has been since published, and read them once a week, and every Sunday evening, either at the church or one of the chapels. The sermons which he composed were truly excellent and original. He reproved the follies and vices of all ranks without distinction or palliation. Few ever possessed, in a higher degree, the rare talent of touching on the most delicate subjects with the nicest propriety, of saying the most familiar things without being low, the plainest without being feeble, the boldest without giving offence. His preaching was, at the same time, highly rational and truly evangelical. He explained, with perspicuity and dignity, the peculiar characteristic doctrines of the gospel. He inculcated the utility, the necessity of them, not merely as speculative truths, but as actual instruments of moral goodness, tending to purify the hearts and regulate the lives of men; and thus, by God's gracious appointment, as well as by the inseparable connexion between true faith and right practice, leading them to salvation. By such doctrines, and with such powers, he quickly became one of the most popular preachers of his time. In 1737 he succeeded to the see of Oxford, on the promotion of Dr. Potter to that of Canterbury. In spring 1748 Mrs. Secker died of the gout in her stomach. She was a woman of great sense and merit. The bishop's affection for her was suited to his character. In 1750 he was installed dean of St. Paul's, for which he gave in exchange the rectory of St. James's and his prebend of Durham. When he preached his farewell sermon the whole audience melted into tears; and he was followed with their prayers and good wishes. Having now leisure both to prosecute his own studies, and to encourage those of others, he gave Dr. Church considerable assistance in his First and Second Vindication of the Miraculous powers, &c., against Dr. Middleton, and he was of equal use to him in his Analysis of Lord Bolingbroke's Works. About the same time began archdeacon Sharp's controversy with the followers of Mr. Hutcheson, which was carried on to the end of 1755. Bishop Secker read over all Dr. Sharp's papers, amounting to 3 vols. 8vo., and improved them throughout. But the ease which his change of situation gave him was disturbed by a heavy and unexpected stroke, viz. the loss of his three friends, bishops Butler, Benson, and Berkely, who were all cut off within one year. Dr. Secker bore an active part in the house of lords in the famous repeal of the Jew Bill; for which the duke of Newcastle moved, and was seconded by the bishop, in a speech which was remarkably well received. On the death of archbishop Hutton, he was promoted to the see of Canterbury, and was confirmed at Bow church, April 21st, 1758; on which occasion his biographers, Messrs. Porteus and Stinton, observe, that, 'in accepting this high and burdensome

station, Dr. Secker sacrificed his own ease and comfort to considerations of public utility; that the mere secular advantages of grandeur were objects below his ambition; and were but poor compensations for the anxiety and difficulties attending them. He had never once through his whole life asked preferment for himself, and the use he made of his newly acquired dignity showed that rank, wealth, and power, had no other charms for him, than as they enlarged the sphere of his active and industrious benevolence.' He sought out and encouraged men of real genius and extensive knowledge; he expended £300 in arranging and improving the MS. library at Lambeth; and, observing that the library of printed books in that palace had received no additions since the time of archbishop Tension, he collected books in all languages from most parts of Europe, at a very great expense, to supply that chasm; which he did, by leaving these to the library at his death, and thereby rendered that collection one of the most useful in the kingdom. All institutions which tended to advance good morals and true religion, he patronised with zeal and generosity: he contributed largely to the maintenance of schools for the poor; to rebuilding or repairing parsonage houses and places of worship; and gave £600 towards erecting a chapel in the parish of Lambeth. To the society for promoting Christian knowledge he was a liberal benefactor; and to that for propagating the gospel in foreign parts, of which he was the president, he paid much attention; was constant at all the meetings of its members, and superintended their deliberations. Whenever any publications came to his knowledge that were calculated to corrupt good morals, or to ridicule Christianity, he did his utmost to stop the circulation of them; yet the wretched authors he was so far from wishing to treat with rigor, that he often extended his bounty to them in distress. And when their writings could not properly be suppressed (as was too often the case) by lawful authority, he engaged men of abilities to answer them, and rewarded them for their trouble. Even the falsehoods and misrepresentations of writers in the newspapers, on religious or ecclesiastical subjects, he took care to have contradicted; and when they seemed likely to injure the cause of virtue and religion, or the reputation of eminent and worthy men, he would sometimes take the trouble of answering them himself. One instance of this kind was his defence of bishop Butler, who, in a pamphlet published in 1767, was accused of having died a Papist. The conduct which he observed towards the several sects of Christians in this kingdom was such as showed his way of thinking to be truly liberal. The dangerous spirit of popery, indeed, he thought should always be kept under proper legal restraints, on account of its natural opposition, not only to the religious, but the civil rights of mankind. He therefore observed its movements with care, and exhorted his clergy to do the same, especially those who were situated in the midst of Roman Catholic families; against whose influence they were charged to be upon their guard, and were furnished with proper books for that purpose.

He took all fit opportunities of combating the errors of the church of Rome in his own writings; and the best answers that were published to some of the late bold apologies for popery were written at his instance, and under his direction. See his Sermons on the Rebellion in 1745; on the Protestant working schools in Ireland; on the 5th of November; and many occasional passages in his other works. With the Dissenters he was desirous of cultivating a good understanding. He considered them, in general, as a conscientious and valuable class of men. With some of the most eminent of them, Watts, Doddridge, Leland, Chandler, and Lardner, he maintained an intercourse of friendship. By the most candid part of them he was highly esteemed; and to such among them as needed help he showed no less kindness and liberality than to those of his own communion. Nor was his concern for the Protestant cause confined to his own country. He was the great patron and protector of it in various parts of Europe; whence he had frequent applications for assistance, which never failed of being favorably received. To several foreign Protestants he allowed pensions, to others he gave occasional relief, and to some of their universities was an annual benefactor. In public affairs, he acted the part of an honest citizen, and a worthy member of the British legislature. From his first entrance into the house of peers, his parliamentary conduct was uniformly upright and noble. He kept equally clear from the extremes of factious petulance and servile dependence; never wantonly thwarting administration from motives of party zeal, private pique, personal attachment, or a passion for popularity; nor yet going every length with every minister from views of interest or ambition. He admired and loved the constitution of his country, and wished to preserve it unimpaired. When the measures of government were inconsistent with the public welfare, he opposed them with freedom and firmness. Yet his opposition was always tempered with the utmost fidelity, respect, and decency, to the excellent prince upon the throne; and the most candid allowances for the unavoidable errors even of the very best ministers, who govern a free and high spirited people. He seldom spoke in parliament, except where the interests of religion and virtue seemed to require it; but, when he did, he spoke with propriety and strength, and was heard with attention and deference. His chief political connexions were with the late duke of Newcastle and lord chancellor Hardwicke, to whom he principally owed his advancement; and he lived long enough to show his gratitude. During more than ten years that Dr. Secker enjoyed the see of Canterbury, he resided constantly at his archiepiscopal house at Lambeth. He had been for many years subject to the gout, which, in the latter part of his life, returned with more frequency and violence, and did not go off in a regular manner, but left the parts very weak, and was succeeded by pains in different parts of the body. On Saturday July 30th, 1768, he was seized, as he sat at dinner, with a sickness at his stomach. He recovered before night; but the next evening, while his servants were raising him

on his couch, he suddenly cried out that his thigh-bone was broken. When the surgeons arrived, and discovered that the bone was broken, he was perfectly resigned. A fever soon ensued. On Tuesday he became lethargic, and continued so till Wednesday about 5 P. M., when he expired with great calmness, in the seventy-fifth year of his age. On examination, the thigh-bone was found to be carious about four inches in length, and at nearly the same distance from its head. The disease took its rise from the internal part of the bone, and had so entirely destroyed its substance, that nothing remained at the part where it was broken but a portion of its outward integument; and even this had many perforations, one of which was large enough to admit two fingers, and was filled with a fungous substance arising from within the bone. There was no appearance of matter about the caries, and the surrounding parts were in a sound state. It was apparent that the torture which he underwent during the gradual corrosion of this bone must have been inexpressibly great. Except some very slight defects of memory, he retained all his faculties and senses. He was buried in a covered passage, between the palace and the church; and he forbade any monument or epitaph to be placed over him. By his will he appointed the Rev. Dr. Daniel Burton, canon of Christ church, and Mrs. Catherine Talbot, his executors; and left £13,000 in trust to Drs. Porteus and Stinton, his chaplains; to pay the interest thereof to Mrs. Talbot and her daughter during their lives, or the life of the survivor; and after their decease £11,000 of the said £13,000 to be transferred to charitable purposes; amongst which were £1000 to the Society for the Propagation of the Gospel, and £1000 to the same society for a bishop or bishops in the king's dominions in America. He was tall and comely; in the early part of his life slender; but as he advanced in years his constitution gained strength, and his size increased, yet never to a degree of corpulency. The dignity of his form corresponded with the greatness of his mind, and inspired at all times respect and awe; but peculiarly so when he was engaged in any of the more solemn functions of religion, which added new life and spirit to the natural gracefulness of his appearance. His countenance was open, ingenuous, and expressive. It varied easily with his feelings, so as to be a faithful interpreter of his mind, which was incapable of dissimulation. It could speak dejection, and, on occasion, anger, very strongly; but, when it meant to show approbation, it softened into a most gracious smile, and diffused over all his features the most benevolent and reviving complacency.

SE'CLE, *n. s.* Fr. *siecle*; Lat. *seculum*. A century.

Of a man's age, part he lives in his father's lifetime, and part after his son's birth; and thereupon it is wont to be said that three generations make one *secle*, or hundred years, in the genealogies.

Hammond's Practical Catechism.

SECLUDE', *v. a.* Lat. *secludo*. To confine from; shut up apart; exclude.

None is secluded from that function, of any degree, state, or calling. *Whitgift.*

Some parts of knowledge God has thought fit to seclude from us; to fence them not only, as he did the interdicted tree, by combination, but with difficulties and impossibilities. *Decay of Piety.*

The number of birds described may be near five hundred, and of fishes, secluding shell-fish, as many; but, if the shell-fish be taken in, more than six times the number. *Ray.*

Let eastern tyrants from the light of heaven

Seclude their bosom slaves. *Thomson.*

Inclose your tender plants in your conservatory, secluding all entrance of cold. *Evelyn's Calendar.*

SECOMLE, in the old system of mineralogy, a genus of fossils of the class of septaria. The characters are, That they are bodies of dusky hue; divided by septa, or partitions of a sparry matter, into several more or less regular portions; of a moderately firm texture; not giving fire with steel; but fermenting with acid menstrua, and easily calcining. The septaria of this genus are of all others the most common, and are what have been known by the mistaken names of the waxen vein, or ludus Helmontii. Of the whitish or brownish, we have thirteen; of the yellowish five; and of the ferruginous ones four.

SEC'OND, *adj.*, *n. s.* & *v. a.* } Fr. *second*; Lat. *secundus*. It is
SEC'OND-HAND, *adj.* } observable that
SEC'OND-SIGHT, *n. s.* } we have no ordinal
SEC'ONDARY, *adj.* & *n. s.* } of two, says
SEC'ONDARILY, *adv.* } Dr. Johnson, as
SEC'ONDRATE. }
the Latins, and the nations deriving from them, have none of *duo*. What the Latins call *secundus*, from *sequor*, the Saxons term *oðer*, or *æftera*. The next in order to the first; the ordinal of two: second-hand and second-rate mean in the next place of order or value: a second is the supporter of the principal in a duel; any supporter: a second, or second minute of time, the second division of an hour by sixty: to second is, to follow next in place; maintain; support: a secondary is a deputy or delegate; and the other derivatives correspond.

First, she hath disobeyed the law; and, *secondly*, trespassed against her husband. *Eccles. xxiii. 23.*

The authors of the former opinion were presently *seconded* by other wittier and better learned, who being loth that the form of church polity, which they sought to bring in, should be otherwise than in the highest degree accounted of, took first an exception against the difference between church polity and matters of necessity to salvation. *Hooker.*

Though we here fall down,
We have supplies to *second* our attempt;
If they miscarry, theirs shall *second* them.

Shakespeare. Henry VI.

Having formerly discoursed of a marital voyage, I think it not impertinent to *second* the same with some necessary relations concerning the royal navy. *Raleigh.*

I shall not speak superlatively of them, lest I be suspected of partiality; but this I may truly say, they are *second* to none in the Christian world. *Bacon's Advice to Villiers.*

Two are the radical differences: the *secondary* differences are as four. *Bacon's Natural History.*

First, metals are more durable than plants; and, *secondly*, they are more solid and hard. *Bacon.*

Their *seconds* minister on oath,
Which was indifferent to them both,
That on their knightly faith and troth

No magick them supplied;
And sought them that they had no charms,
Wherewith to work each other's harms,
But came with simple open arms.

To have their causes tried. *Drayton's Nymphiad.*
He propounded the duke as a main cause of divers infirmities in the state, being sure enough of *seconds* after the first onset. *Wotton.*

It is primarily generated out of the effusion of melancholick blood, or *secondarily* out of the dregs and remainder of a phlegmonous or oedematick tumour. *Harvey.*

These atoms make the wind primarily tend downwards, though other accidental causes impel it *secondarily* to a sloping motion. *Digby.*

Four flames of an equal magnitude will be kept alive the space of sixteen *second* minutes, though one of these flames alone, in the same vessel, will not last above twenty-five, or at most thirty *seconds*.

Wilkins's Mathematical Magick.

None I know

Second to me, or like; equal much less. *Milton.*

I to be the power of Israel's God
Avow, and challenge Dagon to the test,
Offering to combat thee, his champion bold,
With the' utmost of his godhead *seconded*. *Id.*
That we were formed then, sayest thou, and the work

Of *secondary* hands, by task transferred
From father to his son? *Id. Paradise Lost.*

Familiar Ovid tender thoughts inspires,
And nature *seconds* all his soft desires. *Roscommon.*

He confesses that temples are erected, and festivals kept, to the honour of saints, at least *secondarily*. *Stillingfleet.*

They pelted them with satires and epigrams, which perhaps had been taken up at first only to make their court, and at *second-hand* to flatter those who had flattered their king. *Temple.*

A *second* Paris, differing but in name,
Shall fire his country with a *second* flame. *Dryden.*

My eyes are still the same; each glance, each grace,
Keep their first lustre, and maintain their place,
Not *second* yet to any other face. *Id.*

He was not then a *second-rate* champion, as they would have him who think fortitude the first virtue in a hero. *Id.*

Wheresoever there is moral right on the one hand, no *secondary* right can discharge it. *L'Estrange.*

Sounds move above 1140 English feet in a *second* of time, and in seven or eight minutes of time about 100 English miles. *Locke.*

Some men build so much upon authorities, they have but a *second-hand* or implicit knowledge. *Id.*

That which is peculiar and discriminative must be taken from the primariness and *secondariness* of the perception. *Norris.*

In imitation of preachers at *second-hand*, I shall transcribe from Bruyere a piece of raiillery. *Tatler.*

Sin is *seconded* with sin; and a man seldom commits one sin to please, but he commits another to defend himself. *South.*

Not these huge bolts, by which the giants slain
Lay overthrown on the Philegean plain;
'Twas of a lesser mould and lighter weight;
They call it thunder of a *second* rate. *Addison.*

Their first encounters were very furious, till, after some toil and bloodshed, they were parted by the *seconds*. *Id.*

Sawney was descended of an ancient family, renowned for their skill in prognosticks: most of his

ancestors were *second sighted*, and his mother but narrowly escaped for a witch. *Id.*

As he was going out to steal a sheep, he was seized with a fit of *second sight* : the face of the country presented him with a wide prospect of new scenes, which he had never seen before. *Id. Freeholder.*

They call it thunder of the *second-rate*. *Id. Ovid.*

As in a watch's fine machine

Though many artful springs are seen,

The added movements which declare

How full the moon, how old the year,

Derive their *secondary* power

From that which simply points the hour. *Prior.*

Courage, when it is only a *second* to injustice, and falls on without provocation, is a disadvantage to a character. *Collier.*

Gravitation is the powerful cement which holds together this magnificent structure of the world, which stretcheth the north over the empty space, and hangeeth the earth upon nothing, to transfer the words of Job from the first and real cause to the *secondary*. *Bentley.*

If the system had been fortuitously formed by the convening matter of a chaos, how is it conceivable that all the planets, both primary and *secondary*, should revolve the same way, from the west to the east, and that in the same plane ? *Id.*

By a sad train of miseries alone

Distinguished long, and *second* now to none. *Pope.*

In human works, though laboured on with pain,

A thousand movements scarce one purpose gain ;

In God's, one single can its ends produce,

Yet serves to *second* too some other use. *Id.*

Persons of *second rate* merit in their own country, like birds of passage, thrive here, and fly off when their employments are at an end. *Swift.*

Spurious virtue in a maid ;

A virtue but at *second-hand*. *Id.*

If in company you offer something for a jest, and nobody *seconds* you in your laughter, you may condemn their taste, but in the mean time you make a very indifferent figure. *Id.*

The house of commons in Ireland, and, *secondly*, the privy council, addressed his majesty against these half-pence. *Id.*

Personal brawls come in as *seconds* to finish the dispute of opinion. *Hatts.*

SECOND, in geometry, chronology, &c., is the sixtieth part of a prime, whether of a degree or of an hour.

SECOND, in music, one of the musical intervals ; being only the difference between any sound and the next nearest sound, whether above or below it. See INTERVAL.

SECOND SIGHT (in Erse Taisch), is a mode of seeing supposed to be superadded to that which nature generally bestows. This gift or faculty, which is neither voluntary nor constant, is in general rather troublesome than agreeable to the possessors of it, who are chiefly found among the inhabitants of the Highlands of Scotland, those of the Western Isles, of the Isle of Man, and of Ireland. It is an impression made either by the mind upon the eye, or by the eye upon the mind, by which things distant or future are perceived, and seen as if they were present. A man on a journey far from home falls from his horse ; another, who is perhaps at work about the house, sees him bleeding on the ground, commonly with a landscape of the place where the accident befalls him. Another seer, driving home his cattle, or wandering in idleness, or

musings in the sunshine, is suddenly surprised by the appearance of a bridal ceremony, or funeral procession, and counts the mourners or attendants, of whom, if he knows them, he relates the names ; if he knows them not, he can describe the dresses. Things distant are seen at the instant when they happen. Of things future, Johnson says that he knows no rule pretended to for determining the time between the sight and the event ; but we are informed by Mr. Grose that in general the time of accomplishment bears some relation to the time of the day in which the impressions are received. Thus visions seen early in the morning (which seldom happens) will be much sooner accomplished than those appearing at noon ; and those seen at noon will take place in a much shorter time than those happening at night ; sometimes the accomplishment of the last does not fall out within a year or more. These visions are not confined to solemn or important events ; nor is it true, as is commonly reported, that to the second sight nothing is presented but phantoms to evil. The future visit of a mountebank, or piper ; a plentiful draught of fish ; the arrival of common travellers ; or, if possible, still more trifling matters than these,—are foreseen by the seers. A gentleman told Dr. Johnson that, when he had once gone far from his own island, one of his laboring servants predicted his return, and described the livery of his attendants, which he had never worn at home ; and which had been, without any previous design, occasionally given him. As many men eminent for science and literature have admitted the reality of this apparently useless gift, we shall, without interposing our own opinion, give the reflections of two of the first characters of the age upon it, and leave our readers to form their own judgment :—By Dr. Beattie it is thus accounted for. ‘The Highlands of Scotland are a picturesque but a melancholy country. Long tracts of mountainous desert, covered with dark heath, and often obscure by misty weather ; narrow valleys, thinly inhabited, and bounded by precipices resounding with the fall of torrents ; a soil so rugged, and a climate so dreary, as in many parts to admit neither the amusements of pasturage nor the labors of agriculture ; the mournful dashing of waves along the friths and lakes that intersect the country ; the portentous noises which every change of the wind and every increased diminution of the waters is apt to raise in a lonely region full of echoes and rocks and caverns ; the grotesque and ghastly appearance of such a landscape by the light of the moon : objects like these diffuse a gloom over the fancy, which may be compatible enough with occasional and social merriment, but cannot fail to tincture the thoughts of a native in the hour of silence and solitude. If these people, notwithstanding their reformation in religion and more frequent intercourse with strangers, do still retain many of their old superstitions, we need not doubt but in former times they must have been much more enslaved to the horrors of imagination, when beset with the bugbears of Popery and Paganism. Most of their superstitions are of a melancholy cast.

‘That of second sight, by which some are still

supposed to be haunted, is considered by themselves as a misfortune, on account of the many dreadful images it is said to obtrude upon the fancy. It is said that some of the Alpine regions do likewise lay claim to a sort of second sight. Nor is it wonderful that persons of a lively imagination, immured in deep solitude, and surrounded with the stupendous scenery of clouds, precipices, and torrents, should dream (even when they think themselves awake) of those few striking ideas with which their lonely lives are diversified: of corpses, funeral processions, and other subjects of terror; or of marriages, and the arrival of strangers, and such like matters of more agreeable curiosity. Let it be observed, also, that the ancient Highlanders of Scotland had hardly any other way of supporting themselves than by hunting, fishing, or war; professions that are continually exposed to fatal accidents. And hence, no doubt, additional horrors would often haunt their solitude, and a deeper gloom overshadow the imagination even of the hardiest native. A sufficient evidence can hardly be found for the reality of the second sight, or at least of what is commonly understood by that term. A treatise on the subject was published in the year 1762, in which many tales were told of persons whom the author believed to have been favored, or haunted, with these illuminations; but most of the tales were trifling and ridiculous: and the whole work betrayed, on the part of the compiler, such extreme credulity, as could not fail to prejudice many readers against his system. That any of these visionaries are apt to be swayed in their declarations by sinister views we will not say; but this may be said with confidence, that none but ignorant people pretend to be gifted in this way. And in them it may be nothing more, perhaps, than short fits of sudden sleep or drowsiness, attended with lively dreams and arising from some bodily disorder, the effect of idleness, low spirits, or a gloomy imagination. For it is admitted, even by the most credulous Highlanders, that, as knowledge and industry are propagated in their country, the second sight disappears in proportion; and nobody ever laid claim to the faculty who was much employed in the intercourse of social life. Nor is it at all extraordinary that one should have the appearance of being awake, and should even think one's self so, during those fits of drowsing; that they should come on suddenly, and while one is engaged in some business. The same thing happens to persons much fatigued, or long kept awake, who frequently fall asleep for a moment, or for a long space, while they are standing, or walking, or riding on horseback. Add but a lively dream to this slumber, and (which is the frequent effect of disease) take away the consciousness of having been asleep, and a superstitious man may easily mistake his dream for a waking vision; which, however, is soon forgotten when no subsequent occurrence recalls it to his memory; but which, if it shall be thought to resemble any future event, exalts the poor dreamer into a Highland prophet. This conceit makes him more recluse and more melancholy than ever; and so feeds his disease, and multiplies his visions; which, if they are not

dissipated by business or society, may continue to haunt him as long as he lives; and which, in their progress through the neighbourhood, receive some new tinctures of the marvellous from every mouth that promotes their circulation. As to the prophetic nature of this second sight, it cannot be admitted at all. That the Deity should work a miracle in order to give intimation of the frivolous things that these tales are made up of, the arrival of a stranger, the nailing of a coffin, or the color of a suit of clothes; and that these intimations should be given for no end, and to those persons only who are idle and solitary, who speak Gaelic, or who live among mountains and deserts—is like nothing in nature or providence that we are acquainted with; and must, therefore, unless it were confirmed by satisfactory proof (which is not the case), be rejected as absurd and incredible. These visions, such as they are, may reasonably enough be ascribed to a disordered fancy. And that in them, as well as in our ordinary dreams, certain appearances should, on some rare occasions, resemble certain events, is to be expected from the laws of chance; and seems to have in it nothing more marvellous or supernatural, than that the parrot, who deals out his scurrilities at random, should sometimes happen to salute the passenger by his right appellation.' To the confidence of these objections Dr. Johnson replies, 'that by presuming to determine what is fit, and what is beneficial, they presuppose more knowledge of the universal system than man has attained; and therefore depend upon principles too complicated and extensive for our comprehension; that there can be no security in the consequence when the premises are not understood; that the second sight is only wonderful because it is rare, for, considered in itself, it involves no more difficulty than dreams, or perhaps than the regular exercise of the cogitative faculty; that a general opinion of communicative impulses, or visionary representations, has prevailed in all ages and all nations; that particular instances have been given with such evidence as neither Bacon nor Bayle have been able to resist; that sudden impressions, which the event has verified, have been felt by more than own or publish them; that the second sight of the Hebrides implies only the local frequency of a power, which is no where totally unknown; and that, where we are unable to decide by antecedent reason, we must be content to yield to the force of testimony. By pretension to second sight, no profit was ever sought or gained. It is an involuntary affection, in which neither hope nor fear is known to have any part. Those who profess to feel it do not boast of it as a privilege, nor are considered by others as advantageously distinguished. They have no temptation to feign, and their bearers have no motive to encourage the imposture.' Dr. Johnson affirms that the Islanders of all degrees, whether of rank and understanding, universally admit it, except the ministers, who, according to him, reject it, in consequence of a system, against conviction. He affirms, too, that in 1773 there was in the Hebrides a second-sighted gentleman, who complained of the terrors to which he was exposed.

SECOND TERMS, in algebra, those where the

unknown quantity has a degree of power less than it has in the term where it is raised to the highest. The art of throwing these second terms out of an equation, that is, of forming a new equation where they have no place, is one of the most ingenious and useful inventions in all algebra.

SECONDARY, or SECONDARY, an officer who acts as second or next to the chief officer. Such are the secondaries of the courts of king's bench and common pleas; the secondaries of the compters, who are next the sheriffs of London in each of the two compters; two secondaries of the pipe; secondaries to the remembrancers, &c.

SECONDARY CIRCLES OF THE ECLIPTIC are circles of longitude of the stars; or circles which, passing through the poles of the ecliptic, are at right angles to the ecliptic. See CIRCLES.

SECRET, <i>adj.</i> , <i>n. s.</i> & <i>v. a.</i>	} Fr. <i>secret</i> ; Lat. <i>secretus</i> . Hidden; private; affording privacy; retired; unseen; faithful to a secret; occult; privy: as a noun substantive, something concealed or hidden; something not yet discovered or known; privacy; seclusion: to secret or secrete is to keep private, and the latter (in the animal economy) to put aside or separate; to secrete: secretitious follows this sense: a secretist is a dealer in secrets: the adverb and noun substantive following, as well as secrecy, correspond with secret as an adjective: secretory means performing the office of secretion.
SECRETE', <i>v. a.</i>	
SECRETION, <i>n. s.</i>	
SECRETITIOUS, <i>n. s.</i>	
SECRETEST, <i>v. a.</i>	
SECRETLY, <i>adv.</i>	
SECRETNESS, <i>n. s.</i>	
SECRETOREY, <i>adj.</i>	
SECRECY, <i>n. s.</i>	

The *secret* things belong unto the Lord our God; but those things which are revealed belong unto us.

Deut. xxix. 29.

Bread eaten in *secret* is pleasant. *Prov.* ix. 17.

There is no *secret* that they can hide from thee.

Ezek. xxviii.

It is not with publick as with private prayer: in this rather *secrecy* is commanded than outward shew; whereas that, being the publick act of a whole society, requireth accordingly more care to be had of external appearance.

Hooker.

That's not suddenly to be performed,

But with advice and silent *secrecy*.

Shakspeare. Henry VI.

In Nature's book of infinite *secrecy*

A little can I read. *Id. Antony and Cleopatra.*

Secret Romans, that have spoke the word,

And will not palter. *Shakspeare. Julius Cæsar.*

Infected minds

To their deaf pillows will discharge their *secrets*.

Shakspeare.

Give him this letter; do it *secretly*. *Id.*

Great care is to be used of the clerks of the council, for the *secreting* of their consultations.

Bacon's Advice to Villiers.

I could muster up

My giants and my witches too,
Which are vast constancy and *secretness*. *Donne.*

Thou open'st wisdom's way

And givest access, though *secret* she retire:

And I perhaps am *secret*. *Milton.*

The *secret* top

Of Oreb or of Sinai. *Id.*

Or sympathy, or some connatural force
Powerful at greatest distance to unite

With *secret* amity things of like kind,

By *secretest* conveyance. *Id.*

We not to explore the *secrets* ask

Of his eternal empire. *Id.*

Thou, in thy *secrecy*, although alone,

Best with thyself accompanied, seek'st not

Social communication. *Id. Paradise Lost.*

Some things I have not yet thought fit so plainly to reveal; not out of any envious design of having them buried with me, but that I may barter with those *secretists*, that will not part with one *secret* but in exchange for another. *Boyle.*

Those thoughts are not wholly mine; but either they are *secrettly* in the poet, or may be fairly deduced from him. *Dryden.*

All the glands are a congeries of vessels complicated together, whereby they give the blood time to separate through the capillary vessels into the *secreto-*ry, which afterwards exonerate themselves into one duct. *Ray.*

Secresy and fidelity were their only qualities.

Burnet.

There is no such thing as perfect *secrecy*, to encourage a rational mind to the perpetration of any base action; for a man must first extinguish and put out the great light within him, his conscience; he must get away from himself, and shake off the thousand witnesses which he always carries about him, before he can be alone. *South's Sermons.*

Now *secretly* with inward grief he pined;
Now warm resentments to his griefs he joined.

Addison.

Some may place their chief satisfaction in giving *secretly* what is to be distributed; others in being the open and avowed instruments of making such distributions. *Atterbury.*

There *secret* in her sapphire cell

He with the Naïfs wont to dwell. *Fenton.*

All *secrets* of the deep, all nature's works.

Milton.

The Romans seem not to have known the *secret* of paper credit. *Arbutnot.*

They have a similitude or contrariety to the *secrete-*tious humours in taste and quality.

Floyer on the Humours.

SECRETARY, *n. s.* Fr. *secretaire*; low Lat. *secretarius*. One entrusted with the management of business; one who writes for another.

Call Gardiner to me, my new *secretary*.

Shakspeare.

That which is most of all profitable is, acquaintance with the *secretaries*, and employed men of ambassadors. *Bacon.*

Cottington was *secretary* to the prince.

Clarendon.

SECRETARY, in ornithology, the falco serpentarius and sagittarius of Linnæus, but classed by Latham under the genus vultur. See FALCO and VULTUR.

A SECRETARY, in a public office, is an officer who, by his master's orders, writes letters, despatches, and other instruments, which he renders authentic by his signet. Of these there are several kinds: as secretaries of state, or officers that have under their management and direction the most important affairs of the kingdom, and are obliged constantly to attend on the king: they receive and despatch whatever comes to their hands, either from the crown, the church, the army, private grants, pardons, dispensations, &c., as likewise petitions to the sovereign, which, when read, are returned to them; all which they

despatch according to the king's direction. They have authority to commit persons for treason, and other offences against the state, as conservators of the peace at common law, or as justices of the peace throughout the kingdom. They are members of the privy council, which is seldom or never held without one of them being present. As to the business and correspondence in all parts of this kingdom, it is managed by either of the secretaries without any distinction; but, with respect to foreign affairs, the business is divided into two provinces or departments, the southern and the northern, comprehending all the kingdoms and states that have any intercourse with Great Britain; each secretary receiving all letters and addresses from, and making all despatches to, the several princes and states comprehended in his province.

SECT. *n. s.* Fr. *secte*; Lat. *secta*, from **SECTARISM**, *sectando*. A body of men following some particular master, **SECTARY**. Or united in some settled tenets. Often in a bad sense: sectarism is disposition to party: a sectary is one who joins a party, or indulges a party spirit: sectator, an obsolete word for a follower or imitator.

The *sectaries* of my celestial skill,
That want to be the world's chief ornament.
They are under keep. *Spenser.*

We'll wear out,
In a wall'd prison, packs, and *sects* of great ones,
That ebb and flow by the moon.

Shakspeare. King Lear.
Of our unbitted lusts, I take this that you call
love to be a *sect* or cion. *Id. Othello.*

My lord, you are a *sectary*;
That's the plain truth. *Shakspeare.*
Hereof the wiser sort and the best learned philosophers were not ignorant, as Cicero witnesseth, gathering the opinion of Aristotle and his *sectators*.
Raleigh.

Romish catholic tenets are inconsistent, on the one hand, with the truth of religion professed and protested by the church of England, whence we are called protestants; and the anabaptists, and separatists, and *sectaries*, on the other hand, whose tenets are full of schism, and inconsistent with monarchy.
Bacon.

The greatest vicissitude of things is the vicissitude of *sects* and religion; the true religion is built upon a rock; the rest are tossed upon the waves of time.
Id. Essays.

Nothing has more marks of schism and *sectarism* than this presbyterian way. *King Charles.*

The jealous *sects* that dare not trust their cause
So far from their own will as to the laws,
You for their umpire and their synod take.

Dryden.
A *sect* of freethinkers is a sum of cyphers.

Bentley.
The number of *sectaries* does not concern the clergy in point of interest or conscience. *Swift.*

SECTION, *n. s.* Fr. *section*; Lat. *sectio*. The act of cutting or dividing; the part cut off.

Instead of their law, which they might not read openly, they read of the prophets, that which likeness of matter came nearest to each section of their law.
Law.

In the *section* of bodies, man, of all sensible creatures, has the fullest brain to his proportion.

Wotton.

The production of volatile salts I reserve till I mention them in another *section*. *Boule.*

Without breaking in upon the connection of his language, it is hardly possible to give a distinct view of his several arguments in distinct *sections*. *Locke.*

SECTION, in general, denotes a part of a divided thing, or the division itself. Such, particularly, are the subdivisions of a chapter; called also paragraphs and articles: the mark of a section is §.

SECTION, in geometry, denotes a side or surface of a body or figure cut off by another; or the place where lines, planes, &c., cut each other.

SECTIONS, CONIC. See **CONIC SECTIONS**.

SECTOR, *n. s.* Fr. *secteur*. In geometry.

Sector is an instrument made of wood or metal, with a joint, and sometimes a piece to turn out to make a true square, with lines of sines, tangents, secants, equal parts, rhumbs, polygons, hours, latitudes, metals, and solids. It is generally useful in all the practical parts of the mathematics, and particularly contrived for navigation, surveying, astronomy, dialling, and projection of the sphere. All the lines of the *sector* can be accommodated to any radius, which is done by taking off all divisions parallelwise, and not lengthwise; the ground of which practice is this, that parallels to the base of any plain triangle bear the same proportion to it as the parts of the legs above the parallel do to the whole legs.
Harris.

SECTOR, in geometry, is a part of a circle comprehended between two radii and the arch; or it is a mixed triangle, formed by two radii and the arch of a circle.

SECTOR OF AN ELLIPSE, OR OF AN HYPERBOLA, &c., is a part resembling the circular sector, being contained by three lines, two of which are radii, or lines drawn from the centre of the figure to the curve, and the intercepted arc or part of that curve.

SECTOR OF A SPHERE is the solid generated by the revolution of the sector of a circle about one of its radii; the other radius describing the surface of a cone, and the circular arc a circular portion of the surface of the sphere of the same radius. So that the spherical sector consists of a right cone, and of a segment of a sphere having the same common base with the cone. And hence the solid content of it will be found by multiplying the base or spherical surface by the radius of the sphere, and taking a third part of the product.

SECTOR is also a mathematical instrument of great use in finding the proportion between quantities of the same kind: as between lines and lines, surfaces and surfaces, &c.; whence the French call it the compass of proportion. The great advantage of the sector above the common scales, &c., is, that it is made so as to fit all radii and all scales. By the lines of chords, sines, &c., on the sector, we have lines of chords, sines, &c., to any radius betwixt the length and breadth of the sector when open. The real inventor of this valuable instrument is unknown; yet of so much merit has the invention appeared that it was claimed by Galileo, and disputed by nations. The sector is founded on the fourth proposition of the sixth book of Euclid; where it is demonstrated that similar triangles have their homologous sides proportional. An idea of the theory

Fig. 3.

Fig. 4.

Fig 1 & 2.

of its construction may be thus conceived:—Let the lines *AB*, *AC* (plate *SECTOR*, &c.), represent the legs of the sector; and *AD* and *AE* two equal sections from the centre: if now the points *CB* and *DE* be connected, the lines *CB* and *DE* will be parallel; therefore the triangles *ADE*, *ACB* will be similar; and consequently the sides *AD*, *DE*, *AB*, and *BC*, proportional; that is, as *AD*:*DE*::*AB*:*BC*; whence, if *AD* be the half, third, or fourth part of *AB*, *DE* will be a half, third, or fourth part of *CB*; and the same holds of all the rest. If, therefore, *AD* be the chord, sine or tangent, of any number of degrees to the radius *AB*; *DE* will be the same to the radius *BC*.

The instrument (fig. 3, 4), consists of two rulers or legs, of brass or ivory, or any other matter, representing the radii, moveable round an axis or joint, the middle of which expresses the centre: whence are drawn on the faces of the rulers several scales, which may be distinguished into single and double. The double scales or lines graduated upon the faces of the instrument, and which are to be used as sectoral lines, proceed from the centre; and are, 1. Two scales of equal parts, one on each leg, marked *LIN.* or *L.*; each of these scales, from the great extensiveness of its use, is called the line of lines. 2. Two lines of chords marked *CHO.* or *C.* 3. Two lines of secants marked *SEC.* or *S.* A line of polygons marked *POL.* Upon the other face the sectoral lines are, 1. Two lines of sines marked *SIN.* or *S.* 2. Two lines of tangents marked *TAN.* or *T.* 3. Between the line of tangents and sines there is another line of tangents to a lesser radius, to supply the defect of the former, and extending from 45° to 75° , marked *t*. Each pair of these lines (except the line of polygons) is so adjusted as to make equal angles at the centre; and consequently, at whatever distance the sector be opened, the angles will be always respectively equal. That is, the distance between 10 and 10, on the line of lines, will be equal to 60 and 60 on the line of chords, 90 and 90 on the line of sines, and 45 and 45 on the line of tangents. Besides the sectoral scales, there are others on each face, placed parallel to the outward edges, and used as those of the common plane scale. These are 1. A line of inches. 2. A line of latitudes. 3. A line of hours. 4. A line of inclination of meridians. 5. A line of chords. Three logarithmic scales, namely, one of numbers, one of sines, and one of tangents; these are used when the sector is fully opened, the legs forming one line. The value of the divisions on most of the lines is determined by the figures adjacent to them; these proceed by tens, which constitute the divisions of the first order and are numbered accordingly: but the value of the divisions of the line of lines, that are distinguished by figures, is entirely arbitrary, and may represent any value that is given to them; hence the figures 1, 2, 3, 4, &c., may denote either 10, 20, 30, 40, or 100, 200, 300, 400, and so on. The line of lines is divided into ten equal parts, numbered 1, 2, 3, to 10; these may be called divisions of the first order; each of these is again subdivided into ten other equal parts, which may be called divisions of the second order; each of these is divided into two equal

parts, forming divisions of the third order. The divisions on all the scales are contained between four parallel lines; those of the third order extend to the most distant; those of the third to the least; those of the second to the intermediate parallel. When the whole line of lines represents 100, the divisions of the first order, or those to which the figures are annexed, represent tens; those of the second order units; those of the third order the halves of these units. If the whole line represent ten, then the divisions of the first order are units; those of the second tenths; the third twentieths. In the line of tangents, the divisions to which the numbers are affixed are the degrees expressed by those numbers. Every fifth degree is denoted by a line somewhat longer than the rest; between every number and each fifth degree there are four divisions, longer than the intermediate adjacent ones: these are whole degrees; the shorter ones, or those of the third order, are thirty minutes. From the centre to 60° the line of sines is divided like the line of tangents, from 60 to 70; it is divided only to every degree, from 70 to 80, to every two degrees, from 80 to 90° : the division must be estimated by the eye. The divisions on the line of chords are to be estimated in the same manner as the tangents. The lesser line of tangents is graduated every two degrees, from 45 to 50; but from 50 to 60 to every degree; from 60 to the end to half degrees. The line of secants from 0 to 10 is to be estimated by the eye; from 20 to 50 it is divided into every two degrees; from 50 to 60 to every degree; from 60 to the end to every half degree.

1. To open the sector so as the two lines of chords may make an angle or number of degrees, suppose 40. Take the distance from the joint to 40, the number of the degrees proposed, on the line of chords; open the sector till the distance from 40 to 60 on each leg be equal to the given distance of 40; then will the two lines on the sector form an angle of 40° , as was required. 2. The sector being opened, to find the degrees of its aperture. Take the extent from 60 to 60, and lay it off on the line of chords from the centre; the number whereon it terminates will show the degrees, &c., required. 3. To lay off any number of degrees upon the circumference of a circle. Open the sector till the distance between 60 and 60 be equal to the radius of the given circle; then take the parallel extent of the chord of the number of degrees on each leg of the sector, and lay it off on the circumference of the given circle. Hence any regular polygon may be easily inscribed in a given circle.

1. To divide a given line into any number of equal parts, suppose seven. Take the given line in your compasses; and setting one foot in a division of equal parts, that may be divided by 7, for example 70, whose seventh part is 10, open the sector till the other point fall exactly on 70, in the same line on the other leg. In this disposition, applying one point of the compasses to 10 in the same line, shut them till the other fall in 10 in the same line on the other leg, and this opening will be the seventh part of the given line. Note, if the line to be divided be too long to be applied to the legs of the sector, divide only one-half or one-fourth by seven, and the

double or quadruple thereof will be the seventh part of the whole. 2. To measure the lines of the perimeter of a polygon, one of which contains a given number of equal parts. Take the given line in your compasses, and set it parallel, upon the line of equal parts, to the number on each leg expressing its length. The sector remaining thus, set off the length of each of the other lines parallel to the former, and the number each of them falls on will express its length. 3. A right line being given, and the number of parts it contains, suppose 120, to take from it a shorter line containing any number of the same parts, suppose 25. Take the given line in your compasses, open the sector till the two feet fall on 120 on each leg; then will the distance between 25 on one leg, and the same number on the other, give the line required. 4. To multiply by the line of equal parts on the sector. Take the lateral distance from the centre of the line to the given multiplicator; open the sector till you fit that lateral distance to the parallel of 1 and 1, or 10 and 10, and keep the sector in that disposition; then take in the compasses the parallel distance of the multiplicand, which distance, measured laterally on the same line, will give the product required. Thus, suppose it were required to find the product of 8 multiplied by 4: take the lateral distance from the centre of the line to 4 in your compasses, i. e. place one foot of the compasses in the beginning of the divisions, and extend the other along the line to 4. Open the sector till you fit this lateral distance to the parallel of 1 and 1, or 10 and 10. Then take the parallel distance of 8, the multiplicand; i. e. extend the compasses from 8, in this line, on one leg, to 8 in the same line on the other; and that extent, measured laterally, will give the product required. 5. To divide by the line of equal parts on the sector. Extend the compasses laterally from the beginning of the line to 1, and open the sector till you fit that extent to the parallel of the divisor; then take the parallel distance of the dividend; which extent, measured in a lateral direction, will give the quotient required. Thus, suppose it were required to divide 36 by 4; extend the compasses laterally, the beginning of the line to 1, and fit to that extent the parallel of 4, the divisor; then extend the compasses parallel from 36 on one leg to 36 on the other, and that extent, measured laterally, will give 9, the quotient required. 6. Proportion by the line of equal parts. Make the lateral distance of the second term the parallel distance of the first term; the parallel distance of the third term is the fourth proportional. *Example.*—To find a fourth proportional to 8, 4, and 6, take the lateral distance of 4, and make it the parallel distance of 8; then the parallel distance of 6, extended from the centre, shall reach to the fourth proportional 3. In the same manner, a third proportional is found to two numbers. Thus, to find a third proportional to 8 and 4, the sector remaining as in the former example, the parallel distance of 4, extended from the centre, shall reach to the third proportional 2. In all these cases, if the number to be made a parallel distance be too great for the sector, some aliquot part of it is to be taken, and the answer is to be multiplied by the number by which the first number was divided.

1. To inscribe a regular polygon in a given circle. Take the semidiameter of the given circle in the compasses, and adjust it to the number 6, on the line of polygons, on each leg of the sector; then, the sector remaining thus opened, take the distance of the two equal numbers, expressing the number of sides the polygon is to have; e. gr. the distance from 5 to 5 for a pentagon, from 7 to 7 for a heptagon, &c. These distances, carried about the circumference of the circle, will divide it into so many equal parts. 2. To describe a regular polygon, e. gr. a pentagon, on a given right line. Take the length of the line in the compasses, and apply it to the extent of the number 5, 5, on the lines of polygons. The sector thus opened, upon the same lines take the extent from 6 to 6; this will be the semidiameter of the circle the polygon is to be inscribed in. If then, with this distance from the ends of of the given line, you describe two arches of a circle, their intersection will be the centre of the circle. 3. On a right line, to describe an isosceles triangle, having the angles at the base double that at the vertex. Open the sector, till the ends of the given line fall on 10 and 10 on each leg; then take the distance from 6 to 6. This will be the length of the two equal sides of the triangle.

By the several lines disposed on the sector, we have scales to several radii; so that, having a length or radius given, not exceeding the length of the sector when opened, we find the chord, sine, &c., thereto: e. gr. Suppose the chord, sine, or tangent, of 10° , to a radius of three inches required; make three inches the aperture, between 60 and 60, on the lines of chords of the two legs; then will the same extent reach from 45 to 45 on the line of tangents, and from 90 to 90 on the line of the sines on the other side; so that to whatever radius the line of chords is set, to the same are all the others set. In this disposition, therefore, if the aperture between 10 and 10, on the lines of chords, be taken with the compasses, it will give the chord of 10° . If the aperture of 10 and 10 be in like manner taken on the lines of sines, it will be the sine of 10° . Lastly, if the aperture of 10 and 10 be in like manner taken on the lines of tangents, it gives the tangent of 10° . If the chord, or tangent, of 70° were required; for the chord, the aperture of half the arch, viz. 35, must be taken, as before; which distance, repeated twice, gives the chord of 70° . To find the tangent of 70° to the same radius, the small line of tangents must be used, the other only reaching to 45; making, therefore, three inches the aperture between 45 and 45 on the small line; the extent between 70 and 70° on the same, will be the tangent of 70° to three inches radius. To find the secant of an arch, make the given radius the aperture between 0 and 0 on the lines of secants; then will the aperture of 10 and 10, or 70 and 70, on the said lines, give the tangent of 10° or 70° . If the converse of any of these things were required, that is, if the radius be required, to which a given line is the sine, tangent, or secant, it is but making the given line, if a chord, the aperture on the line of chords, between 10 and 10, and then the sector will stand at the radius required; that is, the aperture between 60 and 60 on the said line is the radius.

If the given line were a sine, tangent, or secant, it is but the making it the aperture of the given number of degrees; then will the distance of 90 and 90 on the sines, of 45 and 45 on the tangents, of 0 and 0 on the secants, be the radius.

SECULAR, adj. } Fr. *seculier*; Lat. *secularis*. Not spiritual; relating to affairs of the present world; worldly: in the Romish church not bound by monastic rule.

This, in every several man's actions of common life, appertaineth unto moral, in publick and politick *secular* affairs, unto civil wisdom. *Hooker.*

Then shall they seek to avail themselves of names, Places, and titles; and with these to join *Secular* power, though feigning still to act By spiritual. *Milton's Paradise Lost.*

Those northern nations easily embraced the religion of those they subdued, and by their devotion gave great authority and reverence, and thereby ease, to the clergy, both *secular* and regular. *Temple.*

Littleness and *secularity* of spirit is the greatest enemy to contemplation.

Burnet's Theory of the Earth.

In France vast numbers of ecclesiasticks, *secular* and religious, live upon the labours of others.

Addison.

The *secular* year was kept but once in a century.

Id.

SECULAR is peculiarly used for a person who lives at liberty in the world, not shut up in a monastery, in which sense it stands opposed to regular. The Romish clergy are divided into *secular* and regular, of which the latter are bound by monastic rules, the former not.

SECULAR GAMES, in antiquity, were solemn games held among the Romans once in an age. These games lasted three days and as many nights; during which time sacrifices were performed, theatrical shows exhibited, with combats, sports, &c., in the circus. The occasion of these games, according to Valerius Maximus, was to stop the progress of a plague. Valerius Publicola was the first who celebrated them at Rome, A. U. C. 245. The solemnity was as follows:—

The whole world were invited by a herald to a feast which they had never seen already, nor ever should see again. Some days before the games began, the quindecimviri, in the capitol and the Palatine temple, distributed to the people purifying compositions, of various kinds, as flambeaux, sulphur, &c. From hence the populace passed to Diana's temple on the Aventine Mount, with wheat, barley, and oats, as an offering. After this, whole nights were spent in devotion to the Destinies. When the time of the games was fully come, the people assembled in the Campus Martius, and sacrificed to Jupiter, Juno, Apollo, Latona, Diana, the Paræ, Ceres, Pluto, and Proserpine. On the first night of the feast the emperor, with the quindecimviri, caused three altars to be erected on the banks of the Tiber, which they sprinkled with the blood of three lambs, and then proceeded to regular sacrifice. A space was next marked out for a theatre, which was illuminated with innumerable flambeaux and fires. Here they sung hymns, and celebrated all kinds of sports. On the day after, having offered victims at the capitol, they went into the Campus Martius, and celebrated sports to the

honor of Apollo and Diana. These lasted till the next day, when the noble matrons, at the hour appointed by the oracle, went to the capitol to sing hymns to Jupiter. On the third day, which concluded the solemnity, twenty-seven boys and as many girls sung in the temple of Palatine Apollo hymns and verses in Greek and Latin, to recommend the city to the protection of those deities whom they designed particularly to honor by their sacrifices. The inimitable carmen *seculare* of Horace was composed for this last day in the secular games, held by Augustus. It has been much disputed whether these games were held every 100, or every 110 years. Valerius Antius, Varro, and Livy, are quoted in support of the former opinion; in favor of the latter may be produced the quindecimviral registers, the edicts of Augustus, and the words of Horace in the secular poem, *cætus undenos decies per annos*. It was a general belief that the girls who bore a part in the song should be soonest married; and that the children who did not dance and sing at the coming of Apollo, should die unmarried, and at an early period of life.

SECULAR POEM, a poem sung or rehearsed at the secular games; of which kind we have a very fine piece among the works of Horace, being a sapphic ode at the end of his epodes.

SECULARIZATION, the act of converting a regular person, place, or benefice, into a secular one. Almost all the cathedral churches were anciently regular; that is, the canons were to be religious; but they have been since secularized. For the secularization of a regular church, there is required the authority of the pope, that of the prince, the bishop of the place, the patron, and even the consent of the people. Religious that want to be released from their vow, obtain briefs of secularization from the pope.

SECUNDINE, *n. s.* Fr. *secondines*, *secondes*; Lat. *secundæ*, viz. partes, quod nascentem infantem sequantur. Ainsworth. The membrane in which the embryo is wrapped; the after birth.

The casting of the skin is by the ancients compared to the breaking of the *secundine*, or cawl, but not rightly; for the *secundine* is but a general cover, not shaped according to the parts, but the skin is.

Bacon's Natural History.

Future ages lie

Wrapped in their sacred *secundine* a sleep. *Cowley.*

If the fetus be taken out of the womb inclosed in the *secundines*, it will continue to live, and the blood to circulate.

Ray.

SECUNDINES, in anatomy, are the chorion and amnios, with the placenta, &c. See **ANATOMY** and **MIDWIFERY**.

SECUNDREPORE, the name of two towns in Hindostan, one in the province of Ajmeer, district of Jyepore; the other in the province of Allahabad, district of Gazypoor.

SECUNDUS (Julius), a Roman orator, who flourished under Titus Vespasian, and published Orations, &c.

SECUNDUS (Nicholas Everard), a descendant of an ancient and honorable family in the Netherlands, was born in the neighbourhood of Middleburgh, and was in high favor with the emperor Charles V., having been employed by that monarch in several stations of considerable im-

portance. He was first a member of the grand parliament or council of Mechlin; afterwards president of the states of Holland and Zealand at the Hague; and, lastly, held a similar office at Mechlin, where he died, August 5th, 1532, aged seventy. These various employments did not occupy the whole of Everard's time. Notwithstanding the multiplicity of his business, he found leisure to cultivate letters with great success, and even to act as preceptor to his own children, who were five sons and three daughters, and all took the name of Nicholas from their father.

SECUNDUS (Joannes Nicolaus, or John Nicholas), youngest son of the preceding, improved the education given him by his father, and became a most eminent writer of Latin poetry. Poetry, however, was by no means the profession which his father wished him to follow. He intended him for the law, and, when he could no longer direct his studies himself, placed him under the care of Jacobus Valeardus. This man is said to have been every way well qualified to discharge the important trust which was committed to him; and he certainly gained the affection of his pupil, who, in one of his poems, mentions the death of Valeardus with every appearance of unfeigned sorrow. Another tutor was provided, but the law did not suit Secundus. Poetry, painting, and sculpture, had engaged his mind at a very early period. Secundus wrote verses when only ten years old; and, from the vast quantity which he left behind him, such writing was evidently his principal employment. He found time, however, to carve figures of all his own family, of his mistresses, of the emperor Charles V., of several eminent personages of those times, and of many of his intimate friends; and in the last edition of his works, published by Scriverius at Leyden, 1631, there is a print of one of his mistresses with this inscription found it, *VATIS AMATORIS JULIA SCULPTA MANU*. Secundus having nearly attained the age of twenty-one, and being determined to comply with the wishes of his father, quitted Mechlin, and went to France, where at Bourges he studied the civil law under the celebrated Andreas Alciatus. Alciatus was one of the most learned civilians of that age. But what endeared him most to our author was his acquaintance with literature and his taste in poetry. Having studied a year under this eminent professor, and taken his degrees, Secundus returned to Mechlin, where he remained a few months. In 1533 he went into Spain, with warm recommendations to the count of Nassau and other persons of high rank; and soon afterwards became secretary to the cardinal archbishop of Toledo, in a department of business which required a facility in writing with elegance the Latin language. During his residence with this cardinal, he wrote his *Basia*, a series of wanton poems, of which the fifth, seventh, and ninth carmina of Catullus seem to have given the hint. Secundus was not, however, a servile imitator of Catullus. His expressions seem to have been borrowed rather from Tibullus and Propertius; and, in the warmth of his descriptions, he surpasses every thing that has been written on similar subjects by Catullus,

Tibullus, Propertius, C. Gallus, Ovid, or even Horace. In 1535 he accompanied Charles V. to the siege of Tunis, but gained no laurel as a soldier. The hardships of that memorable siege were little suited to the disposition of a votary of Venus and the Muses; and, upon an enterprise which might have furnished ample matter for an epic poem, it is remarkable that Secundus wrote nothing worthy of preservation. Having returned from his martial expedition, he was sent by the cardinal to Rome to congratulate the pope upon the success of the emperor's arms; but was taken so ill on the road that he was not able to complete his journey. He was advised to seek the benefit of his native air; and that happily recovered him. Having quitted the service of the cardinal, he was employed in the same office by the bishop of Utrecht; and so great was his fame for classical elegance that he was called upon to fill the post of private Latin secretary to the emperor, who was then in Italy; but, before he could enter upon it, death put a stop to his career of glory. Having arrived at St. Amand, to meet with the bishop of Utrecht, he was on the 8th of October, 1536, cut off by a violent fever, in his twenty-fifth year. He was interred in the church of the Benedictines, of which his patron, the bishop, was abbot; and his relations erected to his memory a marble monument, with a Latin inscription. His works have gone through several editions, of which the best and most copious is that of Scriverius. It consists of *Julia*, *Eleg. lib. i.*; *Amores*, *Eleg. lib. ii.*; *ad Diversos*, *Eleg. lib. iii.*; *Basia*, styled by the editor *incomparabilis et divinus prorsus liber*; *Epigrammata*; *Odorum liber unus*; *Epistolarum liber unus Elegiaca*; *Epistolarum liber alter, heroico carmine scriptus*; *Funerum liber unus*; *Sylvæ et Carminum fragmenta*; *Pœmata nonnulla fratrum*; *Itineraria Secundi Tria*, &c.; *Epistolæ totidem, soluta oratione*. To these works ample testimonies are prefixed by Lelius, Gregory Gyraldus, the elder Scaliger, Theodore Beza, and others, who all speak of them with rapture. A French critic, indeed, after having affirmed that the genius of Secundus never produced any thing which was not excellent in its kind, adds, with too much truth, 'Mais sa muse est un peu trop lascive.' For this fault our author makes an apology in a Latin epigram addressed to the grammarians; but, as the poet observes,—

Immodest words admit of no defence,

For want of decency is want of sense.

SECURE*, *adj.* & *v. a.* } *Lat. securus*. Free
SECURELY, *adv.* } from fear; exempt
SECUREMENT, *n. s.* } from terror; easy;
SECURITY. } assured; confident;

careless; the derivatives corresponding.

Gideon smote the host, for the host were *secure*.

Judges.

When they had taken *security* of Jason, they let them go. *Acts xvii. 9.*

Love, that now long time *securely* slept

In Venus lap, unarmed then and naked,
'Gan rear his head, by Clotho being waked.

Spenser.

There is scarcely truth enough alive to make societies *secure*; but *security* enough to make fellowships accurst.

Shakspeare.

'Tis done, like Hector, but *securely* done,
A little proudly, and great deal misprising ;
The knight opposed.

Shakspeare. Troilus and Cressida.

How senseless then and dead a soul hath he
Which thinks his soul doth with his body die ;
Or thinks not so, but so would have it be,
That he might sin with more *security* ! *Davies.*

Marvellous *security* is always dangerous, when men
will not believe any bees to be in a hive, until they
have a sharp sense of their stings. *Hayward.*

Confidence then bore thee on *secure*
To meet no danger. *Milton.*

Haply too *secure* of our discharge
From penalty. *Id.*

Nothing left
That might his happy state *secure*. *Id.*

His daring foe *securely* him defied. *Id.*

They, like Judas, desire death ; Cain, on the contrary,
grew afraid thereof, and obtained *securement*
from it. *Browne's Vulgar Errors.*

If the providence of God be taken away, what *security*
have we against those innumerable dangers to
which human nature is continually exposed ? *Tillotson.*

But thou, *secure* of soul, unbent with woes,
The more thy fortune frowns, the more oppose. *Dryden.*

I spread a cloud before the victor's sight,
Sustained the vanquished, and *secured* his flight ;
Even then *secured* him, when I sought with joy
The vowed destruction of ungrateful Troy. *Id.*

Secure from fortune's blows,
Secure of what I cannot lose,
In my small pinnace I can sail. *Id. Horace.*

A soul that can *securely* death defy,
And count it nature's privilege to die. *Id. Juvenal.*

Actions have their preference, not according to the
transient pleasure or pain that accompanies or follows
them here, but as they serve to *secure* that perfect
durable happiness hereafter. *Locke.*

Deeper to wound, she shuns the fight ;
She drops her arms to gain the field :

Secures her conquest by her flight,
And triumphs when she seems to yield. *Prior.*

It concerns the most *secure* of his strength, to pray
to God not to expose him to an enemy. *Rogers.*

The portion of their wealth they design for the
uses of the poor, they may throw into one of these
publick repositories, *secure* that it will be well em-
ployed. *Atterbury.*

We live and act as if we were perfectly *secure* of
the final event of things, however we may behave
ourselves. *Id.*

Whether any of the reasonings are inconsistent, I
securely leave to the judgment of the reader. *Id.*

The Romans do not seem to have known the secret
of paper credit, and *securities* upon mortgages. *Id. on Coins.*

It is possible for a man, who hath the appearance
of religion, to be wicked and an hypocrite ; but it is
impossible for a man who openly declares against
religion to give any reasonable *security* that he will
not be false and cruel. *Swift.*

Exchequer bills have been generally reckoned the
surest and most sacred of all *securities*. *Id. Examiner.*

Some, who gave their advice for entering into a
war, alledged that we should have no *security* for our
trade while Spain was subject to a prince of the
Bourbon family. *Id.*

Nothing can be more artful than the address of
Ulysses : he *secures* himself of a powerful advocate,
by paying an ingenuous and laudable deference to
his friend. *Browne.*

Where two or three sciences are pursued at the

same time, if one of them be dry, as logick, let
another be more entertaining, to *secure* the mind
from weariness. *Watts.*

SECUTORES, a species of gladiators among
the Romans, whose arms were a helmet, a shield,
and a sword or a leaden bullet. They were
armed in this manner, because they had to con-
tend with the retiarii, who were dressed in a
short tunic, bore a three-pointed lance in their
left hand, and a net in their right. The retiarius
attempted to cast his net over the head of the se-
cutor ; and, if he succeeded, he drew it together
and slew him with his trident ; but, if he missed
his aim, he immediately betook himself to fight
till he could find a second opportunity of en-
tangling his adversary with his net. He was
pursued by the secutor in his flight.

SEDAN', *n. s.* I believe because first made
at Sedan.—Johnson. A kind of portable coach ;
a chair.

Some beg for absent persons, feign them sick,
Close mewed in their *sedans* for want of air,
And for their wives produce an empty chair. *Dryden.*

By a tax of Cato's it was provided that women's
wearing cloaths, ornament, and *sedan*, exceeding
12*l.* 1*s.* 10*d.* halfpenny, should pay 3*s.* in the
hundred pound value. *Arbuthnot.*

SEDAN, a considerable town of France, in the
department of the Ardennes, situated on the
right bank of the Meuse, and strongly fortified,
partly by Vauban. The old castle, in which
Turenne was born, is now converted into a fine
arsenal. The town is divided into Upper and
Lower, and is very uneven and irregular, but not
ill-built. Sedan has been long noted for its ma-
nufactures of superfine woollens, of fire-arms
and copper articles ; it has likewise a cannon
foundry. It was formerly the seat of a Protes-
tant university. Inhabitants 11,000. Thirty-
seven miles south-east of Charlemon, and 170
north-east of Paris. Long. 4 57 50" E., lat. 49
42 29" N.

SEDATE', *adj.* } Lat. *sedatus*. Calm ;
SEDATE'LY, *adv.* } quiet ; still ; unruffled ; un-
SEDATE'NESS, *n. s.* } disturbed : the adverb and
noun substantive corresponding.

With countenance calm and soul *sedate*,
Thus Turnus. *Dryden's Æneid.*

That has most weight with them that appears *se-*
dately to come from their parents' reason. *Locke.*

There is a particular *sedateness* in their conversa-
tion and behaviour that qualifies them for council,
with a great intrepidity that fits them for action. *Addison on the War.*

Disputation carries away the mind from that calm
and *sedate* temper which is so necessary to contem-
plate truth. *Watts.*

SEDATIVES, in medicine, a general name for
such medicines as weaken the powers of nature,
such as blood-letting, cooling salts, purgatives,
&c.

SEDATIVES, in the new system of medicine,
are denied to have any existence. Opium was
long considered by physicians as a sedative, be-
cause it allays pain, and induces sleep, &c., but
its first and chief effect is highly stimulant, and
these are only the consequences of the indirect
debility that arises in the body, when the stimu-
lant effect is gone off (see OPIUM), as is the case
in excess of wine, spirits, and all other intoxicat-

ing liquors. In short, the late Dr. Brown and his followers, insist, that what have hitherto been reckoned sedative powers are only inferior degrees of stimuli, and that no direct sedatives, as such, exist in nature.

SEDATIVE SALT, in the old system of chemistry, borax, now called boracic acid.

SE DEFENDENDO, in law, a plea used for him that is charged with the death of another, by alleging that he was under a necessity of doing what he did in his own defence: as that the other assaulted him in such a manner that, if he had not done what he did, he must have been in hazard of his own life. See HOMICIDE and MURDER.

SEDENTARY, *adj.* Fr. *sedentaire*; Ital. *sedentario*; Lat. *sedentarius*, of *sedco*. Passed in sitting still; wanting motion or action.

A *sedentary* life, appropriate to all students, crushes the bowels; and, for want of stirring the body, suffers the spirits to lie dormant.

Harvey on Consumptions.

The *sedentary* earth,

That better might with far less compass move,

Served by more noble than herself, attains

Her end without least motion. *Milton.*

Till length of years,

And *sedentary* numbness, craze my limbs

To a contemptible old age obscure. *Id. Agonistes.*

The soul, considered abstractedly from its passions, is of a remiss *sedentary* nature, slow in its resolves, and languishing in its executions.

Addison's Spectator.

The blood of labouring people is more dense and heavy than those who live a *sedentary* life.

Arbutnot.

SEDGE, *n. s.* } Sax. *fæcg*. A growth of
SEDCY, *adj.* } narrow flags; a narrow flag.

He hid himself in the *sedges* adjoining. *Sandys.*

Adonis, painted by a running brook,

And Cytherea all in *sedges* hid;

Which seem to move and wanton with her breath,

Even as the waving *sedges* play with wind.

Shakspeare.

On the gentle Severn's *sedgy* bank,

In single opposition, hand to hand,

He did confound the best part of an hour,

In changing hardiment with great Glendower.

Id. Henry IV.

In hotter countries a fly called lucciole, that shineth as the glowworm, is chiefly upon fens and marshes; yet is not seen but in the height of summer, and *sedge* or other green of the fens gives as good shade as bushes.

Bacon.

My bonds I brake,

Fled from my guard, and, in a muddy lake,

Amongst the *sedges*, all the night lay hid. *Denham.*

Niphates, with inverted urn,

And drooping *sedge*, shall his Armenia mourn.

Dryden.

Old father Thames raised up his reverend head,

But feared the fate of Simoeis would return:

Deep in his ooze he sought his *sedgy* bed,

And shrunk his waters back into his urn. *Id.*

SEDHOUT, a noted fortress of Hindostan, in the province of Golcondah, and district of Cuddapah. It is the capital of a small district of the same name, belonging to the British, and was taken by Meer Joomla, about the year 1650. At this period Sedhout and the adjoining district were celebrated for their diamond mines, which

do not now exist. The fortress is six miles north-east of Cuddapah.

SEDIMENT, *n. s.* Fr. *sediment*; Lat. *sedimentum*. That which subsides or settles at the bottom.

The salt water rises into a kind of scum on the top, and partly goeth into a *sediment* in the bottom, and so is rather a separation than an evaporation.

Bacon's Natural History.

It is not bare agitation, but the *sediment* at the bottom, that troubles and defiles the water.

Soult's Sermons.

That matter sunk not down till last of all, settling at the surface of the *sediment*, and covering all the rest.

Woodward.

SEDITION, *n. s.* Fr. *sedition*; Lat. *seditio*. A tumult; insurrection; popular commotion.

That sunshine brewed a shower for him,
That washed his father's fortunes forth of France,
And heaped *sedition* on his crown at home.

Shakspeare. Henry VI.

In soothing them, we nourished 'gainst our senate
The cockle of rebellion, insolence, *sedition*.

Id. Coriolanus.

The cause why I have brought this army hither,
Is to remove proud Somerset from the king,
Seditious to his grace and to the state.

Id. Henry VI.

Very many of the nobility in Edinburgh, at that time, did not appear yet in this *seditious* behaviour.

Clarendon.

Thou returnest

From flight, *seditious* angel.

Milton.

But, if she has deformed this earthly life

With murderous rapine and *seditious* strife,

In everlasting darkness must she lie;

Still more unhappy that she cannot die. *Prior.*

SEDITION, in the civil law, is used for a factious commotion of the people, or an assembly of a number of citizens without lawful authority, tending to disturb the peace and order of society. This offence is of different kinds: some seditions more immediately threatening the supreme power, and the subversion of the constitution; others tending only towards the redress of private grievances. Among the Romans, therefore, it was variously punished, according as its end and tendency threatened greater mischief. See lib. 1, Cod. de Seditiosis; and Mat. de Crimin. lib. ii. n. 5, de Læsa Majestate. In the punishment the authors and ringleaders were justly distinguished from those who, with less wicked intention, joined and made part of the multitude. The same distinction holds in the law of England and in that of Scotland. Some kinds of sedition in England amount to high treason, and come within the statute 25 Edw. III. as levying war against the king. And several seditions are mentioned in the Scottish acts of parliament as treasonable.—Bayne's Crim. Law of Scotland, pp. 33, 34. The law of Scotland makes riotous and tumultuous assemblies a species of sedition. But the law there, as well as in England, is now chiefly regulated by the riot act, made 1 Geo. I.; only it is to be observed that the proper officers in Scotland, to make the proclamation thereby enacted, are sheriffs, stewards, and bailies of regalities, or their deputies; magistrates of royal boroughs, and all other inferior judges and magistrates; high and petty constables, or other officers of the peace,

in any county, stewardry, city, or town. And in that part of the island, the punishment of the offence is any thing short of death which the judges, in their discretion, may appoint.

SEDDLEY (Sir Charles), an English poet and wit, the son of Sir John Sedley, of Aylesford, in Kent, born about 1639. At the restoration he came to London to join the general jubilee, and commenced wit, courtier, poet, and gallant. He was so much admired, that he became a kind of oracle among the poets; which made king Charles tell him that nature had given him a patent to be Apollo's viceroy. The productions of his pen were some plays, and some delicately tender amorous poems, in which the softness of his verses was so exquisite, as to be called by the duke of Buckingham Sedley's witchcraft. 'There were no marks of genius or true poetry to be described,' say the authors of the *Biographia Britannica*; 'the art wholly consisted in raising loose thoughts and lewd desires, without giving any alarm; and so the poison worked gently and irresistibly. Our author, we may be sure, did not escape the infection of his own art, or rather was first tainted himself before he spread the infection to others.' A very ingenious writer of the present day, however, speaks much more favorably of Sir Charles Sedley's writings. 'He studied human nature; and was distinguished for the art of making himself agreeable, particularly to the ladies; for the verses of lord Rochester, beginning with, 'Sedley has that prevailing gentle art,' &c., so often quoted, allude not to his writings, but to his personal address.'—Langhorn's *Effusions*, &c. But while he thus grew in reputation for wit, and in favor with the king, he grew poor and debauched; his estate was impaired, and his morals were corrupted. One of his follies, however, being followed by an indictment and a heavy fine, Sir Charles reformed, applied himself to business, and became a member of parliament, in which he was a frequent speaker. He was in the house of commons in the reign of James II., whose attempts upon the constitution he vigorously withstood; and he was very active in bringing on the Revolution. This was thought more extraordinary as he had received favors from James. But that prince had taken a fancy to Sir Charles's daughter, and, in consequence of his intrigues with her, he created her countess of Dorchester. This honor so far from pleasing, greatly shocked Sir Charles. However libertine he himself had been, yet he could not bear the thoughts of his daughter's dishonor; and, with regard to her exaltation, he only considered it as rendering her more conspicuously infamous. He therefore conceived a hatred for the king; and from this and other motives, perhaps patriotic, readily joined to dispossess him of his throne. 'I hate ingratitude,' said he, 'and therefore, as the king has made my daughter a countess, I will endeavour to make his daughter a queen; meaning the princess Mary, married to the prince of Orange, who deprived James of his crown at the Revolution. He lived to the beginning of queen Anne's reign; and his works were printed in 2 vols. 8vo. 1719.

SEDR, or SEDRE, the high-priest of the

sect of Ali among the Persians. The sedre is appointed by the emperor of Persia, who usually confers the dignity on his nearest relation. The jurisdiction of the sedre extends over all effects destined for pious purposes, over all mosques, hospitals, colleges, sepulchres, and monasteries. He disposes of all ecclesiastical employments, and nominates all the superiors of religious houses. His decisions in matters of religion are received as so many infallible oracles; he judges of all criminal matters in his own house without appeal. His authority is balanced by that of the mudsitehid, or first theologue of the empire.

SEDUCE', *v. a.* } Fr. *seduire*; Lat. *seduco*.
 SEDUCEMENT, *n. s.* } To draw aside from the
 SEDUCER, } right; tempt; corrupt;
 SEDUCIBLE, *adj.* } deprave; deceive: se-
 SEDUCTION, *n. s.* } ducement is the practice
 of seduction: seducer and the other derivatives
 correspond.

In the latter times some shall depart from the faith, giving heed to seducing spirits. 1 Tim. iv. 1.

Me the gold of France did not seduce,
 Although I did admit it as a motive
 The sooner to effect what I intended.

Shakspeare. Henry V.

A beauty-waining and distressed widow
 Seduced the pitch and height of all his thoughts
 To base declension. Id. Richard III.
 Grant it me, O king; otherwise a seducer flourishes,
 and a poor maid is undone. Shakspeare.

I shall never gratify the spitefulness of a few with
 any sinister thoughts of all their allegiance, whom
 pious frauds have seduced. King Charles.

Whatsoever men's faith, patience, or perseverance
 were, any remarkable indulgence to this sin, the se-
 duction of Balaam, was sure to bring judgments.

Hammond.

Subtle he needs must be who could seduce
 Angels. Milton.

To season them, and win them flatter to the love
 of virtue and true labour, ere any flattering seduce-
 ment or vain principle seize them wandering, some
 easy and delightful book of education should be read
 to them. Id. on Education.

We owe much of our error to the power which
 our affections have over our so easy seducible under-
 standings. Glanville.

The deceiver soon found out this soft place of
 Adam's, and innocency itself did not secure him
 from this way of seduction. Id. Scep sis.

To procure the miseries of others in those extremi-
 ties, wherein we hold an hope to have no society our-
 selves, is a strain above Lucifer, and a project beyond
 the primary seduction of hell.

Browne's *Vulgar Errors*.

The vicious example of ages past poisons the
 curiosity of the present, affording a hint of sin unto
 seducible spirits. Browne.

Nor let false friends seduce thy mind to fame,
 By arrogating Jonson's hostile name;
 Let father Flecknoe fire thy mind with praise,
 And uncle Ogleby thy envy raise. Dryden.

He, whose firm faith no reason could remove,
 Will melt before that soft seducer, love. Id.

There is a teaching by restraining seducers, and
 so removing the hindrances of knowledge. South.

Her hero's dangers touched the pitying power,
 The nymph's seducements, and the magick bow.

Pope.

Helen ascribes her seduction to Venus, and men-
 tions nothing of Paris. Id.

A woman who is above flattery, and despises all praise but that which flows from the approbation of her own heart, is, morally speaking, out of the reach of seduction. *Clarissa.*

I know that the devil is continually lying in wait to seduce and destroy the souls of men. *Paley.*

SEDUCTION, is the act of tempting and drawing aside from the right path, and comprehends every endeavour to corrupt any individual of the human race. This is the import of the word in its largest and most general sense; but it is commonly employed to express the act of tempting a virtuous woman to part with her chastity. The seducer of female innocence practises the same stratagems of fraud to get possession of a woman's person, that the swindler employs to get possession of his neighbour's goods or money; yet the law of honor, which pretends to abhor deceit, and which impels its votaries to murder every man who presumes, however justly, to suspect them of fraud, or to question their veracity, applauds the address of a successful intrigue, though it be well known that the seducer could not have obtained his end without swearing to the truth of a thousand falsehoods, and calling upon God to witness promises which he never meant to fulfil. The law of honor is indeed a very capricious rule, which accommodates itself to the pleasures and conveniences of high life; but the law of the land, which is enacted for the equal protection of high and low, may be supposed to view the guilt of seduction with a more impartial eye. Yet, for this offence, even the laws of this kingdom have provided no other punishment than a pecuniary satisfaction to the injured family, which, in England, can be obtained only by one of the quaintest fictions in the world, by the father's bringing his action against the seducer for the loss of his daughter's service during her pregnancy and nurturing. (See Paley's Moral Philosophy, book III., part iii. chap. 3.) The moralist, however, who estimates the merit or demerit of actions, not by laws of human appointment, but their general consequences as established by the laws of nature, must consider the seducer as a criminal of the deepest guilt. In every civilised country, and in many countries where civilisation has made but small progress, the virtue of women is collected as it were into a single point, which they are to guard above all things, as that on which their happiness and reputation wholly depend. At first sight this may appear a capricious regulation; but a moment's reflection will convince us of the contrary. In the married state so much confidence is necessarily reposed in the fidelity of women to the beds of their

husbands, and evils so great result from the violation of that fidelity, that, whatever contributes in any degree to its preservation, must be agreeable to him who, in establishing the laws of nature, intended them to be subservient to the real happiness of all his creatures. But nothing contributes so much to preserve the fidelity of wives to their husbands as the impressing upon the minds of women the highest veneration for the virtue of chastity. She who, when unmarried, has been accustomed to grant favors to different men, will not find it easy, if indeed possible, to resist afterwards the allurements of variety, after marriage. It is therefore a wise institution, and agreeable to the will of Him who made us, to train up women so as that they may look upon the loss of their chastity as the most disgraceful of all crimes, as that which sinks them in the order of society, and robs them of all their value. In this light virtuous women actually look upon the loss of chastity. The importance of that virtue has been so deeply impressed upon their minds, and is so closely associated with the principle of honor, that they cannot think but with abhorrence upon the very deed by which it is lost. He therefore who, by fraud and falsehood, persuades the unsuspecting girl to deviate in one instance from the honor of the sex, weakens in a great degree her moral principle; and, if he reconcile her to a repetition of her crime, he destroys that principle entirely, as she has been taught to consider all other virtues as inferior to that of chastity. Hence it is that the hearts of prostitutes are generally steeled against the miseries of their fellow-creatures; that they lend their aid to the seducer in his practices upon other girls; that they lie and swear, and steal without compunction; and that too many of them hesitate not to commit murder, if it can serve any selfish purpose of their own. The loss of virtue, though the greatest that man or woman can sustain, is not the only injury which the seducer brings upon the girl whom he deceives. She cannot at once reconcile herself to prostitution, or even to the loss of character; and while a sense of shame remains in her mind, the misery which she suffers must be exquisite. She knows that she has forfeited what in the female character is most valued by both sexes; and she must be under the perpetual dread of a discovery. She cannot even confide in the honor of her seducer, who may reveal her secret in a fit of drunkenness, and thus rob her of her fame as well as of her virtue; and, while she is in this state of anxious uncertainty, the agony of her mind must be insupportable.

We shall resume this subject at the beginning of the next volume.
